over and criticise such new music of the German school as came to the London dealers. At one of these meetings the new Trios of Beethoven, Op. 1, were played through, J. B. Cramer at the pianoforte. “This is the man,” he cried, “who is to console us for the loss of Mozart!” According to the recollection of Cipriani Potter, this was after Cramer had made the personal acquaintance of Beethoven in Vienna, and had heard him play there.

Some other incidents recorded by Wegeler belong to this year. Haydn reached Vienna upon his return from his second visit to England on August 20. Beethoven had now ready the three Sonatas, Op. 2, and at one of the Friday morning concerts at Prince Lichnowsky’s he played them to Haydn, to whom they were dedicated.

Here (says Wegeler on page 29 of the ‘Notizen’), Count Appony asked Beethoven to compose a quartet for him for a given compensation, Beethoven not yet having written a piece in this genre. The Count declared that contrary to custom he did not want to have exclusive possession of the quartet for half a year before publication, nor did he ask that it be dedicated to him, etc. In response to repeated urgings by me, Beethoven twice set about the task, but the first effort resulted in a grand violin Trio (Op. 3), the second in a violin Quintet (Op. 4).

How much mistaken Wegeler was in these concluding statements has already been indicated.

The three Pianoforte Sonatas dedicated to Haydn were, therefore, the second group of compositions which Beethoven considered illustrative of his artistic ideals and worthy of publication. Nothing can be said with positiveness touching the time of their origin. Schönfeld’s words in his “Jahrbuch der Tonkunst von Wien und Prag”: “We already have several of his Sonatas, among which his last are particularly noteworthy,” which were written at least eight months before the Sonatas appeared in print, lead to the conclusion that the Sonatas were known in Vienna in manuscript in the spring of 1795. Their appearance in print was announced in the “Wiener Zeitung” of March 9, 1796.

Still another anecdote recorded by Wegeler refers to another composition of this period: “Beethoven was seated in a box at the opera with a lady of whom he thought much at a performance of ‘La Molinara.’ When the familiar _Nel cor più non mi sento_ was reached the lady remarked that she had possessed some variations on the theme but had lost them. In the same night Beethoven wrote the six variations on the melody and the next morning sent them to the lady with the inscription: _Variazioni, etc., Perdute par la--ritrovate par Luigi van Beethoven_. They are so easy that it is likely Beethoven wished that she should be able to play them at sight.” Paisiello’s “La Molinara,” composed in 1788 for Naples, was performed on March 8, 1794 in the Court Opera, and again on June 24 and 27, 1795, in the Kärnthnerthor-Theater in Vienna. Considering the time of the publication of these unpretentious but genial little variations, their composition may be set down after the latter performances. At the same period Beethoven wrote variations on another theme (_Quant’ è più bello_) from the same opera, which were published before the former and dedicated to Prince Carl Lichnowsky. It is likely that a few more sets of variations, a form of composition for which Beethoven had a strong predilection at the time, had their origin in these early years of Beethoven’s life in Vienna. The Variations in C on the “Menuet à la Vigano” from the ballet “Le Nozze disturbate,” may confidently be assigned to the year 1795. The ballet was performed for the first time on May 18, 1795, at Schikaneder’s theatre; the Variations are advertised as published on February 27, 1796.

The Gesellschaft der bildenden Künstler had, in the year 1792, established an annual ball in the Redoutensaal in the month of November; and Haydn, just then returned covered with glory from England, composed a set of twelve minuets and twelve German dances for the occasion. In 1793, the Royal Imperial Composer Kozeluch followed Haydn’s example. In 1794, Dittersdorf wrote the same number of like dances for the large hall, and Eybler for the small. In view of this array of great names, and considering that as yet the Trios, Op. 1, were the only works of a higher order than the Variations which Beethoven had sent to press, the advertisements for the annual ball to be given upon the 22nd of November, 1795, give a vivid proof of the high reputation which the young man had gained as a composer now at the end of his third year in Vienna. These advertisements conclude thus: “The music for the Minuets and German dances for this ball is an entirely new arrangement. For the larger room they were written by the Royal Imperial Chapelmaster Süssmayr; for the smaller room by the master hand of Mr. Ludwig van Beethoven out of love for the artistic fraternity.” These dances, arranged for pianoforte by Beethoven himself, came from the press of Artaria a few weeks later, as did also Süssmayr’s; Beethoven’s name in the advertisement being in large and conspicuous type.

As the year began with the first, so it closed with Beethoven’s second appearance in public as composer and virtuoso; and here is the advertisement of the performance from the “Wiener Zeitung” of December 16:

BEETHOVEN PAYS TRIBUTE TO HAYDN

Next Friday, the 18th instant, Mr. the Chapelmaster Haydn will give a grand musical concert in the small Redoutensaal, at which Mad. Tomeoni and Mr. Mombelli will sing. Mr. van Beethoven will play a Concerto of his composing on the Pianoforte, and three grand symphonies, not yet heard here, which the Chapelmaster composed during his last sojourn in London, will be performed.

One would gladly know what concerto was played.[74] But there was little public criticism then outside of London and very rarely any in Vienna. The mere fact of the appearance of Beethoven at his old master's concert is, however, another proof that too much stress has been laid upon a hasty word spoken by him to Ries. Haydn wanted that Beethoven should put "Pupil of Haydn" on the title-page of his first works. Beethoven was unwilling to do so because, as he said, "though he had taken some lessons from Haydn he had never learned anything from him." Nothing could be more natural than for Haydn, knowing nothing of the studies of his pupil with Schenk, to express such a wish in relation to the Sonatas dedicated to him, and equally natural that the author should refuse; but to add to the attractions of the concert was a very different matter--a graceful and delicate compliment which he could with pleasure make.

This chapter may appropriately close with the one important family event of this year. The father, the mother, two infant brothers and two infant sisters slept in the churchyard at Bonn; but Ludwig, Caspar and Johann were never more to look upon their graves. The three brothers were now reunited. Vienna had become their new home and not one of them beheld the rushing Rhine again.

FOOTNOTES:

[70] Though Thayer fixed the date of this letter in May or June, 1794, Dr. Deiters believed that it was of a much earlier date; and may, indeed, have been written before Beethoven went to Vienna. For his theory Dr. Deiters found a plausible argument in the spelling of the name with a "w" instead of a "v," and the reiterated references to a misunderstanding which had long been made right. The letter has no date or superscription and Wegeler assumed that it was the continuation of one whose first page had been lost. If the letter was written in Bonn it would prove that the Rondo (probably that in G for Pianoforte and Violin, B. and H. Series XII, No. 102) was composed before the beginning of the Viennese period; which might well be. The Sonata is probably the unfinished one in C, dedicated to Eleonore von Breuning.

[71] This was done by Wegeler's grandson, Carl Wegeler, in an essay published in the "Coblenz Zeitung" on May 20, 1890.

[72] An early example of Beethoven's fondness for punning. _Stechen_ means many things in German--among them to sting, stab, tilt in a tournament, take a trick at cards--as well as to engrave, or cut in metal.

[73] The son of Artaria told Nohl that his father had told him that he got the money to pay Beethoven without the composer's knowledge from Prince Lichnowsky.

[74] It was probably that in B-flat. See Nottebohm's "Zweite Beethoveniana," page 72.

Chapter XIV

The Years 1796 and 1797--Beethoven in Prague and Berlin--King Frederick William II and Prince Louis Ferdinand--Himmel, Fasch and Zelter--Compositions and Publications.

The narrative resumes its course with the year 1796, the twenty-sixth of Beethoven's life and his fourth in Vienna. If not yet officially, he was _de facto_ discharged from his obligations to the Elector Maximilian and all his relations with Bonn and its people were broken off. Vienna had become his home, and there is no reason to suppose that he ever afterwards cherished any real and settled purpose to exchange it for another--not even in 1809 when, for the moment, he had some thought of accepting Jerome Bonaparte's invitation to Cassel.

He had now entered his course of contrapuntal study with Albrechtsberger; he was first of the pianoforte players of the capital and his name added attraction even to the concert which Haydn, returning again from his London triumphs, had given to introduce some of his new works to the Viennese; his "master-hand" was already publicly recognized in the field of musical composition; he counted many nobles of the higher ranks in his list of personal friends and had been, perhaps even now was, a member of Prince Carl Lichnowsky's family. The change in his pecuniary condition might have thrown a more equitable temperament than his off its balance. Three years ago he anxiously noted down the few kreutzers occasionally spent for coffee or chocolate "für Haidn und mich"; now he keeps his own servant and a horse. His brothers, if at all a burden, were no longer a heavy one. Carl Caspar, according to the best information now obtainable, soon gained moderate success in the musical profession and, with probably

some occasional aid from Ludwig both pecuniary and in obtaining pupils, earned sufficient for his comfortable support; while Johann had secured a situation in that apothecary shop “Zum Heiligen Geist” which, in 1860, was still to be seen in the Kärnthnerstrasse near the former site of the gate of that name.[75] His wages were, of course, small and we shall soon see that Ludwig offers him assistance if needed, though not to Karl; but Johann’s position gradually improved and he was able in a few years to save enough to enable him, unaided by his brother, to purchase and establish himself in a business of his own.[76]

“Fate had become propitious to Beethoven”; and a final citation from the memorandum book will show in what spirit he was determined to merit the continuance of Fortune’s favor. If we make allowance for the old error as to his real age, this citation may belong to a period a year or two later; but may it not be one of those extracts from books and periodical publications which all his life long he was so fond of making? This seems to be the more probable supposition. The words are these: “Courage! In spite of all bodily weaknesses my spirit shall rule. You have lived 25 years. This year must determine the complete man. Nothing must remain undone.”

And now let the chronological narrative of events be resumed. As the year 1795 had ended with a public appearance of Beethoven as pianoforte player and composer, so also began the year 1796; and, as on a former occasion in a concert by Haydn, so this time he played at a concert given by a singer, Signora Bolla, who afterward became famous, in the Redoutensaal. Again he played a pianoforte concerto.

MEETING OF FRIENDS IN NUREMBERG

“In 1796,” says Wegeler (“Nachträge,” p. 18), “the two older Breuning brothers, Christoph and Stephan, find him (Beethoven) at Nuremberg on a return journey to Vienna. Which journey is not specified. None of the three having a passport from Vienna they were all detained at Linz, but soon liberated through my intervention at Vienna.” And from a letter written by Stephan von Breuning to his mother, dated January, 1796, Wegeler quotes: “From Nuremberg, Beethoven travelled all the way in company with us. The three Bonnians thus attracted the attention of the police, who thought they had made a wonderful discovery. I do not believe that there could be a less dangerous man than Beethoven.” Wegeler’s suggestion that Beethoven was returning “perhaps from Berlin” is of course out of the question. But between the date of Haydn’s concert (December 18th) and Stephan von Breuning’s letter, if written towards the end of January, there was ample time, even in those days of post-coaches, for a journey to Prague and thence across the country to Mergentheim or Ellingen, at that time the temporary residences of Elector Maximilian. The necessity of Beethoven’s knowing precisely in what relation he was to stand with the Elector in the future, accounts sufficiently for his being in Nuremberg at that time, especially if he had had occasion to visit Prague during the Christmas holidays, which is not improbable. Dlabacz, in his “Künstler-Lexikon,” has a paragraph of which this is a part: “v. Beethoven, a Concertmaster on the pianoforte. In the year 1795, he gave an academy in Prague at which he played with universal approval.” It is true that Dlabacz may here record a concert given during Beethoven’s stay in the Bohemian capital some weeks later; but, on the one hand, no other notice of such a concert has been discovered; and, on the other, the “universal approval” on this occasion may have been an inducement for him to return thither so soon.

At all events, his delay in Vienna after coming from Nuremberg was short and was doubtless occupied with the last corrections of the Sonatas, Op. 2, dedicated to Haydn, the six Menuets (second part), the Variations on the theme from “Le Nozze disturbate” and those on “Nel cor più non mi sento,” all of which works are advertised in the “Wiener Zeitung” in the course of the next two months, while their author was again in Prague or cities farther North. For the following letter we are indebted to Madame van Beethoven, widow of the composer’s nephew, Carl:

To my brother Nicholaus Beethoven

to be delivered at the apothecary shop at the Kärnthner Thor Mr. von Z.[77] will please hand this letter to the wig-maker who will care for its delivery.

Prague, February 19th (1796).

Dear Brother!

So that you may at least know where I am and what I am doing I must needs write you. In the first place I am getting on well--very well. My art wins for me friends and respect; what more do I want? This time, too, I shall earn considerable money. I shall remain here a few weeks more and then go to Dresden, Leipsic and Berlin. It will probably be six weeks before I shall return. I hope that you will be more and more pleased with your sojourn in Vienna; but beware of the whole guild of wicked women. Have you yet

called on Cousin Elss? You might write to me at this place if you have inclination and time.

F. Linowsky will probably soon return to Vienna; he has already gone from here. If you need money you may go to him boldly, for he still owes me some.

For the rest I hope that your life will grow continually in happiness and to that end I hope to contribute something. Farewell, dear brother, and think occasionally of

Your true, faithful brother L. Beethoven.

Greetings to Brother Caspar. My address is The Golden Unicorn on the Kleinseite.

A debt of gratitude is certainly due Johann van Beethoven for having carefully preserved this letter for full half a century and leaving it to his heirs, notwithstanding all the troubles which afterwards arose between the brothers, since it is hardly more valuable and interesting for the facts which it states directly than for what it indicates and suggests more or less clearly.

A SOJOURN IN PRAGUE AND ITS FRUITS

It, with other considerations, render it well nigh certain that Beethoven had now come to Prague with Prince Lichnowsky as Mozart had done, seven years before, and that upon leaving Vienna he had had no intention of pursuing his journey farther; but encouraged by the success thus reported to his brother, he suddenly determined to seek instruction and experience, pleasure, profit and fame in an extended tour. Had he projected this journey already in Vienna, how could all recollection of it have been lost by Wegeler? How could von Breuning in the letter cited above have omitted all mention of it? Nor is it possible to think that Beethoven, still so young and still so unknown outside the Austrian and Bohemian capitals, having so many powerful and influential friends there, and there only, could at this time have gone forth to seek elsewhere some permanent position with a fixed salary. The remarks which have been preserved, made by him in writing or conversation, expressing a desire for such an appointment, all belong to a later period, and cannot by any torture of language be made to refer to this, when he was looking into the future with well-grounded hopes and serene confidence of advancement in his new home. Vienna seemed to offer him all his ambition could crave; why should he seek his fortune beyond her walls?

It is pleasant to note his care for the welfare of his brother Johann, which care, doubtless, the other brother did not need. But how could Prince Lichnowsky have been indebted to Ludwig?

The musical public of Prague was the same that had so recently honored itself by its instant and noble appreciation of Mozart, and had given so glorious a welcome to “Figaro,” “Don Giovanni” and “Titus.” There being no royal or imperial court there, and the public amusements being less numerous than in Vienna, the nobility were thrown more on their own resources for recreation; and hence, besides the traditional taste of the Bohemians for instrumental music, their capital was, perhaps, a better field for the virtuoso than Vienna. No notice of any public concert given by Beethoven on this visit has been discovered, either in the newspapers of the time or in the reminiscences of Thomaschek and others; and “the considerable money” earned “this time” must have been the presents of the nobility for his performances in their salons, and, perhaps, for compositions.

The conception of the aria “Ah, perfido! spergiuro” is generally associated with Beethoven’s sojourn in Prague. The belief rests upon the fact that upon the cover of a copy which he revised Beethoven wrote the words “Une grande Scène mise en musique par L. v. Beethoven à Prague, 1796.” On the first page is written: _Recitativo e Aria composta e dedicata alla Signora Contessa di Clari da L. v. Beethoven_. The opus number, 46, in this title is in the handwriting of Al. Fuchs, who owned a copy. Now, on November 21st, 1796, Madame Duschek, the well known friend of Mozart, at a concert in Leipsic sang “An Italian Scena composed for Madame Duschek by Beethoven,” and it was easy to conclude that the aria was really written by Beethoven for Madame Duschek. On a page of sketches preserved in Berlin among others there are sketches belonging to “Ah, perfido!” which do not agree with the printed page. On the lower margin of the first page is the remark: _pour Mademoiselle la Comtesse de Clari_. Nottebohm is led by these things to surmise that the aria was written in Vienna in 1795, before the visit to Prague. In any case, we are permitted to associate the date 1796 only with the completion of the work in Prague; and the purpose may well have been to have it sung by Madame Duschek, who is thus proved to have belonged to the circle of Beethoven’s friends in Prague. Nevertheless, the aria was originally intended for the Countess Josephine Clari, a well known amateur singer who married Count Christian Clam-Gallas in 1797. The scena first appeared in print in the fall of 1805, when it was published in a collection made by Hoffmeister and Kühnel. Beethoven placed it upon the programme of his concert in 1808.

Another family in which Beethoven was received on the footing of a friend was that of Appellate Councillor Kanka. Both father and son were dilettante composers and instrumental players--the father on the violoncello, the son on the pianoforte. Gerber gives them a place in his Lexicon. “Miss Jeanette” (the daughter), says the eulogistic Schönfeld, “played the pianoforte with great expression and skill.” The son adopted his father’s profession, became a distinguished writer on Bohemian law, and in later years did Beethoven good service as legal adviser.

There is in the Artaria collection, a thick fascicle of sketches and musical fragments from Beethoven’s hand in which papers from the Bonn period down to the close of the century are stitched together in such disorder as to show that they were thus joined merely for preservation. One sheet of mere sketches bears, if correctly deciphered, this inscription: “Written and dedicated to Gr. C. G. as a souvenir of his stay in P.” On the fourth page of the sheet stands “these 4 Bagtalles by B.” with something more illegible. May not some yet unknown composition of Beethoven be still in the possession of the family Clam-Gallas? Count Christian and his two daughters are numbered by Schönfeld among the fine pianoforte players of Prague, and these few notices exhaust the information obtained upon this visit of Beethoven there. His next appearance is in Berlin. No record has been found of the proposed visit to either Dresden or Leipsic, although his journey, it would seem, must have taken him through the Saxon capital.

INCIDENTS OF A VISIT TO BERLIN

In after years he was fond of talking about his sojourn in Berlin, and some particulars have thus been preserved. “He played,” says Ries,

several times at court (that of King Frederick William II), where he played the two grand sonatas with _obbligato_ violoncello, Op. 5, written for Duport, first violoncellist of the King, and himself. On his departure he received a gold snuff-box filled with Louis d’ors. Beethoven declared with pride that it was not an ordinary snuff-box, but such an one as it might have been customary to give to an ambassador.

This king shared his uncle Frederick II’s love for music, while his taste was better and more cultivated. His instrument was the violoncello, and he often took part in quartets and sometimes in the rehearsals of Italian operas. He exerted a powerful and enduring influence for good upon the musical taste of Berlin. It was he who caused the operas of Gluck and Mozart to be performed there and introduced oratorios of Handel into the court concerts. His appreciation of Mozart’s genius, and his wish to attach that great master to his court, are well known; and these facts render credible a statement with which Carl Czerny closes a description of Beethoven’s extemporaneous playing contributed to Cock’s “London Musical Miscellany” (August 2nd, 1852):

His improvisation was most brilliant and striking. In whatever company he might chance to be, he knew how to produce such an effect upon every hearer that frequently not an eye remained dry, while many would break out into loud sobs; for there was something wonderful in his expression in addition to the beauty and originality of his ideas and his spirited style of rendering them. After ending an improvisation of this kind he would burst into loud laughter and banter his hearers on the emotion he had caused in them. “You are fools!” he would say. Sometimes he would feel himself insulted by these indications of sympathy. “Who can live among such spoiled children?” he would cry, and only on that account (as he told me) he declined to accept an invitation which the King of Prussia gave him after one of the extemporary performances above described.

Chapelmaster Reichardt had withdrawn himself from Berlin two years before, having fallen into disfavor because of his sympathy with the French Revolution. Neither Himmel nor Righini, his successors, ever showed a genius for chamber music of a high order, and, indeed, there was no composer of reputation in this sphere then living in that quarter. The young Beethoven by his two sonatas had proved his powers and the King saw in him precisely the right man to fill the vacancy--no small proof of superior taste and judgment. What the German expression was which the translator of Czerny’s letter has rendered “accept an invitation which the King gave him” there is no means of knowing; but as it stands it can only mean an invitation to enter permanently into his service. The death of the King the next year, of course, prevented its being ever renewed.

Friedrich Heinrich Himmel, five years older than Beethoven, whom the King had withdrawn from the study of theology and caused to be thoroughly educated as a musician, first under Naumann in Dresden and afterwards in Italy, had returned the year before and had assumed his duties as Royal Pianist and Composer. As a virtuoso on his instrument his only rival in Berlin was Prince Louis Ferdinand, son of Prince August and nephew of Frederick II, two years younger than Beethoven and endowed by nature with talents and genius which would have made him conspicuous had fortune not given him royal descent. He and Beethoven became well known to each other and each felt and did full justice to the other’s musical genius and attainments. Now let Ries speak again:

MEETINGS WITH HIMMEL, FASCH AND ZELTER

In Berlin he (Beethoven) associated much with Himmel, of whom he said that he had a pretty talent, but no more; his pianoforte playing, he said, was elegant and pleasing, but he was not to be compared with Prince Louis Ferdinand. In his opinion he paid the latter a high compliment when once he said to him that his playing was not that of a king or prince but more like that of a thoroughly good pianoforte player. He fell out with Himmel in the following manner: One day when they were together Himmel begged Beethoven to improvise; which Beethoven did. Afterwards Beethoven insisted that Himmel do the same. The latter was weak enough to agree; but after he had played for quite a time Beethoven remarked: “Well, when are you going fairly to begin?” Himmel had flattered himself that he had already performed wonders; he jumped up and the men behaved ill towards each other. Beethoven said to me: “I thought that Himmel had been only preluding a bit.” Afterwards they were reconciled, indeed, but Himmel could never forgive or forget[78]. They also exchanged letters until Himmel played Beethoven a shabby trick. The latter always wanted to know the news from Berlin. This bored Himmel, who at last wrote that the greatest news from Berlin was that a lamp for the blind had been invented. Beethoven ran about with the news and all the world wanted to know how this was possible. Thereupon he wrote to Himmel that he had blundered in not giving more explicit information. The answer which he received, but which does not permit of communication, not only put an end to the correspondence but brought ridicule upon Beethoven, who was so inconsiderate as to show it then and there.

With Carl Friedrich Christian Fasch and Carl Friedrich Zelter he also made a friendly acquaintance, and twice at least attended meetings of the Singakademie, which then numbered about 90 voices. The first time, June 21st, says the “Geschichte der Singakademie”:

A chorale, the first three numbers of the mass and the first six of the 119th Psalm were sung for him. Hereupon he seated himself at the pianoforte and played an improvisation on the theme of the final fugue: “Meine Zunge rühmt im Wettgesang dein Lob.” The last numbers of “Davidiana” (a collection of versets by Fasch) formed the conclusion. No biographer has mentioned this visit or even his sojourn in Berlin. Nor does Fasch pay special attention to it; but the performance must have pleased, for it was repeated at the meeting on the 28th.

The performance of the Society must also have pleased Beethoven, and with good reason; for Fasch’s mass was in sixteen parts and the psalm and “Davidiana,” in part, in eight; and no such music was then to be heard elsewhere north of the Alps.

In 1810, Beethoven, speaking of his playing on that occasion, told Mme. von Arnim (then Elizabeth Brentano) that at the close his hearers did not applaud but came crowding around him weeping; and added, ironically, “that is not what we artists wish--we want applause!” Fasch’s simple record of Beethoven’s visit is this:

June 21, 1796. Mr. van Beethoven extemporized on the “Davidiana,” taking the fugue theme from Ps. 119, No. 16.... Mr. Beethoven, pianist from Vienna, was so accommodating as to permit us to hear an improvisation. . . . June 28, Mr. van Beethoven was again so obliging as to play an improvisation for us.

Early in July, the King left Berlin for the baths of Pyrmont, the nobility dispersed to their estates or to watering-places, and the city “was empty and silent.” Beethoven, therefore, could have had no inducement to prolong his stay; but the precise time of his departure is unknown. Schindler names Leipsic as one of the cities in which, during this tour, Beethoven “awakened interest and created a sensation by his pianoforte playing, and, particularly, by his brilliant improvisation”; but no allusion in any public journal of that or any subsequent period, not even the faintest tradition, has been discovered to confirm the evidently erroneous statements. Moreover, Rochlitz in his account of a visit to the composer in 1822 remarks, “I had not yet seen Beethoven”; and again, “It was only as a youth that he ... passed through (Leipsic).” So, until some new discovery be made, this must also find its place in the long list of Schindler’s mistakes.

Notwithstanding Wegeler’s statement (“Notizen,” 28) that he left Beethoven a member of the family of Prince Lichnowsky “in the middle of 1796,” it is as certain as circumstantial evidence can well make it that the Doctor and Christoph von Breuning had returned to Bonn before Beethoven reached Vienna again; but Stephan and Lenz were still there. The former obtained at this time an appointment in the Teutonic Order, which so many of his ancestors had served, and his name appears in the published “Calendars of the Order” from 1797 to 1803, both inclusive, as “Hofrathsassessor.” He then soon departed from Vienna to Mergentheim, whence he wrote (November 23rd) with other matters the following upon Beethoven to Wegeler and Christoph:

I do not know whether or not Lenz has written you anything about Beethoven; but take notice that I saw him in Vienna and that according to my mind, which Lenz has confirmed, he has become somewhat staider, or, perhaps I should say, has acquired more knowledge of humanity through travels (or was it because of the new ebullition of friendship on his arrival?) and a greater conviction of the scarceness and value of good friends. A hundred times, dear Wegeler, he wishes you here again, and regrets nothing so much as that he did not follow much of your advice. ("Notizen," page 19.)

Except this notice of his bearing and demeanor, there is a complete hiatus in Beethoven's history from his appearance in the Singakademie until the following November. The so-called Fischoff Manuscript has, it is true, a story of a "dangerous illness" which was caused by his own imprudence this summer; but as it is in date utterly irreconcilable with other known facts, it will receive its due consideration hereafter. The most plausible suggestion is that coming back, flushed with victory, with the success of his tour and delighted with the novelty of travelling at his ease, he made that excursion to Pressburg and Pesth of which afterwards Ries was informed and made record ("Notizen," page 109), but of which no other account is known.

ATTEMPTS AT PATRIOTIC MUSIC

And thus we come to November. This was the year of that astounding series of victories ending at Arcole, gained by the young French general Napoleon Bonaparte. The Austrian government and people alike saw and feared the danger of invasion, a general uprising took place and volunteer corps were formed in all quarters. For the Vienna corps, Friedelberg wrote his "Abschiedsgesang an Wiens Bürger beim Auszug der Fahnen-Division der Wiener Freiwilliger," and Beethoven set it to music. The original printed edition bears date "November 15, 1795." It does not appear to have gained any great popularity, and a drinking-song ("Lasst das Herz uns froh erheben") was afterwards substituted for Friedelberg's text, and published by Schott in Mayence.

The rapid progress of the French army had caused the Germans in Italy to become distrustful of the future and to hasten homeward. Among them were Beethoven's old companions in the Bonn orchestra, the cousins Andreas and Bernhard Romberg, who in the spring of this year (May 26th), had kissed the hand of the Queen of Naples, daughter of the Empress Maria Theresia, and then departed to Rome to join another friend of the Bonn period, Karl Kügelgen. The three coming north arrived at Vienna in the autumn; the Rombergs remained there for a space with Beethoven, while Kügelgen proceeded to Berlin. Baron von Braun--not to be mistaken for Beethoven's "first Mæcenas" the Russian Count Browne--had heard the cousins the year before in Munich and invited them "to give Vienna an opportunity to hear them." There is no notice of their concert in the Vienna newspapers of the period, and the date is unknown. From Lenz von Breuning is gleaned an additional fact which alone gives interest to the concert for us. He writes to Wegeler in January, 1797--not 1796, as erroneously printed in the appendix to the "Notizen," page 20--and after the meeting with the von Breunings at Nuremberg:

Beethoven is here again;[79] he played in the Romberg concert. He is the same as of old and I am glad that he and the Rombergs still get along with each other. Once he was near a break with them; I interceded and achieved my end to a fair extent. Moreover, he thinks a great deal of me just now.

It it clear that the Rombergs, under the circumstances, must have largely owed their limited success to Beethoven's name and influence. In February, 1797, they were again in their old positions in Schroeder's orchestra in Hamburg.

Beethoven during this winter must be imagined busily engaged with pupils and private concerts, perhaps also with his operatic studies with Salieri, certainly with composition and with preparation for and the oversight of various works then passing through the press; for in February and April, Artaria advertises the two Violoncello Sonatas, Op. 5, the Pianoforte Sonata for four hands, Op. 6, the Trio, Op. 3, the Quintet, Op. 4, and the Twelve Variations on a Danse Russe; these last are the variations which he dedicated to the Countess Browne and which gave occasion for the anecdote related by Ries illustrating Beethoven's forgetfulness; for this dedication he had

received a handsome riding-horse from Count Browne as a gift. He rode the animal a few times, soon after forgot all about it and, worse than that, its food also. His servant, who soon noticed this, began to hire out the horse for his own benefit and, in order not to attract the attention of Beethoven to the fact, for a long time withheld from him all bills for fodder. At length, however, to Beethoven's great amazement he handed in a very large one, which recalled to him at once his horse and his neglectfulness. ("Notizen," page 120.)

On Thursday, April 6, 1797, Schuppanzigh gave a concert, on the programme of which Beethoven's name figured twice. Number 2 was an "Aria by Mr. van Beethoven, sung by Madame Tribolet (-Willmann);" No. 3 was "a Quintet for Pianoforte and 4

wind-instruments, played and composed by Mr. L. v. Beethoven." This was the beautiful Quintet, Op. 16, the time of whose origin is thus more definitely indicated than in the "Chronologisches Verzeichniss," a fact for which we are indebted to Nottebohm.

But the war was renewed and the thoughts of the Viennese were occupied with matters more serious than the indulgence of their musical taste. On the 16th of March, Bonaparte forced the passage of the Tagliamento and Isonzo. During the two weeks following he had conquered the greater part of Carniola, Carinthia and the Tyrol, and was now rapidly approaching Vienna. On the 11th of February, Lorenz Leopold Hauschka's "Gott erhalte unsern Kaiser" with Haydn's music had been sung for the first time in the theatre and now, when, on April 7th, the Landsturm was called out, Friedelberg produced his war-song "Ein grosses, deutsches Volk sind wir," to which Beethoven also gave music. The printed copy bears date April 14th, suggesting the probability that it was sung on the occasion of the grand consecration of the banners which took place on the Glacis on the 17th. Beethoven's music was, however, far from being so fortunate as Haydn's, and seems to have gained as little popularity as his previous attempt; but as the preliminaries to a treaty of peace were signed at Leoben on the 18th, and the armies, so hastily improvised, were dismissed three weeks afterwards, the taste for war-songs vanished.

A QUIET AND UNEVENTFUL PERIOD

The little that is known of Beethoven's position as a teacher at this period is very vague and unsatisfactory; enough, however, to render it sufficiently certain that he had plenty of pupils, many of them young ladies of high rank who paid him generously. In the triple capacity of teacher, composer and pianist his gains were large and he was able to write in May to Wegeler that he was doing well and steadily better.

It is very possible that the illness mentioned by the Fischoff Manuscript may have occurred during this summer. There can be little doubt that the original authority for the statement is Zmeskall, and therefore the fact of such an attack may be accepted as certain, but the date--being, as there given, clearly wrong, as well as the inference that in it lay the original cause of the composer's subsequent loss of hearing--must be left mainly to conjecture. From May to November, 1797, Beethoven's history is still a blank and nothing but the utter silence of Lenz von Breuning in his correspondence with his family at Bonn on a topic so likely to engage his sympathies as the dangerous illness of his friend, appears to prevent the filling of this blank in part by throwing him upon a bed of sickness. True, Lenz may have written and the letter have been lost or destroyed; or he may have neglected to write because of his approaching departure from Vienna, which took place in the autumn. His album, still preserved, has among its contributors Ludwig and Johann van Beethoven and Zmeskall. Ludwig wrote as follows:

Truth exists for the wise, Beauty for a feeling heart: They belong to each other.

Dear, good Breuning;

Never shall I forget the time which I spent with you in Bonn as well as here. Hold fast your friendship for me; you will always find me the same.

Vienna 1797 the 1st of October. Your true friend L. v. Beethoven.

They never met again. Lenz died on April 10th of the following year. In November, Beethoven enjoyed a singular compliment paid him by the association of the Bildende Künstler--a repetition of his minuets and trios composed two years before for the artists' ball; and on the 23rd of December, he again contributed to the attractions of the Widows' and Orphans' Concert by producing the Variations for two Oboes and English Horn on "Là ci darem la mano," played by Czerwenka, Reuter and Teimer. His publications in 1797, besides those mentioned at the beginning of the year, were the Twelve Variations for Pianoforte and Violoncello on the theme from Handel's "Judas Maccabæus," precise date unknown; the Pianoforte Sonata, Op. 7; and the Serenade, Op. 8, both advertised by Artaria and Co., October 7th. Finally, the Rondo in C, Op. 51, No. 1, published by Artaria with the catalogue number 711.

* * * * *

We come to a consideration of the facts touching the compositions of the years 1796 and 1797.

THE COMPOSITION OF "ADELAIDE"

Among the most widely known of these is "Adelaide." The composition of this song must have been begun in the first half of 1795, if not earlier, for sketches of it are found among the exercises in double counterpoint written for Albrechtsberger. Other sheets

containing sketches for “Adelaide” and the setting of Bürger’s “Seufzer eines Ungeliebten” are preserved in the library of the Gesellschaft der Musikfreunde in Vienna and the British Museum in London. The song was published by Artaria in 1797, under the title “Adelaide von Matthisson. Eine Kantate für eine Singstimme mit Begleitung des Klaviers. In Musik gesetzt und dem Verfasser gewidmet von Ludwig van Beethoven.” The opus number 46 was given to it later. In 1800 Beethoven sent a copy of the song to the poet and accompanied it with the following letter:

Most honored Sir!

You are herewith receiving from me a composition which has been in print for several years, but concerning which you probably, to my shame, know nothing. Perhaps I can excuse myself and explain how it came about that I dedicated something to you which came so warmly from my heart yet did not inform you of the fact, by saying that at first I was unaware of your place of residence, and partly also I was diffident, not knowing but that I had been over-hasty in dedicating a work to you without knowing whether or not it met with your approval.

Even now I send you “Adelaide” with some timidity. You know what changes are wrought by a few years in an artist who is continually going forward; the greater the progress one makes in art the less one is satisfied with one’s older works. My most ardent wish will be fulfilled if my musical setting of your heavenly “Adelaide” does not wholly displease you, and if it should move you soon to write another poem of its kind, and you, not finding my request too immodest, should send it to me at once, I will put forth all my powers to do your beautiful poetry justice. Look upon the dedication as partly a token of the delight which the composition of your A. gave me, partly as an evidence of my gratitude and respect for the blessed pleasure which your poetry has always given, _and always will_ give me.

Vienna, August 4th, 1800.

When playing “Adelaide” sometimes recall your sincere admirer

Beethoven.

Whether or not Matthisson answered this letter is not known; but when he republished “Adelaide” in the first volume of his collected poems in 1815, he appended to it a note to this effect: “Several composers have vitalized this little lyric fantasy with music; but according to my strong conviction none of them so threw the text into the shade with his melody as the highly gifted Ludwig van Beethoven in Vienna.” The “Opferlied,” the words of which were also written by Matthisson, is one of the poems to which Beethoven repeatedly recurred. “It seems always to have presented itself to him as a prayer,” says Nottebohm. Its last words, “The beautiful to the good,” were written in autograph albums even in his later years. The origin of the composition is to be ascribed to 1795, as Nottebohm enters it in his catalogue. It was thus possible for Wegeler to know it in 1797, when he put a Masonic text under the music. It had not yet been published at that time, however, which fact accounts for the discovery of sketches for it in a sketchbook of 1798-1799 described by Nottebohm.

It was not published until later, probably in 1808, when it came with two other songs from the press of Simrock. Beethoven composed the poem a second time, utilizing the beginning of his first melody, for solo, chorus and orchestra (Op. 121b). To this setting we shall recur hereafter. There is still another song which must be brought into the story of this period. It is the “Seufzer eines Ungeliebten,” with its two parts based on two independent but related poems by Bürger. Particular interest attaches to the second part, “Gegenliebe,” from the fact that its melody was used afterward by Beethoven for the variations in the “Choral Fantasia,” Op. 80. Sketches for this melody are found associated with sketches for “Adelaide” on a sheet in the archives of the Gesellschaft der Musikfreunde. Nottebohm fixes the year of the song’s origin as 1795. It was first published as late as 1837 by Diabelli along with the song, “Turteltaube, du klagest,” which was composed much later. The Italian song, “O care selve, o cara felice libertà” (from Metastasio’s “Olimpiade”), entered under number 1264 in Thayer’s “Chronologisches Verzeichniss,” appears as a chorus for three voices at the end of the Albrechtsberger exercises, and hence may be placed in the year 1795, as is done by Nottebohm, who adds that it originated simultaneously with the setting of “Wer ist ein freier Mann?” Here mention must also be made of two arias which Beethoven wrote for introduction in Umlauf’s comic opera “Die schöne Schusterin.” These songs were assigned to the Bonn period in the first edition of this biography because the opera was performed in Bonn in the years 1789 and 1790. The two songs composed by Beethoven are an arietta, or rather strophic song, “O welch’ ein Leben,” for tenor, and an aria, “Soll ein Schuh nicht drücken?” for soprano. The words of the latter are in the original libretto. The words of the tenor song, though not part of the original text, were obviously written for the opera. The melody was afterward used by Beethoven as a setting for Goethe’s “Mailied,” published in 1805, as Op. 52. Both songs, as written for the opera, were published for the first time in the

Complete Edition of Beethoven's works from the copies preserved in the Berlin Library.

NUMEROUS PIECES OF CHAMBER MUSIC

Most important of the instrumental compositions of this period is the Quintet for Strings, Op. 4, which is frequently set down as an arrangement (or revised transcription) of the Octet, Op. 103. The Quintet, however, though it employs the same motivi as the Octet, is an entirely new work, made so by the radical changes of structure--changes of register to adapt the themes to the stringed instruments and changes in the themes themselves. The origin of the Quintet can be placed anywhere in the period from 1792 (when the Octet was probably begun) to the beginning of 1797, when the Quintet was advertised as "wholly new." There is a clue in the Wegeler anecdote already related in connection with the String Trio, Op. 3, in the chapter of this work devoted to the works composed in Bonn. In 1795, Count Appony commissioned Beethoven to compose a quartet, the honorarium being fixed. Wegeler's recollection was that Beethoven twice undertook the task; but the first effort resulted in the String Trio and the second in "a quintet (Op. 4)." There is not sufficient internal evidence to reject the story so far as it affects the Quintet (the Trio has already been subjected to study), and from its structure it might well be argued that the composition was undertaken as a quartet and expanded into a quintet in the hands of the composer. If Count Appony's commission was given in 1795, the date of the completion of the Quintet may be set down as 1796. Artaria, who published the work, advertised it in the "Wiener Zeitung" of February 8th, 1797.

The two Sonatas for Pianoforte and Violoncello, Op. 5, belong to the year 1796, and are the fruits of the visit to Berlin. There is no reason to question Ries's story that Beethoven composed them for Pierre Duport and played them with him. The dedication to Friedrich Wilhelm II and the character of the works lend credibility to Ries's account of their origin. Beethoven played them with Bernhard Romberg in Vienna at the close of 1796 or beginning of 1797, and they were published soon afterward, being advertised by Artaria in the "Wiener Zeitung" of February 8th, 1797. The Twelve Variations on a theme from Handel's "Judas Maccabæus," were published by Artaria in 1797, dedicated to the Princess Lichnowsky, _née_ Countess Thun. There were no performances of Handel's oratorios in Vienna at this time, but it is not improbable that the suggestion for the Variations came from Baron van Swieten.

Here seems to be the place to refer to the Allegro movement in sonata-form for viola and violoncello which Beethoven gave the title, "Duett mit zwei Augengläsern obbligato von L. v. Beethoven" (Duet with two Eyeglasses obbligato, by L. v. Beethoven), to be found in the volume of sketches from this period (1784-1800) which the British Museum bought from J. N. Kafka in 1875.[80] There ought to be a hint as to the identity of the two players "with two eyeglasses obbligato." Here is also the place for the three Duos for Clarinet and Bassoon first published by André in Offenbach. The Sextet for Wind-Instruments published by Breitkopf and Härtel in 1810 (it received the opus number 71 later), belongs to this period. Sketches for the last movement, which differ from the ultimate form, however, are found amongst the sketches for the Pianoforte Sonata, Op. 10, No. 3. The inception of the Sonata must fall sometime between the middle of 1796 and the middle of 1798, since the subscription for it was opened in the beginning of July, 1798, and other works of a similar character were already completed in 1797. It is, therefore, possible to place the origin of the earlier movements of the Sextet in an earlier period, say 1796-97, a proceeding which is confirmed by the circumstance that the beginning is found before sketches for "Ah, perfido!" (which was composed in 1796 at the latest), on a sheet of sketches in the Artaria collection. The Kafka volume of sketches in the British Museum contains sketches for the minuet and trio of the Sextet, "Ah, perfido!" and the Pianoforte Sonata, Op. 49, No. 2. This fact also indicates the year 1796. Beethoven let the work lie a long time. It had its first hearing at a chamber concert for the benefit of Schuppanzigh in April, 1805; but it was not until 1809 that he gave it out for publication. On August 3rd of that year he wrote to Breitkopf and Härtel: "By the next mail-coach you will receive a song, _or perhaps two_, and a sextet for wind-instruments," and on August 8th: "The sextet is one of my earlier things and, moreover, was written in a single night--nothing can really be said of it beyond that it was written by an author who at least has produced a few better works; yet for many people such works are the best." The statement that the work was written in a single night must be taken in a Pickwickian sense, for sketches of it have been found.

PREDILECTION FOR WIND-INSTRUMENTS

It is plain that at this time Beethoven had a particular predilection for wind-instruments. Erich Prieger owned a fragment of a Quintet in E-flat for Oboe, three Horns and Bassoon, formerly in the possession of Artaria. The beginning of the first movement is lacking, but can be supplied from the repetition in the second part. The Adagio is intact, but there are only a few measures of the Minuet. Influenced, no doubt, by the performances of such compositions, Beethoven composed at this time two works for two oboes and English horn. Nottebohm surmises that they were instigated by a terzetto for two oboes and English horn composed by a musician named Wendt and performed at a concert of the Tonkünstler-Gesellschaft by three brothers, Johann, Franz and Philipp Teimer, on

December 23rd, 1793. One of the two works, the Trio which was published as Op. 87, is pretty well known, since it was made accessible to wider circles by arrangements published in Beethoven's day and with his approval. Artaria published it in April, 1806, without opus number. He also published it for two violins and viola as Op. 29, and finally as a Sonata for Pianoforte and Violin. The last transcription was published first, as stated in Thayer's Catalogue. Nothing of a historical nature is known of the Variations on "Là ci darem" for the same instruments beyond the fact that they were performed on December 23rd, 1797, at the concert for the benefit of the Widows and Orphans in the National Court Theatre. On a free page of the autograph (after the sixth variation) there are some miscellaneous sketches, among them a motive for the Adagio of Op. 3, another which was used in the Serenade, Op. 25, and, more remarkable still, a few measures of "Adelaide," on which he was at work in 1793, and which appeared in print in 1797. Obviously, the Variations were finished, and we may set down at the latest the year 1795 for their beginning.

The Sextet for four stringed instruments and two horns, Op. 81b, also belongs to this early period and in all likelihood was conceived before the Sextet for wind-instruments. Sketches for the first two movements are upon a sheet in the Berlin library by the side of sketches for the song, "Seufzer eines Ungeliebten." Sketches for this song keep company with some for "Adelaide." The Sextet is therefore to be credited to the year 1795, or perhaps 1794. It was published in 1819 by Simrock in Bonn. In a letter which Beethoven sent to Simrock with the MS. (but which has been lost) he had written to the publisher, who was an admirable horn player, that "the pupil had given his master many a hard nut to crack." As to whether or not, and if so when and where, the Sextet had been played before being sent to Simrock there is, as yet, no conclusive evidence.

The beautiful Quintet in E flat, Op. 16, for Pianoforte and Wind-instruments, was played at a concert given by Schuppanzigh on April 6th, 1797, being number 5 on the programme which described it as "A Quintet for the Fortepiano accompanied by four Wind-Instruments, played and composed by Mr. Ludwig van Beethoven." It had probably been completed not long before. Sketches are found in connection with a remark concerning the Sonata in C minor, Op. 10, No. 1.

It was in all probability composed between 1794 and the beginning of 1797. In the minutes of a meeting of the Tonkünstler-Gesellschaft under date May 10th, 1797, occurs this entry: "On the second day Mr. van Beethoven produced a Quintet and distinguished himself in the Quintet and incidentally by an improvisation." The word "dabey" (incidentally) seems to indicate that he introduced an improvisation in the Quintet as he did on a later occasion to the embarrassment of the other players, but to the delight of the listeners. Ries tells the story in his "Notizen," p. 79. It was at a concert at which the famous oboist Friedrich Ramm, of Munich, took part.

In the final Allegro there occur several holds before a resumption of the theme. At one of these Beethoven suddenly began to improvise, took the Rondo as a theme and entertained himself and the others for a considerable space; but not his associates. They were displeased, and Ramm even enraged (_aufgebracht_). It really was comical to see these gentlemen waiting expectantly every moment to go on, continually lifting their instruments to their lips, then quietly putting them down again. At last Beethoven was satisfied and dropped again into the Rondo. The entire audience was delighted.

Wasielewski doubts the correctness of the story, since there is but one hold in the Finale. Dr. Deiters thought that Ries confounded the last with the first movement, in which the clarinet enters after a _fermata_. The Quintet was published by Mollo in Vienna in 1801, and was dedicated to Prince Schwarzenberg. It appeared simultaneously in one arrangement made by Beethoven himself as a Quartet for Pianoforte and Strings, as Ries expressly declares. Beethoven had nothing to do with the arrangement as a String Quartet published by Artaria as Op. 75.

Touching the history of the Serenade for Violin, Viola and Violoncello, Op. 8, little else is known beyond the fact that its publication was announced in the "Wiener Zeitung" on October 7th, 1797, by Artaria. Mr. Shedlock called attention in the "Musical Times" of 1892 (p. 525) to sketches which appeared along with others of the Pianoforte Concerto in B-flat, and the Trio, Op. 1, No. 2. That Beethoven valued the work highly is a fair deduction from the fact that he published it soon after its composition and authorized the publication of an arrangement for Pianoforte and Viola which he had revised. This arrangement received the opus number 42, though probably not from Beethoven. Hoffmeister in Leipzig, who published it in 1804, under the title "Notturno pour Fortepiano et Alto arrangé d'un Notturno pour Violon, Alto et Violoncello et revu par l'auteur--Œuvre 42," advertised it in the "Intelligenzblatt der Zeitschrift für die elegante Welt" on December 17, 1803. It is this arrangement, no doubt, to which Beethoven referred in a letter to Hoffmeister, dated September 22nd, 1803, in which he said: "These transcriptions are not mine, though they were much improved by me in places. Therefore, I am not willing to have you state that I made them, for that would be a lie and I could find neither time nor patience for such work." According to the view of Dr. Deiters, which was shared also by Nottebohm, the Serenade, Op. 25, also belongs here. It was probably composed before Op. 8. Beethoven entrusted its publication in the beginning of 1802 to Cappi, who

had just begun business. Then, like Op. 8, it was published by Hoffmeister as Op. 41, in an arrangement for Pianoforte and Flute (or Violin), which, no doubt, was included in Beethoven's protest against being set down as the transcriber.

A GROUP OF PIANOFORTE SONATAS

Prominent among the compositions of this time is the Sonata in E-flat for Pianoforte, Op. 7. The only evidence of the date of its composition is the announcement of its publication by Artaria in the "Wiener Zeitung" of October 7th, 1797. There are sketches for the third movement in the Kafka volume, but they afford no help in fixing a date. The Sonata is inscribed to the Countess Babette Keglevich, one of Beethoven's pupils, who afterwards married Prince Innocenz Odescalchi in Pressburg. Nottebohm quotes the following from a letter written by a nephew of the Countess: "The Sonata was composed for her when she was still a maiden. It was one of the hobbies, of which he (Beethoven) had many, that, living as he did _vis-à-vis_, he came in morning gown, slippers and tasseled cap (_Zipfelmütze_) to give her lessons." Inasmuch as the sketches mentioned belong only to the third movement and the sheet contains the remark: "diverse 4 bagatelles de inglese Ländler, etc.," Nottebohm supposes that the movement was originally intended for one of the Bagatelles and was later incorporated in the Sonata. It is very probable that the two little Sonatas, Op. 49, belong to this period. Everybody knows that the second movement of the second Sonata (the minuet) is based on the same motive as the third movement of the Septet. That the motive is older in the Sonata than in the Septet is proved by the fact that sketches for it are found along with some to "Ah, perfido!" (1795-96) and the Sextet for Wind-instruments, Op. 71. This circumstance establishes its early origin, say in 1795 or, at latest, 1796. Nottebohm considers it likely that the first Sonata was finished at the latest in 1798, certainly before the Sonata "Pathétique" and the Trio for strings, Op. 9, No. 3. The Sonatas were ready for publication as early as 1802, in which year brother Carl offered them to André in Offenbach. They were not published until 1805, when they appeared with the imprint of the Bureau d'Arts et d'Industrie, as appears from an advertisement in the "Wiener Zeitung" of January l9th, 1805. Here, too, belongs the little Sonata in D for four hands, Op. 6, published by Artaria in October, 1797, as Nottebohm surmises. It was probably composed for purposes of instruction. Except a few trifles (marches, and two sets of variations) Beethoven wrote nothing more for four hands, though Diabelli offered him 40 ducats for a four-hand sonata in 1824.

In the pianoforte compositions of these two years are to be included the Variations in A on a Russian dance from the ballet "Das Waldmädchen," published in April, 1797, and dedicated to the Countess Browne, _née_ Bietinghoff. "Das Waldmädchen," by Traffieri, music by Paul Wranitzky, was first performed at the Kärnthnerthor-Theater on September 28, 1796, and was repeated sixteen times the same year. This fixes the time of the composition of the Variations approximately. They were probably written before the end of 1796.

There are a few other compositions brought to light by Nottebohm and Mandyczewski, which call for notice. No. 299, Series XXV (Supplement), B. and H. Complete Works, is an Allegretto in C minor, 3/4 time; No. 295 a Bagatelle, also in C minor 3/4, Presto, sketches for which are associated with those for the C minor Sonata, Op. 10, No. 1. From the remark: "Very short minuets to the new sonatas. The Presto remains for that in C minor," written about this time Nottebohm concludes that this Bagatelle was conceived as an intermezzo in the C minor Sonata, and that, possibly, the Allegretto had a similar origin.[81]

A unique place among Beethoven's early works is occupied by the two pieces for mandolin with pianoforte accompaniment first published in the Complete Edition. Thayer, who knew of the sketches at Artaria's, but seems not to have seen the composition recovered by Nottebohm, which is called Sonatine, associated Beethoven's purpose with Krumpholz, who was a virtuoso on the mandolin; but Mylich, Amenda's student companion, may have been in the composer's mind.

The fact that no compositions for orchestra save the dances for the Redoutensaal, to be referred to presently, have been preserved, is not to be taken as conclusive evidence that Beethoven did not venture into the field of orchestral music in the Bonn and early Vienna days. Such an assertion is less likely to be made now than before the discovery of the two Imperial cantatas of 1790. Moreover, Mr. Shedlock's extracts from the Kafka sketchbook in the British Museum show that Beethoven tried his youthful hand at a symphony. Among the earliest of the sketches there is one in C minor marked "Sinfonia," which begins as follows:

[Illustration]

THE "JENA" SYMPHONY AND SOME DANCES

Nottebohm notes the theme also in his "Zweite Beethoveniana" (p. 577). Shedlock's contention that out of this theme grew the second movement of the first Pianoforte Quartet (composed in 1785) is incontestable. The symphonic sketch is therefore of earlier date than 1785. In 1909, Prof. Fritz Stein, Musical Director of the University of Jena, announced that in the collection of music of the

Academic Concerts, founded in 1780, he had discovered the complete parts of a symphony in four movements in C “par Louis van Beethoven.” These words are in the handwriting of the copyist on the second violin part; on the ’cello part is written: “Symphonie von Beethoven.” Dr. Hugo Riemann,[82] after a glance through the score prepared by Prof. Stein and put at his disposal, gave it as his opinion that the symphony might well be a composition by Beethoven. Thematically, he says it suggests partly the Mannheim school, partly Haydn; the instrumentation is nearer Mozart than Stamitz or Cannabich.

Mention of Beethoven’s orchestral dances has already been made. Schindler’s remark that the musicians of Vienna “refused citizenship” to Beethoven’s efforts to write Austrian dance music is discredited, at least so far as Viennese society is concerned, by the success of his dances composed for the Redoutensaal and the very considerable number of his waltzes, ländlers, minuets, écossaises, allemandes and contra-dances which have been preserved. Only the smaller portion of these dances have been included in the Complete Edition of Breitkopf and Härtel. Thus in Series II there are 12 minuets and 12 German dances; in Series XXV (Supplement), 6 “Ländrische Tänze” for two violins and bass, 6 German dances for pianoforte and violin, and, for pianoforte alone, 6 German dances, 6 écossaises and a few miscellaneous dances; in Series XVIII (Small Pieces for Pianoforte) there are 6 minuets and 13 “Ländrische” (1-6 identical with those numbered 7-13 in Series II, but transcribed). There are many dances as yet unpublished. For instance, among the Artaria MSS, purchased by Erich Prieger, there are 12 écossaises, of which 6 are as yet unknown, also 12 “Deutsche” for pianoforte and 6 minuets for two violins and bass, which have never been printed. The three orchestral dances noted by Thayer in the Thematic Catalogue as No. 290, of the Artaria collection, are Nos. 3, 9 and 11 of the 12 minuets which A. von Perger discovered in the archives of the Künstler-Pensions-Institut in 1872, and which were published by Hengel in Paris in pianoforte transcription in 1903 and in score and parts in 1906, edited by Chantavoine. They were composed for the Künstlersocietät and are now in the Court Library at Vienna. (MS. 16,925.)

FOOTNOTES:

[75] It is now No. 16 of the extended Operngasse.

[76] Czerny described Beethoven’s brothers to Otto Jahn as follows: “Carl: small of stature, red-haired, ugly; Johann: large, dark, a handsome man and complete dandy.”

[77] “Mr. von Z.” is doubtless Zmeskall, who is thus shown to have been a trusted friend of Beethoven’s in 1796. “This time” indicates plainly that Beethoven had been in Prague before. Through the words: “Greetings to Brother Caspar” the pen has been heavily drawn, and, if the color of the ink can be trusted after so many years, it was done at the time of writing. “F. Linowsky” is Fürst (Prince) Lichnowsky.

[78] Beethoven told the story to Mme. von Arnim with the additional particular that they were walking in Unter den Linden and went thence into a private room of the principal coffee-house where there was a pianoforte, for the exhibition of their skill.

[79] After the journey to Pesth?

[80] See the articles by J. S. Shedlock in “The Musical Times,” June to December, 1892. Mr. Shedlock made a copy of the duet for Dr. Deiters.

[81] “Beethoveniana,” p. 31. Later Beethoven wanted to give the Sonata an Intermezzo in C major (Ibid., p. 479), but did not carry out the intention.

[82] See Vol. II, p. 60, of the revised edition of “Ludwig van Beethoven’s Leben” by Thayer, 1910.

Chapter XV

General Bernadotte--His Connection with the “Heroic” Symphony--Rival Pianists--J. Wölffl--Dragonetti and Cramer--Compositions of the Years 1798 and 1799.

Early in the year 1798, a political event occurred which demands notice here from its connection with one of Beethoven’s noblest and most original works--the “Sinfonia Eroica.” The singular tissue of error which, owing to carelessness in observing dates, has been woven in relation to its origin may be best destroyed by a simple statement of fact.

The extraordinary demands made by the French Directory upon the Austrian government as preliminary to the renewal of diplomatic intercourse, after the peace of Campo Formio--such as a national palace and French theatre for the minister and the

right of jurisdiction over all Frenchmen in the Austrian dominions--all of which were rejected by the Imperial government, had aroused to a high pitch the public curiosity both as to the man who might be selected for the appointment and as to the course he might adopt. This curiosity was by no means diminished by the intelligence that the new minister was Jean Baptiste Bernadotte, the young general who had borne so important a part in the recent invasion of Istria. He arrived in Vienna on February 5th, 1798. The state of the Empress's health, who was delivered of the Archduchess Maria Clementine on the 1st of March, delayed the private audience of Bernadotte for the presentation of his credentials to the Emperor until the second of that month, and his public audience until the 8th of April. During the festivities of the court, which then took place, Bernadotte was always present, and a reporter of that day says both the Emperor and Empress held more conversation with him than with any other of the "cercle." This familiar intercourse, however, came speedily to an end; for on the 13th Bernadotte had the rashness to display the hated tricolor from his balcony and to threaten to defend it by force. A riot occurred, and it was thought that in the extreme excitement of popular feeling nothing but the strong detachments of cavalry and infantry detailed for his protection saved his life--saved it to ascend the throne of Sweden on the twentieth anniversary of his arrival in Vienna!

Since etiquette allowed a foreign minister neither to make nor receive visits in his public capacity until after his formal reception at court, the General, during the two months of his stay, except the last five days, "lived very quietly." Those who saw him praised him as "well behaved, sedate and modest." In his train was Rudolph Kreutzer, the great violinist.

BERNADOTTE AND THE HEROIC SYMPHONY

Bernadotte had now just entered his 34th year; Kreutzer was in his 32nd; both of them, therefore, in age, as in tastes and acquirements, fitted to appreciate the splendor of Beethoven's genius and to enjoy his society. Moreover, as the Ambassador was the son of a provincial advocate, there was no difference of rank by birth, which could prevent them from meeting upon equal terms. Under such circumstances, and remembering that just at that epoch the young General Bonaparte was the topic of universal wonder and admiration, one is fully prepared for the statement of Schindler upon the origin of the "Heroic" Symphony:

The first idea for the symphony is said to have gone out from General Bernadotte, then French Ambassador in Vienna, who esteemed Beethoven very highly. This I heard from several of Beethoven's friends. I was also told so by Count Moritz Lichnowsky (brother of Prince Lichnowsky), who was often in the society of Bernadotte with Beethoven....

Again in 1823:

Beethoven had a lively recollection that Bernadotte had really first inspired him with the idea of the "Eroica" Symphony.

This is from Schindler's work in its first form. His unfortunate propensity sometimes to accept the illusions of his fancy for matters of fact is exhibited in the corresponding passage in his third edition:

In Bernadotte's salon, which was open to notabilities of all ranks of life, Beethoven also appeared. He had already made it known that he was a great admirer of the First Consul of the Republic. From the General emanated the suggestion that Beethoven celebrate the greatest hero of his age in a musical composition. It was not long (!) before the thought had become a deed. (Vol. I, page 101.)

In proceeding with the history of the Symphony, Schindler extracts largely from Beethoven's own copy of Schleiermacher's translation of Plato. That the idea of Bonaparte as First Consul may have influenced the form and matter of the Symphony, when he came to the labor of its composition, and that Beethoven may have based for himself a sort of system of political ethics upon Schleiermacher's Plato--all this is very possible; but Bernadotte was far away from Vienna before the consular form of government was adopted at Paris, and the "Sinfonia Eroica" had been publicly performed at Vienna before the Plato came from the Berlin press!

It is certainly to be regretted that so much fine writing by Schindler and his copyists on this point should be exploded by a date--like a ship by a single shell; but how could anyone believe that the much-employed Beethoven, at the age of 27, he who had refused two years before, even despite Wegeler's urging, to listen to a single private lecture on Kant, had become in so short a time a Platonic philosopher?

Let us return to a field where Beethoven was even now more at home than he ever became in Plato's political philosophy. Salieri had again engaged him for the "Widows and Orphans" concerts of April 1st and 2nd at which Haydn's "Seven Last Words" was sung and Beethoven's Pianoforte Quintet played. Kaiser Franz and the imperial family were present.

RIVALRY OF BEETHOVEN AND WÖLFFL

It was now no longer the case that Beethoven was without a rival as pianoforte virtuoso. He had a competitor fully worthy of his powers; one who divided about equally with him the suffrages of the leaders in the Vienna musical circles. In fact the excellencies peculiar to the two were such and so different, that it depended upon the taste of the auditor to which he accorded the praise of superiority. Joseph Wölffl of Salzburg, two years younger than Beethoven, a “wonder-child,” who had played a violin concerto in public at the age of seven years, was a pupil of Leopold Mozart and Michael Haydn. Being in Vienna, when but eighteen years old, he was engaged, on the recommendation of Mozart, by the Polish count Oginsky, who took him to Warsaw. His success there, as pianoforte virtuoso, teacher and composer, was almost unexampled. But it is only in his character as pianist that we have to do with him; and a reference may be made to the general principle, that a worthy competition is the best spur to genius. When we read in one of his letters Beethoven’s words “I have also greatly perfected my pianoforte playing,” they will cause no surprise; for only by severe industry and consequent improvement could he retain his high position, in the presence of such rivals as Wölffl and, a year or two later, J. B. Cramer. A lively picture of Wölffl by Tomaschek, who heard him in 1799, in his autobiography sufficiently proves that his party in Vienna was composed of those to whom extraordinary execution was the main thing; while Beethoven’s admirers were of those who had hearts to be touched. A parallel between Beethoven and Wölffl in a letter to the “Allgemeine Musikalische Zeitung” (Vol. I, pp. 24, 25) dated April 22, 1799, just at the time when the performances of both were topics of general conversation in musical circles, and still fresh in the memory of all who had heard them, is in the highest degree apposite to the subject of this chapter. The writer says:

Opinion is divided here touching the merits of the two; yet it would seem as if the majority were on the side of the latter (Wölffl). I shall try to set forth the peculiarities of each without taking part in the controversy. Beethoven’s playing is extremely brilliant but has less delicacy and occasionally he is guilty of indistinctness. He shows himself to the greatest advantage in improvisation, and here, indeed, it is most extraordinary with what lightness and yet firmness in the succession of ideas Beethoven not only varies a theme given him on the spur of the moment by figuration (with which many a virtuoso makes his fortune and--wind) but really develops it. Since the death of Mozart, who in this respect is for me still the _non plus ultra_, I have never enjoyed this kind of pleasure in the degree in which it is provided by Beethoven. In this Wölffl fails to reach him. But W. has advantages in this that, sound in musical learning and dignified in his compositions, he plays passages which seem impossible with an ease, precision and clearness which cause amazement (of course he is helped here by the large structure of his hands) and that his interpretation is always, especially in Adagios, so pleasing and insinuating that one can not only admire it but also enjoy.... That Wölffl likewise enjoys an advantage because of his amiable bearing, contrasted with the somewhat haughty pose of Beethoven, is very natural.

No biography of Beethoven which makes any pretence to completeness, can omit the somewhat inflated and bombastic account which Seyfried gives of the emulation between Beethoven and Wölffl. Ignatz von Seyfried at the period in question was one of Schikaneder’s conductors, to which position he had been called when not quite twenty-one years of age, and had assumed its duties March 1, 1797. He was among the most promising of the young composers of the capital, belonged to a highly respectable family, had been educated at the University, and his personal character was unblemished. He would, therefore, naturally have access to the musical salons and his reminiscences of music and musicians in those years may be accepted as the records of observation. The unfavorable light which the researches of Nottebohm have thrown upon him as editor of the so-called “Beethoven Studien” does not extend to such statements of fact as might easily have come under his own cognizance; and the passage now cited from the appendix of the “Studien,” though written thirty years after the events it describes, bears all the marks of being a faithful transcript of the writer’s own memories:

Beethoven had already attracted attention to himself by several compositions and was rated a first-class pianist in Vienna when he was confronted by a rival in the closing years of the last century. Thereupon there was, in a way, a revival of the old Parisian feud of the Gluckists and Piccinists, and the many friends of art in the Imperial City arrayed themselves in two parties. At the head of Beethoven’s admirers stood the amiable Prince Lichnowsky; among the most zealous patrons of Wölffl was the broadly cultured Baron Raymond von Wetzlar, whose delightful villa (on the Grünberg near the Emperor’s recreation-castle) offered to all artists, native and foreign, an asylum in the summer months, as pleasing as it was desirable, with true British loyalty. There the interesting combats of the two athletes not infrequently offered an indescribable artistic treat to the numerous and thoroughly select gathering. Each brought forward the latest product of his mind. Now one and anon the other gave free rein to his glowing fancy; sometimes they would seat themselves at two pianofortes and improvise alternately on themes which they gave each other, and thus created many a four-hand Capriccio which if it could have been put upon paper at the moment would surely have bidden defiance to time. It would have been difficult, perhaps impossible, to award the palm of victory to either one of the gladiators in respect of technical skill. Nature had been a particularly kind mother to Wölffl in bestowing upon him a gigantic hand which could span a tenth as easily

as other hands compass an octave, and permitted him to play passages of double notes in these intervals with the rapidity of lightning. In his improvisations even then Beethoven did not deny his tendency toward the mysterious and gloomy. When once he began to revel in the infinite world of tones, he was transported also above all earthly things;--his spirit had burst all restricting bonds, shaken off the yoke of servitude, and soared triumphantly and jubilantly into the luminous spaces of the higher æther. Now his playing tore along like a wildly foaming cataract, and the conjurer constrained his instrument to an utterance so forceful that the stoutest structure was scarcely able to withstand it; and anon he sank down, exhausted, exhaling gentle plaints, dissolving in melancholy. Again the spirit would soar aloft, triumphing over transitory terrestrial sufferings, turn its glance upward in reverent sounds and find rest and comfort on the innocent bosom of holy nature. But who shall sound the depths of the sea? It was the mystical Sanscrit language whose hieroglyphs can be read only by the initiated. Wölffl, on the contrary, trained in the school of Mozart, was always equable; never superficial but always clear and thus more accessible to the multitude. He used art only as a means to an end, never to exhibit his acquirements. He always enlisted the interest of his hearers and inevitably compelled them to follow the progression of his well-ordered ideas. Whoever has heard Hummel will know what is meant by this....

But for this (the attitude of their patrons) the _protégés_ cared very little. They respected each other because they knew best how to appreciate each other, and as straightforward honest Germans followed the principle that the roadway of art is broad enough for many, and that it is not necessary to lose one's self in envy in pushing forward for the goal of fame!

Wölffl proved his respect for his rival by dedicating to "M. L. van Beethoven" the pianoforte sonatas, Op. 7, which were highly commended in the "Allg. Mus. Zeit." of Leipsic of January, 1799. Another interesting and valuable discussion of Beethoven's powers and characteristics as a pianoforte virtuoso at this period is contained in the autobiography of Tomaschek, who heard him both in public and in private during a visit which Beethoven made again this year to Prague. Tomaschek was then both in age (he was born on April 17, 1774) and in musical culture competent to form an independent judgment on such a subject.

TOMASCHEK ON BEETHOVEN'S PLAYING

In the year 1798, says Tomaschek (unfortunately without giving any clue to the time of the year), in which I continued my juridical studies, Beethoven, the giant among pianoforte players, came to Prague. He gave a largely attended concert in the Konviktssaal, at which he played his Concerto in C major, Op. 15, and the Adagio and graceful Rondo in A major from Op. 2, and concluded with an improvisation on a theme given him by Countess Sch... (Schick?), "Ah tu fosti il primo oggetto," from Mozart's "Titus" (duet No. 7). Beethoven's magnificent playing and particularly the daring flights in his improvisation stirred me strangely to the depths of my soul; indeed I found myself so profoundly bowed down that I did not touch my pianoforte for several days.... I heard Beethoven at his second concert, which neither in performance nor in composition renewed again the first powerful impression. This time he played the Concerto in B-flat which he had just composed in Prague.[83] Then I heard him a third time at the home of Count C., where he played, besides the graceful Rondo from the A major Sonata, an improvisation on the theme: "Ah! vous dirai-je, Maman." This time I listened to Beethoven's artistic work with more composure. I admired his powerful and brilliant playing, but his frequent daring deviations from one motive to another, whereby the organic connection, the gradual development of idea was put aside, did not escape me. Evils of this nature frequently weaken his greatest compositions, those which sprang from a too exuberant conception. It is not seldom that the unbiassed listener is rudely awakened from his transport. The singular and original seemed to be his chief aim in composition, as is confirmed by the answer which he made to a lady who asked him if he often attended Mozart's operas. "I do not know them," he replied, "and do not care to hear the music of others lest I forfeit some of my originality."

The veteran Tomaschek when he wrote thus had heard all the greatest virtuosos of the pianoforte, who, from the days of Mozart to 1840, had made themselves famous; and yet Beethoven remained for him still "the lord of pianoforte players" and "the giant among pianoforte players." Still, great as he was now when Tomaschek heard him, Beethoven could write three years later that he had greatly perfected his playing.

It is only to be added to the history of the year 1798, that it is the time in which Beethoven fixes the beginning of his deafness. Like it, the year 1799 offers, upon the whole, but scanty materials to the biographers of Beethoven--standing in broad contrast to the next and, indeed all succeeding years, in which their quantity and variety become a source of embarrassment.

Two new and valuable, though but passing acquaintances, were made by Beethoven this year, however--with Domenico Dragonetti, the greatest contrabassist known to history, and John Baptist Cramer, one of the greatest pianists. Dragonetti was not more remarkable for his astounding execution than for the deep, genuine musical feeling which elevated and ennobled it. He was now--the spring of 1799, so far as the means are at hand of determining the time--returning to London from a visit to his native

province, and his route taking him to Vienna he remained there for several weeks. Beethoven and he soon met and they were mutually pleased with each other. Many years afterwards Dragonetti related the following anecdote to Samuel Appleby, Esq., of Brighton, England: “Beethoven had been told that his new friend could execute violoncello music upon his huge instrument, and one morning, when Dragonetti called at his room, he expressed his desire to hear a sonata. The contrabass was sent for, and the Sonata, No. 2, of Op. 5, was selected. Beethoven played his part, with his eyes immovably fixed upon his companion, and, in the finale, where the arpeggios occur, was so delighted and excited that at the close he sprang up and threw his arms around both player and instrument.” The unlucky contrabassists of orchestras had frequent occasion during the next few years to know that this new revelation of the powers and possibilities of their instrument to Beethoven, was not forgotten.

Cramer, born at Mannheim, 1771, but from early infancy reared and educated in England, was successively the pupil of the noted Bensor, Schroeter and Clementi; but, like Beethoven, was in no small degree self-taught. He was so rarely and at such long intervals on the Continent that his extraordinary merits have never been fully understood and appreciated there. Yet for a period of many years in the first part of the nineteenth century he was undoubtedly, upon the whole, the first pianist of Europe, The object of his tour in 1799 was not to display his own talents and acquirements, but to add to his general musical culture and to profit by his observations upon the styles and peculiar characteristics of the great pianists of the Continent. In Vienna he renewed his intercourse with Haydn, whose prime favorite he had been in England, and at once became extremely intimate with Beethoven.

Cramer surpassed Beethoven in the perfect neatness, correctness and finish of his execution; Beethoven assured him that he preferred his touch to that of any other player; his brilliancy was astonishing; but yet taste, feeling, expression, were the qualities which more eminently distinguished him. Beethoven stood far above Cramer in power and energy, especially when extemporizing. Each was supreme in his own sphere; each found much to learn in the perfections of the other; each, in later years, did full justice to the other’s powers. Thus Ries says: “Amongst the pianoforte players he [Beethoven] had praise for but one as being distinguished--John Cramer. All others were but little to him.” On the other hand, Mr. Appleby, who knew Cramer well, was long afterwards told by him, “No man in these days has heard extempore playing, unless he has heard Beethoven.”

CRAMER’S RECOLLECTIONS OF BEETHOVEN

Making a visit one morning to him, Cramer, as he entered the anteroom, heard Beethoven extemporizing by himself, and remained there more than half an hour “completely entranced,” never in his life having heard such exquisite effects, such beautiful combinations. Knowing Beethoven’s extreme dislike to being listened to on such occasions, Cramer retired and never let him know that he had so heard him.

Cramer’s widow communicates a pleasant anecdote. At an Augarten Concert the two pianists were walking together and hearing a performance of Mozart’s pianoforte Concerto in C minor (Köchel, No. 491); Beethoven suddenly stood still and, directing his companion’s attention to the exceedingly simple, but equally beautiful motive which is first introduced towards the end of the piece, exclaimed: “Cramer, Cramer! we shall never be able to do anything like that!” As the theme was repeated and wrought up to the climax, Beethoven, swaying his body to and fro, marked the time and in every possible manner manifested a delight rising to enthusiasm.

Schindler’s record of his conversations upon Beethoven with Cramer and Cherubini in 1841 is interesting and valuable. He has, however, left one important consideration unnoticed, namely, that the visits of those masters to Vienna were five years apart--five years of great change in Beethoven--a period during which his deafness, too slight to attract Cramer’s attention, had increased to a degree beyond concealment, and which, joined to his increased devotion to composition and compulsory abandonment of all ambition as a virtuoso, with consequent neglect of practice, had affected his execution unfavorably. Hence the difference in the opinions of such competent judges as Cramer, describing him as he was in 1799-1800, Cherubini in 1805-6, and two years later Clementi, afford a doubtless just and fair indication of the decline of Beethoven’s powers as a mere pianist--not extending, however, at least for some years yet, to his extemporaneous performances. We shall find from Ries and others ample confirmation of the fact.

And now let Schindler speak:

To the warm feeling of Cramer for Beethoven I owe the more important matters.... Cherubini, disposed to be curt, characterized Beethoven’s pianoforte playing in a single word: “rough.” The gentleman Cramer, however, desired that less offence be taken at the rudeness of his performance than at the unreliable reading of one and the same composition--one day intellectually brilliant and full of characteristic expression, the next freakish to the verge of unclearness; often confused. (Which is confirmed by Ries, Czerny and

others.) Because of this a few friends expressed a wish to hear Cramer play several works publicly from the manuscript. This touched a sensitive spot in Beethoven; his jealousy was aroused and, according to Cramer, their relations became strained.

This strain, however, left no such sting behind it as to diminish Cramer's good opinion of Beethoven both as man and artist, or hinder his free expression of it. To this fact the concurrent testimony of his widow and son, and those enthusiasts for Beethoven Charles Neate, Cipriani Potter and others who knew Cramer well, bear witness. It was the conversation of Cramer about Beethoven which induced Potter, after the fall of Napoleon, to journey to Vienna, to make the acquaintance of the great master and, if possible, become his pupil.

Cramer's musical gods were Handel and Mozart, notwithstanding his life-long love for Bach's clavier compositions; hence the abrupt transitions, the strange modulations, and the, until then, unheard passages, which Beethoven introduced ever more freely into his works--many of which have not yet found universal acceptance--were to him, as to Tomaschek and so many other of his contemporaries, imperfections and distortions of compositions, which but for them were models of beauty and harmonious proportion. He once gave this feeling utterance with comic exaggeration, when Potter, then a youth, was extolling some abstruse combinations, by saying: "If Beethoven emptied his inkstand upon a piece of music paper you would admire it!"

Upon Beethoven's demeanor in society, Schindler proceeds thus:

BEETHOVEN'S DEMEANOR IN SOCIETY

The communications of both (Cramer and Madame Cherubini) agreed in saying that in mixed society his conduct was reserved, stiff and marked by artist's pride; whereas among his intimates he was droll, lively, indeed, voluble at times, and fond of giving play to all the arts of wit and sarcasm, not always wisely especially in respect of political and social prejudices. To this the two were able to add much concerning his awkwardness in taking hold of such objects as glasses, coffee cups, etc., to which Master Cherubini added the comment: "Toujours brusque." These statements confirmed what I had heard from his older friends touching the social demeanor of Beethoven in general.

Cramer reached Vienna early in September, and remained there, according to Schindler, through the following winter; but he does not appear to have given any public concerts, although, during the first month of his stay, we learn from a newspaper, he "earned general and deserved applause by his playing." It is needless to dwell upon the advantages to Beethoven of constant intercourse for several months with a master like Cramer, whose noblest characteristics as pianist were the same as Mozart's, and precisely those in which Beethoven was deficient.

* * * * *

Let us pass in review the compositions which had their origin in the years 1798 and 1799. First of all come the three Trios for stringed instruments, Op. 9. The exact date of their conception has not yet been determined, all that is positive being that Beethoven sold them to Traeg on March 16, 1798, and that the publisher's announcement of them appeared on July 21st of the same year. The only sketches for the Trios quoted by Nottebohm show them in connection with a sketch for the last movement of the "Sonate pathétique," which was published in 1799; but this proves nothing. It may be easily imagined that Beethoven desired to make more extended use of the experience gained in writing the Trios, Op. 3, and that he therefore began sketching Op. 9 in 1796 or 1797. Beethoven dedicated the works to Count Browne in words such as could hardly have been called forth by the present of a horse. Perhaps some future investigator will be able to show upon what grounds Beethoven in the dedication called Count Browne his "first Mæcenas," a title better deserved by Prince Lichnowsky.

THE FIRST TWO PIANOFORTE CONCERTOS

The first two concertos for pianoforte call for consideration here, for it was not until 1798 that they acquired the form in which they are now known. That the Concerto in B-flat was the earlier of the two has been proved in a preceding chapter of this volume. It was this Concerto and not the one in C major (as Wegeler incorrectly reported) that was played in March, 1795. Wegeler's error was due to the circumstance that the Concerto in C was published first. Sketches for the Concerto in B-flat major are found among the exercises written for Albrechtsberger, sketches for the Sonata in E major (Op. 14, No. 1), and others for a little quartet movement which was owned by M. Malherbe of Paris; on this sheet occurs a short exercise with the remark "Contrapunto all'ottava" which points to the beginning of 1795 or even 1794. The sketch is an obviously early form of a passage in the free fantasia. This agrees with the statement that on March 29, 1795, Beethoven played a new concerto, the key of which is not indicated. It is most likely that it was this in B-flat, since the one in C did not exist at the time. Beethoven, it appears, played it a few times afterward in Vienna and

then rewrote it. According to Tomaschek's account he played the B-flat Concerto (expressly distinguished from that in C) in 1798, again in Prague. Tomaschek added, "which he had composed in Prague." This is confounding the original version with the revision, concerning which Nottebohm gives information in his "Zweite Beethoveniana" on the basis of sketches which point to 1798. The fact of the revision is proved by Beethoven's memoranda, such as "To remain as it was," "From here on everything to remain as it was." The revision of the first movement was radical, and the entire work was apparently undertaken in view of an imminent performance, most likely that of Prague in 1798. It was published by Hoffmeister und Kühnel and dedicated to Carl Nikl Edlen von Nikelsberg.

That the Concerto in C was composed later than that in B-flat has been proved by Beethoven's testimony as well as other external evidences and is confirmed by the few remaining sketches analyzed by Nottebohm. They appear in connection with a sketch for the cadenza for the B-flat Concerto which, therefore, must have been finished when its companion was begun. A sketch for a cadenza for the C major Concerto comes after sketches for the Sonata in D, Op. 10, No. 3, which was published in 1798. This new concerto must, therefore, have been finished. According to the testimony of Tomaschek he played it in 1798 in the Konviktsaal in Prague. Schindler says he played it for the first time "in the spring of 1800 in the Kärnthnerthor-Theater," but this concert is likely to have been that of April 2nd, 1800, described by Hanslick in his "Geschichte des Concertwesens in Wien" (p. 127). Schindler evidently knew nothing of the performance in Prague and a confusion must be at the bottom of Czerny's statement that the Concerto was played in the Kärnthnerthor-Theater in 1801. The Concerto in C, dedicated to the Countess Odescalchi, _née_ Keglevich, was published by Mollo in Vienna in 1801. There are three cadenzas for the first movement of the Concerto, the last two of which call for an extended compass of the pianoforte and are thus shown to be of later date than the first.

To these concertos must be added the Rondo in B-flat for Pianoforte and Orchestra found unfinished among Beethoven's compositions and published by Diabelli and Co. in 1829. Sonnleithner, on the authority of Diabelli, says it was completed by Czerny, who also filled out the accompaniment. There is no authentic record of the time of its composition. O. Jahn surmised that it may have been designed for the Concerto in B-flat. Its contents indicate an earlier period. A sketch printed by Nottebohm associated with a Romanza for Pianoforte, Flute and Bassoon, judged by the handwriting, is not of later date than 1795. E. Mandyczewski compared the original manuscript, now in the library of the Gesellschaft der Musikfreunde, with the printed form and decided that the work was completed in plan and _motiri_ by Beethoven, who, however, did not carry out the cadenzas and only indicated the passages. The share which Czerny had in it is thus indicated; he added the cadenzas and extended the pianoforte passages which Beethoven had only indicated, making them more effective and brilliant. The use of the high registers of the pianoforte which Czerny employs somewhat too freely in view of the simple character of the piece, was not contemplated by Beethoven, who once remarked of Czerny: "He uses the piccolo too much for me." In Mandyczewski's opinion the handwriting points to a time before 1800, and the contents indicate the early Vienna if not the Bonn period. Mandyczewski also thinks that the romanza-like Andante is palpably a very early composition and that the correspondence in key and measure with the B-flat Concerto might indicate that it was originally designed as a part of that work, a supposition which is strengthened by the fact that the original manuscript is neither dated nor signed. This internal evidence has much in its favor, the more since it is not at all obvious what might have prompted Beethoven to write an independent rondo for concert use. There is no external evidence; if there were, the conception of the B-flat Concerto would have to be set at a much earlier date than has yet been done. The first Vienna sketches for the Concerto, as Nottebohm shows, prove that the present three movements belonged together from the beginning. They were, therefore, surely played at the first performance in 1795. Nottebohm, who repeated Jahn's surmise in his "Thematisches Verzeichniss," changed his mind after a study of the sketches and rejected the notion that the rondo had been designed for the Concerto. Only by assuming an earlier date for the rondo can the theory be upheld. Attention may here be called to Wegeler's statement ("Notizen," p. 56) that the rondo of the first Concerto (he says, of course, the Concerto in C) was not composed until the second afternoon before the performance. There may possibly have been another. This is not necessarily disproved by the fact that sketches for the present one were in existence. The question is not settled by the evidence now before us, but the probabilities are with Mandyczewski.

Now begins the glorious series of sonatas. The first were the three (Op. 10) which, though begun in part at an earlier date, were definitively finished and published in 1798. Eder, the publisher, opened a subscription for them by an advertisement in the "Wiener Zeitung," July 5th, 1798; therefore they were finished at that time. The sketching for them had begun in 1796, as appears from Nottebohm's statement,[84] and Beethoven worked on the three simultaneously. Sketches for the first movement of the first Sonata are mixed with sketches for the soprano air for Umlauf's "Schusterin" which have been attributed to 1796, and the Variations for three Wind-Instruments which were played in 1797. Sketches for the third sonata are found among notes for the Sextet for Wind-Instruments (composed about 1796) and also for the Concerto in C minor, which, therefore, was begun thus early, and for

one of the seven country dances which appeared in 1799, or perhaps earlier. The sketches for the last movement of No. 3 are associated alone with sketches for a cadenza for the C major Concerto which Beethoven played in Prague in 1798, and may therefore be placed in this year. It follows that the three sonatas were developed gradually in 1796-98, and completed in 1798. From the sketches and the accompanying memoranda[85] we learn, furthermore, that for the first Sonata, which now has three movements, a fourth, an Intermezzo, was planned on which Beethoven several times made a beginning but permitted to fall. Two of these movements became known afterwards as “Bagatelles.” We learn also that the last movement of the first Sonata, and the second movement of the second, were originally laid out on a larger scale.

COMPOSITION OF THE “SONATE PATHÉTIQUE”

The “Sonate pathétique,” Op. 13, was published by Eder, in Vienna, in 1799, and afterwards by Hoffmeister, who announced them on December 18 of the same year. Sketches for the rondo are found among those for the Trio, Op. 9, and after the beginning of a fair copy of the Sonata, Op. 49, No. 1. From this there is no larger deduction than that the Sonata probably had its origin about 1798. One of the sketches, however, indicates that the last movement was originally conceived for more than one instrument, probably for a sonata for pianoforte and violin. Beethoven published the two Sonatas, Op. 14, which he dedicated to the Baroness Braun, immediately after the “Sonate pathétique.” They came from the press of Mollo and were announced on December 21, 1799. The exact time of their composition cannot be determined definitely. Up to the present time no sketches for the second are known to exist; copious ones for the first, however, are published by Nottebohm in his “Zweite Beethoveniana” (p. 45 _et seq._), some of which appear before sketches for the Sonata, Op. 12, No. 3, then approaching completion, and some after sketches for the Concerto in B-flat. Because of this juxtaposition, Nottebohm places the conception of the Sonata in 1795.

Touching the history of the Trio, Op. 11, for Pianoforte, Clarinet and Violoncello, little is known. It was advertised as wholly new by Mollo and Co. on October 3, 1798, and is inscribed to the Countess Thun. Sketches associated with works that are unknown or were never completed are in the British Museum and set forth by Nottebohm in his “Zweite Beethoveniana” (p. 515). The sketch for the Adagio resembles the beginning of the minuet in the Sonata, Op. 49, No. 2, and is changed later; this points approximately to 1798. The last movement consists of a series of variations on the theme of a trio from Weigl’s opera “L’Amor marinaro,” beginning “Pria ch’io l’impegno.” Weigl’s opera was performed for the first time on October 15, 1797. Czerny told Otto Jahn that Beethoven took the theme at the request of a clarinet player (Beer?) for whom he wrote the Trio. The elder Artaria told Cipriani Potter in 1797, that he had given the theme to Beethoven and requested him to introduce variations on it into a trio, and added that Beethoven did not know that the melody was Weigl’s until after the Trio was finished, whereupon he grew very angry on finding it out. Czerny says in the supplement to his “Pianoforte School”:

It was at the wish of the clarinet player for whom Beethoven wrote this Trio that he employed the above theme by Weigl (which was then very popular) as the finale. At a later period he frequently contemplated writing another concluding movement for this Trio, and letting the variations stand as a separate work.

If Czerny is correct in his statement, obvious deductions from it are these, which are scarcely consistent with Artaria’s story: if the theme was “very popular” at the time the opera must have had several performances, and it is not likely that the melody was unfamiliar to Beethoven, who also, it may be assumed, wrote the title of Weigl’s trio, which is printed at the beginning of the last movement of Beethoven’s composition. Beethoven produced the Trio for the first time at the house of Count Fries on the occasion of his first meeting with Steibelt. The three Sonatas for Pianoforte and Violin, Op. 12, were advertised in the “Wiener Zeitung” of January 12, 1799, as published by Artaria, which would seem to place their origin in 1798. The program of a concert given by Madame Duschek on March 29, 1798, preserved in the archives of the Gesellschaft der Musikfreunde, announces a sonata with accompaniment to be played by Beethoven. The accompanying (_obbligato_) instrument is not mentioned, but the work may well have been one of these Sonatas. Nottebohm discusses the juxtaposition of sketches for the second Sonata with sketches for the Pianoforte Concerto in B-flat and the sonata in E, Op. 14, No. 1, and is inclined to fix 1795 as the year of the sonata’s origin. But we are in the dark as to whether the sketches for the Pianoforte Concerto were for its original or its revised form.

Among the instrumental compositions of this year belong the Variations for Pianoforte and Violoncello on “Ein Mädchen oder Weibchen” from Mozart’s “Zauberflöte,” of which nothing more is known than that Traeg announced their publication on September 12, 1798. They were afterward taken over by Artaria. The Variation for Pianoforte on a theme from Grétry’s “Richard, Cœur de Lion” (“Une fièvre brûlante”) were announced as newly published on November 7, 1798, by Traeg; Cappi and Diabelli acquired them later. Sketches for them are found by the side of sketches for the first movement of the Sonata in C minor, Op. 10, No. 1, which circumstance indicates that 1796 was the year of their origin. According to Sonnleithner, “Richard, Cœur de Lion” was first

performed at the Hoftheater, Vienna, on January 7, 1788; then again on June 13, 1799 in the Theater auf den Wieden; but a ballet, “Richard Löwenherz,” by Vigano, music by Weigl, in which Grétry’s romance, “Une fièvre brûlante,” was interpolated, was brought forward on July 2, 1795, in the Hof- und Nationaltheater and repeated often in that year, and it was thence, no doubt, that the suggestion for the variations came to Beethoven. The six little Variations on a Swiss air were published, according to Nottebohm, by Simrock in Bonn in 1798. The ten Variations on “La stessa, la stessissima” from Salieri’s “Falstaff, ossia le tre Burle,” were announced as just published in the “Wiener Zeitung” of March 2, 1799. Salieri’s opera was performed on January 3 (Wlassak says January 6), 1799, in the Hoftheater; Beethoven’s, therefore, was an occasional composition conceived and produced in a very short time. Sketches are found among some for the first Quartet, Op. 18, and others. The Variations are dedicated to the Countess Babette Keglevich. Twice more in the same year operatic productions induced similar works. The publication of the Variations on “Kind, willst du ruhig schlafen?” from Winter’s “Unterbrochenes Opferfest,” was announced in the “Wiener Zeitung” of December 21, 1799, by Mollo and Co.; the opera had its first performance in Vienna on June 15, 1796, and was repeated frequently within the years immediately following--six times in 1799. In this case also it may be assumed that publication followed hard on the heels of composition. Sketches are found in companionship with others belonging to the Quartet, Op. 18, No. 5, and the Septet. The Variations on “Tändeln und Scherzen,” from Süssmayr’s opera “Soliman II, oder die drei Sultaninnen,” belong to the same time. The opera was performed on October 1, 1799, in the Hoftheater; the publication of the variations by Hoffmeister was announced in the “Wiener Zeitung” on December 18, 1799. They may have been printed previously by Eder. They were dedicated to Countess Browne, _née_ von Bietinghoff. It is interesting to learn from Czerny that these Variations were the first of Beethoven’s compositions which the master gave him to study when he became his pupil. Before them he had pieces by C. P. E. Bach and after them the “Sonate pathéthique.”

THE PERIOD OF THE FIRST SYMPHONY

As evidence pointing to the period in which the first Symphony was written we have, first of all, the report of the first performance on April 2, 1800; but inasmuch as the copying of the parts and the rehearsals must have consumed a considerable time, the period would be much too short (especially in view of Beethoven’s method of working) if we were also to assume that the Symphony originated in 1800. It is very likely that, with the Quartets, it was sketched at an earlier period and worked out in the main by 1799 at the latest. It was published toward the end of 1801 by Hoffmeister and Kühnel as Op. 21, dedicated to Baron van Swieten and advertised in the “Wiener Zeitung” of January 16, 1802. Beethoven had already planned a symphony while studying with Albrechtsberger. Nottebohm reports on his purposes after a study of some sketches and from him we learn that the theme of the present last movement was originally intended for a first movement. Beethoven must have worked on this composition in 1794-’95, perhaps at the suggestion of van Swieten--a conclusion suggested by the fact that the dedication of the first symphony went to him. Beethoven abandoned this early plan and turned to other ideas for the new symphony, but there is no clue as to the precise time when this was done. In 1802, Mollo published an arrangement of the symphony as a quintet at the same time that Hoffmeister and Kühnel published a like arrangement of the Septet. Beethoven published the following protest in the “Wiener Zeitung” of October 20, 1802:

I believe that I owe it to the public and myself publicly to announce that the two Quintets in C major and E-flat major, of which the first (taken from a symphony of mine) has been published by Mr. Mollo in Vienna, and the second (taken from my familiar Septet, Op. 20) by Mr. Hoffmeister in Leipzig, are not original quintets but transcriptions prepared by the publishers. The making of transcriptions at the best is a matter against which (in this prolific day of such things) an author must protest in vain; but it is possible at least to demand of the publishers that they indicate the fact on the title-page, so that the honor of the author may not be lessened and the public be not deceived. This much to hinder such things in the future. At the same time I announce that a new Quintet of mine in C major, Op. 29, will shortly be published by Breitkopf and Härtel in Leipzig.

Mention may here be made in conclusion of the two French songs, “Que le temps (jour) me dure” (Rousseau) and “Plaisir d’aimer,” recovered from sketches and described by Jean Chantavoine in “Die Musik” (Vol. I, No. 12, 1902). The origin of the latter is fixed in 1799, by its association with a sketch for the Quartets, Op. 18.

FOOTNOTES:

[83] It will be seen in a letter of Beethoven’s that this concerto was in fact composed before that in C major; but it is not improbable that the last movement was written in Prague.

[84] “Zweite Beethoveniana,” p. 29 _et seq._

[85] Among sketches for the second movement of the Quintet, Op. 16, Beethoven wrote: “For the new sonatas very short minuets. The Scherzo remains for that in C minor.” And in another sketch he writes: “Intermezzo for the sonata in C minor.”--Nottebohm, “Zweite Beethoveniana,” 32, 479.

Chapter XVI

Beethoven’s Social Life in Vienna--His Friends: Vogl, Kiesewetter, Zmeskall, Amenda, Count Lichnowsky, Eppinger, Krumpholz--Schuppanzigh and His Quartet--Hummel--Friendships with Women--His Dedications.

The chronological progress of the narrative must again be interrupted for a chapter or two, since no picture of a man’s life can be complete without the lights or shades arising from his social relations--without some degree of knowledge respecting those with whom he is on terms of equality and intimacy and whose company he most affects. The attempt to draw such a picture in the case of Beethoven, that is, during his first years in Vienna, leaves much to be desired, for, although the search for materials has not been very unsuccessful, many of the data are but vague and scattered notices. In a Conversation Book, bearing Beethoven’s own date “on the 20th of March, 1820,” some person unknown writes:

Do you want to know where I first had the honor and good fortune to see you? More than 25 years ago I lived with Frank of Prague in the Drachengassel in the old Fish Market. Several noblemen, for instance His Excellency van B. Cristen (?), Heinerle, Vogl (now a singer), Kösswetter, basso, now Court Councillor, Greyenstein (?), has long been living in France, etc. There we often

musicicised, etc. supperized, etc. punchized, etc.

and at the conclusion Your Excellency often rejoiced us at _my_ P. F. I was then Court Councillor in the War Office (?). I have practised since then at least 15 thousand métiers--Did we meet in Prague? In what year?--1796--3 days--I was in Prague also in 1790-1-2.

There is nothing in the portions of this Conversation Book, copied for this work, to show who this man of “15 thousand métiers” was, now sitting with Beethoven in an eating-house, and recalling to his memory the frolics of his first year and a quarter in Vienna; nor are Heinerle, Cristen, Greyenstein and Frank of Prague sufficiently known to fame as to be now identified; but Johann Michael Vogl, less than two years older than Beethoven, was afterward a very celebrated tenor of the opera. In 1793-4 he was still pursuing the study of jurisprudence, which he abandoned in 1795 for the stage. May not this early friendship for Beethoven have been among the causes of the resuscitation of “Fidelio” in 1814, for the benefit performance of Vogl, Saal and Weinmüller?

There is a story, first put in circulation by a certain August Barth, to the effect that the singer of that name once finding Beethoven employed in burning a mass of musical and other papers, sang one vocal piece thus destined to destruction, was pleased with it, and saved the immortal “Adelaide!” The story is sufficiently refuted by the fact that when Barth first came to Vienna, in 1807, the “Adelaide” had been in print some ten years. If the name Vogl be substituted in the tale, there may, perhaps, be so much truth in it as this: that he was consulted upon the merits of the composition by Beethoven, approved it, and first sang it and made it known--as he was the first, years afterwards, to sing in public the “Erlkönig” and other fine productions of Franz Schubert. The “Kösswetter, basso,” was Raphael George Kiesewetter, who lived to be renowned as a writer upon topics of musical history, and to play a part in the revival of ancient music in Vienna, not less noteworthy than that of Thibaut in Heidelberg. At the period of the “music-making, supping and punch drinking” by the “noblemen” in the apartments of Frank of Prague, Kiesewetter was a young man of twenty, engaged, like Vogl, in the study of the law. In the spring of 1794--and thus the date of these meetings is determined--he received an appointment in the military chancellary, and went at once to the headquarters at Schwetzingen on the Rhine. More important and valuable during these years, as subsequently, was the warm, sincere friendship of Nicolaus Zmeskall von Domanovecz, an official in the Royal Hungarian Court Chancellary. “You belong to my earliest friends in Vienna,” writes Beethoven in 1816. Zmeskall, to quote the words of Sonnleithner,

was an expert violoncellist, a sound and tasteful composer. Too modest to publish his compositions, he willed them to the archives of the Gesellschaft der Musikfreunde. After personal examination I can only give assurance that his three string quartets would entitle him to an honorable place among masters of the second rank, and are more deserving to be heard than many new things which, for all manner of reasons, we are compelled to hear.

BEETHOVEN’S REGARD FOR ZMESKALL

That Zmeskall was a very constant attendant at the musical parties of Prince Carl Lichnowsky and frequently took part in them, may be seen from Wegeler's record. He was ten years older than Beethoven, had been long enough in Vienna to know the best society there, into which he was admitted not more because of his musical attainments than because of the respectability of his position and character; and was, therefore, what the young student-pianist needed most, a friend, who at the same time could be to a certain degree an authoritative adviser, and at all times was a judicious one. On the part of Zmeskall there was an instant and hearty appreciation of the extraordinary powers of the young stranger from the Rhine and a clear anticipation of his splendid artistic future. A singular proof of this is the care with which he preserved the most insignificant scraps of paper, if Beethoven had written a few words upon them; for, certainly, no other motive could have induced him to save many notes of this kind and of no importance ten, fifteen, twenty years, as may be seen in the published letters of the composer. On the part of Beethoven, there was sincere respect for the dignity and gravity of Zmeskall's character, which usually restrained him within proper limits in their personal intercourse; but he delighted, especially in the earlier period, to give, in his notes and letters, full play to his queer fancies and sometimes extravagant humour.

Here are a few examples in point:

To His Well Well Highest and Bestborn, the Herr von Zmeskall, Imperial and Royal as also Royal and Imperial Court Secretary:

Will His High and Wellborn, His Herrn von Zmeskall's Zmeskallity have the kindness to say where we can speak to him to-morrow?

We are your most damnably devoted

Beethoven.

My dearest Baron Muckcartdriver.

Je vous suis bien obligé pour votre faiblesse de vos yeux. Moreover I forbid you henceforth to rob me of the good humor into which I occasionally fall, for yesterday your Zmeskall-damanovitzian chatter made me melancholy. The devil take you; I want none of your moral (precepts) for Power is the morality of men who loom above the others, and it is also mine; and if you begin again to-day I'll torment you till you agree that everything that I do is good and praiseworthy (for I am going to the Swan--the Ox would be preferable, yet this rests with your Zmeskallian Domanovezian decision (_résponse_).

Adieu Baron Ba...ron, ~ron / nor / orn / rno / onr /~ (_voilà quelque chose_ from the old pawnshop.)

Mechanical skill was never so developed in Beethoven that he could make good pens from goose quills--and the days of other pens were not yet. When, therefore, he had no one with him to aid him in this, he usually sent to Zmeskall for a supply. Of the large number of such applications preserved by his friend and now scattered in all civilized lands as autographs, here are two specimens.

Best of Music Counts! I beg of you to send me one or a few pens of which I am really in great need. As soon as I learn where real good, and admirable pens are to be found I will buy some of them. I hope to see you at the Swan today.

Adieu, most precious Music Count yours etc.

His Highness von Z. is commanded to hasten a bit with the plucking out of a few of his quills (among them, no doubt, some not his own). It is hoped that they may not be too tightly grown. As soon as you have done all that we shall ask we shall be, with excellent esteem your

F---- Beethoven.

Had Zmeskall not carefully treasured these notes, they would never have met any eye but his own; it is evident, therefore, that he entered fully into their humor, and that it was the same to him, whether he found himself addressed as "Baron," "Count," "Cheapest Baron," "Music Count," "Baron Muckcartdriver," "His Zmeskallian Zmeskallity," or simply "Dear Z."--which last is the more usual. He knew his man, and loved him; and these "quips and quiddities" were received in the spirit which begat them. The whole tenor of the correspondence between the two shows that Zmeskall had more influence for good upon Beethoven than any other of his friends; he could reprove him for faults, and check him when in the wrong, without producing a quarrel more serious than the one indicated in the protest, above given, against interrupting his "good humor."

As a musician, as well as man and friend, Zmeskall stood high in Beethoven's esteem. His apartments, No. 1166, in that huge conglomeration of buildings known as the Bürgerspital, were for a long series of years the scene of a private morning concert, to

which only the first performers of chamber music and a very few guests were admitted. Here, after the rupture with Prince Lichnowsky, Beethoven's productions of this class were usually first tried over. Not until Beethoven's death did their correspondence cease.

ESTEEM AND AFFECTION FOR AMENDA

Another young man who gained an extraordinary place in Beethoven's esteem and affection, and who departed from Vienna before anything occurred to cause a breach between them, was a certain Karl Amenda, from the shore of the Baltic, who died some forty years later as Provost in Courland. He was a good violinist, belonged to the circle of dilettanti which Beethoven so much affected, and, on parting, received from the composer one of his first attempts at quartet composition. His name most naturally suggests itself to fill the blank in a letter to Ries, July, 1804, wherein some living person, not named, is mentioned as one with whom he (Beethoven) "never had a misunderstanding," but he adds "although we have known nothing of each other for nearly six years," which was not true of Amenda, since letters passed between them in 1801. The small portion of their written correspondence which has been made public shows that their friendship was of the romantic character once so much the fashion; and a letter of Amenda is filled with incense which in our day would bear the name of almost too gross flattery. But times change and tastes with them. His name appears once in the Zmeskall correspondence, namely, in a mutilated note now in the Royal Imperial Court Library, beginning "My cheapest Baron! Tell the guitarist to come to me to-day. Amenda is to make an _Amende_ (part torn away) which he deserves for his bad pauses (torn) provide the guitarist."

Karl Amenda was born on October 4, 1771, at Lippaiken in Courland. He studied music with his father and Chapelmaster Beichtmer, was so good a violinist that he was able to give a concert at 14 years of age, and continued his musical studies after he was matriculated as a student of theology at the University of Jena. After a three years' course there he set out on a tour, and reached Vienna in the spring of 1798. There he first became precentor for Prince Lobkowitz and afterward music-teacher in the family of Mozart's widow. How, thereupon, he became acquainted with Beethoven we are able to report from a document still in the possession of the family, which bears the superscription "Brief Account of the Friendly Relations between L. v. Beethoven and Karl Friedrich Amenda, afterward Provost at Talsen in Courland, written down from oral tradition":

After the completion of his theological studies K. F. Amenda goes to Vienna, where he several times meets Beethoven at the table d'hôte, attempts to enter into conversation with him, but without success, since Beeth. remains very _réservé_. After some time Amenda, who meanwhile had become music-teacher at the home of Mozart's widow, receives an invitation from a friendly family and there plays first violin in a quartet. While he was playing somebody turned the pages for him, and when he turned about at the finish he was frightened to see Beethoven, who had taken the trouble to do this and now withdrew with a bow. The next day the extremely amiable host at the evening party appeared and cried out: "What have you done? You have captured Beethoven's heart! B. requests that you rejoice him with your company." A., much pleased, hurries to B., who at once asks him to play with him. This is done and when, after several hours, A. takes his leave, B. accompanies him to his quarters, where there was music again. As B. finally prepared to go he said to A.: "I suppose you can accompany me." This is done, and B. kept A. till evening and went with him to his home late at night. From that time the mutual visits became more and more numerous and the two took walks together, so that the people in the streets when they saw only one of them in the street at once called out: "Where is the other one?" A. also introduced Mylich, with whom he had come to Vienna, to B., and Mylich often played trios with B. and A. His instrument was the second violin or viola. Once when B. heard that Mylich had a sister in Courland who played the pianoforte prettily, he handed him a sonata in manuscript with the inscription: "To the sister of my good friend Mylich." The manuscript was rolled up and tied with a little silk ribbon. B. complained that he could not get along on the violin. Asked by A. to try it, nevertheless, he played so fearfully that A. had to call out: "Have mercy--quit!" B. quit playing and the two laughed till they had to hold their sides. One evening B. improvised marvellously on the pianoforte and at the close A. said: "It is a great pity that such glorious music is born and lost in a moment." Whereupon B.: "There you are mistaken; I can repeat every extemporization"; whereupon he sat himself down and played it again without a change. B. was frequently embarrassed for money. Once he complained to A.; he had to pay rent and had no idea how he could do it. "That's easily remedied," said A. and gave him a theme ("Freudvoll und Leidvoll") and locked him in his room with the remark that he must make a beginning on the variations within three hours. When A. returns he finds B. on the spot but ill-tempered. To the question whether or not he had begun B. handed over a paper with the remark: "There's your stuff!" (_Da ist der Wisch!_) A. takes the notes joyfully to B.'s landlord and tells him to take it to a publisher, who would pay him handsomely for it. The landlord hesitated at first but finally decided to do the errand and, returning joyfully, asks if other bits of paper like that were to be had. But in order definitely to relieve such financial needs A. advised B. to make a trip to Italy. B. says he is willing but only on condition that A. go with him. A. agrees gladly and the trip is practically planned. Unfortunately news of a death calls A. back to his

home. His brother has been killed in an accident and the duty of caring for the family devolves on him. With doubly oppressed heart A. takes leave of B. to return to his home in Courland. There he receives a letter from B. saying: “Since you cannot go along, I shall not go to Italy.” Later the friends frequently exchanged thoughts by correspondence.[86]

Though, as we have learned, it was music which brought Beethoven into contact with Amenda, it was the latter’s amiability and nobility of character that endeared him to the composer, who cherished him as one of his dearest friends and confided things to him which he concealed from his other intimates--his deafness, for instance. A striking proof of Beethoven’s affection is offered by the fact that he gave Amenda a copy of his Quartet in F (Op. 18, No. 1), writing on the first violin part:

Dear Amenda: Take this quartet as a small memorial of our friendship, and whenever you play it recall the days which we passed together and the sincere affection felt for you then and which will always be felt by

Your true and warm friend Ludwig van Beethoven.

Vienna, 1799, June 25.

In a letter written nearly a year later Beethoven asks his friend not to lend the quartet, as he had revised it. A letter written, evidently, about the time of Amenda’s departure from Vienna indicated that Beethoven was oppressed at this period with another grief than that caused by the loss of his friend’s companionship. Beethoven speaks of his “already lacerated heart,” says that “the worst of the storm is over” and mentions an invitation to Poland--which he had accepted. Nothing came of this Polish enterprise. Dr. A. C. Kalischer suspected that the lacerated heart was due to the composer’s unrequited love for Magdalena Willmann, a singer then in Vienna to whom he made a proposal of marriage which was never answered.

FRIENDSHIP WITH COUNT LICHNOWSKY

Count Moritz Lichnowsky, brother of Prince Carl, of whom we shall not lose sight entirely until the closing scene, was another of the friends of those years. He had been a pupil of Mozart, played the pianoforte with much skill and was an influential member of the party which defended the novelty and felt the grandeur of his friend’s compositions. Schindler saw much of him during Beethoven’s last years, and eulogizes the “noble Count” in very strong terms.

Another of that circle of young dilettanti, and one of the first players of Beethoven’s compositions, was a young Jewish violinist, Heinrich Eppinger. He played at a charity concert in Vienna, making his first appearance there in 1789. “He became, in after years,” says a correspondent of the time, “a dilettante of the most excellent reputation, lived modestly on a small fortune and devoted himself entirely to music.” At the period before us Eppinger was one of Beethoven’s first violins at the private concerts of the nobility. Häring, who became a distinguished merchant and banker, belonged now to this circle of young amateur musicians, and in 1795 had the reputation of being at the head of the amateur violinists. The youthful friendship between him and the composer was not interrupted as they advanced into life, and twenty years later was of great advantage to Beethoven.

But a more interesting person for us is the instructor under whom Beethoven in Vienna resumed his study of the violin (a fact happily preserved by Ries)--Wenzel Krumpholz. He was a brother of the very celebrated Bohemian harp player who drowned himself in the Seine in 1790. In his youth Krumpholz had been for a period of three years a pupil of Haydn at Esterhaz and had played first violin in the orchestra there. He left Esterhaz to enter the service of Prince Kinsky, but came to Vienna in 1795 to join the operatic orchestra, and at once became noted as a performer in Haydn’s quartets. He was (says Eugene Eiserle in Glöggl’s “Neue Wiener Musik-Zeitung” of August 13, 1857),

a highly sensitive art-enthusiast, and one of the first of those who foresaw and recognized Beethoven’s greatness. He attached himself to Beethoven with such pertinacity and self-sacrifice that the latter, though he always called him “his fool,” accepted him as “a most intimate friend,” made him acquainted with all his plans for compositions and generally reposed the utmost confidence in him. Krumpholz formed also an exceedingly close friendship with his countryman Wenzel Czerny, a music-teacher living in the Leopoldstadt, and from 1797 onward spent most of his leisure evenings with the Czerny family, and thus the little son Karl, in his eighth and ninth years, learned almost daily what works Beethoven had in hand, and, like Krumpholz, became filled with enthusiasm for the tone-hero.

Krumpholz was a virtuoso on the mandolin, and hence, probably, that page of sketches by Beethoven in the Artaria Collection headed “Sonatine für Mandolin u. P. F.” Among the Zmeskall papers in the Royal Imperial Library in Vienna there is a half-sheet of coarse foolscap paper upon which is written with lead-pencil in huge letters by the hand of Beethoven,

The Music Count is dismissed with infamy to-day.--

The First Violin will be exiled to the misery of Siberia.

The _Baron_ is forbidden for a whole month to ask questions and never again to be overhasty, and he must concern himself with nothing but his _ipse miserum_.

B.

“Music Count” and “Baron” are, of course, Zmeskall; but these notices of Beethoven’s various first violins show the folly of attempting to decide whether one of them or Schuppanzigh was to be sent to Siberia, so long as there is no hint whatever as to the time and occasion of the note.

The very common mistake of forgetting that there is a time in the lives of distinguished men when they are but aspirants to fame, when they have their reputations still to make, often, in fact, attracting less notice and raising feebler hopes of future distinction in those who know them, than many a more precocious contemporary--this mistake has thrown the figures of Schuppanzigh and his associates in the quartet concerts at Prince Carl Lichnowsky’s into a very false prominence in the picture of these first seven years of Beethoven’s Vienna life. The composer himself was not the Beethoven whom we know. Had he died in 1800, his place in musical history would have been that of a great pianoforte player and of a very promising young composer, whose decease thus in his prime had disappointed well-founded hopes of great future eminence.

SCHUPPANZIGH AND HIS QUARTET

This is doubly true of the members of the quartet. Had they passed away in early manhood, not one of them, except perhaps young Kraft, the only one who ever distinguished himself as a virtuoso upon his instrument, would have been remembered in the annals of music. They were during these years but laying the foundation for future excellence and celebrity as performers of Mozart’s, Haydn’s, Förster’s and Beethoven’s quartets. Schuppanzigh, first violin, and Weiss, viola, alone appear to have been constantly associated in their quartet-playing. Kraft, violoncellist, was often absent, when his father, or Zmeskall, or some other, supplied his place; and as the second violin was often taken by the master of the house, when they were engaged for private concerts, Sina was, naturally, absent. Still, from 1794 to 1799, the four appear to have practised much and very regularly together. They enjoyed an advantage known to no other quartet--that of playing the compositions of Haydn and Förster under the eyes of the composers, and being taught by them every effect that the music was intended to produce. Each of the performers, therefore, knowing precisely the intentions of the composer, acquired the difficult art of being independent and at the same time of being subordinate to the general effect. When Beethoven began to compose quartets he had, therefore, a set of performers schooled to perfection by his great predecessors, and who already had experience in his own music through his trios and quartets.

Ignatz Schuppanzigh, the leader, born 1776, died March 2, 1830 in Vienna, originally studied music as a dilettante and became a capital player of the viola; but, about the time when Beethoven came to Vienna, he exchanged that instrument for the violin and made music his profession. He was fond of directing orchestral performances and seems to have gained a considerable degree of local reputation and to have been somewhat of a favorite in that capacity before reaching his 21st year. In 1798-99, he took charge of those concerts in the Augarten established by Mozart and Martin, and afterwards led by Rudolph. Seyfried, writing after his death, calls Schuppanzigh a “natural born and really energetic leader of the orchestra.” The difference in age, character and social position between him and Beethoven was such as not to admit between them that higher and nobler friendship which united the latter and Zmeskall; but they could be, and were, of great use to each other, and there was a strong personal liking, if not affection, which was mutual. Schuppanzigh’s person early assumed very much of the form and proportions of Sterne’s Dr. Slop, and after his return from Russia he is one of the “Milord Falstaffs” of Beethoven’s correspondence and Conversation Books. His obesity was, however, already the subject of the composer’s jests, and he must have been an exceedingly good-tempered young man, to bear with and forgive the coarse and even abusive text of the short vocal piece (1801) headed “Lob auf den Dicken” (“Praise of the Fat One”). But it is evidently a mere jest, and was taken as such. It is worthy of note that Beethoven and Schuppanzigh in addressing each other used neither the familiar “du” nor the respectful “Sie,” but “er”--a fact which has been supposed to prove Beethoven’s great contempt for the violinist; but as it would prove equal contempt on the other side, it proves too much. Of Sina and Weiss, both Silesians by birth, there is little that need be added here. Weiss became the first viola player of Vienna, and a not unsuccessful composer of ballet and other music.

Anton Kraft (the father) came from Bohemia to pursue his legal studies in Vienna, but abandoned them to enter the Imperial Court Orchestra as violoncellist. In 1778, he accepted an invitation from Haydn to join the orchestra in Esterhaz; where, on the 18th of December of the same year, his son Nicholas Anton was born. The child, endowed by nature with great musical talents, enjoyed the advantages of his father's instructions and example and of growing up under the eye of Haydn and in the constant study of that great musician's works. Upon the death of Esterhazy and the dispersion of his orchestra, Kraft came with his son, now in his fourteenth year, to Vienna. On April 15th, 1792, Nicholas played a concerto composed by his father at the "Widows and Orphans" concert, and on the 21st again appeared in a concert given by the father. Notwithstanding a very remarkable success, the son was destined for another profession than music; and from this time until his eighteenth year, he played his instrument only as an amateur, and as such Beethoven first knew the youth. But when the young Prince Lobkowitz formed his orchestra in 1796, both the Krafts were engaged, and Nicholas Anton thenceforth made music his profession. In the maturity of his years and powers, his only rival among all the German violoncellists was Bernhard Romberg.

Schindler, with his characteristic inattention to dates, observes, speaking of Schuppanzigh, Weiss and the elder Kraft:

KNOWLEDGE OF ORCHESTRAL INSTRUMENTS

These three artists are intimately connected with the development of Beethoven and, indeed, with a large portion of his creations; wherefore they will frequently be remembered here. Meanwhile it may suffice to say that it was to this company of practically-trained musicians that the rising young composer owed his knowledge of the efficient use of stringed instruments. In addition are to be mentioned Joseph Friedlowsky, who taught our master the mechanism of the clarinet, and the famous hornist, Johann Wenzel Stich, who called himself Giovanni Punto in Italian, to whom Beethoven owed what he knew of the proper writing for horn, of which he already gave striking illustration in his Sonata for Horn, Op. 17. In the mechanism of the flute and its construction, which underwent so many changes in the first decades of the century, Carl Scholl steadily remained Beethoven's instructor.

There is doubtless some degree of truth in this in so far as it relates to a later period. Punto, of course, gave Beethoven a new revelation of the powers and possibilities of the horn, as Dragonetti did of the contrabass; but he first came to Vienna near the end of 1799, and died at Prague only three years after (February 16, 1803). All the others here named by Schindler--with one exception, the elder Kraft--were youths of 16-18 years, when Beethoven composed his first and second concertos--works which prove that he was not altogether ignorant of the use of orchestral instruments! Had Schindler known something of the history of Max Franz's orchestra in Bonn, he would have avoided many a mistake.[87]

Johann Nepomuk Hummel, the pupil of Mozart, was another of the youths whom Beethoven drew into his circle. In 1795, the elder Hummel brought back his son to Vienna (from that very successful concert tour which had occupied the last six years and had made the boy known even to the cities of distant Scotland) and put him to the studies of counterpoint and composition with Albrechtsberger and Salieri. He seems to have been quietly at his studies, playing only in private, until April 28th, 1799, when he again appeared in public both as pianist and composer, in a concert in the Augartensaal, directed by Schuppanzigh. "He performed a symphony besides a melodrama composed for the occasion and between them played prettily _composed_ improvisations on the pianoforte." That the talented and promising boy of seventeen years should, upon arriving home again, seek the acquaintance and favor of one who during his absence had made so profound an impression upon the Vienna public as Beethoven, and that the latter should have rejoiced to show kindness to Mozart's favorite pupil, hardly needs to be mentioned. A chapter of description would not illustrate the nature of their intercourse so vividly, as two short but exceedingly characteristic notes of Beethoven's which Hummel preserved and which found their way into print after his death:

I

He is not to come to me again. He is a treacherous dog and may the flayer get all such treacherous dogs!

II

Herzens Natzerl:

You are an honest fellow and I now see you were right. Come, then, to me this afternoon. You'll find Schuppanzigh here also and we two will bump, thump and pump you to your heart's delight. A kiss from

Your

Beethoven also called Mehlschöberl.[88]

ENVIOUS VIENNESE MUSICIANS

In a letter to Eleonore von Breuning, Beethoven described many of the Vienna pianists as his “deadly enemies.” Schindler’s observations upon the composer’s relations with the Viennese musicians, though written in his peculiar style, seem to be very judicious and correct.

Nobody is likely to expect, he says (Vol. I, 23-24), that an artist who made his way upwards as our Beethoven, although almost confining his activities exclusively to aristocratic circles that upheld him in extraordinary fashion, would remain free from the attacks of his colleagues; on the contrary, the reader will be prepared to see a host of enemies advance against him because of the shining qualities and evidences of genius of our hero, in contrast with the heavy burden of social idiosyncrasies and uncouthness. More than anything else, what seemed least tolerable to his opponents was the notion that his appearance, the excitability which he controlled too little in his intercourse with his colleagues and his lack of consideration in passing judgment were natural accompaniments of genius. His too small toleration of many bizarreries and weaknesses of high society, and on the other hand his severe demand on his colleagues for higher culture, even his Bonn dialect, afforded his enemies more than enough material to revenge themselves on him by evil gossip and slander.... The musicians in Vienna at that time, with a very few exceptions, were lacking, not only in artistic, but also in the most necessary degree of general, education and were as full of the envy of handicraftsmen as the members of the guilds themselves. There was a particular antipathy to all foreigners as soon as they manifested a purpose to make their homes in the imperial city.

Schindler might have added that the change had been in no small degree produced through the instructions and example of Beethoven as they acted upon the Czernys, Moscheles and other young admirers of his genius. In short, Beethoven’s instant achievement of a position as artist only paralleled by Mozart and of a social rank which Gluck, Salieri, Haydn had gained only after making their names famous throughout Europe, together with the general impression that the mantle of Mozart had fallen upon him--all this begat bitter envy in those whom his talents and genius overshadowed; they revenged themselves by deriding him for his personal peculiarities and by condemning and ridiculing the novelties in his compositions; while he met their envy with disdain, their criticisms with contempt; and, when he did not treat their compositions with indifference, but too often only noticed them with sarcasm.

This picture, certainly, is not an agreeable one, but all the evidence proves it, unfortunately, faithful. Such men as Salieri, Gyrowetz, Weigl, are not to be understood as included in the term “pianist” as used by Beethoven in his letter to Eleonore von Breuning. For these men “stood high in Beethoven’s respect,” says Schindler, and his words are confirmed to the fullest extent by the Conversation Books and other authorities; which also show that Eybler’s name might have been added to the list. They were all more or less older than Beethoven, and for their contrapuntal learning, particularly in the case of Weigl and Eybler, he esteemed them very highly. No indications, however, have been found, that he was upon terms of close private friendship and intimacy with either.

FRIENDSHIPS WITH WOMEN

Beethoven was no exception to the general rule, that men of genius delight in warm and lasting friendships with women of superior minds and culture--not meaning those “conquests” which, according to Wegeler, even during his first three years in Vienna, “he occasionally made, which if not impossible for many an Adonis would still have been difficult.” Let such matters, even if details concerning them were now attainable, be forgotten. His celibacy was by no means owing to a deliberate choice of a single life. What is necessary and proper of the little that is known on _this_ point will, in due time, be imparted simply and free from gloss or superfluous comment. As to his friendships with the other sex, it would be throwing the view of them into very false perspective to employ those of later years in giving piquancy to a chapter here. Let them also come in due order and thus, while they lose nothing of interest, they may, perchance afford relief and give brightness to canvas which otherwise might sometimes become too sombre. Happily during these prosperous years now before us, the picture has been for the most part bright and sunny and the paucity of the information upon the topic in question is of less consequence.

In the present connection one of our old Bonn friends again comes upon the scene. The beautiful, talented and accomplished Magdalene Willmann was invited to sing at Venice during the carnival of 1794. She left Bonn the preceding summer with her brother Max and his wife (Fräulein Tribolet) to fulfill the engagement. After leaving Venice, they gave a concert in Gratz, and journeyed on to Vienna. Here Max and his wife remained, having accepted engagements from Schikaneder, while Magdalene went

on to Berlin. Not suiting the operatic public there she returned to Vienna, and was soon engaged to sing both German and Italian parts in the Court Opera. Beethoven renewed his intercourse with them and soon became so captivated with the charms of the beautiful Magdalene as to offer her his hand. This fact was communicated to the author by a daughter of Max Willmann, still living in 1860, who had often heard her father speak of it. To the question, why her aunt did not accept the offer of Beethoven, Madame S. hesitated a moment, and then, laughing, replied: “Because he was so ugly, and half crazy!” In 1799, Magdalene married a certain Galvani, but her happiness was short; she died toward the end of 1801.

Two letters of Beethoven to be found in the printed collection have been preserved from the period before us, addressed to Christine Gerhardi, a young woman of high distinction in society at the time for the splendor of her talents and her high culture. Dr. Sonnleithner wrote of her:

She was the daughter of an official at the court of the Emperor Leopold II ... an excellent singer, but remained a dilettante and sang chiefly in concerts for charitable purposes (which she herself arranged), or for the benefit of eminent artists. Old Professor Peter Frank was director of the general hospital of Vienna in the neighborhood of which (No. 20 Alserstrasse) she lived. He was a great lover of music, but his son, Dr. Joseph Frank, was a greater; he made essays in composition and arranged musical soirées at the home of his father at which Beethoven and Fräulein Gerhardi took part, playing and singing. The son frequently composed cantatas, which Beethoven corrected, for the name-days and birthdays of his father, and in which Fräulein Gerhardi sang the soprano solos.... She was at the time the most famous amateur singer in Vienna, and inasmuch as Haydn knew her well there is no doubt but that he had her in mind when he composed “The Creation”; indeed, she sang the soprano part with great applause not only at Schwarzenberg but also at the first performance in the Burgtheater. All reports agree that she met Beethoven often at Frank’s and that he frequently accompanied her singing on the pianoforte. He did not give her lessons.

Dr. Joseph von Frank and Christine Gerhardi were married on August 20, 1798; they moved away from Vienna in 1804.

A few notes upon certain young women to whom Beethoven dedicated compositions at this period of his life may form no inappropriate close to this chapter. It was much the custom then for teachers of music to dedicate their works to pupils, especially to those who belonged to the higher social ranks--such dedications being at the same time compliments to the pupils and advertisements for the instructors, with the farther advantage often of being sources of pecuniary profit. When, therefore, we read the name of Baroness Albini on the title-page of certain sonatas by Sterkel, of Julia Countess Guicciardi on one by Kleinheinz, of Anna Countess Mailath on songs by Teyber, we assume at once the probability in these and like instances that the relation of master and pupil existed. Beethoven also followed the custom; and the young ladies, subjects of the following notices, are all known or supposed to have taken lessons of him.

Anna Louisa Barbara (“La Comtesse Babette”) was the daughter of Karl Count Keglevics de Busin, of Hungarian Croatian lineage, and Barbara Countess Zichy. She married Prince Innocenz d’Erba Odescalchi on the 10th of February, 1801 (another authority gives 1800). Beethoven’s dedications to her are the Sonata, Op. 7 (published in 1797), the Variations “La stessa la stessissima” (1799), and the Pianoforte Concerto, Op. 15, 1801--the last to her as Princess Odescalchi. A note by the composer to Zmeskall--which, judging both from its contents and the handwriting, could not have been written later than 1801-2--shows that the Odescalchi palace was one of those at which he took part in musical soirées.

“Countess Henriette Lichnowsky,” writes Count Amade, “was the sister of the ruling Prince Carl, and was doubtless married to the Marquis of Carneville after the dedication to her of the Rondo (G major, Op. 51, No. 2, published in September, 1802); she lived in Paris after her marriage and died about 1830.” The Rondo was first dedicated to Countess Giulietta Guicciardi, but Beethoven asked it back in exchange for the C-sharp minor Sonata; to which fact we shall recur presently. Countess Thun, to whom Beethoven dedicated the Clarinet Trio, Op. 11, in 1797, was the mother of Prince Carl Lichnowsky and Countess Henriette Lichnowsky. She died May 18, 1800. The Sonata in E-flat, Op. 27, No. 1, was dedicated to Josepha Sophia, wife of Prince Johann Joseph von Liechtenstein, daughter of Joachim Egon, Landgrave of Fürstenberg-Weitra. She was born on June 20, 1776, married on April 22, 1792 and died February 23, 1848. Whether her father was related at all, and if so, how, to the Fürstenberg in whose house Beethoven gave lessons in Bonn, is not known. Her husband, however, was first cousin to Count Ferdinand von Waldstein. The Baroness Braun to whom Beethoven dedicated the two Pianoforte Sonatas Op. 14 and the Sonata for Horn in 1801, was the wife of Baron Peter von Braun, lessee of the Nationaltheater and afterwards of the Theater an der Wien. The dedications disclose an early association which eventually led to Beethoven’s being asked to compose an opera. It is not known that Beethoven was a social visitor in the house of Baron Braun, but he was a highly respected guest in the house of Count Browne, to whose wife Beethoven dedicated the “Waldmädchen” Variations and the three Pianoforte Sonatas, Op. 10.

FOOTNOTES:

[86] Amenda returned to his home in Courland in the fall of 1799. The friends corresponded with each other for a time, but the majority of Beethoven's letters are lost. While a student at the University in Leipzig, Amenda's grandson placed some of them in the hands of a publisher at his request and did not get them back. Amenda was first a private teacher, became a preacher in Talsen in 1802, provost of the diocese of Kadau in 1820, consistorial councillor in 1830 and died on March 8, 1836. A portrait painted in 1808, is preserved in the Beethoven Museum in Bonn.

[87] Beethoven did not always follow the suggestions of these men. According to an anecdote told by Doležalek to Otto Jahn, Kraft once complained that a passage was not playable. "It's got to be," answered Beethoven. In a like vein K. Holz relates that "Beethoven asked an excellent artist whether or not certain things were possible"; the question of how difficult they were did not enter. Thus Friedlowsky for clarinet, Czerwensky for oboe, Hradezky and Herbst for horn. If others complained of impossibilities the answer was "They can do it and you must." (From Thayer's papers.)

[88] The humor to which Beethoven resorts in this note in order to show his contrition necessarily evaporates in any attempt to translate its Viennese colloquialisms. "Herzens Natzerl" is to be understood as "Dear little Ignacius of my heart," Nazerl being an affectionate diminutive of Ignaz or Ignacius. Why it should have been applied to Hummel, whose Christian names were Johann Nepomuk, does not appear. "Mehlschöberl" is a term which has survived in the Austrian cuisine of to-day, the article itself being a sort of soup dumpling.

Chapter XVII

Beethoven's Character and Personality--His Disposition--Love of Nature--Relations with the Opposite Sex--Literary Tastes--His Letters--Manner of Composing--The Sketchbooks--Origin of His Deafness.

The year 1800 is an important era in Beethoven's history. It is the year in which, cutting loose from the pianoforte, he asserted his claims to a position with Mozart and the still living and productive Haydn in the higher forms of chamber and orchestral composition--the quartet and the symphony. It is the year, too, in which the bitter consciousness of an increasing derangement of his organs of hearing was forced upon him and the terrible anticipation of its incurable nature and of its final result in almost total deafness began to harass and distress him. The course of his life was afterwards so modified, on the one hand, by the prosperous issue of these new appeals to the taste and judgment of the public, and, on the other, by the unhappy progress of his malady, each acting and reacting upon a nature singularly exceptional, that for this and other reasons some points in his personal character and habits, and a few general remarks upon and illustrations of another topic or two must be made before resuming the narrative of events.

A true and exhaustive picture of Beethoven as a man would present an almost ludicrous contrast to that which is generally entertained as correct. As sculptors and painters have each in turn idealized the work of his predecessor, until the composer stands before us like a Homeric god until those who knew him personally, could they return to earth, would never suspect that the grand form and noble features of the more pretentious portraits are intended to represent the short muscular figure and pock-pitted face of their old friend--so in literature evoked by the composer a similar process has gone on, with a corresponding suppression of whatever is deemed common and trivial, until he is made a being living in his own peculiar realm of gigantic ideas, above and apart from the rest of mankind--a sort of intellectual Thor, dwelling in "darkness and clouds of awful state," and making in his music mysterious revelations of things unutterable! But it is really some generations too soon for a conscientious investigator of his history to view him as a semi-mythological personage, or to discover that his notes to friends asking for pens, making appointments to dinner at taverns, or complaining of servants, are "cyclopean blocks of granite," which, like the "chops and tomato sauce" of Mr. Pickwick, contain depths unfathomable of profound meaning. The present age must be content to find in Beethoven, with all his greatness, a very human nature, one which, if it showed extraordinary strength, exhibited also extraordinary weaknesses.

INCONSISTENT TRAITS OF CHARACTER

It was the great misfortune of Beethoven's youth--his impulses good and bad being by nature exceedingly quick and violent--that he did not grow up under the influence of a wise and strict parental control, which would have given him those habits of self-restraint that, once fixed, are a second and better nature, and through which the passions, curbed and moderated, remain only as sources of noble energy and power. His very early admission into the orchestra of the theatre as cembalist, was more to the advantage of

his musical than of his moral development. It was another misfortune that, in those years, when the strict regulations of a school would have compensated in some measure for the unwise, unsteady, often harsh discipline of his father, he was thus thrown into close connection with actors and actresses, who, in those days, were not very distinguished for the propriety of their manners and morals. Before his seventeenth or eighteenth year, when he became known to the Breuning family and Count Waldstein, he could hardly have learned the importance of cultivating those high principles of life and conduct on which in later years he laid so much stress. And, at that period of life, the character even under ordinary circumstances is so far developed, the habits have become so far formed and fixed, and the natural tendencies have acquired so much strength, that it is, as a rule, too late to conquer the power of a perfect self-command. At all events, the consequences of a deficient early moral education followed Beethoven through life and are visible in the frequent contests between his worse and his better nature and in his constant tendency to extremes. To-day, upon some perhaps trivial matter, he bursts into ungovernable wrath; to-morrow, his penitence exceeds the measure of his fault. To-day he is proud, unbending, offensively careless of those claims which society grants to people of high rank; to-morrow his humility is more than adequate to the occasion. The poverty in which he grew up was not without its effect upon his character. He never learned to estimate money at its real value; though often profuse and generous to a fault, even wasteful, yet at times he would fall into the other extreme. With all his sense of nobility of independence, he early formed the habit of leaning upon others; and this the more, as his malady increased, which certainly was a partial justification; but he thus became prone to follow unwise counsels, or, when his pride was touched, to assert an equally unwise independence. At other times, in the multitude of counsellors he became the victim of utter irresolution, when decision and firmness were indispensable and essential to his welfare. Thus, both by following the impulse of the moment, and by hesitation when a prompt determination was demanded, he took many a false step, which could no longer be retrieved when reflection brought with it bitter regret.

It would be doing great injustice both to Beethoven and to the present writer to understand the preceding remarks as being intended to represent the composer's lapses in these regards, as being more than unpleasant and unfortunate episodes in the general tenor of his life; but as they did occur to his great disadvantage, the fact cannot be silently passed over.

A romantically sentimental admiration of the heroes of ancient classic literature, having its origin in Paris, had become widely the fashion in Beethoven's youth. The democratic theories of the French sentimentalists had received a new impulse from the dignified simplicity of the foreign representatives of the young American Republic, Franklin, Adams, Jay--from the retirement to private life on their plantations and farms of the great military leaders in the contest, Washington, Greene, Schuyler, Knox and others, after the war with England was over; from the pride taken by the French officers, who had served in America, in their insignia of the order of the Cincinnati; and even from the letters and journals of German officers, who, in captivity, had formed friendships with many of the better class of the republican leaders, and seen with their own eyes in what simplicity they lived while guiding the destinies of the new-born nation. Thus through the greater part of Central Europe the idea became current of a pure and sublime humanity, above and beyond the influence of the passions, of which Cincinnatus, Scipio, Cato, Washington, Franklin, were the supposed representatives. Zschokke makes his Heuwen say: "Virtue and the heroes of antiquity had inspired me with enthusiasm for virtue and heroism"; and so, also, Beethoven. He exalted his imagination and fancy by the perusal of the German poets and translations of the ancient and English classics, especially Homer, Plutarch and Shakespeare; dwelt fondly upon the great characters as models for the conduct of life; but between the sentiment which one feels and the active principle on which he acts, there is often a wide cleft. That Beethoven proved to be no Stoic, that he never succeeded in governing his passions with absolute sway, was not because the spirit was unwilling; the flesh was weak. Adequate firmness of character had not been acquired in early years. But those who have most thoroughly studied his life, know best how pure and lofty were his aspirations, how wide and deep his sympathies with all that is good, how great his heart, how, on the whole, heroic his endurance of his great calamity. They can best feel the man's true greatness, admire the nobility of his nature, and drop the tear of sorrow and regret upon his vagaries and faults. He who is morbidly sensitive, and compelled to keep constant ward and watch over his passions, can best appreciate and sympathize with the man, Beethoven.

Truth and candor compel the confession, that in those days of prosperity he bore his honors with less of meekness than we could wish; that he had lost something of that modesty and ingenuousness eulogized by Junker ten years before, in his Mergentheim letter. His "somewhat lofty bearing" had even been reported by the correspondent of the "Allgemeine Musikalische Zeitung." Traces of self-sufficiency and even arrogance--faults almost universal among young and successful geniuses, often in a far higher degree than was true of Beethoven, and with not a tithe of his reason--are unquestionably visible. No one can read without regret his remarks upon certain persons not named, with whom at this very time he was upon terms of apparently intimate friendship. "I value them," he writes, "only by what they do for me.... I look upon them only as instruments upon which I play when I feel so disposed." His "somewhat lofty bearing" was matter for jest to the venerable Haydn, who, according to a trustworthy tradition, when

Beethoven's visits to him had become few and far between would inquire of other visitors: "How goes it with our Great Mogul?" Nor would the young nobles, whose society he frequented, take offence; but it certainly made him enemies among those whom he "valued according to their service and looked upon as mere instruments"--and no wonder!

Pierson, in his edition of the so-called "Beethoven's Studien," has added to Seyfried's personal sketches a few reminiscences of that Griesinger, who was so long Saxon Minister in Vienna, and to whom we owe the valuable "Biographische Notizen über Joseph Haydn." One of his anecdotes is to the purpose here and may be taken as substantially historical.

BEETHOVEN'S SELF-ESTEEM INJURED

When he was still only an attaché, and Beethoven was little known except as a celebrated pianoforte player, both being still young, they happened to meet at the house of Prince Lobkowitz. In conversation with a gentleman present, Beethoven said in substance, that he wished to be relieved from all bargain and sale of his works, and would gladly find some one willing to pay him a certain income for life, for which he should possess the exclusive right of publishing all he wrote; adding, "and I would not be idle in composition. I believe Goethe does this with Cotta, and, if I mistake not, Handel's London publisher held similar terms with him."

"My dear young man," returned the other, "You must not complain; for you are neither a Goethe nor a Handel, and it is not to be expected that you ever will be; for such masters will not be born again." Beethoven bit his lips, gave a most contemptuous glance at the speaker, and said no more. Lobkowitz endeavored to appease him, and in a subsequent conversation said:

"My dear Beethoven, the gentleman did not intend to wound you. It is an established maxim, to which most men adhere, that the present generation cannot possibly produce such mighty spirits as the dead, who have already earned their fame."

"So much the worse, Your Highness," retorted Beethoven: "but with men who will not believe and trust in me because I am as yet unknown to universal fame, I cannot hold intercourse!"

It is easy for this generation, which has the productions of the composer's whole life as the basis of its judgment of his powers, to speak disparagingly of his contemporaries for not being able to discover in his first twelve or fifteen works good reason for classing him with Goethe and Handel; but he who stand upon a mountain cannot justly ridicule him on the plain for the narrow extent of his view. It was as difficult then to conceive the possibility of instrumental music being elevated to heights greater than those reached by Haydn and Mozart, as it is for us to conceive of Beethoven being hereafter surpassed.

In the short personal sketches of Beethoven's friends which have been introduced, the dates of their births have been noted so far as known, that the reader may observe how very large a proportion of them were of the same age as the composer, or still younger--some indeed but boys--when he came to Vienna. And so it continued. As the years pass by in our narrative and names familiar to us disappear, the new ones which take their places, with rare exceptions, are still of men much younger than himself. The older generation of musical amateurs at Vienna, van Swieten and his class, had accepted the young Bonn organist and patronized him, as a pianist. But when Beethoven began to press his claims as a composer, and, somewhat later, as his deafness increased, to neglect his playing, some of the elder friends had passed away, others had withdrawn from society, and the number was few of those who, like Lichnowsky, could comprehend that departures from the forms and styles of Mozart and Haydn were not necessarily faults. With the greater number, as perfection necessarily admits of no improvement and both quartet and symphony in _form_ had been carried to that point by Haydn and Mozart, it was a perfectly logical conclusion that farther progress was impossible. They could not perceive that there was still room for the invention or discovery of new elements of interest, beauty, power; for such perceptions are the offspring of genius. With Beethoven they were instinctive.

One more remark: Towards the decline of life, the masterpieces of literature and art, on which the taste was formed, are apt to become invested in the mind with a sort of nimbus of sanctity; hence, the productions of a young and daring innovator, even when the genius and talent displayed in them are felt and receive just acknowledgement, have the aspect, not only of an extravagant and erring waste of misapplied powers, but of a kind of profane audacity. For these and similar reasons Beethoven's novelties found little favor with the veterans of the concert-room.

THE HOMAGE OF YOUNG DISCIPLES

The criticism of the day was naturally ruled and stimulated by the same spirit. Beethoven's own confession how it at first wounded him, will come in its order; but after he felt that his victory over it was sure--was in fact gained with a younger generation--he only laughed at the critics; to answer them, except by new works, was beneath him. Seyfried says of him (during the years of the

“Eroica,” “Fidelio,” etc.): “When he came across criticisms in which he was accused of grammatical errors he rubbed his hands in glee and cried out with a loud laugh: ‘Yes, yes! they marvel and put their heads together because they do not find it in any school of thoroughbass!’” But for the young of both sexes, Beethoven’s music had an extraordinary charm. And this not upon technical grounds, nor solely for its novelties, always an attractive feature to the young, but because it appealed to the sensibilities, excited emotions and touched the heart as no other purely instrumental compositions had ever done. And so it was that Beethoven also in his quality of composer soon gathered about him a circle of young disciples, enthusiastic admirers. Their homage may well have been grateful to him--as such is to every artist and scholar of genius, who, striking out and steadfastly pursuing a new path, subjects himself to the sharp animadversions of critics who, in all honesty, really can see little or nothing of good in that which is not to be measured and judged by old standards. The voice of praise under such circumstances is doubly pleasing. It is known that, when Beethoven’s works began to find a just appreciation from a new generation of critics, who had indeed been schooled by them, he collected and preserved a considerable number of laudatory articles, whose fate cannot now be traced. When, however, the natural and just satisfaction which is afforded by the homage of honest admirers and deservedly eulogistic criticism, degenerates into a love of indiscriminate praise and flattery, it becomes a weakness, a fault. Of this error in Beethoven there are traces easily discernible, and especially in his later years; there are pages of fulsome eulogy addressed to him in the Conversation Books, which would make the reader blush for him, did not the mere fact that such books existed remind him of the bitterness of the composer’s lot. The failing was also sometimes his misfortune; for those who were most profuse in their flatteries, and thus gained his ear, were by no means the best of his counsellors. But aside from the attractive force of his genius, Beethoven possessed a personal magnetism, which attached his young worshippers to him and, all things considered, to his solid and lasting benefit in his private affairs. Just at this time, and for some years to come, his brothers usually rendered him the aid he needed; but thenceforth to the close of his life, the names of a constant succession of young men will appear in and vanish from our narrative, who were ever necessary to him and ever ready at his call with their voluntary services.

Beethoven’s love of nature was already a marked trait of his character. This was indulged and strengthened by long rambles upon the lofty hills and in the exquisitely beautiful valleys which render the environs of Vienna to the north and west so charming. Hence, when he left the city to spend the hot summer months in the country, with but an exception or two in a long series of years, his residence was selected with a view to the indulgence of this noble passion. Hence, too, his great delight in the once celebrated work of Christian Sturm: “Beobachtungen über die Werke Gottes,” which, however absurd much of its natural philosophy (in the old editions) appears now in the light of advanced knowledge, was then by far the best manual of popular scientific truth, and was unsurpassed in fitness to awaken and foster a taste for, and the understanding of, the beauties of nature. Schindler has recorded the master’s life-long study and admiration of this book. It was one which cherished his veneration for the Creator and Preserver of the universe, and yet left his contempt for procrustean religious systems and ecclesiastical dogmas its free course. “To him, who, in the love of Nature, holds communion with her visible forms, she speaks a various language,” says Bryant. Her language was thoroughly well understood by Beethoven; and when, in sorrow and affliction, his art, his Plutarch, his “Odyssey,” proved to be resources too feeble for his comfort, he went to Nature for solace, and rarely failed to find it.

BEETHOVEN’S MORAL PRINCIPLES

Art has been so often disgraced by the bad morals and shameless lives of its votaries, that it is doubly gratifying to be able to affirm of Beethoven that, like Handel, Bach and Mozart, he did honor to his profession by his personal character and habits. Although irregular, still he was as simple and temperate in eating and drinking as was possible in the state of society in which he lived. That he was no inordinate lover of wine or strong drinks is certain. No allusion is remembered in any of his letters, notes, memoranda, nor in the Conversation Books, which indicates a liking for any game of chance or skill. He does not appear to have known one playing-card from another. Music, books, conversation with men and women of taste and intelligence, dancing, according to Ries (who adds that he could never learn to dance in time--but Beethoven’s dancing days were soon over--), and, above all, his long walks, were his amusements and recreations. His whim for riding was of short duration--at all events, the last allusion to any horse owned by him is in the anecdote on a previous page.

One rather delicate point demands a word: and surely, what Franklin in his autobiography could confess of himself, and Lockhart mention without scruple of Walter Scott, his father-in-law, need not be here suppressed. Nor can it well be, since a false assumption on the point has been made the basis already of a considerable quantity of fine writing, and employed to explain certain facts relative to Beethoven’s compositions. Spending his whole life in a state of society in which the vow of celibacy was by no means a vow of chastity; in which the parentage of a cardinal’s or archbishop’s children was neither a secret nor a disgrace; in which the illegitimate offspring of princes and magnates were proud of their descent and formed upon it well-grounded hopes of

advancement and success in life; in which the moderate gratification of the sexual was no more discountenanced than the satisfying of any other natural appetite--it is nonsense to suppose, that, under such circumstances, Beethoven could have puritanic scruples on that point. Those who have had occasion and opportunity to ascertain the facts, know that he had not, and are also aware that he did not always escape the common penalties of transgressing the laws of strict purity. But he had too much dignity of character ever to take part in scenes of low debauchery, or even when still young to descend to the familiar jesting once so common between tavern girls and the guests. Thus, as the elder Simrock related, upon the journey to Mergentheim recorded in the earlier pages of this work, it happened at some place where the company dined, that some of the young men prompted the waiting-girl to play off her charms upon Beethoven. He received her advances and familiarities with repellent coldness; and as she, encouraged by the others, still persevered, he lost his patience, and put an end to her importunities by a smart box on the ear.

The practice, not uncommon in his time, of living with an unmarried woman as a wife, was always abhorrent to him--how much so, a sad story will hereafter illustrate; to a still greater degree an intrigue with the wife of another man. In his later years he so broke off his once familiar intercourse with a distinguished composer and conductor of Vienna, as hardly to return his greetings with common politeness. Schindler affirmed that the only reason for this was that the man in question had taken to his bed and board the wife of another.

The names of two married women might be here given, to whom at a later period Beethoven was warmly attached; names which happily have hitherto escaped the eyes of literary scavengers, and are therefore here suppressed. Certain of his friends used to joke him about these ladies, and it is certain that he rather enjoyed their jests even when the insinuations, that his affection was beyond the limit of the Platonic, were somewhat broad; but careful enquiry has failed to elicit any evidence that even in these cases he proved unfaithful to his principles. A story related by Jahn is also to the point, viz.: that Beethoven only by the urgent solicitations of the Czerny family was after much refusal persuaded to extemporize in the presence of a certain Madame Hofdemel. She was the widow of a man who had attempted her life and then committed suicide; and the refusal of Beethoven to play before her arose from his having the general belief at the time, that a too great intimacy had existed between her and Mozart. Jahn, it may be observed, has recently had the great satisfaction of being able to prove the innocence of Mozart in this matter and of rescuing his memory from the only dark shadow which rested upon it. This much on this topic it has been deemed necessary to say here, not only for the reason above given, but to put an end to long-prevailing misconceptions and misconstructions of passages in Beethoven's letters and private memoranda and to save farther comment when they shall be introduced hereafter.

Beethoven's fine sense for the lyric element in poetry was already conspicuous in the fine tact with which the texts of his songs, belonging in date to his last years in Bonn, were selected from the annual publications in which most of them appeared. Another fine proof of this is afforded by a glance through the older editions of Matthisson's poems. In the fourth (1797), there are but two which are really well adapted to composition in the song-form--the "Adelaide" and "Das Opferlied." A third Beethoven left unfinished. He had doubtless been led to attempt its composition through the force of its appeal to his personal feelings and sympathies, but soon discovering its non-lyrical character abandoned it. It is the "Wunsch."

Rochlitz in his letters from Vienna (1822) reports Beethoven's humorous account of his enthusiasm for Klopstock in his early life:

Since that summer in Carlsbad I read Goethe every day, that is, when I read at all. He (Goethe) has killed Klopstock for me. You are surprised? And now you laugh? Ah ha! It is because I have read Klopstock. I carried him about with me for years while walking and also at other times. Well, I did not always understand him, of course. He leaps about so much and he begins at too lofty an elevation. Always _Maestoso_, D-flat major! Isn't it so? But he is great and uplifts the soul nevertheless. When I could not understand him I could sort of guess. If only he did not always want to die! That will come quickly enough. Well, it always sounds well, at any rate, etc.

Thus, whatever scattered hints bearing upon the point come under our notice combine to impart a noble idea of Beethoven's poetic taste and culture, and to show that the allusions to the ancient classic authors in his letters and conversation were not made for display, but were the natural consequence of a love for and a hearty appreciation of them derived from their frequent perusal in translations.

BEETHOVEN AS A LETTER-WRITER

Beethoven's correspondence forms so important a portion of his biography that something must be said here upon his character as a letter-writer. A few of his autograph letters bear marks of previous study and careful elaboration; but, in general, whatever he wrote in the way of private correspondence was dashed off on the spur of the moment, and with no thought that it would ever come

under any eye but that for which it was intended. It is therefore easy to imagine how energetically he would have protested could he have known that his most insignificant notes were preserved in such numbers, and that the time would come when they would all be made public; or, still worse, that some which were but the offspring of momentary pique against those with whom he lived in closest relations would be used after his death to their injury; and that outbursts of sudden passion--when the wrong was perhaps as often on his side as on the other--after all the parties concerned had passed away, would have an almost judicial authority accorded to them.

In studying a collection of some eight hundred of his letters and notes,[89] originals and copies in print or manuscript, the most striking fact is the insignificance of by far the greater number--that so few bear marks of any care in their preparation, or contain matter of any intrinsic value. In fact, perhaps the greater part of the short notes to Zmeskall and others owe their origin to Beethoven's dislike of entrusting oral messages to his servants. For the most part it is in vain to seek in his correspondence anything bearing upon the theory or art of music; very seldom is any opinion expressed upon the productions of any contemporary composer; no vivid sketches of men and manners flow from his pen, like those which render the letters of Mozart and Mendelssohn so charming. The proportion of their correspondence which possesses more than a merely biographical value was large; of Beethoven's very small.

His letters, of course, exhibit the usual imperfections of a hasty and confidential correspondence; sometimes, indeed, of an aggravated character. Some of them contain loose statements of fact, such as all men are liable to make through haste or imperfect knowledge; others contain passages of which the only conceivable explanation is Schindler's statement that Beethoven sometimes amused himself with the harmless mystification of others; but, taken together, the more important letters--while they usually evince his difficulty in finding the best expressions of his thoughts and his constant struggle with the rules of his mother tongue--place his truth and candor in a very favorable light and sometimes rise into a rude eloquence. The reader feels that when the writer is unjust he is under the influence of a mistake or passion--and, as a rule, it is not too late to detect such injustice; that his errors of fact are simply mistakes, honestly made and easily corrected; that if, in the mass, a few paragraphs occur which can be neither fully justified nor excused, it is not to be forgotten that they were not intended for our eyes and that they were written under the constant pressure of a great calamity, which made him doubly sensitive and irritable; and so it will be easy, like Sterne's Recording Angel, to blot such passages with a tear.

Another striking fact of Beethoven's correspondence, when viewed as a whole, is the proof it affords that, except in his hours of profound depression, he was far from being the melancholy and gloomy character of popular belief. He shows himself here--as he was by nature--of a gay and lively temperament, fond of a jest, an inveterate though not always a very happy punster, a great lover of wit and humor. It is a cause for profound gratitude that it was so; since he thus preserved an elasticity of spirits that enabled him to escape the consequences of brooding in solitude over his great misfortune; to rise superior to his fate and concentrate his great powers upon his self-imposed tasks; and to meet with hope and courage the cruel fortune which put an end to so many well-founded expectations and ambitious projects, and confined him to a single road to fame and honor--that of composition. It happens that several of the more valuable and interesting of his letters belong to the period immediately following that now before us, and in them we are able to trace, with reasonable accuracy, the effect which his incipient and increasing deafness produced upon him--first, the anxiety caused by earliest symptoms; then the profound grief bordering upon despair when the final result had become certain; and at last his submission to and acceptance of his fate. There is in truth something nobly heroic in the manner in which Beethoven at length rose superior to his great affliction. The magnificent series of works produced in the ten years from 1798 to 1808 are no greater monuments to his genius than to the godlike resolution with which he wrought out the inspirations of that genius under circumstances most fitted to weaken its efforts and restrain its energies.

BEETHOVEN AND HIS SKETCHBOOKS

Beethoven was seldom without a folded sheet or two of music paper in his pocket upon which he wrote with pencil in two or three measures of music hints of any musical thought which might occur to him wherever he chanced to be. Towards the end of his life his Conversation Books often answered the same purpose; and there are traditions of bills-of-fare at dining-rooms having been honored with ideas afterwards made immortal. This habit gave Abbé Gelinek a foundation for the following amusing nonsense as related by Tomaschek: "He (Gelinek) declared," says Tomaschek,

as if it were an aphorism, that all of Beethoven's compositions were lacking in internal coherency and that not infrequently they were overloaded. These things he looked upon as grave faults of composition and sought to explain them from the manner in which Beethoven went about his work, saying that he had always been in the habit of noting every musical idea that occurred to him upon

a bit of paper which he threw into a corner of his room, and that after a while there was a considerable pile of the memoranda which the maid was not permitted to touch when cleaning the room. Now when Beethoven got into a mood for work he would hunt a few musical _motivi_ out of his treasure-heap which he thought might serve as principal and secondary themes for the composition in contemplation, and often his selection was not a lucky one. I (Tomaschek) did not interrupt the flow of his passionate, yet awkward speech, but briefly answered that I was unfamiliar with Beethoven's method of composing but was inclined to think that the aberrations occasionally to be found in his compositions were to be ascribed to his individuality, and that only an unprejudiced and keen psychologist, who had had an opportunity to observe Beethoven from the beginning of his artistic development to its maturity in order gradually to familiarize himself with his views on art, could fit himself to give the musical world an explanation of the intellectual cross-relationships in Beethoven's glorious works, a thing just as impossible to his blind enthusiasts as to his virulent opponents. Gelinek may have applied these last words to himself, and not incorrectly.

This conversation took place in 1814, the day after a rehearsal of Beethoven's Symphony in A--the Seventh! Gelinek's pile of little bits of paper in the corner of the room, when touched by the wand of truth, resolves itself into blank music books, to which his new ideas were transferred from the original slight pencil sketches, and frequently with two or three words to indicate the kind of composition to which they were suited. Divers anecdotes are current which pretend to give the origin of some of the themes thus recorded and afterwards wrought out, but few judicious readers will attach much weight to most of them. For although conceptions can sometimes be traced directly to their exciting causes, the musical composer can seldom say more than that they occurred to him at such a time and place--and often not even that. It is certainly not improbable that Beethoven's admirers may have questioned him upon this point, as Schindler did upon the "Pastoral" Symphony, and that he was able to satisfy them; but Handel's "Harmonious Blacksmith" may be taken as the type of most of the current stories, which only need truth to make them interesting.

To return to the sketchbooks--which performed a twofold office; being not alone the registers of new conceptions, but containing the preliminary studies of the instrumental works into which they were wrought out. The introduction to the excellent pamphlet, "Ein Skizzenbuch von Beethoven, beschrieben und in Auszügen dargestellt von Gustav Nottebohm," though properly confined by him to the single book which he was describing, is equally true of so many that have been examined with care as to warrant its general application. The following extracts may be taken as true of the greater part of the sketchbooks:

HOW THE SKETCHING WAS DONE

Before us (he says) lies a volume in oblong folio (_Teatro_) of 192 pages and bearing 16 staves on each page, and, save a few empty places, containing throughout notes and sketches in Beethoven's handwriting for compositions of various sorts. The volume is bound in craftsman's style, trimmed, and has a stout pasteboard cover. It was bound thus before it was used or received the notes. [Excepting the number of pages this description applies to most of the true sketchbooks.] The sketches are for the greater part one-part; that is, they occupy but a single staff, only exceptionally are they on two or more staves. [In some of the later books the proportion of sketches in two or more parts is much greater than in this.] It is permissible to assume in advance that they were written originally and in the order in which they follow each other in the sketchbook. When a cursory glance over the whole does not seem to contradict this assumption, a careful study nevertheless compels a modification at times. It is to be observed that generally Beethoven began a new page with a new composition; and, moreover, that he worked alternately or simultaneously at different movements. As a result, different groups of sketches are crowded so closely together that in order to find room he was obliged to make use of spaces which had been left open, and thus eventually sketches for the most different compositions had to be mixed together and brought into companionship. [In some of the books "vi-" not infrequently meets the eye. It was the one of Beethoven's modes of keeping the clue in the labyrinth of sketches, being part of the word _vide_. The second syllable, "-de," can always be found on the same or a neighboring page.] "N.B.," "No. 100," "No. 500," "No. 1000," etc., and in later sketches "meilleur," are common, all which signs are explained by Schindler as being a whimsical mode of estimating the comparative value of different musical ideas, or of forms of the same. Again Nottebohm continues: In spite of this confused working it is plain that Beethoven, as a rule, was conscious from the beginning of the goal for which he was striving, that he was true to his first concept and carried out the projected form to the end. The contrary is also true at times, and the sketchbook (like others) disclosed a few instances in which Beethoven in the course was led from the form originally conceived into another, so that eventually something different appeared from what was planned in the first instance. (Once more.) In general it may be observed that Beethoven in all his work begun in the sketchbook proceeded in the most varied manner, and at times reached his goal in a direction opposite to that upon which he first set out. [At times] the thematic style dominates; the first sketch breaks off abruptly with the principal subject and the work that follows is confined to transforming and reshaping the thematic kernel at first thrown on the paper until it appears to be fitted for development; then the same process is undertaken with intermediary sections; everywhere we find beginnings, never a whole; a

whole comes before us only outside of the sketchbook, in the printed composition where sections which were scattered in the sketchbook are brought together. [In other cases] the thematic manner is excluded; every sketch is aimed at a unity and is complete in itself; the very first one gives the complete outline for a section of a movement; those that follow are then complete reshapings of the first, as other readings directed towards a change in the summary character, or a reformation of the whole, an extension of the middle sections, etc. Naturally, the majority of the sketches do not belong exclusively to either of the two tendencies, but hover between them, now leaning toward one, now toward the other.

One readily sees that, when the general plan of a work is clear and distinct before the mind, it is quite indifferent in what order the various parts are studied; and that Beethoven simply adopted the method of many a dramatic and other author, who sketches his scenes or chapters not in course but as mood, fancy or opportunity dictates. It is equally evident that the composer could have half a dozen works upon his hands at the same time, not merely without disadvantage to any one of them, but to the gain of all, since he could turn to one or another as the spirit of composition impelled; like the author of a profound literary work, who relieves and recreates his mind by varying his labors, and executes his grand task all the more satisfactorily, because he, from time to time, refreshes himself by turning his attention to other and lighter topics. When Beethoven writes to Wegeler: “As I am writing now I often compose three or four pieces at once,” he could have referred only to the preliminary studies of the sketchbooks. Sometimes, it is true, works were laid aside incomplete after he had begun the task of writing them out in full, and finished when occasion demanded; but as a rule his practice was quite different, viz.: All the parts of a work having been thus studied until he had determined upon the form, character and style of every important division and subdivision, and recorded the results in his sketchbook by a few of the first measures, followed by “etc.” or “and so on,” the labor of composition may be said to have been finished, and there remained only the task of writing out the clean copy of what now existed full and complete in his mind, and of making such minor corrections and improvements as might occur to him on revision. The manuscripts show that these were sometimes very numerous, though they rarely extend to any change in the form or to any alteration in the grand effect except to heighten it, or render it more unexpected or exciting. When upon reflection he was dissatisfied with a movement as a whole he seems rarely to have attempted its improvement by mere correction, choosing rather to discard it at once and compose a new one based either upon the same themes or upon entirely new motives. The several overtures to “Fidelio” are illustrations of both procedures.

The sketches of the greater part of Beethoven’s songs, after the Bonn period, are preserved, and prove with what extreme care he wrought out his melodies. The sketchbook analysed by Nottebohm affords a curious illustration in Matthison’s “Opferlied,” the melody being written out in full not less than six times, the theme in substance remaining unchanged. Absolute correctness of accent, emphasis, rhythm--of prosody, in short--was with him a leading object; and various papers, as well as the Conversation Books, attest his familiarity with metrical signs and his scrupulous obedience to metrical laws. Since the shameful mutilation and dispersion of Beethoven’s manuscripts at the time of their sale, probably no one person has been able to trace and examine half of the sketchbooks; still, enough have come under observation during the researches for this work to establish with reasonable certainty these points:

I. That each sketchbook was filled in pretty regular course from beginning to end before a new one was taken.

II. That had the collection been kept entire it would have afforded the means of determining with a good degree of certainty the chronology of most of his instrumental works, after coming to Vienna, as to their first conception and studies--excluding, of course, those which, in one form or another, he brought with him from Bonn.

III. That the more important vocal compositions were studied separately.

IV. That only from the sketchbooks can an adequate idea of the vast fertility of Beethoven’s genius be formed. They are in music, like Hawthorne’s “Notebooks” in literature, the record of a never ceasing flow of new thoughts and ideas, until death sealed the fountain forever. There are themes and hints, never used, for all kinds of instrumental compositions, from the trifles, which he called “Bagatelles,” to symphonies, evidently intended to be as different from those we know as they are from each other; and these hints are in such numbers, that those which can be traced in the published works are perhaps much the smaller proportion of the whole. Whoever has the will and opportunity to devote an hour or two to an examination of a few of these monuments of Beethoven’s inventive genius, will easily comprehend the remark which he made near the close of his life: “It seems to me that I have just begun to compose!”[90]

SYMPTOMS OF APPROACHING DEAFNESS

One topic more demands brief notice before closing this chapter. In the “Merrymaking of the Countryfolk” of Beethoven’s “Pastoral” Symphony, at the point where the fun grows most fast and furious and the excitement rises to its height, an ominous sound, as of distant thunder, gives the first faint warning of the coming storm. So in the life of the composer at the moment of that highest success and prosperity, which we have labored to place vividly before the mind of the reader, just when he could first look forward with well-grounded confidence to the noblest gratification of a musician’s honorable ambition, a new and discordant element thrust itself into the harmony of his life. This was the symptoms of approaching deafness. His own account fixes their appearance in the year 1799; then they were still so feeble and intermittent, as to have caused him at first no serious anxiety; but in another year they had assumed so much the appearance of a chronic and increasing evil, as to compel him to abandon plans for travel which he had formed, and for which he was preparing himself, with great industry and perseverance, to appear in the twofold capacity of virtuoso and composer. Instead, therefore, in 1801, of having “long since journeyed through half the world,” he, for two years, had been confined to Vienna or its immediate vicinity, vainly seeking relief from surgeons and physicians.

It is not difficult to imagine calamities greater than that which now threatened Beethoven--as, the loss of sight to a Raphael or Rubens in the height of their fame and powers; a partial paralysis or other incurable disease of the brain cutting short the career of a Shakespeare or Goethe, a Bacon or Kant, a Newton or Humboldt. Better the untimely fate of a Buckle, than to live long years of unavailing regret over the blasted hopes and promise of early manhood. In such cases there remains no resource; hope itself is dead. But to Beethoven, even if his worst fears should prove prophetic and his infirmity at length close all prospects of a career as virtuoso and conductor, the field of composition still remained open. This he knew, and it saved him from utter despair. Who can say that the world has not been a gainer by a misfortune which stirred the profoundest depths of his being and compelled the concentration of all his powers into one direction?

As the disease made progress and the prospect of relief became less, notwithstanding a grief and anxiety which caused him such mental agony as even to induce the thought of suicide, he so well succeeded in keeping it concealed from all but a few intimate and faithful friends, that no notice whatever is to be found of it until 1802 except in papers from his own hand. They form a very touching contrast to his letters to other correspondents. Neither the head nor the heart is to be envied of the man who can read them without emotion. The two most important are letters to Wegeler giving full details of his case; doubly valuable because they are not merely letters to a friend, but an elaborate account of the symptoms and medical treatment of his disease, made to a physician of high standing who thoroughly understood the constitution of the patient. They are therefore alike significant for what they contain and for what they omit. No hypothesis as to the cause of the evil can be entertained, which is discordant with them. Reserving them, however, for their proper places in the order of time, a story or two inconsistent with them may here be disposed of.

The so-called Fischoff Manuscript says:

THEORIES AS TO THE LOSS OF HEARING

In the year 1796, Beethoven, on a hot summer day, came greatly overheated to his home, threw open doors and windows, disrobed down to his trousers and cooled himself in a draft at the open window. The consequence was a dangerous sickness which, on his convalescence, settled in his organs of hearing, and from this time his deafness steadily increased.

In this passage both the date and the averment are irreconcilable with the letters to Wegeler.

Dr. Weissenbach, in his “Reise zum Congress” (1814), gives what appears to be the same story but in fewer words. “He (Beethoven) once endured a fearful attack of typhus. From this time dates the decay of his nervous system, and probably also the, to him, great misfortune of the loss of hearing.” Neither a typhus nor a typhoid fever is a matter of a few days or weeks if severe; and the chronology of our narrative is, to say the least, so far fixed and certain as to exclude the possibility of his having passed through any very serious illness of that nature since he came to Vienna. But it is not at all improbable that, in 1784 or 1785, he may have been a victim to this frightful disorder, and that it may have been the cause of his melancholy condition of health at the time of his mother’s death, and of the chronic diarrhœa with which he was so long troubled. True, there is no record of such an illness; but that proves nothing. There is no record that he passed through an attack of small-pox, except that which the disease left upon his face.

But the most extraordinary and inexplicable account of the origin of his deafness is that given by Beethoven himself to the English pianist, Charles Neate, in 1815. Mr. Neate was once urging Beethoven to visit England and mentioned as a farther inducement the great skill of certain English physicians in treating diseases of the ear, assuring him that he might cherish hopes of relief. Beethoven replied in substance as follows: “No; I have already had all sorts of medical advice. I shall never be cured--I will tell you

how it happened. I was once busy writing an opera--

Neate: “Fidelio?”

Beethoven: “No. It was not ‘Fidelio.’ I had a very ill-tempered, troublesome _primo tenore_ to deal with. I had already written two grand airs to the same text, with which he was dissatisfied, and now a third which, upon trial, he seemed to approve and took away with him. I thanked the stars that I was at length rid of him and sat down immediately to a work which I had laid aside for those airs and which I was anxious to finish. I had not been half an hour at work, when I heard a knock at my door, which I at once recognized as that of my _primo tenore_. I sprang up from my table under such an excitement of rage, that, as the man entered the room, I threw myself upon the floor as they do upon the stage (here B. spread out his arms and made a gesture of illustration), coming down upon my hands. When I arose I found myself deaf and have been so ever since. The physicians say, the nerve is injured.”

That Beethoven really related this strange story cannot be questioned; the word of the venerable Charles Neate to the author is sufficient on that point. What is to be thought of it, is a very different matter. Here at least it may stand without comment.

FOOTNOTES:

[89] The number of known letters and documents has grown greatly since Thayer wrote these words. Kalischer’s Collection numbers over 1200 and Emerich Kastner gives the first lines of 1380 in Frimmel’s second “Beethoven Jahrbuch” published in 1909.

[90] Opportunities for studying Beethoven’s sketchbooks have greatly increased since Mr. Thayer wrote these words. Nottebohm who rendered an incalculable service to all students of the great composer after the book from which our author quotes, published a volume entitled “Beethoveniana” in 1872, and a second entitled “Zweite Beethoveniana” in 1887. To these the revisors of this biography have repeatedly referred in tracing the history of Beethoven’s compositions. A collection of sketches formerly owned by J. N. Kafka and now in the British Museum was described by Mr. J. S. Shedlock in “The Musical Times” (July to December, 1892). A volume containing sketches for the last quartets is at the present writing in the possession of Mr. Cecilio de Roda of Madrid and was described by the “Rivista Italiana” (Nos. XI-XIV, 1907) and also published in pamphlet form under the title “Un Quadrena di autografi di Beethoven del 1825.”

Chapter XVIII

Beethoven’s Brothers--His First Concert on His Own Account--Punto and the Sonata for Horn--Steibelt Confounded--E. A. Förster and the First Quartets--The Septet and First Symphony--Beethoven’s Homes--Hoffmeister--Compositions and Publications of 1800.

It is not easy to conceive upon what ground the opinion became current, as it did, that Beethoven in the year 1800 and for several years to come was still burdened with the support of his brothers--young men now respectively in their 26th and 24th years. This mistake as to Johann has already been exposed. Leaving Ludwig for the first quarter of this year doubly busy--having, in addition to his usual occupations, his preparations to make for a grand concert in April--we turn, for a page, to his brother Carl.

In the “Hof- und Staats-Schematismus” for the year 1800, at the end of the list of persons employed in the “K. K. Universal-Staatschuldenkasse” are the names of two “Praktikanten”; the first is “Mr. Carl v. Beethoven lives in the Sterngasse, 484.” In the same publication appears a new department or bureau of the above-named office called the “K. K. n. öst. Klassen-Steuer-Kasse” and the second of the three bureau officers is “Mr. Carl v. Beethoven lives unterm Tuchladen, 605.”

It is not improbable that, while simply “Praktikant,” he may have needed occasional pecuniary aid, but his preferment to the place of “Kassa-Officier” rendered him independent. This appointment is dated March 24th, 1800, and gave him a salary of 250 florins. Small as the sum now appears, it was amply sufficient, with what he could earn by teaching music (and the brother of the great Beethoven could have no lack of pupils), to enable him to live comfortably. In fact, he was better off than many a colleague in the public service, who still with care and economy managed to live respectably. It may therefore be confidently asserted that Beethoven was henceforth relieved of all care on account of Carl, as of Johann, until the bankruptcy of the government and Carl’s broken health many years later, made fraternal assistance indispensable.

At the beginning of this year Carl had tried his fortune as a composer--but probably with slender profit, since no second venture has been discovered. Six minuets, six “Deutsche” and six contradances by him are advertised in the “Wiener Zeitung” of January 11, in double editions, one for clavier and one for two violins and violoncello. The concert for which Beethoven had been preparing during the winter took place on the 2d of April. It was his first public appearance for his own benefit in Vienna, and, so far as is known,

anywhere except in Prague. All that is now to be ascertained in relation to it is contained in the advertisement, in the programme, and in a single notice, sent to the “Allgemeine Musikalische Zeitung.” The programme, which was in the possession of Madame van Beethoven (widow of the composer’s nephew) is as follows:

To-day, Wednesday, April 2nd, 1800, Herr _Ludwig van Beethoven_ will have the honor to give a grand concert for his benefit in the Royal Imperial Court Theatre beside the Burg. The pieces which will be performed are the following:

1. A grand symphony by the late Chapelmaster Mozart.

2. An aria from “The Creation” by the Princely Chapelmaster Herr Haydn, sung by Mlle. Saal.

3. A grand Concerto for the Pianoforte, played and composed by Herr _Ludwig van Beethoven_.

4. A Septet, most humbly and obediently dedicated to Her Majesty the Empress, and composed by Herr _Ludwig van Beethoven_ for four stringed and three wind-instruments, played by Messrs. Schuppanzigh, Schreiber, Schindlecker, Bär, Nickel, Matauschek and Dietzel.

5. A Duet from Haydn’s “Creation,” sung by Mr. and Mlle. Saal.

6. Herr _Ludwig van Beethoven_ will improvise on the pianoforte.

7. A new grand symphony with complete orchestra, composed by Herr _Ludwig van Beethoven_.

Tickets for boxes and stalls are to be had of Herr van Beethoven at his lodgings in the Tiefen Graben, No. 241, third storey, and of the box-keeper.

Prices of admission are as usual.

The beginning is at half-past 6 o’clock.

The correspondent of the “Allgemeine Musikalische Zeitung” described the concert as the most interesting affair of its kind given for a long time, said the new concerto had “many beauties, especially in the first two movements,” praised the “taste and feeling” exhibited in the Septet, and in the Symphony found “much art, novelty and wealth of ideas”; but, he continues: “unfortunately there was too much use of the wind-instruments, so that the music sounded more as if written for a military band than an orchestra.” The rest of the notice is devoted to scolding the band for inattention to the conductor. Which of the pianoforte Concertos Beethoven played on this occasion is nowhere intimated. The Symphony in C soon became known throughout Germany; while the Septet achieved a sudden popularity so widely extended and enduring as at length to become an annoyance to the composer.[91]

A PUBLIC CONCERT WITH PUNTO

Before the month was out Beethoven again played in public in a concert given by Johann Stich, known as Punto. This Bohemian virtuoso, after several years of wandering, had lately come to Vienna from Paris, _via_ Munich. As a performer upon the horn he was unrivalled by any predecessor or contemporary; but as a composer he was beneath criticism. Beethoven’s delight in any one whose skill afforded him new experience of the powers and possible effects of any orchestral instrument is known to the reader. Nothing more natural, therefore, than his readiness to compose a sonata for himself and Punto to be played at the latter’s concert on April 18th. Ries informs us that “though the concert was announced with the Sonata the latter was not yet begun. Beethoven began the work the day before the performance and it was ready for the concert.” His habit of merely sketching his own part and of trusting to his memory and the inspiration of the moment, even when producing his grand Concertos in public, probably rendered him good service on this occasion. The “Allgemeine Musikzeitung” (III, 704) preserves also the interesting fact that owing to the enthusiastic applause the Sonata was immediately repeated.

April 27th was the anniversary of the day on which Maximilian Franz entered Bonn to assume the duties of Elector and Archbishop. Sixteen years had passed and on this day he, with a small retinue, again entered Vienna. He took refuge “in an Esterhazy villa in a suburb,” while the small château near which now stands the railway station at Hetzendorf, behind Schönbrunn Garden, was preparing for his residence; whither he soon removed, and where for the present we leave him.

At the end of February or early in March, the charlatan Daniel Steibelt gave a concert in Prague which brought him in 1800 florins, and in April or May, “having finished his speculation, he went to Vienna, his purse filled with ducats, where he was knocked in the head by the pianist Beethoven,” says Tomaschek. Ries relates how:

When Steibelt came to Vienna with his great name, some of Beethoven's friends grew alarmed lest he do injury to the latter's reputation. Steibelt did not visit him; they met first time one evening at the house of Count Fries, where Beethoven produced his new Trio in B-flat major for Pianoforte, Clarinet and Violoncello (Op. 11), for the first time.[92] There is no opportunity for particular display on the part of the pianist in this Trio. Steibelt listened to it with a sort of condescension, uttered a few compliments to Beethoven and felt sure of his victory. He played a Quintet of his own composition, improvised, and made a good deal of effect with his tremolos, which were then something entirely new. Beethoven could not be induced to play again. A week later there was again a concert at Count Fries's; Steibelt again played a quintet which had a good deal of success. He also played an improvisation (which had, obviously, been carefully prepared) and chose the same theme on which Beethoven had written variations in his Trio.[93] This incensed the admirers of Beethoven and him; he had to go to the pianoforte and improvise. He went in his usual (I might say, ill-bred) manner to the instrument as if half-pushed, picked up the violoncello part of Steibelt's quintet in passing, placed it (intentionally?) upon the stand upside down and with one finger drummed a theme out of the first few measures. Insulted and angered he improvised in such a manner that Steibelt left the room before he finished, would never again meet him and, indeed, made it a condition that Beethoven should not be invited before accepting an offer.

It was, and still is, the custom at Vienna for all whose vocations and pecuniary circumstances render it possible, to spend all or some portion of the summer months in the country. The aristocracies of birth and wealth retire to their country-seats, live in villas for the season or join the throngs at the great watering-places; other classes find refuge in the villages and hamlets which abound in the lovely environs of the city, where many a neat cottage is built for their use and where the peasants generally have a spare room or two, cleanly kept and neatly furnished. Beethoven's habit of escaping from town during the hot months was, therefore, nothing peculiar to him. We have reached the point whence, with little if any interruption, Beethoven can be followed from house to house, in city and country, through the rest of his life; a matter of great value in fixing the true dates of important letters and determining the chronology of his life and works--but for the first seven years the record is very incomplete.

VARIOUS DWELLING PLACES IN VIENNA

Carl Holz told Jahn: "He (Beethoven) lived at first in a little attic-room in the house of the book-binder Strauss in the Alservorstadt, where he had a miserable time." This is one of the facts which an inquisitive young man like Holz would naturally learn of the master during the short period when he was his factotum. This attic-room must have been soon changed for the room "on the ground-floor" mentioned in a previous chapter. An undated note of van Swieten is directed to Beethoven at "No. 45 Alsergasse, at Prince Lichnowsky's"; but in the Vienna directory for 1804 no street is so named, and the only number 45 in the "Alsergrund" is in the Lämmelgasse, property of Georg Musial; but Prince Josef Lichnowsky is named as owner of No. 125 in the Hauptstrasse of that suburb. This was the same house; it had merely changed numbers. The site is now occupied by the house No. 30 Alserstrasse. Thence Beethoven went as a guest to the house occupied by Prince Lichnowsky. In May, 1795, Beethoven, in advertising the Trios, Op. 1, gives the "residence of the author" as the "Ogylisches Haus in the Kreuzgasse behind the Minorite church, No. 35 in the first storey"; but that is no reason to think that Prince Lichnowsky then lived there. Where Beethoven was during the next few years has not been ascertained, but, as has been seen by the concert bill on a preceding page, he was during the winter of 1799-1800 in the Tiefen Graben "in a very high and narrow house," as Czerny wrote to F. Luib.[94] For the summer of 1800, he took quarters for himself and servant in one of those houses in Unter-Döbling, an hour's walk, perhaps, from town, to which the readiest access is by the bridge over the brook on the North side of the Döbling hospital for the insane. The wife of a distinguished Vienna advocate occupied with her children another part of the same house. One of these children was Grillparzer, afterward famous as a poet. The zeal with which Beethoven at this period labored to perfect his pianoforte playing, and his dislike to being listened to, have been already noted. Madame Grillparzer was a lady of fine taste and culture, fond of music and therefore able to appreciate the skill of her fellow-lodger, but ignorant of his aversion to listeners. Her son, in 1861, still remembered Beethoven's incessant practice and his mother's habit of standing outside her own door to enjoy his playing. This continued for some time; but one day Beethoven sprang from the instrument to the door, opened it, looked out to see if any one was listening, and unfortunately discovered the lady. From that moment he played no more. Madame Grillparzer, thus made aware of his sensitiveness on this point, informed him through his servant that thenceforth her door into the common passageway should be kept locked, and she and her family would solely use another. It was of no avail; Beethoven played no more.

Another authentic and characteristic anecdote can belong only to this summer. There lived in a house hard by a peasant of no very good reputation, who had a daughter remarkably beautiful, but also not of the best fame. Beethoven was greatly captivated by her and was in the habit of stopping to gaze at her when he passed by where she was at work in farmyard or field. She, however, made no return of his evident liking and only laughed at his admiration. On one occasion the father was arrested for engaging in a brawl

and imprisoned. Beethoven took the man's part and went to the magistrates to obtain his release. Not succeeding, he became angry and abusive, and in the end would have been arrested for his impertinence but for the strong representations made by some, who knew him, of his position in society and of the high rank, influence and power of his friends.

Throughout this period of Beethoven's life, each summer is distinguished by some noble composition, completed, or nearly so, so that on his return to the city it was ready for revision and his copyist. Free from the demands of society, his time was his own; his fancy was quickened, his inspiration strengthened, in field and forest labor was a delight. The most important work of the master bears in his own hand the date, 1800, and may reasonably be supposed to have been the labor of this summer. It is the Concerto in C minor for Pianoforte and Orchestra, Op. 37.

DOLEŽALEK AND HOFFMEISTER

At the approach of autumn Beethoven returned to his old quarters in the Tiefen Graben. In this year Krumpholz introduced to him Johann Emanuel (possibly Johann Nepomuk Emanuel) Doležalek, a young man of 20 years, born in Chotieborz in Bohemia, who had come to Vienna to take lessons from Albrechtsberger. He played the pianoforte and violoncello, was a capable musician, in his youth a rather popular composer of Bohemian songs and then, for half a century, one of the best teachers in the capital. Toward the close of his life he was frequently occupied with the arrangement of private concerts, chiefly quartet parties, for Prince Czartoryski and other prominent persons. As long as he lived he was an enthusiastic admirer of Beethoven, and enjoyed the friendship of the composer till his death. Among his observations are the statements concerning the hatred of Beethoven felt by the Vienna musicians already noted. Koželuch, he relates, threw the C minor Trio at his (Doležalek's) feet when the latter played it to him. Speaking of Beethoven, Koželuch said to Haydn: "We would have done that differently, wouldn't we, Papa?" and Haydn answered, smilingly, "Yes, we would have done that differently." Haydn, says Doležalek, could not quite reconcile himself with Beethoven's music. It was Doležalek who witnessed the oft-told scene in the Swan tavern when Beethoven insisted on paying without having eaten.

One of the most prolific and popular composers whom Beethoven found in Vienna was Franz Anton Hoffmeister, "Chapelmaster and R. I. licensed Music, Art and Book Seller." He was an immigrant from the Neckar valley and (born 1754) much older than Beethoven, to whom he had extended a warm sympathy and friendship, doubly valuable from his somewhat similar experience as a young student in Vienna. This is evident from the whole tone of their correspondence. In 1800, Hoffmeister left Vienna and in Leipzig formed a copartnership with Ambrosius Kühnel, organist of the Electoral Saxon Court Chapel, and established a publishing house there, still retaining his business in Vienna. As late as December 5, 1800, his signature is as above given; but on the 1st of January, 1801, the advertisements in the public press announce the firm of "Hoffmeister and Kühnel, _Bureau de Musique_ in Leipzig." Since 1814 the firm name has been C. F. Peters. Knowing Beethoven personally and so intimately, it is alike creditable to the talents of the one and the taste and appreciation of the other that Hoffmeister, immediately upon organizing his new publishing house, should have asked him for manuscripts. To his letter he received an answer dated Dec. 15, 1800, in which Beethoven says:

... Per _primo_ you must know that I am very sorry that you, my dear brother in music, did not earlier let me know something (of your doings) so that I might have marketed my quartets with you, as well as many other pieces which I have sold, but if Mr. Brother is as conscientious as many other honest engravers who grave us poor composers to death, you will know how to derive profit from them when they appear. I will now set forth in brief what Mr. Brother can have from me. I^{mo} a Septet _per il Violino_, _Viola_, _Violoncello_, _Contrabasso_, _Clarinetto_, _Corno_, _Fagotto_--_tutti obligati_. (I cannot write anything not obligato for I came into this world with an obligato accompaniment.) This Septet has pleased greatly. For more frequent use the three wind-instruments, namely _Fagotto_, _Clarinetto_ and _Corno_ might be transcribed for another violin, viola and violoncello. II^o A grand Symphony for full orchestra. III^o A Concerto for pianoforte which I do not claim to be one of my best, as well as another one which will be published here by Mollo (this for the information of the Leipzig critics) because I am for the present keeping the better ones for myself until I make a tour; but it will not disgrace you to publish it. IV^o A grand Solo Sonata.[95] That is all that I can give you at this moment. A little later you may have a Quintet for stringed instruments as well as, probably, Quartets and other things which I have not now with me. In your reply you might set the prices and as you are neither a Jew nor an Italian, nor I either one or the other, we shall no doubt come to an understanding.

THE FIRST STRING QUARTETS

The reference to the Quartets, Op. 18, in this letter, taken in connection with the apologies for long delay in writing, indicates conclusively enough that at least the first set, the first three, had been placed in the hands of Mollo and Co. early in the autumn,

and it is barely possible, not probable, that they had already been issued from the press.[96] The importance of these Quartets in the history both of Beethoven and of chamber music renders very desirable more definite information upon their origin and dates of composition than the incomplete, unsatisfactory and not always harmonious data already known, afford. The original manuscripts appear to have been lost.

Von Lenz quotes in his “Critical Catalogue of Beethoven’s Works” an anecdote from a pamphlet printed at Dorpat in which is related:

After Beethoven had composed his well-known String Quartet in F major he played for his friend (Amenda) (on the pianoforte?) the glorious _Adagio_ (D minor, 9-8 time) and asked him what thought had been awakened by it. “It pictured for me the parting of two lovers,” was the answer. “Good!” remarked Beethoven, “I thought of the scene in the burial vault in ‘Romeo and Juliet’.”

This Quartet existed, then, before Amenda left Vienna. Czerny says in his notes for Jahn: “Of the first six Violin Quartets that in D major, No. 3 in print, was the very first composed by Beethoven. On the advice of Schuppanzigh he called that in F major No. 1, although it was composed later.” Ries confirms this: “Of his Violin Quartets, Op. 18, he composed that in D major first of all. That in F major, which now precedes it, was originally the third.”[97] _Nota bene_ that neither Czerny nor Ries spoke from personal observation at the time of composition; they must both have learned the fact from Beethoven himself, or, more probably, from dates on the original manuscripts. A criticism of three quartets which appeared in the “Allg. Mus. Zeitung” in 1799, which failed to give the name of the composer, has been applied by some writers (by Langhans in his History of Music, for instance) to Beethoven’s Op. 18; but erroneously. They were the works of Emanuel Aloys Förster (born January 26, 1748, in Neurath, Upper Silesia, died November 12, 1823, in Vienna), a musician who was so highly esteemed by Beethoven that, on one occasion at least, he called him his “old master.” The phrase can easily be interpreted to mean that Beethoven found instruction in Förster’s chamber music which he heard at the soirées of Prince Lichnowsky and other art-patrons. Förster’s compositions, not many of which have been preserved in print, are decidedly Beethovenish in character. His eldest son, who in 1870 was still living in Trieste, remembered Beethoven perfectly well from 1803 to 1813, and communicated to the author of this biography some reminiscences well worth preserving. It is known from other sources that Beethoven, after the retirement of Albrechtsberger, considered Förster to be the first of all the Vienna teachers of counterpoint and composition, and this is confirmed by the son’s statement that it was on Beethoven’s advice that he sent to press the compendious “Anleitung zum Generalbass” which Breitkopf and Härtel published in 1805. A year or two later, Count Rasoumowsky applied to Beethoven for instruction in musical theory and especially in quartet composition. Beethoven absolutely refused, but so strongly recommended his friend Förster, that the latter was engaged. Förster’s dwelling in all those years was a favorite resort of the principal composers and dilettanti. Thither came Beethoven; Zmeskall, a very precise gentleman with abundant white hair; Schuppanzigh, a short fat man with a huge belly; Weiss, tall and thin; Linke, the lame violoncellist, Henry Eppinger, the Jewish violin dilettante, the youthful Mayseder, J. N. Hummel, and others. The regular periods of these quartet meetings were Sunday at noon, and the evening of Thursday; but Beethoven in those years often spent other evenings with Förster, “when the conversation usually turned upon musical theory and composition.” Notwithstanding the wide difference in their ages (22 years), their friendship was cordial and sincere. The elder not only appreciated and admired the genius of the younger, but honored him as a man; and spoke of him as being not only a great musical composer, but, however at times rough in manner and harsh, even rude, in speech, of a most honorable and noble nature. Add to all this the fact, that Beethoven in later years recommended Förster to pupils as his own “old master,” and it is no forced and unnatural inference, that he (Beethoven) had studied quartet composition with him, as he had counterpoint with Albrechtsberger, and operatic writing with Salieri. Nor is this inference weakened--it is rather strengthened--by some points in what now follows:

The earliest mention of a string quartet in connection with Beethoven is that proposal by Count Appony cited from Wegeler which led to no instant result. Then comes a passage from a letter to Amenda: “Do not give your Quartet to anybody, because I have greatly changed it, having learned how to write quartets properly.” Had he learned from study under Förster?

SKETCHES FOR THE FIRST QUARTETS

The original manuscripts being lost, further chronological notices concerning them must be sought for in the sketchbooks. Here Nottebohm comes to our assistance. In the Petter collection at Vienna there are sketches for the last movement of the G major Quartet, the last movement of the B-flat Quartet (among them one which was discarded), both deviating from the printed form more or less, and one for the last movement of the F major Quartet, this approaching pretty closely the ultimate form; thus this quartet was farther advanced than the others. Associated with this sketch are sketches for the Sonata in B-flat, Op. 22, and for the easy Variations in G major which were begun while work was in progress on the last movement of the Quartet in G. Beethoven worked

simultaneously on the first movement of Op. 22 and the scherzo of the first Quartet; while working on the last movement of the Quartet in B-flat the rondo of the Sonata was begun. The sketches date from 1799 and 1800. Inasmuch as they occur before those for the Horn Sonata, which was composed very hurriedly and performed on April 18, 1800, the sketches were doubtless written earlier. One of the variations of the Quartet in A major was sketched much earlier--in 1794 or 1795. A little sketch for the first movement of the F major Quartet found beside sketches for the Violin Sonata, Op. 24, no doubt belongs to the revised form of the Quartet. In a sketchbook formerly in the possession of Grassnick in Berlin, there are sketches for the Quartet in D major which are near the ultimate form, except that there is a different theme for the last movement. Then comes a beginning in G major inscribed "Quartet 2," the germ of the theme of the second Quartet. There was, therefore, at the time no second Quartet, and that in D is the first. There follows "Der Kuss," sketches for the "Opferlied," the Rondo in G major, Op. 51, No. 2, to a passage from Schiller's "Ode to Joy," to Gellert's "Meine Lebenszeit verstreicht," in G minor, to an intermezzo for pianoforte, to the revised form of the B-flat Concerto (which he played in Prague in 1798), and to various songs. The indications are, therefore, that the sketches were written in 1798. Then come sketches for the variations on "La stessa, la stessissima," which originated and were published in the beginning of 1799, and after them extended sketches for the first movement of the F major Quartet, of which those belonging to the first movement are in an advanced stage, those for the second movement less so. A few sketches for a "third" quartet (thus specified) which were not used show that there was no third at the time; therefore, the Quartet in F is the second and was planned in 1799. Another sketchbook contains the continuation of the sketches for the F major Quartet, and, indeed, for all the movements; then an unused sketch for a "third" quartet (still not yet in existence), then to two songs by Goethe (one "Ich denke dein"), then to the movements of the G major Quartet, which is thus indicated to have been the third (the intermezzo in the second movement was conceived later), further sketches for the A major Quartet, which, it follows, was the fourth. Among these sketches are others for the Septet and the Variations on "Kind, willst du ruhig schlafen?" which appeared in December in 1799, and was therefore not composed earlier. All these sketches date from 1798 and 1799; but the Quartets were not finished. In an unused sketch for the Adagio of the quartet in F occur the words: "Les derniers soupirs," which confirm the story told by Amenda. The continuation of the G major Quartet dates to 1800. Up to now no sketches for the Quartet in C minor have been found.

The results of this chronological investigation may be summed up as follows: The composition of the Quartets was begun in 1798, that in D, the third, being first undertaken. This was followed by that in F and soon after, or simultaneously, work was begun on that in G, which was originally designed as the second; but, as that in F was completed earlier, this was designated as the second by Beethoven, and that in G became in point of time the third. The Quartet in F was finished in its original shape by June 25, 1799, on which day he gave it to Amenda; he revised it later. Whether or not this was also done with the others cannot be said; there is no evidence. The remark made in 1801, that he had just learned to write quartets, need not be read as meaning that he had formal instruction from Förster, but is amply explained by his practice on the six Quartets; yet Förster may have influenced him strongly. He then wrote the one in A (now No. 5), intending it to be the fourth; in this he seems to have made use of a _motif_ invented at an earlier period. The Quartets in B-flat and C minor followed, the latter being, perhaps, the last. The definitive elaboration of the Quartets lasted certainly until 1800, possibly until 1801. The Quartets then appeared in two sets from the press of Mollo. It is likely that the first three, at least, were in the hands of the publisher before the end of 1800, as is proved by the letter to Hoffmeister. The first three appeared in the summer of 1801 and were advertised as on sale by Nägeli in Zurich already in July; they were mentioned in the "Allg. Musik. Zeitung" on August 26, and in Spazier's "Zeitung für die Elegante Welt." In October of the same year the last three appeared and Mollo advertised them in the "Wiener Zeitung" of October 28. The Quartets are dedicated to Prince Lobkowitz.

Notice of a valuable present to Beethoven from his lenient and generous patron, Prince Carl Lichnowsky, naturally connects itself with the story of the Quartets--a gift thus described by Alois Fuchs, formerly violinist in the Imperial Court Orchestra, under date of December 2, 1846:

BEETHOVEN'S QUARTET OF INSTRUMENTS

Ludwig van Beethoven owned a complete quartet of excellent Italian instruments given to him by his princely patron and friend Lichnowsky at the suggestion of the famous quartet-player Schuppanzigh. I am in a position to describe each of the instruments in detail.

1. A violin made by Joseph Guarnerius in Cremona in the year 1718 is now in the possession of Mr. Karl Holz, director of the _Concerts spirituels_ in Vienna.

2. The second violin (which was offered for sale) was made by Nicholas Amati in the year 1667, and was in the possession of Dr. Ohmeyer, who died recently in Hütteldorf; it has been purchased by Mr. Huber.

3. The viola, made by Vincenzo Ruger in 1690, is also the property of Mr. Karl Holz.

4. The violoncello, an Andreas Guarnerius of the year 1712, is in the possession of Mr. P. Wertheimber of Vienna.

The seal of Beethoven has been impressed under the neck of each instrument and on the back of each Beethoven scratched a big B, probably for the purpose of protecting himself against an exchange. The instruments are all well preserved and in good condition. The most valuable one, without question, is the violin by Joseph Guarnerius, which is distinguished by extraordinary power of tone, for which, indeed, Mr. Holz has refused an offer of 1000 florins.

The four instruments were bought by Peter Th. Jokits in 1861, who gave them to the Royal Library at Berlin. Beethoven received them from Lichnowsky certainly before 1802, but in what year is unknown.[98] Another proof of the Prince's regard and generosity, however, belongs to this, namely, an annuity of 600 florins to be continued until the composer should find some suitable permanent employment.

* * * * *

The only known publication of the year 1800 is the Rondo in G major, Op. 51, No. 2, which came from the press of Simrock. As for the compositions of the year it is safe to assume that Beethoven put the finishing touches to the first Symphony, the Septet, Op. 20, and the Quartets, Op. 18. Furthermore, there can be little doubt but that the Sonata for Horn, Op. 17, the Pianoforte Sonata, Op. 22, the Concerto in C minor, and the Variations for Four Hands on the melody of the song "Ich denke dein," belong to this year. The "Variations très faciles" on an original theme in G were sketched and probably completed. The only chronological clues to the Horn Sonata are the date of its first performance, April 18, 1800, and the anecdote by Ries concerning the rapid completion of the work. No sketches have been found and nothing is known of the autograph; but according to Nottebohm the beginning of a clean copy of the Adagio is to be found among the sketches for the Sonatas Op. 22 and 23. Punto was still in Munich in 1800, and since the work seems assuredly to have been designed for him, there is equal certainty that it was composed in that year. It was published by Mollo in March, 1801. The Septet, for four strings and three wind-instruments, dedicated to the Empress Maria Theresia, was played at the concert at which the Symphony in C major was brought forward, April 2, 1800; but it had been heard previously in the house of Prince Schwarzenberg. Inasmuch as sketches for it are found among those for the Quartets, specially the one in A major, which belong to the year 1799, its inception may be placed in that year, though it was probably finished in 1800 shortly before its performance. There is no date on the autograph. It was offered to Hoffmeister in the letter of December 15, 1800, and was published by him in 1802. The Septet speedily won great popularity and was frequently transcribed. Hoffmeister had an arrangement for string quintet which he advertised on August 18, 1802. Ries thought that Beethoven had made it, but he was in error; nevertheless, Beethoven gave Hoffmeister permission to publish an arrangement in which strings were substituted for the wind-instruments, and himself transcribed it as a pianoforte trio with violin or clarinet _ad lib_. This arrangement was made as a tribute of gratitude from the composer to his new physician, Dr. Johann Schmidt. The doctor played the violin and his daughter the pianoforte, both fairly well, and Beethoven arranged his popular piece for family use and, as was customary at the time, gave Dr. Schmidt the exclusive possession of the music for a year.[99]

The theme of the minuet in the Septet was borrowed from the Pianoforte Sonata, Op. 49, No. 2, but its treatment is original. There has been considerable controversy without absolutely definitive result touching the melody which is varied in the Andante. Kretschmer, in his "Deutsche Volkslieder" (Berlin, 1838; Vol. I, No. 102, p. 181), prints the melody in connection with a Rhenish folksong ("Ach Schiffer, lieber Schiffer"), and there is a tradition that Czerny said that it was taken by Beethoven from that source. Nottebohm offers evidence deserving of consideration that the melody is a folktune; but Ries and Wegeler, who lived on the Rhine, had nothing to say on the subject. Erk and Böhme ("Deutscher Liederhort," Vol. I, p. 273) publish folksongs dealing with the legend which is at the base of "Ach Schiffer, lieber Schiffer," but the melody of the Andante is not to be found among them, and Böhme gives it as his opinion that the song printed by Kretschmer was written to Beethoven's melody by Kretschmer's collaborator Zuccalmaglio. It is not likely that the melody, had it lived in the mouths of the people, would have escaped so industrious a collector as Erk, who, moreover, was a native of the Rhine country. The evidence would seem to indicate that the melody was original with Beethoven.

COMPOSITIONS SKETCHED IN 1800

The Pianoforte Sonata in B-flat, Op. 22, also belongs to this year, as appears from the fact that it was offered to Hoffmeister in the letter of December 15. It was still in an unfinished state on the completion of the Sonata for Horn, as is shown by the circumstance that sketches of it are mingled with a fair transcript of a passage from the latter work. There are also sketches for Op. 22, among

those for the Quartet in B-flat, Op. 18, No. 6, and the later movements of the Quartet in F--no doubt the revision. The sketches therefore belong to the year 1800, but may date back to 1799, from which it would appear that Beethoven worked an unusually long time on the Sonata. The principal labor was performed most likely in the summer of 1800, which Beethoven spent at Unterdöbling. It was published in 1802 by Hoffmeister and Kühnel. Sketches from the “Six Easy Variations” are found amongst some for the last movement of the Quartet in G, which seem to be nearly finished. Again we can fix the year as 1799 or 1800. Of special importance is the fact that the theme of the Variations is the same as the first episode of the rondo of the Sonata in B-flat, and the circumstance that the sketches are of almost the same date indicates that the identity was not accidental. The Variations were advertised as new by Traeg on December 16, 1800.

The Variations in D for four hands on the melody of Goethe’s poem, “Ich denke dein,” were conceived at practically the same time as those just described. Beethoven at first intended to give each stanza a separate setting, and to this end made two sketches, which are associated with the Quartet sketches and belong to the year 1799. He then took the melody of the first stanza as a theme for variations for four hands in the same year and wrote them into the autograph album of two sisters, the countesses Therese Brunswick and Josephine Deym. On September 22, 1803, he offered them to Hoffmeister in the place of the Trio Variations, Op. 44, with the remark that he considered them better than the latter. Hoffmeister, however, published the Trio Variations (in 1804). The Variations in D were not published until the beginning of 1805, and were described as having been written in 1800 for the two countesses mentioned, and dedicated to them.

An autograph preserved in the Royal Library in Berlin contains four of the variations on “Ich denke dein,” an Adagio in F major noted on four staves (three with treble, one with the bass clef), a Scherzo in G major, 3/4 time, and an Allegro in G major, 2/4. Albert Kopfermann, who published the Adagio for the first time in No. 12, Vol. I, of “Die Musik,” considers, no doubt correctly, that the three compositions were written for an automatic musical instrument. Though the number of new compositions produced in 1800 was small, attention must be directed to the fact that the revision and completion of works for publication, together with the planning of new works, gave a deal of occupation to Beethoven. Amongst the compositions made ready for the printer were the Quartets, which were not ready till near the end of the year. To them must be added the Sonata in E-flat, Op. 27, No. 1, and the Concerto in C minor, the autograph of which distinctly bears the date 1800. It is certain, moreover, that Beethoven began working on “Prometheus” in this year, and the summer must have been a busy one for him.

FOOTNOTES:

[91] “He could not endure his Septet and grew angry because of the universal applause with which it was received.” (Czerny to Jahn.) “The theme of the variations is said to be a Rhenish folksong.” (_Ibid._)

[92] This is, of course, an error, as the Trio had been before the public since October 3rd, 1798.

[93] From Weigl’s “Corsair aus Liebe.”

[94] According to Frimmel, “Beethoven’s Wohnungen,” Vienna “Neue Freie Presse,” August 11, 1899, this house was that of Court Councillor Greiner, then No. 241, afterwards 235, now No. 10 in the Tiefen Graben which, slightly altered, still remains. On the strength of Czerny’s statement that one had to look up to the fifth or sixth storey to see Beethoven, and the old report that Beethoven lived “in the Kleine Weintraube,” Frimmel was led to think that possibly he lived in one of the houses on the higher ground behind the Greiner house to which there was access from the open place “Am Hof” as well as from the houses in the Tiefen Graben and the Greiner house. The houses which bore the sign “Zur Weintraube” were situated “am Hofe.”

[95] In B-flat, Op. 22.

[96] The Pianoforte Concerto offered to Hoffmeister was that in B-flat. It was published by Hoffmeister and Kühnel toward the end of 1801 and advertised on January 16, 1802. The Concerto published by Mollo was that in C major. A letter written to Breitkopf and Härtel on the same day contains the equivalent of the remark: “I am for the present keeping the better ones for myself until I make a tour,” which is significant, since it makes it sure that other concertos were at least planned and that the one in C minor was looked upon as finished by Beethoven.

[97] In reality it was the second, as the Amenda parts show.

[98] Holz sold the Guarnerius violin in 1852 (see the “Allgemeine Deutsche Musikzeitung” of 1888). When the Beethoven Museum in Bonn was dedicated, the instruments were borrowed from the authorities of the Royal Library, and exhibited in a glass case,

where they remain by sufferance of the Prussian authorities.

[99] See the dedication in Kalischer's collection of Beethoven's letters translated by J. S. Shedlock, Vol. I, p. 94.

Chapter XIX

The Year 1801--Concerts for Wounded Soldiers--Vigano and the Ballet "Prometheus"--Stephan von Breuning--Hetzendorf--"Christus am Ölberg"--Compositions and Publications of the Year--The Funeral March in the Sonata, Op. 26--The "Moonlight" Sonata--The Quintet, Op. 29.

The tone of Beethoven's correspondence and the many proofs of his untiring industry during the winter 1800-1 and early part of the succeeding spring, suggest a mind at ease, rejoicing in the exercise of its powers, and a body glowing with vigorous health. But for his own words to Wegeler: "I have been really miserable this winter," the passing allusions to ill health in his replies to Hoffmeister's letters would merely impress the reader as being half-groundless apologies for lack of punctuality in writing. This chapter will exhibit the young master both as he appeared to the public and as he showed himself in confidential intercourse to the few in whose presence he put aside the mask and laid open his heart; and will, therefore, it is believed, be found fully to justify what has been said of his heroic energy, courage and endurance under a trouble of no ordinary nature.

In the beginning of the year he wrote to Hoffmeister[100] as follows under date "January 15 (or thereabouts), 1801":

... Your enterprises delight me also and I wish that if works of art ever bring profit that it might go to real artists instead of mere shopkeepers.

The fact that you purpose to publish the works of _Sebastian Bach_ does good to my heart which beats only for the lofty and magnificent art of this patriarch of harmony, and I hope soon to see them in vigorous sale. I hope, as soon as golden peace has been declared, to be helpful in many ways, especially if you offer the works for subscription.

As regards our real business, since you ask it I meet your wishes by offering you the following items: Septet (concerning which I have already written you), 20 ducats; Symphony, 20 ducats; Grand Solo Sonata--Allegro, Adagio, Minuetto, Rondo--20 ducats. This Sonata is a tidy piece of work (_hat sich gewaschen_), my dearest Mr. Brother.

Now for an explanation: You will wonder, perhaps, that I have made no distinction here between Sonata, Septet and Symphony. I have done this because I have learned that a septet or symphony has a smaller sale than a sonata, though a symphony ought unquestionably to be worth more. (N. B. The Septet consists of a short introductory _Adagio_, then _Allegro_, _Adagio_, _Minuetto_, _Andante_ with variations, _Minuetto_ again, a short _Adagio_ introduction and then _Presto_.) I put the price of the Concerto at only 10 ducats because, as I have already written, I do not give it out as one of my best. I do not think the amount excessive on the whole; I have tried, at least, to make the price as moderate as possible for you. As regards the bill of exchange you may, since you leave the matter to me, issue it to Geimüller or Schüller. The whole sum amounts to 70 ducats for the four works. I do not understand any money except Viennese ducats; how many thalers in gold that amounts to does not concern me, I being a really bad negotiator and mathematician.

This disposes of the disagreeable (_saure_) business; I call it so because I wish things were different in the world. There ought to be only one art warehouse in the world to which an artist would only need to carry his art-works to take away with him whatever he needed; as it is one must be half tradesman; and how we adjust ourselves--good God!--that is what I again call disagreeable. As regards the L... O...,[101] let them talk; they will certainly never make anybody immortal by their twaddle, and as little will they rob anybody of immortality to whom Apollo has decreed it.

BENEFIT CONCERTS FOR WOUNDED SOLDIERS

The next letter requires a word of introduction. That military campaign which included the disastrous field of Hohenlinden (December 3, 1800), had filled the hospitals at Vienna, and among the various means of raising funds for the benefit of the wounded, was a series of public concerts. The two in which they reached their climax took place in the large Ridotto room (_Redouten-Saal_) of the imperial palace. The one arranged by Baron von Braun as Director of the Court Opera, was a performance of Haydn's "Creation" conducted by the composer, on January 16th; the other was arranged by Mme. Frank (Christine Gerhardi) for January 30th. That lady, Mme. Galvani (Magdalena Willmann) and Herr Simoni were the singers, Beethoven and Punto the instrumental solo performers; Haydn directed two of his own symphonies, Paër and Conti directed the orchestra in the

accompaniments to the vocal music. In the first public announcement printed in the “Wiener Zeitung” the only artist mentioned was “the famous amateur singer Frau von Frank, _née_ Gerhardi,” as the giver of the concert. This called out from Beethoven the following letter:

Pour Madame de Frank.

I think it my duty, best of women, to ask you not to permit your husband again in the second announcement of our concert to forget that those who contribute their talents to the same also be made known to the public. This is the custom, and I do not see if it is not done what is to increase the attendance at the concert, which is its chief aim. Punto is not a little wrought up about the matter, and he is right, and it was my intention even before I saw him to remind you of what must have been the result of great haste or great forgetfulness. Look after this, best of women, since if it is not done dissatisfaction will surely result.

Having been convinced, not only by myself but by others as well, that I am not a useless factor in this concert, I know that not only I but Punto, Simoni, Galvani will ask that the public be informed also of our zeal for the philanthropic purposes of this concert; otherwise we must all conclude that we are useless.

Wholly yours

L. v. Bthvn.

Whether this sharp remonstrance produced the desired effect cannot now be ascertained, but the original advertisement was repeated in the newspaper on the 24th and 28th _verbatim_.

In the state of affairs then existing it was no time to give public concerts for private emolument; moreover, a quarrel with the orchestra a year before might have prevented Beethoven from obtaining the Burgtheater again, and the new Theater-an-der-Wien was not yet ready for occupation; but there is still another adequate reason for his giving no _Akademie_ (concert) this spring. He had been engaged to compose an important work for the court stage.

VIGANO AND THE PROMETHEUS BALLET

Salvatore Vigano, dancer and composer of ballets, both action and music, the son of a Milanese of the same profession, was born at Naples, March 29, 1769. He began his career at Rome, taking female parts because women were not allowed there to appear upon the stage. He then had engagements successively at Madrid--where he married Maria Medina, a celebrated Spanish danseuse--Bordeaux, London and Venice, in which last city, in 1791, he composed his “Raoul, Sire de Croqui.” Thence he came to Vienna, where he and his wife first appeared in May, 1793. His “Raoul” was produced on June 25th at the Kärnthnerthor-Theater. After two years of service here he accepted engagements in five continental cities and returned to Vienna again in 1799. The second wife of Emperor Franz, Maria Theresia, was a woman of much and true musical taste and culture, and Vigano determined to compliment her in a ballet composed expressly for that purpose. Haydn’s gloriously successful “Creation” may, perhaps, have had an influence in the choice of a subject, “The Men of Prometheus,” and the dedication of Beethoven’s Septet to the Empress may have had its effect in the choice of a composer. At all events, the work was entrusted to Beethoven.

If the manner in which this work has been neglected by Beethoven’s biographers and critics may be taken as a criterion, an opinion prevails that it was not worthy of him in subject, execution or success. It seems to be forgotten that as an orchestral composer he was then known only by two or three pianoforte concertos and his first Symphony--a work which by no means rivals the greater production of Mozart and Haydn--and that for the stage he was not known to have written anything. There is a misconception, too, as to the position which the ballet just then held in the Court Theatre. As a matter of fact it stood higher than ever before and, perhaps, than it has ever stood since. Vigano was a man of real genius and had wrought a reform which is clearly, vigorously and compendiously described in a memoir of Heinrich von Collin, from which we quote:

In the reign of Leopold II the ballet, which had become a well-attended entertainment in Vienna through the efforts of Noverre, was restored to the stage. Popular interest turned at once to them again, and this was intensified in a great degree when, beside the ballet-master Muzarelli, a second ballet-master, Mr. Salvatore Vigano, whose wife disclosed to the eyes of the spectators a thitherto unsuspected art, also gave entertainments. The most important affairs of state are scarcely able to create a greater war of feeling than was brought about at the time by the rivalry of the two ballet-masters. Theatre-lovers without exception divided themselves into two parties who looked upon each other with hatred and contempt because of a difference of conviction.... The new ballet-master owed his extraordinary triumph over his older rival to his restoration of his art back from the exaggerated,

inexpressive artificialities of the old Italian ballet to the simple forms of nature. Of course, there was something startling in seeing a form of drama with which thitherto there had been associated only leaps, contortions, constrained positions, and complicated dances which left behind them no feeling of unity, suddenly succeeded by dramatic action, depth of feeling, and plastic beauty of representation as they were so magnificently developed in the earlier ballets of Mr. Salvatore Vigano, opening, as they did, a new realm of beauty. And though it may be true that it was especially the natural, joyous, unconstrained dancing of Madame Vigano and her play of features, as expressive as it was fascinating, which provoked the applause of the many, it is nevertheless true that the very subject-matter of the ballets, which differentiate themselves very favorably from his later conceits, and his then wholly classical, skilful and manly dancing, were well calculated to inspire admiration and respect for the master and his creations.

Two or three pages might be compiled of spicy matter upon the beautiful Mme. Vigano's lavish display of the Venus-like graces and charms of her exquisite form; but her name, long before the "Prometheus" ballet, had disappeared from the roll of the theatre and Fräulein Cassentini reigned in her stead. There was nothing derogatory to Beethoven in his acceptance of the commission to compose the music to a ballet by Vigano; but by whom commissioned, upon what terms, and when--concerning these and similar particulars, we know nothing. We only know, that at the close of the season before Easter, on the 28th of March, "Die Geschöpfe des Prometheus" was performed for the first time for the benefit of the prima ballerina of the ballet corps, Fräulein Cassentini, and that the whole number of its performances this year was sixteen, and in 1802 thirteen. The pecuniary result to Beethoven must therefore have been satisfactory. True, the full score did not appear in print in Beethoven's lifetime or for a long time thereafter; it was not published, indeed, until the appearance of the critical Complete Edition, in which it figures as No. 11 of Series II; nothing is known of the original manuscript. A copy revised except as to two numbers, is in the Royal Imperial Court Library at Vienna. A pianoforte arrangement of the score was published in June, 1801, by Artaria with the opus number 24 and a dedication to Prince Lichnowsky. Hoffmeister printed the orchestral parts and a pianoforte score in 1804 as Op. 43 (the number 24 having meanwhile been assigned to the Violin Sonata in F). Mention ought, perhaps, also to be made of a pianoforte arrangement of No. 8 for four hands "composé pour la famille Kobler par Louis van Beethoven. Cette pièce se trouve aussi à gr. Orchestre dans le même Magazin." The Kobler family was frequently in Vienna, among other times in 1814; it had nothing to do with the "Prometheus" music.

Alois Fuchs has preserved a characteristic anecdote which came to him "from the worthy hand of a contemporary":

When Beethoven had composed the music to the ballet "Die Geschöpfe des Prometheus" in 1801, he was one day met by his former teacher, the great Joseph Haydn, who stopped him at once and said: "Well, I heard your ballet yesterday and it pleased me very much!" Beethoven replied: "O, dear Papa, you are very kind; but it is far from being a 'Creation!'" Haydn, surprised at the answer and almost offended, said after a short pause: "That is true; it is not yet a 'Creation' and I can scarcely believe that it will ever become one." Whereupon the men said their adieus, both somewhat embarrassed.

From the period immediately following we have another letter from Beethoven to Hoffmeister, dated April 22, 1801, in which he says:

Perhaps, too, it is the only sign of genius about me that my things are not always in the best of order, and nobody can mend the matter except myself. Thus, for instance, the pianoforte part, as is usual with me, was not written out in score and I only now have made a fair copy of it so that because of your haste you might not receive my too illegible manuscript. So that the works may appear in the proper sequence as far as possible I inform you that the following opus numbers ought to be placed on the compositions:

On the Solo Sonata Opus 22 On the Symphony „ 21 On the Septet „ 20 On the Concerto „ 19

The titles I will send you soon.

Set me down as a subscriber for the works of Johann Sebastian Bach, also Prince Lichnowsky. The transcription of the Mozart sonata (or sonatas) as quartets and quintets will do you honor and certainly prove remunerative. In this also I should like to be of greater service, but I am a disorderly individual and with the best of intentions I am continually forgetting everything; yet I have spoken about the matter here and there, and everywhere have found inclination towards it. It would be a handsome thing if Mr. Brother besides doing this were to publish an arrangement of the Septet for flute, as quintet, for example; by this means the amateur flautists, who have already approached me on the subject, would be helped and they would swarm around it like hungry insects. To say something about myself, I have just written a ballet in which the ballet-master did not do as well as he might have done. Baron von Liechtenstein has endowed us with a product not commensurate with the ideas which the newspapers have

spread touching his genius; another bit of evidence against the newspapers. The Baron seems to have formed his ideal on Herr Müller in the marionette show, without, however, having attained it.

INTRODUCTION

"_A philosophy of the history of the human race, worthy of its name, must begin with the heavens and descend to the earth, must be charged with the conviction that all existence is one--a single conception sustained from beginning to end upon one identical law._"--FRIEDRICH RATZEL.

This _Outline of History_ is an attempt to tell, truly and clearly, in one continuous narrative, the whole story of life and mankind so far as it is known to-day. It is written plainly for the general reader, but its aim goes beyond its use as merely interesting reading matter. There is a feeling abroad that the teaching of history considered as a part of general education is in an unsatisfactory condition, and particularly that the ordinary treatment of this "subject" by the class and teacher and examiner is too partial and narrow. But the desire to extend the general range of historical ideas is confronted by the argument that the available time for instruction is already consumed by that partial and narrow treatment, and that therefore, however desirable this extension of range may be, it is in practice impossible. If an Englishman, for example, has found the history of England quite enough for his powers of assimilation, then it seems hopeless to expect his sons and daughters to master universal history, if that is to consist of the history of England, plus the history of France, plus the history of Germany, plus the history of Russia, and so on. To which the only possible answer is that universal history is at once something more and something less than the aggregate of the national histories to which we are accustomed, that it must be approached in a different spirit and dealt with in a different manner. This book seeks to justify that answer. It has been written primarily to show that _history as one whole_ is amenable to a more broad and comprehensive handling than is the history of special nations and periods, a broader handling that will bring it within the normal limitations of time and energy set to the reading and education of an ordinary citizen. This outline deals with ages and races and nations, where the ordinary history deals with reigns and pedigrees and campaigns; but it will not be found to be more crowded with names and dates, nor more difficult to follow and understand. History is no exception amongst the sciences; as the gaps fill in, the outline simplifies; as the outlook broadens, the clustering multitude of details dissolves into general laws. And many topics of quite primary interest to mankind, the first appearance and the growth of scientific knowledge for example, and its effects upon human life, the elaboration of the ideas of money and credit, or the story of the origins and spread and influence of Christianity, which must be treated fragmentarily or by elaborate digressions in any partial history, arise and flow completely and naturally in one general record of the world in which we live.

The need for a common knowledge of the general facts of human history throughout the world has become very evident during the tragic happenings of the last few years. Swifter means of communication have brought all men closer to one another for good or for evil. War becomes a universal disaster, blind and monstrously destructive; it bombs the baby in its cradle and sinks the food-ships that cater for the non-combatant and the neutral. There can be no peace now, we realize, but a common peace in all the world; no prosperity but a general prosperity. But _there can be no common peace and prosperity without common historical ideas_. Without such ideas to hold them together in harmonious co-operation, with nothing but narrow, selfish, and conflicting nationalist traditions, races and peoples are bound to drift towards conflict and destruction. This truth, which was apparent to that great philosopher Kant a century or more ago--it is the gist of his tract upon universal peace--is now plain to the man in the street. Our internal policies and our economic and social ideas are profoundly vitiated at present by wrong and fantastic ideas of the origin and historical relationship of social classes. A sense of history as the common adventure of all mankind is as necessary for peace within as it is for peace between the nations.

Such are the views of history that this _Outline_ seeks to realize. It is an attempt to tell how our present state of affairs, this distressed and multifarious human life about us, arose in the course of vast ages and out of the inanimate clash of matter, and to estimate the quality and amount and range of the hopes with which it now faces its destiny. It is one experimental contribution to a

great and urgently necessary educational reformation, which must ultimately restore universal history, revised, corrected, and brought up to date, to its proper place and use as the backbone of a general education. We say “restore,” because all the great cultures of the world hitherto, Judaism and Christianity in the Bible, Islam in the Koran, have used some sort of cosmogony and world history as a basis. It may indeed be argued that without such a basis any really binding culture of men is inconceivable. Without it we are a chaos.

Remarkably few sketches of universal history by one single author have been written. One book that has influenced the writer very strongly is Winwood Reade’s _Martyrdom of Man_. This _dates_, as people say, nowadays, and it has a fine gloom of its own, but it is still an extraordinarily inspiring presentation of human history as one consistent process. Mr. F. S. Marvin’s _Living Past_ is also an admirable summary of human progress. There is a good _General History of the World_ in one volume by Mr. Oscar Browning. America has recently produced two well-illustrated and up-to-date class books, Breasted’s _Ancient Times_ and Robinson’s _Medieval and Modern Times_, which together give a very good idea of the story of mankind since the beginning of human societies. There are, moreover, quite a number of nominally Universal Histories in existence, but they are really not histories at all, they are encyclopædias of history; they lack the unity of presentation attainable only when the whole subject has been passed through one single mind. These universal histories are compilations, assemblies of separate national or regional histories by different hands, the parts being necessarily unequal in merit and authority and disproportionate one to another. Several such universal histories in thirty or forty volumes or so, adorned with allegorical title pages and illustrated by folding maps and plans of Noah’s Ark, Solomon’s Temple, and the Tower of Babel, were produced for the libraries of gentlemen in the eighteenth century. Helmolt’s _World History_, in eight massive volumes, is a modern compilation of the same sort, very useful for reference and richly illustrated, but far better in its parts than as a whole. Another such collection is the _Historians’ History of the World_ in 25 volumes. _The Encyclopædia Britannica_ contains, of course, a complete encyclopædia of history within itself, and is the most modern of all such collections.[1] F. Ratzel’s _History of Mankind_, in spite of the promise of its title, is mainly a natural history of man, though it is rich with suggestions upon the nature and development of civilization. That publication and Miss Ellen Churchill Semple’s _Influence of Geographical Environment_, based on Ratzel’s work, are quoted in this _Outline_, and have had considerable influence upon its plan. F. Ratzel would indeed have been the ideal author for such a book as our present one. Unfortunately neither he nor any other ideal author was available.[2]

The writer will offer no apology for making this experiment. His disqualifications are manifest. But such work needs to be done by as many people as possible, he was free to make his contribution, and he was greatly attracted by the task. He has read sedulously and made the utmost use of all the help he could obtain. There is not a chapter that has not been examined by some more competent person than himself and very carefully revised. He has particularly to thank his friends Sir E. Ray Lankester, Sir H. H. Johnston, Professor Gilbert Murray, and Mr. Ernest Barker for much counsel and direction and editorial help. Mr. Philip Guedalla has toiled most efficiently and kindly through all the proofs. Mr. A. Allison, Professor T. W. Arnold, Mr. Arnold Bennett, the Rev. A. H. Trevor Benson, Mr. Aodh de Blacam, Mr. Laurence Binyon, the Rev. G. W. Broomfield, Sir William Bull, Mr. L. Cranmer Byng, Mr. A. J. D. Campbell, Mr. A. Y. Campbell, Mr. L. Y. Chen, Mr. A. R. Cowan, Mr. O. G. S. Crawford, Dr. W. S. Culbertson, Mr. R. Langton Cole, Mr. B. G. Collins, Mr. J. J. L. Duyvendak, Mr. O. W. Ellis, Mr. G. S. Ferrier, Mr. David Freeman, Mr. S. N. Fu, Mr. G. B. Gloyne, Sir Richard Gregory, Mr. F. H. Hayward, Mr. Sydney Herbert, Dr. Fr. Krupicka, Mr. H. Lang Jones, Mr. C. H. B. Laughton, Mr. B. I. Macalpin, Mr. G. H. Mair, Mr. F. S. Marvin, Mr. J. S. Mayhew, Mr. B. Stafford Morse, Professor J. L. Myres, the Hon. W. Ormsby-Gore, Sir Sydney Olivier, Mr. R. I. Pocock, Mr. J. Pringle, Mr. W. H. R. Rivers, Sir Denison Ross, Dr. E. J. Russell, Dr. Charles Singer, Mr. A. St. George Sanford, Dr. C. O. Stallybrass, Mr. G. H. Walsh, Mr. G. P. Wells, Miss Rebecca West, and Mr. George Whale have all to be thanked for help, either by reading parts of the MS. or by pointing out errors in the published parts, making suggestions, answering questions, or giving advice. The amount of friendly and sympathetic assistance the writer has received, often from very busy people, has been a quite extraordinary experience. He has met with scarcely a single instance of irritation or impatience on the part of specialists whose domains he has invaded and traversed in what must have seemed to many of them an exasperatingly impudent and superficial way. Numerous other helpful correspondents have pointed out printer’s errors and minor slips in the serial publication which preceded this book edition, and they have added many useful items of information, and to those writers also the warmest thanks are due. But of course none of these generous helpers are to be held responsible for the judgments, tone, arrangement, or writing of this _Outline_. In the relative importance of the parts, in the moral and political implications of the story, the final decision has necessarily fallen to the writer. The problem of illustrations was a very difficult one for him, for he had had no previous experience in the production of an illustrated book. In Mr. J. F. Horrabin he has had the good fortune to find not only an illustrator but a collaborator. Mr. Horrabin has spared no pains to make this work informative and exact. His maps and drawings are a part of the text, the most vital and decorative part. Some of them, the hypothetical maps, for example,

of the western world at the end of the last glacial age, during the “pluvial age” and 12,000 years ago, and the migration map of the Barbarian invaders of the Roman Empire, represent the reading and inquiry of many laborious days.

The index to this edition is the work of Mr. Strickland Gibson of Oxford. Several correspondents have asked for a pronouncing index and accordingly this has been provided.

The writer owes a word of thanks to that living index of printed books, Mr. J. F. Cox of the London Library. He would also like to acknowledge here the help he has received from Mrs. Wells. Without her labour in typing and re-typing the drafts of the various chapters as they have been revised and amended, in checking references, finding suitable quotations, hunting up illustrations, and keeping in order the whole mass of material for this history, and without her constant help and watchful criticism, its completion would have been impossible.

SCHEME OF CONTENTS

BOOK I

THE MAKING OF OUR WORLD

PAGE CHAPTER I. THE EARTH IN SPACE AND TIME 3

CHAPTER II. THE RECORD OF THE ROCKS

§ 1. The first living things 7

§ 2. How old is the world? 13

CHAPTER III. NATURAL SELECTION AND THE CHANGES OF SPECIES 16

CHAPTER IV. THE INVASION OF THE DRY LAND BY LIFE

§ 1. Life and water 23

§ 2. The earliest animals 25

CHAPTER V. CHANGES IN THE WORLD’S CLIMATE

§ 1. Why life must change continually 29

§ 2. The sun a steadfast star 34

§ 3. Changes from within the earth 35

§ 4. Life may control change 36

CHAPTER VI. THE AGE OF REPTILES

§ 1. The age of lowland life 38

§ 2. Flying dragons 43

§ 3. The first birds 43

§ 4. An age of hardship and death 44

§ 5. The first appearance of fur and feathers 47

CHAPTER VII. THE AGE OF MAMMALS

§ 1. A new age of life 51

§ 2. Tradition comes into the world 52

§ 3. An age of brain growth 56

BOOK I

THE MAKING OF OUR WORLD

THE OUTLINE OF HISTORY

I

THE EARTH IN SPACE AND TIME

The earth on which we live is a spinning globe. Vast though it seems to us, it is a mere speck of matter in the greater vastness of space.

Space is, for the most part, emptiness. At great intervals there are in this emptiness flaring centres of heat and light, the "fixed stars." They are all moving about in space, notwithstanding that they are called fixed stars, but for a long time men did not realize

their motion. They are so vast and at such tremendous distances that their motion is not perceived. Only in the course of many thousands of years is it appreciable. These fixed stars are so far off that, for all their immensity, they seem to be, even when we look at them through the most powerful telescopes, mere points of light, brighter or less bright. A few, however, when we turn a telescope upon them, are seen to be whirls and clouds of shining vapour which we call nebulæ. They are so far off that a movement of millions of miles would be imperceptible.

One star, however, is so near to us that it is like a great ball of flame. This one is the sun. The sun is itself in its nature like a fixed star, but it differs from the other fixed stars in appearance because it is beyond comparison nearer than they are; and because it is nearer men have been able to learn something of its nature. Its mean distance from the earth is ninety-three million miles. It is a mass of flaming matter, having a diameter of 866,000 miles. Its bulk is a million and a quarter times the bulk of our earth.

These are difficult figures for the imagination. If a bullet fired from a Maxim gun at the sun kept its muzzle velocity unimpaired, it would take seven years to reach the sun. And yet we say the sun is near, measured by the scale of the stars. If the earth were a small ball, one inch in diameter, the sun would be a globe of nine feet diameter; it would fill a small bedroom. It is spinning round on its axis, but since it is an incandescent fluid, its polar regions do not travel with the same velocity as its equator, the surface of which rotates in about twenty-five days. The surface visible to us consists of clouds of incandescent metallic vapour. At what lies below we can only guess. So hot is the sun's atmosphere that iron, nickel, copper, and tin are present in it in a gaseous state. About it at great distances circle not only our earth, but certain kindred bodies called the planets. These shine in the sky because they reflect the light of the sun; they are near enough for us to note their movements quite easily. Night by night their positions change with regard to the fixed stars.

It is well to understand how empty space is. If, as we have said, the sun were a ball nine feet across, our earth would, in proportion, be the size of a one-inch ball, and at a distance of 323 yards from the sun. The moon would be a speck the size of a small pea, thirty inches from the earth. Nearer to the sun than the earth would be two other very similar specks, the planets Mercury and Venus, at a distance of 125 and 250 yards respectively. Beyond the earth would come the planets Mars, Jupiter, Saturn, Uranus, and Neptune, at distances of 500, 1806, 3000, 6000, and 9500 yards respectively. There would also be a certain number of very much smaller specks, flying about amongst these planets, more particularly a number called the asteroids circling between Mars and Jupiter, and occasionally a little puff of more or less luminous vapour and dust would drift into the system from the almost limitless emptiness beyond. Such a puff is what we call a comet. _All the rest of the space about us and around us and for unfathomable distances beyond is cold, lifeless, and void._ The nearest fixed star to us, _on this minute scale_, be it remembered,--the earth as a one-inch ball, and the moon a little pea--would be over 40,000 miles away.

The science that tells of these things and how men have come to know about them is Astronomy, and to books of astronomy the reader must go to learn more about the sun and stars. The science and description of the world on which we live are called respectively Geology and Geography.

The diameter of our world is a little under 8000 miles. Its surface is rough; the more projecting parts of the roughness are mountains, and in the hollows of its surface there is a film of water, the oceans and seas. This film of water is about five miles thick at its deepest part--that is to say, the deepest oceans have a depth of five miles. This is very little in comparison with the bulk of the world.

About this sphere is a thin covering of air, the atmosphere. As we ascend in a balloon or go up a mountain from the level of the sea-shore the air is continually less dense, until at last it becomes so thin that it cannot support life. At a height of twenty miles there is scarcely any air at all--not one hundredth part of the density of air at the surface of the sea. The highest point to which a bird can fly is about four miles up--the condor, it is said, can struggle up to that; but most small birds and insects which are carried up by aeroplanes or balloons drop off insensible at a much lower level, and the greatest height to which any mountaineer has ever climbed is under five miles. Men have flown in aeroplanes to a height of over four miles, and balloons with men in them have reached very nearly seven miles, but at the cost of considerable physical suffering. Small experimental balloons, containing not men, but recording instruments, have gone as high as twenty-two miles.

It is in the upper few hundred feet of the crust of the earth, in the sea, and in the lower levels of the air below four miles that life is found. We do not know of any life at all except in these films of air and water upon our planet. So far as we know, all the rest of space is as yet without life. Scientific men have discussed the possibility of life, or of some process of a similar kind, occurring upon such kindred bodies as the planets Venus and Mars. But they point merely to questionable possibilities.

Astronomers and geologists and those who study physics have been able to tell us something of the origin and history of the earth. They consider that, vast ages ago, the sun was a spinning, flaring mass of matter, not yet concentrated into a compact centre of heat and light, considerably larger than it is now, and spinning very much faster, and that as it whirled, a series of fragments detached themselves from it, which became the planets. Our earth is one of these planets. The flaring mass that was the material of the earth broke as it spun into two masses, a larger, the earth itself, and a smaller, which is now the dead, still moon. Astronomers give us convincing reasons for supposing that sun and earth and moon and all that system were then whirling about at a speed much greater than the speed at which they are moving to-day, and that at first our earth was a flaming thing upon which no life could live. The way in which they have reached these conclusions is by a very beautiful and interesting series of observations and reasoning, too long and elaborate for us to deal with here. But they oblige us to believe that the sun, incandescent though it is, is now much cooler than it was, and that it spins more slowly now than it did, and that it continues to cool and slow down. And they also show that the rate at which the earth spins is diminishing and continues to diminish--that is to say, that our day is growing longer and longer, and that the heat at the centre of the earth wastes slowly. There was a time when the day was not a half and not a third of what it is to-day; when a blazing hot sun, much greater than it is now, must have moved visibly--had there been an eye to mark it--from its rise to its setting across the skies. There will be a time when the day will be as long as a year is now, and the cooling sun, shorn of its beams, will hang motionless in the heavens.

It must have been in days of a much hotter sun, a far swifter day and night, high tides, great heat, tremendous storms and earthquakes, that life, of which we are a part, began upon the world. The moon also was nearer and brighter in those days and had a changing face.[3]

II

THE RECORD OF THE ROCKS

§ 1. _The First Living Things._ § 2. _How Old Is the World?_

§ 1

We do not know how life began upon the earth.[4]

Biologists, that is to say, students of life, have made guesses about these beginnings, but we will not discuss them here. Let us only note that they all agree that life began where the tides of those swift days spread and receded over the steaming beaches of mud and sand.

The atmosphere was much denser then, usually great cloud masses obscured the sun, frequent storms darkened the heavens. The land of those days, upheaved by violent volcanic forces, was a barren land, without vegetation, without soil. The almost incessant rain-storms swept down upon it, and rivers and torrents carried great loads of sediment out to sea, to become muds that hardened later into slates and shales, and sands that became sandstones. The geologists have studied the whole accumulation of these sediments as it remains to-day, from those of the earliest ages to the most recent. Of course the oldest deposits are the most distorted and changed and worn, and in them there is now no certain trace to be found of life at all. Probably the earliest forms of life were small and soft, leaving no evidence of their existence behind them. It was only when some of these living things developed skeletons and shells of lime and such-like hard material that they left fossil vestiges after they died, and so put themselves on record for examination.

The literature of geology is very largely an account of the fossils that are found in the rocks, and of the order in which layers after layers of rocks lie one on another. The very oldest rocks must have been formed before there was any sea at all, when the earth was too hot for a sea to exist, and when the water that is now sea was an atmosphere of steam mixed with the air. Its higher levels were dense with clouds, from which a hot rain fell towards the rocks below, to be converted again into steam long before it reached their incandescence. Below this steam atmosphere the molten world-stuff solidified as the first rocks. These first rocks must have solidified as a cake over glowing liquid material beneath, much as cooling lava does. They must have appeared first as crusts and clinkers. They must have been constantly remelted and recrystallized before any thickness of them became permanently solid. The name of Fundamental Gneiss is given to a great underlying system of crystalline rocks which probably formed age by age as this hot youth of the world drew to its close. The scenery of the world in the days when the Fundamental Gneiss was formed must have been more like the interior of a furnace than anything else to be found upon earth at the present time.

After long ages the steam in the atmosphere began also to condense and fall right down to earth, pouring at last over these warm primordial rocks in rivulets of hot water and gathering in depressions as pools and lakes and the first seas. Into those seas the streams that poured over the rocks brought with them dust and particles to form a sediment, and this sediment accumulated in layers, or as geologists call them, _strata_, and formed the first Sedimentary Rocks. Those earliest sedimentary rocks sank into depressions and were covered by others; they were bent, tilted up, and torn by great volcanic disturbances and by tidal strains that swept through the rocky crust of the earth. We find these first sedimentary rocks still coming to the surface of the land here and there, either not covered by later strata or exposed after vast ages of concealment by the wearing off of the rock that covered them later--there are great surfaces of them in Canada especially; they are cleft and bent, partially remelted, recrystallized, hardened and compressed, but recognizable for what they are. And they contain no single certain trace of life at all. They are frequently called _Azoic_ (lifeless) Rocks. But since in some of these earliest sedimentary rocks a substance called graphite (black lead) occurs, and also red and black oxide of iron, and since it is asserted that these substances need the activity of living things for their production, which may or may not be the case, some geologists prefer to call these earliest sedimentary rocks _Archæozoic_ (primordial life). They suppose that the first life was soft living matter that had no shells or skeletons or any such structure that could remain as a recognizable fossil after its death, and that its chemical influence caused the deposition of graphite and iron oxide. This is pure guessing, of course, and there is at least an equal probability that in the time of formation of the Azoic Rocks, life had not yet begun.

Long ago there were found in certain of these ancient first-formed rocks in Canada, curious striped masses, and thin layers of white and green mineral substance which Sir William Dawson considered were fossil vestiges, the walls or coverings of some very simple sort of living thing which has now vanished from the earth. He called these markings _Eozoon Canadense_ (the Canadian dawn-animal). There has been much discussion and controversy over this Eozoon, but to-day it is agreed that Eozoon is nothing more than a crystalline marking. Mixed minerals will often intercrystallize in blobs or branching shapes that are very suggestive of simple plant or animal forms. Any one who has made a lead tree in his schooldays, or lit those queer indoor fireworks known as serpents' eggs, which unfold like a long snake, or who has seen the curious markings often found in quartz crystals, or noted the tree-like pattern on old stone-ware beer mugs, will realize how closely non-living matter can sometimes mock the shapes of living things.

Overlying or overlapping these Azoic or Archæozoic rocks come others, manifestly also very ancient and worn, which do contain traces of life. These first remains are of the simplest description; they are the vestiges of simple plants, called algæ, or marks like the tracks made by worms in the sea mud. There are also the skeletons of the microscopic creatures called Radiolaria. This second series of rocks is called the Proterozoic (beginning of life) series, and marks a long age in the world's history. Lying over and above the Proterozoic rocks is a third series, which is found to contain a considerable number and variety of traces of living things. First comes the evidence of a diversity of shellfish, crabs, and such-like crawling things, worms, seaweeds, and the like; then of a multitude of fishes and of the beginnings of land plants and land creatures. These rocks are called the Palæozoic (ancient life) rocks. They mark a vast era, during which life was slowly spreading, increasing, and developing in the seas of our world. Through long ages, through the earliest Palæozoic time, it was no more than a proliferation of such swimming and creeping things in the water. There were creatures called trilobites; they were crawling things like big sea woodlice that were probably related to the American king-crab of to-day. There were also sea-scorpions, the prefects of that early world. The individuals of certain species of these were nine feet long. These were the very highest sorts of life. There were abundant different sorts of an order of shellfish called brachiopods. There were plant animals, rooted and joined together like plants, and loose weeds that waved in the waters.

It was not a display of life to excite our imaginations. There was nothing that ran or flew or even swam swiftly or skilfully. Except for the size of some of the creatures, it was not very different from, and rather less various than, the kind of life a student would gather from any summer-time ditch nowadays for microscopic examination. Such was the life of the shallow seas through a hundred million years or more in the early Palæozoic period. The land during that time was apparently absolutely barren. We find no trace nor hint of land life. Everything that lived in those days lived under water for most or all of its life.

[Illustration: Life in the Early Palæozoic

Note its general resemblance, except for size, to the microscopic summer ditch-water life of to-day.]

Between the formation of these Lower Palæozoic rocks in which the sea scorpion and trilobite ruled, and our own time, there have intervened almost immeasurable ages, represented by layers and masses of sedimentary rocks. There are first the Upper Palæozoic Rocks, and above these the geologists distinguish two great divisions. Next above the Palæozoic come the Mesozoic

(middle life) rocks, a second vast system of fossil-bearing rocks, representing perhaps a hundred millions of swift years, and containing a wonderful array of fossil remains, bones of giant reptiles and the like, which we will presently describe; and above these again are the Cainozoic (recent life) rocks, a third great volume in the history of life, an unfinished volume of which the sand and mud that was carried out to sea yesterday by the rivers of the world, to bury the bones and scales and bodies and tracks that will become at last fossils of the things of to-day, constitute the last written leaf.

(It is, we may note, the practice of many geologists to make a break between the rest of the Cainozoic system of rocks and those which contain traces of humanity, which latter are cut off as a separate system under the name of Quaternary. But that, as we shall see, is rather like taking the last page of a book, which is really the conclusion of the last chapter, and making a separate chapter of it and calling it the last chapter.)

These markings and fossils in the rocks and the rocks themselves are our first historical documents. The history of life that men have puzzled out and are still puzzling out from them is called the Record of the Rocks. By studying this record men are slowly piecing together a story of life's beginnings, and of the beginnings of our kind, of which our ancestors a century or so ago had no suspicion. But when we call these rocks and the fossils a record and a history, it must not be supposed that there is any sign of an orderly keeping of a record. It is merely that whatever happens leaves some trace, if only we are intelligent enough to detect the meaning of that trace. Nor are the rocks of the world in orderly layers one above the other, convenient for men to read. They are not like the books and pages of a library. They are torn, disrupted, interrupted, flung about, defaced, like a carelessly arranged office after it has experienced in succession a bombardment, a hostile military occupation, looting, an earthquake, riots, and a fire. And so it is that for countless generations this Record of the Rocks lay unsuspected beneath the feet of men. Fossils were known to the Ionian Greeks in the sixth century B.C.,[5] they were discussed at Alexandria by Eratosthenes and others in the third century B.C., a discussion which is summarized in Strabo's _Geography_ (?20-10 B.C.). They were known to the Latin poet Ovid, but he did not understand their nature. He thought they were the first rude efforts of creative power. They were noted by Arabic writers in the tenth century. Leonardo da Vinci, who lived so recently as the opening of the sixteenth century (1452-1519), was one of the first Europeans to grasp the real significance of fossils,[6] and it has been only within the last century and a half that man has begun the serious and sustained deciphering of these long-neglected early pages of his world's history.

§ 2

[Illustration: graph of eras]

Speculations about geological time vary enormously.[7] Estimates of the age of the oldest rocks by geologists and astronomers starting from different standpoints have varied between 1,600,000,000, and 25,000,000. The lowest estimate was made by Lord Kelvin in 1867. Professor Huxley guessed at 400,000,000 years. There is a summary of views and the grounds upon which the estimates have been made in Osborn's _Origin and Evolution of Life_; he inclines to the moderate total of 100,000,000. It must be clearly understood by the reader how sketchy and provisional all these time estimates are. They rest nearly always upon theoretical assumptions of the slenderest kind. That the period of time has been vast, that it is to be counted by scores and possibly by hundreds of millions of years, is the utmost that can be said with certainty in the matter. It is quite open to the reader to divide every number in the appended time diagram by ten or multiply it by two; no one can gainsay him. Of the relative amount of time as between one age and another we have, however, stronger evidence; if the reader cuts down the 800,000,000 we have given here to 400,000,000, then he must reduce the 40,000,000 of the Cainozoic to 20,000,000. And be it noted that whatever the total sum may be, most geologists are in agreement that _half or more than half of the whole of geological time had passed before life had developed to the Later Palæozoic level_. The reader reading quickly through these opening chapters may be apt to think of them as a mere swift prelude of preparation to the apparently much longer history that follows, but in reality that subsequent history is longer only because it is more detailed and more interesting to us. It looms larger in perspective. For ages that stagger the imagination this earth spun hot and lifeless, and again for ages of equal vastness it held no life above the level of the animalculæ in a drop of ditch-water.

Not only is Space from the point of view of life and humanity empty, but Time is empty also. Life is like a little glow, scarcely kindled yet, in these void immensities.

III

NATURAL SELECTION AND THE CHANGES OF SPECIES

Now here it will be well to put plainly certain general facts about this new thing, _life_, that was creeping in the shallow waters and intertidal muds of the early Palæozoic period, and which is perhaps confined to our planet alone in all the immensity of space.

Life differs from all things whatever that are without life in certain general aspects. There are the most wonderful differences among living things to-day, but all living things past and present agree in possessing _a certain power of growth_, all living things _take nourishment_, all living things _move about_ as they feed and grow, though the movement may be no more than the spread of roots through the soil, or of branches in the air. Moreover, living things reproduce; they give rise to other living things, either by growing and then dividing or by means of seeds or spores or eggs or other ways of producing young. _Reproduction_ is a characteristic of life.

No living thing goes on living forever. There seems to be a _limit of growth_ for every kind of living thing. Among very small and simple living things, such as that microscopic blob of living matter the _Amæba_, an individual may grow and then divide completely into two new individuals, which again may divide in their turn. Many other microscopic creatures live actively for a time, grow, and then become quiet and inactive, enclose themselves in an outer covering and break up wholly into a number of still smaller things, spores, which are released and scattered and again grow into the likeness of their parent. Among more complex creatures the reproduction is not usually such simple division, though division does occur even in the case of many creatures big enough to be visible to the unassisted eye. But the rule with almost all larger beings is that the individual grows up to a certain limit of size. Then, before it becomes unwieldy, its growth declines and stops. As it reaches its full size it _matures_, it begins to produce young, which are either born alive or hatched from eggs. But all of its body does not produce young. Only a special part does that. After the individual has lived and produced offspring for some time, it ages and dies. It does so by a sort of necessity. There is a practical limit to its life as well as to its growth. These things are as true of plants as they are of animals. And they are not true of things that do not live. Non-living things, such as crystals, grow, but they have no set limits of growth or size, they _do not move of their own accord_ and there is _no stir within them_. Crystals once formed may last unchanged for millions of years. There is _no reproduction_ for any non-living thing.

This growth and dying and reproduction of living things leads to some very wonderful consequences. The young which a living thing produces are either directly, or after some intermediate stages and changes (such as the changes of a caterpillar and butterfly), like the parent living thing. But they are never exactly like it or like each other. There is always a slight difference, which we speak of as _individuality_. A thousand butterflies this year may produce two or three thousand next year; these latter will look to us almost exactly like their predecessors, but each one will have just that slight difference. It is hard for us to see individuality in butterflies because we do not observe them very closely, but it is easy for us to see it in men. All the men and women in the world now are descended from the men and women of A.D. 1800, but not one of us now is exactly the same as one of that vanished generation. And what is true of men and butterflies is true of every sort of living thing, of plants as of animals. Every species changes all its individualities in each generation. That is as true of all the minute creatures that swarmed and reproduced and died in the Archæozoic and Proterozoic seas, as it is of men to-day.

Every species of living things is continually dying and being born again, as a multitude of fresh individuals.

Consider, then, what must happen to a new-born generation of living things of any species. Some of the individuals will be stronger or sturdier or better suited to succeed in life in some way than the rest, many individuals will be weaker or less suited. In particular single cases any sort of luck or accident may occur, but _on the whole_ the better equipped individuals will live and grow up and reproduce themselves and the weaker will _as a rule_ go under. The latter will be less able to get food, to fight their enemies and pull through. So that in each generation there is as it were a picking over of a species, a picking out of most of the weak or unsuitable and a preference for the strong and suitable. This process is called _Natural Selection_ or the _Survival of the Fittest_.[8]

It follows, therefore, from the fact that living things grow and breed and die, that every species, so long as the conditions under which it lives remain the same, becomes more and more perfectly fitted to those conditions in every generation.

But now suppose those conditions change, then the sort of individual that used to succeed may now fail to succeed and a sort of individual that could not get on at all under the old conditions may now find its opportunity. These species will change, therefore, generation by generation; the old sort of individual that used to prosper and dominate will fail and die out and the new sort of individual will become the rule,--until the general character of the species changes.

Suppose, for example, there is some little furry whitey-brown animal living in a bitterly cold land which is usually under snow. Such individuals as have the thickest, whitest fur will be least hurt by the cold, less seen by their enemies, and less conspicuous as they seek their prey. The fur of this species will thicken and its whiteness increase with every generation, until there is no advantage in carrying any more fur.

[Illustration: DIAGRAM OF LIFE IN THE LATER PALÆOZOIC AGE.

Life is creeping out of the water. An insect like a dragon fly is shown. There were amphibia like gigantic newts and salamanders, and even primitive reptiles in these swamps.]

Imagine now a change of climate that brings warmth into the land, sweeps away the snows, makes white creatures glaringly visible during the greater part of the year and thick fur an encumbrance. Then every individual with a touch of brown in its colouring and a thinner fur will find itself at an advantage, and very white and heavy fur will be a handicap. There will be a weeding out of the white in favour of the brown in each generation. If this change of climate come about too quickly, it may of course exterminate the species altogether; but if it come about gradually, the species, although it may have a hard time, may yet be able to change itself and adapt itself generation by generation. This change and adaptation is called the _Modification of Species_.

Perhaps this change of climate does not occur all over the lands inhabited by the species; maybe it occurs only on one side of some great arm of the sea or some great mountain range or such-like divide, and not on the other. A warm ocean current like the Gulf Stream may be deflected, and flow so as to warm one side of the barrier, leaving the other still cold. Then on the cold side this species will still be going on to its utmost possible furriness and whiteness and on the other side it will be modifying towards brownness and a thinner coat. At the same time there will probably be other changes going on; a difference in the paws perhaps, because one half of the species will be frequently scratching through snow for its food, while the other will be scampering over brown earth. Probably also the difference of climate will mean differences in the sort of food available, and that may produce differences in the teeth and the digestive organs. And there may be changes in the sweat and oil glands of the skin due to the changes in the fur, and these will affect the excretory organs and all the internal chemistry of the body. And so through all the structure of the creature. A time will come when the two separated varieties of this formerly single species will become so unlike each other as to be recognizably different species. Such a splitting up of a species in the course of generations into two or more species is called the _Differentiation of Species_.

And it should be clear to the reader that given these elemental facts of life, given growth and death and reproduction with individual variation in a world that changes, life _must_ change in this way, modification and differentiation _must_ occur, old species _must_ disappear, and new ones appear. We have chosen for our instance here a familiar sort of animal, but what is true of furry beasts in snow and ice is true of all life, and equally true of the soft jellies and simple beginnings that flowed and crawled for hundreds of millions of years between the tidal levels and in the shallow, warm waters of the Proterozoic seas.

The early life of the early world, when the blazing sun rose and set in only a quarter of the time it now takes, when the warm seas poured in great tides over the sandy and muddy shores of the rocky lands and the air was full of clouds and steam, must have been modified and varied and species must have developed at a great pace. Life was probably as swift and short as the days and years; the generations, which natural selection picked over, followed one another in rapid succession.

Natural selection is a slower process with man than with any other creature. It takes twenty years or more before an ordinary human being in western Europe grows up and reproduces. In the case of most animals the new generation is on trial in a year or less. With such simple and lowly beings, however, as first appeared in the primordial seas, growth and reproduction was probably a matter of a few brief hours or even of a few brief minutes. Modification and differentiation of species must accordingly have been extremely rapid, and life had already developed a very great variety of widely contrasted forms before it began to leave traces in the rocks. The Record of the Rocks does not begin, therefore, with any group of closely related forms from which all subsequent and existing creatures are descended. It begins in the midst of the game, with nearly every main division of the animal kingdom already represented.[9] Plants are already plants, and animals animals. The curtain rises on a drama in the sea that has already begun, and has been going on for some time. The brachiopods are discovered already in their shells, accepting and consuming much the same sort of food that oysters and mussels do now; the great water scorpions crawl among the seaweeds, the trilobites roll up into balls and unroll and scuttle away. In that ancient mud and among those early weeds there was probably as rich and abundant and active a life of infusoria and the like as one finds in a drop of ditch-water to-day. In the ocean waters, too, down to the utmost downward limit to which light could filter, then as now, there was an abundance of minute and translucent, and in many cases

phosphorescent, beings.

But though the ocean and intertidal waters already swarmed with life, the land above the high-tide line was still, so far as we can guess, a stony wilderness without a trace of life.

IV

THE INVASION OF THE DRY LAND BY LIFE

§ 1. _Life and Water._ § 2. _The Earliest Animals._

§ 1

Wherever the shore line ran there was life, and that life went on in and by and with water as its home, its medium, and its fundamental necessity.

The first jelly-like beginnings of life must have perished whenever they got out of the water, as jelly-fish dry up and perish on our beaches to-day. Drying up was the fatal thing for life in those days, against which at first it had no protection. But in a world of rain-pools and shallow seas and tides, any variation that enabled a living thing to hold out and keep its moisture during hours of low tide of drought met with every encouragement in the circumstances of the time. There must have been a constant risk of stranding. And, on the other hand, life had to keep rather near the shore and beaches in the shallows because it had need of air (dissolved of course in the water) and light.

No creature can breathe, no creature can digest its food, without water. We talk of breathing air, but what all living things really do is to breathe oxygen dissolved in water. The air we ourselves breathe must first be dissolved in the moisture in our lungs; and all our food must be liquefied before it can be assimilated. Water-living creatures which are always under water, wave the freely exposed gills by which they breathe in that water, and extract the air dissolved in it. But a creature that is to be exposed for any time out of the water, must have its body and its breathing apparatus protected from drying up. Before the seaweeds could creep up out of the Early Palæozoic seas into the intertidal line of the beach, they had to develop a tougher outer skin to hold their moisture. Before the ancestor of the sea scorpion could survive being left by the tide it had to develop its casing and armour. The trilobites probably developed their tough covering and rolled up into balls, far less as a protection against each other and any other enemies they may have possessed, than as a precaution against drying. And when presently, as we ascend the Palæozoic rocks, the fish appear, first of all the backboned or vertebrated animals, it is evident that a number of them are already adapted by the protection of their gills with gill covers and by a sort of primitive lung swimming-bladder, to face the same risk of temporary stranding.

Now the weeds and plants that were adapting themselves to intertidal conditions were also bringing themselves into a region of brighter light, and light is very necessary and precious to all plants. Any development of structure that would stiffen them and hold them up to the light, so that instead of crumpling and flopping when the waters receded, they would stand up outspread, was a great advantage. And so we find them developing fibre and support, and the beginning of _woody fibre_ in them. The early plants reproduced by soft spores, or half-animal “gametes,” that were released in water, were distributed by water and could only germinate under water. The early plants were tied, and most lowly plants to-day are tied, by the conditions of their life cycle, to water. But here again there was a great advantage to be got by the development of some protection of the spores from drought that would enable reproduction to occur without submergence. So soon as a species could do that, it could live and reproduce and spread above the high-water mark, bathed in light and out of reach of the beating and distress of the waves. The main classificatory divisions of the larger plants mark stages in the release of plant life from the necessity of submergence by the development of woody support and of a method of reproduction that is more and more defiant of drying up. The lower plants are still the prisoner attendants of water. The lower mosses must live in damp, and even the development of the spore of the ferns demands at certain stages extreme wetness. The highest plants have carried freedom from water so far that they can live and reproduce if only there is some moisture in the soil below them. They have solved their problem of living out of water altogether.

The essentials of that problem were worked out through the vast æons of the Proterozoic Age and the early Palæozoic Age by nature’s method of experiment and trial. Then slowly, but in great abundance, a variety of new plants began to swarm away from the sea and over the lower lands, still keeping to swamp and lagoon and watercourse as they spread.

§ 2

And after the plants came the animal life.

There is no sort of land animal in the world, as there is no sort of land plant, whose structure is not primarily that of a water-inhabiting being which has been adapted through the modification and differentiation of species to life out of the water. This adaptation is attained in various ways. In the case of the land scorpion the gill-plates of the primitive sea scorpion are sunken into the body so as to make the lung-books secure from rapid evaporation. The gills of crustaceans, such as the crabs which run about in the air, are protected by the gill-cover extensions of the back shell or carapace. The ancestors of the insects developed a system of air pouches and air tubes, the tracheal tubes, which carry the air all over the body before it is dissolved. In the case of the vertebrated land animals, the gills of the ancestral fish were first supplemented and then replaced by a bag-like growth from the throat, the primitive lung swimming-bladder. To this day there survive certain mudfish which enable us to understand very clearly the method by which the vertebrated land animals worked their way out of the water. These creatures (_e.g._ the African lung fish) are found in tropical regions in which there is a rainy full season and a dry season, during which the rivers become mere ditches of baked mud. During the rainy season these fish swim about and breathe by gills like any other fish. As the waters of the river evaporate, these fish bury themselves in the mud, their gills go out of action, and the creature keeps itself alive until the waters return by swallowing air, which passes into its swimming-bladder. The Australian lung fish, when it is caught by the drying up of the river in stagnant pools, and the water has become deaerated and foul, rises to the surface and gulps air. A newt in a pond does exactly the same thing. These creatures still remain at the transition stage, the stage at which the ancestors of the higher vertebrated animals were released from their restriction to an under-water life.

The amphibia (frogs, newts, tritons, etc.) still show in their life history all the stages in the process of this liberation. They are still dependent on water for their reproduction; their eggs must be laid in sunlit water, and there they must develop. The young tadpole has branching external gills that wave in the water; then a gill cover grows back over them and forms a gill chamber. Then, as the creature's legs appear and its tail is absorbed, it begins to use its lungs, and its gills dwindle and vanish. The adult frog can live all the rest of its days in the air, but it can be drowned if it is kept steadfastly below water. When we come to the reptile, however, we find an egg which is protected from evaporation by a tough egg case, and this egg produces young which breathe by lungs from the very moment of hatching. The reptile is on all fours with the seeding plant in its freedom from the necessity to pass any stage of its life cycle in water.

[Illustration: _Australian Lung fish breathing air_]

The later Palæozoic Rocks of the northern hemisphere give us the materials for a series of pictures of this slow spreading of life over the land. Geographically, all round the northern half of the world it was an age of lagoons and shallow seas very favourable to this invasion. The new plants, now that they had acquired the power to live this new aerial life, developed with an extraordinary richness and variety.

[Illustration: Some Reptiles of the Late Palæozoic Age]

There were as yet no true flowering plants,[10] no grasses nor trees that shed their leaves in winter;[11] the first "flora" consisted of great tree ferns, gigantic equisetums, cycad ferns, and kindred vegetation. Many of these plants took the form of huge-stemmed trees, of which great multitudes of trunks survive fossilized to this day. Some of these trees were over a hundred feet high, of orders and classes now vanished from the world. They stood with their stems in the water, in which no doubt there was a thick tangle of soft mosses and green slime and fungoid growths that left few plain vestiges behind them. The abundant remains of these first swamp forests constitute the main coal-measures of the world to-day.

Amidst this luxuriant primitive vegetation crawled and glided and flew the first insects. They were rigid-winged, four-winged creatures, often very big, some of them having wings measuring a foot in length. There were numerous dragon flies--one found in the Belgian coal-measures had a wing span of twenty-nine inches! There were also a great variety of flying cockroaches. Scorpions abounded, and a number of early spiders, which, however, had no spinnerets for web making.[12] Land snails appeared. So too did the first-known step of our own ancestry upon land, the amphibia. As we ascend the higher levels of the Later Palæozoic record, we find the process of air adaptation has gone as far as the appearance of true reptiles amidst the abundant and various amphibia.

The land life of the Upper Palæozoic Age was the life of a green swamp forest without flowers or birds or the noises of modern insects. There were no big land beasts at all; wallowing amphibia and primitive reptiles were the very highest creatures that life had so far produced. Whatever land lay away from the water or high above the water was still altogether barren and lifeless. But steadfastly, generation by generation, life was creeping away from the shallow sea-water of its beginning.

V

CHANGES IN THE WORLD'S CLIMATE

§ 1. _Why Life Must Change Continually._ § 2. _The Sun a Steadfast Star._ § 3. _Changes from Within the Earth._ § 4. _Life May Control Change._

§ 1

The Record of the Rocks is like a great book that has been carelessly misused. All its pages are torn, worn, and defaced, and many are altogether missing. The outline of the story that we sketch here has been pieced together slowly and painfully in an investigation that is still incomplete and still in progress. The Carboniferous Rocks, the "coal-measures," give us a vision of the first great expansion of life over the wet lowlands. Then come the torn pages known as the Permian Rocks (which count as the last of the Palæozoic), that preserve very little for us of the land vestiges of their age. Only after a long interval of time does the history spread out generously again.

It must be borne in mind that great changes of climate have always been in progress, that have sometimes stimulated and sometimes checked life. Every species of living thing is always adapting itself more and more closely to its conditions. And conditions are always changing. There is no finality in adaptation. There is a continuing urgency towards fresh change.

About these changes of climate some explanations are necessary here. They are not regular changes; they are slow fluctuations between heat and cold. The reader must not think that because the sun and earth were once incandescent, the climatic history of the world is a simple story of cooling down. The centre of the earth is certainly very hot to this day, but we feel nothing of that internal heat at the surface; the internal heat, except for volcanoes and hot springs, has not been perceptible at the surface since first the rocks grew solid. Even in the Azoic or Archæozoic Age there are traces in ice-worn rocks and the like of periods of intense cold. Such cold waves have always been going on everywhere, alternately with warmer conditions. And there have been periods of great wetness and periods of great dryness throughout the earth.

A complete account of the causes of these great climatic fluctuations has still to be worked out, but we may perhaps point out some of the chief of them.[13] Prominent among them is the fact that the earth does not spin in a perfect circle round the sun. Its path or orbit is like a hoop that is distorted; it is, roughly speaking, elliptical (ovo-elliptical), and the sun is nearer to one end of the ellipse than the other. It is at a point which is a focus of the ellipse. And the shape of this orbit never remains the same. It is slowly distorted by the attractions of the other planets, for ages it may be nearly circular, for ages it is more or less elliptical. As the ellipse becomes most nearly circular, then the focus becomes most nearly the centre. When the orbit becomes most elliptical, then the position of the sun becomes most remote from the middle or, to use the astronomer's phrase, most eccentric. When the orbit is most nearly circular, then it must be manifest that all the year round the earth must be getting much the same amount of heat from the sun; when the orbit is most distorted, then there will be a season in each year when the earth is nearest the sun (this phase is called _Perihelion_) and getting a great deal of heat comparatively, and a season when it will be at its farthest from the sun (_Aphelion_) and getting very little warmth. A planet at _aphelion_ is travelling its slowest, and its fastest at _perihelion_; so that the hot part of its year will last for a much less time than the cold part of its year. (Sir Robert Ball calculated that the greatest difference possible between the seasons was thirty-three days.) During ages when the orbit is most nearly circular there will therefore be least extremes of climate, and when the orbit is at its greatest eccentricity, there will be an age of cold with great extremes of seasonal temperature. These _changes in the orbit of the earth_ are due to the varying pull of all the planets, and Sir Robert Ball declared himself unable to calculate any regular cycle of orbital change, but Professor G. H. Darwin maintained that it is possible to make out a kind of cycle between greatest and least eccentricity of about 200,000 years.

But this change in the shape of the orbit is only one cause of the change of the world's climate. There are many others that have to be considered with it. As most people know, the change in the seasons is due to the fact that the equator of the earth is inclined at an angle to the plane of its orbit. If the earth stood up straight in its orbit, so that its equator was in the plane of its orbit, there would be no change in the seasons at all. The sun would always be overhead at the equator, and the day and night would each be exactly twelve hours long throughout the year everywhere. It is this inclination which causes the difference in the seasons and the unequal length of the day in summer and winter. There is, according to Laplace, a possible variation of nearly three degrees (from 22° 6' to 24° 50') in this inclination of the equator to the orbit, and when this is at a maximum, the difference between summer and winter is at its greatest. Great importance has been attached to this variation in the inclination of the equator to the orbit by Dr. Croll in his

book _Climate and Time_. At present the angle is 23° 27’. Manifestly when the angle is at its least, the world’s climate, other things being equal, will be most equable.

And as a third important factor there is what is called the _precession of the equinoxes_. This is a slow wabble of the pole of the spinning earth that takes 25,000 odd years. Any one who watches a spinning top as it “sleeps,” will see its axis making a slow circular movement, exactly after the fashion of this circling movement of the earth’s axis. The north pole, therefore, does not always point to the same north point among the stars; its pointing traces out a circle in the heavens every 25,000 years.

Now, there will be times when the earth is at its extreme of aphelion or of perihelion, when one hemisphere will be most turned to the sun in its midsummer position and the other most turned away at its midwinter position. And as the precession of the equinoxes goes on, a time will come when the summer-winter position will come not at aphelion and perihelion, but at the half-way points between them. When the summer of one hemisphere happens at perihelion and the winter at aphelion, it will be clear that the summer of the other hemisphere will happen at aphelion and its winter at perihelion. One hemisphere will have a short hot summer and a very cold winter, and the other a long cold summer and a briefer warmish winter. But when the summer-winter positions come at the half-way point of the orbit, and it is the spring of one hemisphere and the autumn of the other that is at aphelion or perihelion, there will not be the same wide difference between the climate of the two hemispheres.

Here are three wavering systems of change all going on independently of each other; the precession of the equinoxes, the change in the obliquity of the equator to the orbit, and the changes in the eccentricity of the orbit. Each system tends by itself to produce periods of equability and periods of greater climatic contrast. And all these systems of change interplay with each other. When it happens that at the same time the orbit is most nearly circular, the equator is at its least inclination from the plane of the earth’s orbit, and the spring and autumn are at perihelion and aphelion, then all these causes will be conspiring to make climate warm and uniform; there will be least difference of summer and winter. When, on the other hand, the orbit is in its most eccentric stage of deformation, when also the equator is most tilted up and when further the summer and winter are at aphelion and perihelion, then climates will be at their extremest and winter at its bitterest. There will be great accumulations of ice and snow in winter; the heat of the brief hot summer will be partly reflected back into space by the white snow, and it will be unequal to the task of melting all the winter’s ice before the earth spins away once more towards its chilly aphelion. The earth will accumulate cold so long as this conspiracy of extreme conditions continues.

[Illustration: DIAGRAM TO ILLUSTRATE ONE SET OF CAUSES, THE ASTRONOMICAL VARIATIONS, WHICH MAKE THE CLIMATE OF THE WORLD CHANGE SLOWLY BUT CONTINUOUSLY.

It does not change in regular periods. It fluctuates through vast ages. As the world’s climate changes, life must change too or perish.]

So our earth’s climate changes and wavers perpetually as these three systems of influence come together with a common tendency towards warmth or severity, or as they contradict and cancel each other.

We can trace in the Record of the Rocks an irregular series of changes due to the interplay of these influences; there have been great ages when the separate rhythms of these three systems kept them out of agreement and the atmosphere was temperate, ages of world-wide warmth, and other ages when they seemed to concentrate bitterly to their utmost extremity, to freeze out and inflict the utmost stresses and hardship upon life.

And in accordance we find from the record in the rocks that there have been long periods of expansion and multiplication when life flowed and abounded and varied, and harsh ages when there was a great weeding out and disappearance of species, genera, and classes, and the learning of stern lessons by all that survived. Such a propitious conjunction it must have been that gave the age of luxuriant low-grade growth of the coal-measures; such an adverse series of circumstances that chilled the closing æons of the Palæozoic time.

It is probable that the warm spells have been long relatively to the cold ages. Our world to-day seems to be emerging with fluctuations from a prolonged phase of adversity and extreme conditions. Half a million years ahead it may be a winterless world with trees and vegetation even in the polar circles. At present we have no certainty in such a forecast, but later on, as knowledge increases, it may be possible to reckon with more precision, so that our race will make its plans thousands of years ahead to meet the coming changes.

§ 2

Another entirely different cause of changes in the general climate of the earth may be due to variations in the heat of the sun. We do not yet understand what causes the heat of the sun or what sustains that undying fire. It is possible that in the past there have been periods of greater and lesser intensity. About that we know nothing; human experience has been too short; and so far we have been able to find no evidence on this matter in the geological record. On the whole, scientific men are inclined to believe that the sun has blazed with a general steadfastness throughout geological time. It may have been cooling slowly, but, speaking upon the scale of things astronomical, it has certainly not cooled very much.

§ 3

A third great group of causes influencing climate are to be found in the forces within the world itself. Throughout the long history of the earth there has been a continuous wearing down of the hills and mountains by frost and rain and a carrying out of their material to become sedimentary rocks under the seas. There has been a continuous process of wearing down the land and filling up the seas, by which the seas, as they became shallower, must have spread more and more over the land. The reverse process, a process of crumpling and upheaval, has also been in progress, but less regularly. The forces of upheaval have been spasmodic; the forces of wearing down continuous. For long ages there has been comparatively little volcanic upheaval, and then have come periods in which vast mountain chains have been thrust up and the whole outline of land and sea changed. Such a time was the opening stage of the Cainozoic period, in which the Alps, the Himalayas, and the Andes were all thrust up from the sea-level to far beyond their present elevations, and the main outlines of the existing geography of the world were drawn.

Now, a time of high mountains and deep seas would mean a larger dry land surface for the world, and a more restricted sea surface, and a time of low lands would mean a time of wider and shallower seas. High mountains precipitate moisture from the atmosphere and hold it out of circulation as snow and glaciers, while smaller oceans mean a lesser area for surface evaporation. Other things being equal, lowland stages of the world's history would be ages of more general atmospheric moisture than periods of relatively greater height of the mountains and greater depth of the seas. But even small increases in the amount of moisture in the air have a powerful influence upon the transmission of radiant heat through that air. The sun's heat will pass much more freely through dry air than through moist air, and so a greater amount of heat would reach the land surfaces of the globe under the conditions of extremes of elevation and depth, than during the periods of relative lowness and shallowness. Dry phases in the history of the earth mean, therefore, hot days. But they also mean cold nights, because for the same reason that the heat comes abundantly to the earth, it will be abundantly radiated away. Moist phases mean, on the other hand, cooler days and warmer nights. The same principle applies to the seasons, and so a phase of great elevations and depressions of the surface would also be another contributory factor on the side of extreme climatic conditions.

And a stage of greater elevation and depression would intensify its extreme conditions by the gradual accumulation of ice caps upon the polar regions and upon the more elevated mountain masses. This accumulation would be at the expense of the sea, whose surface would thus be further shrunken in comparison with the land.

Here, then, is another set of varying influences that will play in with and help or check the influence of the astronomical variations stated in § 1 and § 2. There are other more localized forces at work into which we cannot go in any detail here, but which will be familiar to the student of the elements of physical geography; the influence of great ocean currents in carrying warmth from equatorial to more temperate latitudes; the interference of mountain chains with the moisture borne by prevalent winds and the like. As in the slow processes of nature these currents are deflected or the mountain chains worn down or displaced by fresh upheavals, the climate over great areas will be changed and all the conditions of life changed with it. Under the incessant slow variations of these astronomical, telluric, and geographical influences life has no rest. As its conditions change it must change or perish.

§ 4

And while we are enumerating the forces that change climate and the conditions of terrestrial life, we may perhaps look ahead a little and add a fourth set of influences, at first unimportant in the history of the world so far as the land surface is concerned, but becoming more important after the age of Reptiles, to which we shall proceed in our next chapter. These are the effects produced upon climate by life itself. Particularly great is the influence of vegetation, and especially that of forests. Every tree is continually transpiring water vapour into the air; the amount of water evaporated in summer by a lake surface is far less than the amount evaporated by the same area of beech forest. As in the later Mesozoic and the Cainozoic Age, great forests spread over the world, their action in keeping the air moist and mitigating and stabilizing climate by keeping the summer cool and the winter mild must have become more and more important. Moreover, forests accumulate and protect soil and so prepare the possibility of agricultural

life.

Water-weeds again may accumulate to choke and deflect rivers, flood and convert great areas into marshes, and so lead to the destruction of forests or the replacement of grass-lands by boggy wildernesses.

Finally, with the appearance of human communities, came what is perhaps the most powerful of all living influences upon climate. By fire and plough and axe man alters his world. By destroying forests and by irrigation man has already affected the climate of great regions of the world's surface. The destruction of forests makes the seasons more extreme; this has happened, for instance, in the northeastern states of the United States of America. Moreover, the soil is no longer protected from the scour of rain, and is washed away, leaving only barren rock beneath. This has happened in Spain and Dalmatia and, some thousands of years earlier, in South Arabia. By irrigation, on the other hand, man restores the desert to life and mitigates climate. This process is going on in Northwest India and Australia. In the future, by making such operations worldwide and systematic, man may be able to control climate to an extent at which as yet we can only guess.

VI

THE AGE OF REPTILES

§ 1. _The Age of Lowland Life._ § 2. _Flying Dragons._ § 3. _The First Birds._ § 4. _An Age of Hardship and Death._ § 5. _The First Appearance of Fur and Feathers._

§ 1

We know that for hundreds of thousands of years the wetness and warmth, the shallow lagoon conditions that made possible the vast accumulations of vegetable matter which, compressed and mummified,[14] are now coal, prevailed over most of the world. There were some cold intervals, it is true; but they did not last long enough to destroy the growths. Then that long age of luxuriant low-grade vegetation drew to its end, and for a time life on the earth seems to have undergone a period of world-wide bleakness.

When the story resumes again, we find life entering upon a fresh phase of richness and expansion. Vegetation has made great advances in the art of living out of water. While the Palæozoic plants of the coal-measures probably grew with swamp water flowing over their roots, the Mesozoic flora from its very outset included palm-like cycads and low-ground conifers that were distinctly land plants growing on soil above the water level. The lower levels of the Mesozoic land were no doubt covered by great fern brakes and shrubby bush and a kind of jungle growth of trees. But there existed as yet no grass, no small flowering plants, no turf nor greensward. Probably the Mesozoic was not an age of very brightly coloured vegetation. It must have had a flora green in the wet season and brown and purple in the dry. There were no gay flowers, no bright autumn tints before the fall of the leaf, because there was as yet no fall of the leaf. And beyond the lower levels the world was still barren, still unclothed, still exposed without any mitigation to the wear and tear of the wind and rain.

When one speaks of conifers in the Mesozoic the reader must not think of the pines and firs that clothe the high mountain slopes of our time. He must think of low-growing evergreens. The mountains were still as bare and lifeless as ever. The only colour effects among the mountains were the colour effects of naked rock, such colours as make the landscape of Colorado so marvellous to-day.

Amidst this spreading vegetation of the lower plains the reptiles were increasing mightily in multitude and variety. They were now in many cases absolutely land animals. There are numerous anatomical points of distinction between a reptile and an amphibian; they held good between such reptiles and amphibians as prevailed in the carboniferous time of the Upper Palæozoic; but the fundamental difference between reptiles and amphibia which matters in this history is that the amphibian must go back to the water to lay its eggs, and that in the early stages of its life it must live in and under water. The reptile, on the other hand, has cut out all the tadpole stages from its life cycle, or, to be more exact, its tadpole stages are got through before the young leave the egg case. The reptile has come out of the water altogether. Some had gone back to it again, just as the hippopotamus and the otter among mammals have gone back, but that is a further extension of the story to which we cannot give much attention in this _Outline_.

[Illustration: Some Mesozoic Reptiles]

In the Palæozoic period, as we have said, life had not spread beyond the swampy river valleys and the borders of sea lagoons and the like; but in the Mesozoic, life was growing ever more accustomed to the thinner medium of the air, was sweeping boldly up over

the plains and towards the hillsides. It is well for the student of human history and the human future to note that. If a disembodied intelligence with no knowledge of the future had come to earth and studied life during the early Palæozoic age, he might very reasonably have concluded that life was absolutely confined to the water, and that it could never spread over the land. It found a way. In the Later Palæozoic Period that visitant might have been equally sure that life could not go beyond the edge of a swamp. The Mesozoic Period would still have found him setting bounds to life far more limited than the bounds that are set to-day. And so to-day, though we mark how life and man are still limited to five miles of air and a depth of perhaps a mile or so of sea, we must not conclude from that present limitation that life, through man, may not presently spread out and up and down to a range of living as yet inconceivable.

[Illustration: Some

Late Mesozoic

Reptiles]

The earliest known reptiles were beasts with great bellies and not very powerful legs, very like their kindred amphibia, wallowing as the crocodile wallows to this day; but in the Mesozoic they soon began to stand up and go stoutly on all fours, and several great sections of them began to balance themselves on tail and hind legs, rather as the kangaroos do now, in order to release the fore limbs for grasping food. The bones of one notable division of reptiles which retained a quadrupedal habit, a division of which many remains have been found in South African and Russian Early Mesozoic deposits, display a number of characters which approach those of the mammalian skeleton, and because of this resemblance to the mammals (beasts) this division is called the _Theriomorpha_ (beastlike). Another division was the crocodile branch, and another developed towards the tortoises and turtles. The _Plesiosaurs_ and _Ichthyosaurs_ were two groups which have left no living representatives; they were huge reptiles returning to a whale-like life in the sea. _Pliosaurus_, one of the largest plesiosaurs, measured thirty feet from snout to tail tip--of which half was neck. The _Mosasaurs_ were a third group of great porpoise-like marine lizards. But the largest and most diversified group of these Mesozoic reptiles was the group we have spoken of as kangaroo-like, the _Dinosaurs_, many of which attained enormous proportions. In bigness these greater _Dinosaurs_ have never been exceeded, although the sea can still show in the whales creatures as great. Some of these, and the largest among them, were herbivorous animals; they browsed on the rushy vegetation and among the ferns and bushes, or they stood up and grasped trees with their fore legs while they devoured the foliage. Among the browsers, for example, were the _Diplodocus carnegii_, which measured eighty=four feet in length, and the _Atlantosaurus_. The _Gigantosaurus_, disinterred by a German expedition in 1912 from rocks in East Africa, was still more colossal. It measured well over a hundred feet! These greater monsters had legs, and they are usually figured as standing up on them; but it is very doubtful if they could have supported their weight in this way, out of water. Buoyed up by water or mud, they may have got along. Another noteworthy type we have figured is the _Triceratops_. There were also a number of great flesh-eaters who preyed upon these herbivores. Of these, _Tyrannosaurus_ seems almost the last word in “frightfulness” among living things. Some species of this genus measured forty feet from snout to tail. Apparently it carried this vast body kangaroo fashion on its tail and hind legs. Probably it reared itself up. Some authorities even suppose that it leapt through the air. If so, it possessed muscles of a quite miraculous quality. A leaping elephant would be a far less astounding idea. Much more probably it waded half submerged in pursuit of the herbivorous river saurians.

§ 2

One special development of the dinosaurian type of reptile was a light, hopping, climbing group of creatures which developed a bat-like web between the fifth finger and the side of the body, which was used in gliding from tree to tree after the fashion of the flying squirrels. These bat-lizards were the _Pterodactyls_. They are often described as _flying_ reptiles, and pictures are drawn of Mesozoic scenery in which they are seen soaring and swooping about. But their breastbone has no keel such as the breastbone of a bird has for the attachment of muscles strong enough for long-sustained flying. They must have flitted about like bats. They must have had a grotesque resemblance to heraldic dragons, and they played the part of bat-like birds in the Mesozoic jungles. But bird-like though they were, they were not birds nor the ancestors of birds. The structure of their wings was altogether different from that of birds. The structure of their wings was that of a hand with one long finger and a web; the wing of a bird is like an arm with feathers projecting from its hind edge. And these Pterodactyls had no feathers.

§ 3

Far less prevalent at this time were certain other truly birdlike creatures, of which the earlier sorts also hopped and clambered and the later sorts skimmed and flew. These were at first--by all the standards of classification--Reptiles. They developed into true birds as they developed wings and as their reptilian scales became long and complicated, fronds rather than scales, and so at last, by much spreading and splitting, feathers. Feathers are the distinctive covering of birds, and they give a power of resisting heat and cold far greater than that of any other integumentary covering except perhaps the thickest fur. At a very early stage this novel covering of feathers, this new heatproof contrivance that life had chanced upon, enabled many species of birds to invade a province for which the pterodactyl was ill equipped. They took to sea fishing--if indeed they did not begin with it--and spread to the north and south polewards beyond the temperature limits set to the true reptiles. The earliest birds seem to have been carnivorous divers and water birds. To this day some of the most primitive bird forms are found among the sea birds of the Arctic and Antarctic seas, and it is among these sea birds that zoologists still find lingering traces of teeth, which have otherwise vanished completely from the beak of the bird.

The earliest known bird (the _Archæopteryx_) had no beak; it had a row of teeth in a jaw like a reptile's. It had three claws at the forward corner of its wing. Its tail too was peculiar. All modern birds have their tail feathers set in a short compact bony rump; the _Archæopteryx_ had a long bony tail with a row of feathers along each side.

§ 4

[Illustration: Archæopteryx

(the earliest known bird)]

This great period of Mesozoic life, this second volume of the book of life, is indeed an amazing story of reptilian life proliferating and developing. But the most striking thing of all the story remains to be told. Right up to the latest Mesozoic Rocks we find all these reptilian orders we have enumerated still flourishing unchallenged. There is no hint of an enemy or competitor to them in the relics we find of their world. Then the record is broken. We do not know how long a time the break represents; many pages may be missing here, pages that may represent some great cataclysmal climatic change. When next we find abundant traces of the land plants and the land animals of the earth, this great multitude of reptile species had gone. For the most part they have left no descendants. They have been "wiped out." The pterodactyls have gone absolutely; of the plesiosaurs and ichthyosaurs none is alive; the mosasaurs have gone; of the lizards a few remain, the monitor of the Dutch East Indies is the largest; all the multitude and diversity of the dinosaurs have vanished. Only the crocodiles and the turtles and tortoises carry on in any quantity into Cainozoic times. The place of all these types in the picture that the Cainozoic fossils presently unfold to us is taken by other animals not closely related to the Mesozoic reptiles and certainly not descended from any of their ruling types. A new kind of life is in possession of the world.

This apparently abrupt ending up of the reptiles is, beyond all question, the most striking revolution in the whole history of the earth before the coming of mankind. It is probably connected with the close of a vast period of equable warm conditions and the onset of a new austerer age, in which the winters were bitterer and the summers brief but hot. The Mesozoic life, animal and vegetable alike, was adapted to warm conditions and capable of little resistance to cold. The new life, on the other hand, was before all things capable of resisting great changes of temperature.

Whatever it was that led to the extinction of the Mesozoic reptiles, it was probably some very far-reaching change indeed, for the life of the seas did at the same time undergo a similar catastrophic alteration. The crescendo and ending of the Reptiles on land was paralleled by the crescendo and ending of the Ammonites, a division of creatures like squids with coiled shells which swarmed in those ancient seas. All through the rocky record of this Mesozoic period there is a vast multitude and variety of these coiled shells; there are hundreds of species, and towards the end of the Mesozoic period they increased in diversity and produced exaggerated types. When the record resumes, these too have gone. So far as the reptiles are concerned, people may perhaps be inclined to argue that they were exterminated because the Mammals that replaced them competed with them, and were more fitted to survive; but nothing of the sort can be true of the Ammonites, because to this day their place has not been taken. Simply they are gone. Unknown conditions made it possible for them to live in the Mesozoic seas, and then some unknown change made life impossible for them. No genus of Ammonite survives to-day of all that vast variety, but there still exists one isolated genus very closely related to the Ammonites, the Pearly Nautilus. It is found, it is to be noted, in the warm waters of the Indian and Pacific oceans.[15]

And as for the Mammals competing with and ousting the less fit reptiles, a struggle of which people talk at times, there is not a scrap of evidence of any such direct competition. To judge by the Record of the Rocks as we know it to-day, there is much more reason for believing that first the reptiles in some inexplicable way perished, and then that later on, after a very hard time for all life upon the earth, the mammals, as conditions became more genial again, developed and spread to fill the vacant world.

§ 5

Were there mammals in the Mesozoic period?

This is a question not yet to be answered precisely. Patiently and steadily the geologists gather fresh evidence and reason out completer conclusions. At any time some new deposit may reveal fossils that will illuminate this question. Certainly either mammals, or the ancestors of the mammals, must have lived throughout the Mesozoic period. In the very opening chapter of the Mesozoic volume of the Record there were those Theriomorphous Reptiles to which we have already alluded, and in the later Mesozoic a number of small jaw-bones are found, entirely mammalian in character. But there is not a scrap, not a bone, to suggest that there lived any Mesozoic Mammal which could look a dinosaur in the face. The Mesozoic mammals or mammal-like reptiles--for we do not know clearly which they were--seem to have been all obscure little beasts of the size of mice and rats, more like a down-trodden order of reptiles than a distinct class; probably they still laid eggs and were developing only slowly their distinctive covering of hair. They lived away from big waters, and perhaps in the desolate uplands, as marmots do now; probably they lived there beyond the pursuit of the carnivorous dinosaurs. Some perhaps went on all fours, some chiefly went on their hind legs and clambered with their fore limbs. They became fossils only so occasionally that chance has not yet revealed a single complete skeleton in the whole vast record of the Mesozoic rocks by which to check these guesses.

[Illustration: _Hesperornis_

(_Reptilian wingless water-bird_)]

These little Theriomorphs, these ancestral mammals, developed hair. Hairs, like feathers, are long and elaborately specialized scales. Hair is perhaps the clue to the salvation of the early mammals. Leading lives upon the margin of existence, away from the marshes and the warmth, they developed an outer covering only second in its warmth-holding (or heat-resisting) powers to the down and feathers of the Arctic sea-birds. And so they held out through the age of hardship between the Mesozoic and Cainozoic ages, to which most of the true reptiles succumbed.

All the main characteristics of this flora and sea and land fauna that came to an end with the end of the Mesozoic age were such as were adapted to an equable climate and to shallow and swampy regions. But in the case of their Cainozoic successors, both hair and feathers gave _a power of resistance to variable temperatures_ such as no reptile possessed, and with it they gave a range far greater than any animal had hitherto attained.

The range of life of the Lower Palæozoic Period was confined to warm water.

The range of life of the Upper Palæozoic Period was confined to warm water or to warm swamps and wet ground.

The range of life of the Mesozoic Period as we know it was confined to water and fairly low-lying valley regions under equable conditions.

Meanwhile in each of these periods there were types involuntarily extending the range of life beyond the limits prevailing in that period; and when ages of extreme conditions prevailed, it was these marginal types which survived to inherit the depopulated world.

That perhaps is the most general statement we can make about the story of the geological record; it is a story of widening range. Classes, genera, and species of animals appear and disappear, but the range widens. It widens always. Life has never had so great a range as it has to-day. Life to-day, in the form of man, goes higher in the air than it has ever done before; man’s geographical range is from pole to pole, he goes under the water in submarines, he sounds the cold, lifeless darkness of the deepest seas, he burrows into virgin levels of the rocks, and in thought and knowledge he pierces to the centre of the earth and reaches out to the uttermost star. Yet in all the relics of the Mesozoic time we find no certain memorials of his ancestry. His ancestors, like the ancestors of all the kindred mammals, must have been creatures so rare, so obscure, and so remote that they have left scarcely a trace amidst the abundant vestiges of the monsters that wallowed rejoicing in the steamy air and lush vegetation of the Mesozoic lagoons, or crawled or hopped or fluttered over the great river plains of that time.[16]

VII

THE AGE OF MAMMALS

§ 1. _A New Age of Light._ § 2. _Tradition Comes into the World._ § 3. _An Age of Brain Growth._ § 4. _The World Grows Hard Again._ § 5. _Chronology of the Ice Age._

§ 1

The third great division of the geological record, the Cainozoic, opens with a world already physically very like the world we live in to-day. Probably the day was at first still perceptibly shorter, but the scenery had become very modern in its character. Climate was, of course, undergoing, age by age, its incessant and irregular variations; lands that are temperate to-day have passed, since the Cainozoic age began, through phases of great warmth, intense cold, and extreme dryness; but the landscape, if it altered, altered to nothing that cannot still be paralleled to-day in some part of the world or other. In the place of the cycads, sequoias, and strange conifers of the Mesozoic, the plant names that now appear in the lists of fossils include birch, beech, holly, tulip trees, ivy, sweet gum, bread-fruit trees. Flowers had developed concurrently with bees and butterflies. Palms were now very important. Such plants had already been in evidence in the later levels of the (American Cretaceous) Mesozoic, but now they dominated the scene altogether. Grass was becoming a great fact in the world. Certain grasses, too, had appeared in the later Mesozoic, but only with the Cainozoic period came grass plains and turf spreading wide over a world that was once barren stone.

The period opened with a long phase of considerable warmth; then the world cooled. And in the opening of this third part of the record, this Cainozoic period, a gigantic crumpling of the earth's crust and an upheaval of mountain ranges was in progress. The Alps, the Andes, the Himalayas, are all Cainozoic mountain ranges; the background of an early Cainozoic scene, to be typical, should display an active volcano or so. It must have been an age of great earthquakes.

Geologists make certain main divisions of the Cainozoic period, and it will be convenient to name them here and to indicate their climate. First comes the _Eocene_ (dawn of recent life), an age of exceptional warmth in the world's history, subdivided into an older and newer Eocene; then the _Oligocene_ (but little of recent life), in which the climate was still equable. The _Miocene_ (with living species still in a minority) was the great age of mountain building, and the general temperature was falling. In the _Pliocene_ (more living than extinct species), climate was very much at its present phase; but with the _Pleistocene_ (a great majority of living species) there set in a long period of extreme conditions--it was the Great Ice Age. Glaciers spread from the poles towards the equator, until England to the Thames was covered in ice. Thereafter to our own time came a period of partial recovery.

§ 2

In the forests and following the grass over the Eocene plains there appeared for the first time a variety and abundance of mammals. Before we proceed to any description of these mammals, it may be well to note in general terms what a mammal is.

[Illustration: Some Oligocene Mammals]

From the appearance of the vertebrated animals in the Lower Palæozoic Age, when the fish first swarmed out into the sea, there has been a steady progressive development of vertebrated creatures. A fish is a vertebrated animal that breathes by gills and can live only in water. An amphibian may be described as a fish that has added to its gill-breathing the power of breathing air with its swimming-bladder in adult life, and that has also developed limbs with five toes to them in place of the fins of a fish. A tadpole is for a time a fish; it becomes a land creature as it develops. A reptile is a further stage in this detachment from water; it is an amphibian that is no longer amphibious; it passes through its tadpole stage--its fish stage, that is--in an egg. From the beginning it must breathe in air; it can never breathe under water as a tadpole can do. Now, a modern mammal is really a sort of reptile that has developed a peculiarly effective protective covering, hair; and that also retains its eggs in the body until they hatch so that it brings forth living young (viviparous), and even after birth it cares for them and feeds them by its mammæ for a longer or shorter period. Some reptiles, some vipers for example, are viviparous, but none stand by their young as the real mammals do. Both the birds and the mammals, which escaped whatever destructive forces made an end to the Mesozoic reptiles, and which survived to dominate the Cainozoic world, have these two things in common: first, a far more effective protection against changes of temperature than any other variation of the reptile type ever produced; and, secondly, a peculiar care for their eggs, the bird by incubation and the mammal by retention, and a disposition to look after the young for a certain period after hatching or birth. There is by comparison the greatest carelessness about offspring in the reptile.

Hair was evidently the earliest distinction of the mammals from the rest of the reptiles. It is doubtful if the particular Theriodont reptiles who were developing hair in the early Mesozoic were viviparous. Two mammals survive to this day which not only do not suckle their young,[17] but which lay eggs, the _Ornithorhynchus_ and the _Echidna_, and in the Eocene there were a number of allied forms. They are the survivors of what was probably a much larger number and variety of small egg-laying hairy creatures, hairy reptiles, hoppers, climbers, and runners, which included the Mesozoic ancestors of all existing mammals up to and including man.

Now we may put the essential facts about mammalian reproduction in another way. _The mammal is a family animal._ And the family habit involved the possibility of a new sort of continuity of experience in the world. Compare the completely closed-in life of an individual lizard with the life of even a quite lowly mammal of almost any kind. The former has no mental continuity with anything beyond itself; it is a little self-contained globe of experience that serves its purpose and ends; but the latter “picks up” from its mother, and “hands on” to its offspring. All the mammals, except for the two genera we have named, had already before the lower Eocene age arrived at this stage of pre-adult dependence and imitation. They were all more or less imitative in youth and capable of a certain modicum of education; they all, as a part of their development, received a certain amount of care and example and even direction from their mother. This is as true of the hyæna and rhinoceros as it is of the dog or man; the difference of educability is enormous, but the fact of protection and educability in the young stage is undeniable. So far as the vertebrated animals go, these new mammals, with their viviparous, young-protecting disposition, and these new birds, with their incubating, young-protecting disposition, introduce at the opening of the Cainozoic period a fresh thing into the expanding story of life, namely, social association, the addition to hard and inflexible instinct of _tradition_, and the nervous organization necessary to receive tradition.

All the innovations that come into the history of life begin very humbly. The supply of blood-vessels in the swimming-bladder of the mudfish in the lower Palæozoic torrent-river, that enabled it to pull through a season of drought, would have seemed at that time to that bodiless visitant to our planet we have already imagined, a very unimportant side fact in that ancient world of great sharks and plated fishes, sea-scorpions, and coral reefs and seaweed; but it opened the narrow way by which the land vertebrates arose to predominance. The mudfish would have seemed then a poor refugee from the too crowded and aggressive life of the sea. But once lungs were launched into the world, every line of descent that had lungs went on improving them. So, too, in the upper Palæozoic, the fact that some of the Amphibia were losing their “amphibiousness” by a retardation of hatching of their eggs, would have appeared a mere response to the distressful dangers that threatened the young tadpole. Yet that prepared the conquest of the dry land for the triumphant multitude of the Mesozoic reptiles. It opened a new direction towards a free and vigorous land-life along which all the reptilian animals moved. And this viviparous, young-tending training that the ancestral mammalia underwent during that age of inferiority and hardship for them, set going in the world a new continuity of perception, of which even man to-day only begins to appreciate the significance.

§ 3

A number of types of mammal already appear in the Eocene. Some are differentiating in one direction, and some in another, some are perfecting themselves as herbivorous quadrupeds, some leap and climb among the trees, some turn back to the water to swim, but all types are unconsciously exploiting and developing the brain which is the instrument of this new power of acquisition and educability. In the Eocene rocks are found small early predecessors of the horse (Eohippus), tiny camels, pigs, early tapirs, early hedgehogs, monkeys and lemurs, opossums and carnivores. Now, all these were more or less ancestral to living forms, and all have brains relatively much smaller than their living representatives. There is, for instance, an early rhinoceros, _Titanotherium_, with a brain not one tenth the size of that of the existing rhinoceros. The latter is by no means a perfect type of the attentive and submissive student, but even so it is ten times more observant and teachable than its predecessor. This sort of thing is true of all the orders and families that survive until to-day. All the Cainozoic mammals were doing this one thing in common under the urgency of a common necessity; they were all growing brain. It was a parallel advance. In the same order or family to-day, the brain is usually from six to ten times what it was in the Eocene ancestor.

Grass was now spreading over the world, and with this extension arose some huge graminivorous brutes of which no representative survives to-day. Such were the Uintatheres and the Titanotheres. And in pursuit of such beasts came great swarms of primitive dogs, some as big as bears, and the first cats, one in particular (_Smilodon_), a small fierce-looking creature with big knife-like canines, the first sabre-toothed tiger, which was to develop into greater things. American deposits in the Miocene display a great variety of camels, giraffe camels with long necks, gazelle camels, llamas, and true camels. North America, throughout most of the Cainozoic period, appears to have been in open and easy continuation with Asia, and when at last the glaciers of the Great

Ice Age, and then the Bering Strait, came to separate the two great continental regions, the last camels were left in the old world and the llamas in the new.

In the Eocene the first ancestors of the elephants appear in northern Africa as snouted creatures; the elephant's trunk dawned on the world in the Miocene.

One group of creatures is of peculiar interest in a history that is mainly to be the story of mankind. We find fossils in the Eocene of monkeys and lemurs, but of one particular creature we have as yet not a single bone. It was half ape, half monkey; it clambered about the trees and ran, and probably ran well, on its hind legs upon the ground. It was small-brained by our present standards, but it had clever hands with which it handled fruits and beat nuts upon the rocks and perhaps caught up sticks and stones to smite its fellows. It was our ancestor.

§ 4

Through millions of simian generations the spinning world circled about the sun; slowly its orbit, which may have been nearly circular during the equable days of the early Eocene, was drawn by the attraction of the circling outer planets into a more elliptical form. Its axis of rotation, which had always heeled over to the plane of its orbit, as the mast of a yacht under sail heels over to the level of the water, heeled over by imperceptible degrees a little more and a little more. And each year its summer point shifted a little further from perihelion round its path. These were small changes to happen to a one-inch ball, circling at a distance of 330 yards from a flaming sun nine feet across, in the course of a few million years. They were changes an immortal astronomer in Neptune, watching the earth from age to age, would have found almost imperceptible. But from the point of view of the surviving mammalian life of the Miocene, they mattered profoundly. Age by age the winters grew on the whole colder and harder and a few hours longer relatively to the summers in a thousand years; age by age the summers grew briefer. On an average the winter snow lay a little later in the spring in each century, and the glaciers in the northern mountains gained an inch this year, receded half an inch next, came on again a few inches....

[Illustration: Miocene Mammals]

The Record of the Rocks tells of the increasing chill. The Pliocene was a temperate time, and many of the warmth-loving plants and animals had gone. Then, rather less deliberately, some feet or some inches every year, the ice came on.

An arctic fauna, musk ox, woolly mammoth, woolly rhinoceros, lemming, ushers in the Pleistocene. Over North America, and Europe and Asia alike, the ice advanced. For thousands of years it advanced, and then for thousands of years it receded, to advance again. Europe down to the Baltic shores, Britain down to the Thames, North America down to New England, and more centrally as far south as Ohio, lay for ages under the glaciers. Enormous volumes of water were withdrawn from the ocean and locked up in those stupendous ice caps so as to cause a world-wide change in the relative levels of land and sea. Vast areas were exposed that are now again sea bottom.

The world to-day is still coming slowly out of the last of four great waves of cold. It is not growing warmer steadily. There have been fluctuations. Remains of bog oaks, for example, which grew two or three thousand years ago, are found in Scotland at latitudes in which not even a stunted oak will grow at the present time. And it is amidst this crescendo and diminuendo of frost and snow that we first recognize forms that are like the forms of men. The Age of Mammals culminated in ice and hardship and man.

§ 5

Guesses about the duration of the great age of cold are still vague, but in the Time diagram on page 60 we follow H. F. Osborn in accepting as our guides the estimates of Albrecht Penck[18] and C. A. Reeds.[19]

[Illustration: TIME DIAGRAM OF THE GLACIAL AGES.

The reader should compare this diagram carefully with our first time diagram, Chapter II, § 2, p. 14. That diagram, if it were on the same scale as this one, would be between 41 and 410 feet long. The position of the Eoanthropus is very uncertain: it may be as early as the Pliocene]

BOOK II

THE MAKING OF MEN

VIII

THE ANCESTRY OF MAN[20]

§ 1. _Man Descended from a Walking Ape._ § 2. _First Traces of Man-like Creatures._ § 3. _The Heidelberg Sub-man._ § 4. _The Piltdown Sub-man._ § 5. _The Riddle of the Piltdown Remains._

§ 1

The origin of man is still very obscure. It is commonly asserted that he is “descended” from some man-like ape such as the chimpanzee, the orang-utang, or the gorilla, but that of course is as reasonable as saying that I am “descended” from some Hottentot or Esquimaux as young or younger than myself. Others, alive to this objection, say that man is descended from the common ancestor of the chimpanzee, the orang-utang, and the gorilla. Some “anthropologists” have even indulged in a speculation whether mankind may not have a double or treble origin; the negro being descended from a gorilla-like ancestor, the Chinese from a chimpanzee-like ancestor, and so on. These are very fanciful ideas, to be mentioned only to be dismissed. It was formerly assumed that the human ancestor was “probably arboreal,” but the current idea among those who are qualified to form an opinion seems to be that he was a “ground ape,” and that the existing apes have developed in the arboreal direction.

[Illustration: Early Pleistocene Animals]

Of course, if one puts the skeleton of a man and the skeleton of a gorilla side by side, their general resemblance is so great that it is easy to jump to the conclusion that the former is derived from such a type as the latter by a process of brain growth and general refinement. But if one examines closely into one or two differences, the gap widens. Particular stress has recently been laid upon the tread of the foot. Man walks on his toe and his heel; his great toe is his chief lever in walking, as the reader may see for himself if he examines his own footprints on the bathroom floor and notes where the pressure falls as the footprints become fainter. His great toe is the king of his toes.

Among all the apes and monkeys, the only group that have their great toes developed on anything like the same fashion as man are some of the lemurs. The baboon walks on a flat foot and all his toes, using his middle toe as his chief throw off, much as the bear does. And the three great apes all walk on the outer side of the foot in a very different manner from the walking of man.

[Illustration: POSSIBLE APPEARANCE OF THE SUB-MAN _PITHECANTHROPUS_.

The face, jaws, and teeth are mere guess work (_see_ text). The creature may have been much less human looking than this.]

The great apes are forest dwellers; their walking even now is incidental; they are at their happiest among trees. They have very distinctive methods of climbing; they swing by the arms much more than the monkeys do, and do not, like the latter, take off with a spring from the feet. They have a specially developed climbing style of their own. But man walks so well and runs so swiftly as to suggest a very long ancestry upon the ground. Also, he does not climb well now; he climbs with caution and hesitation. His ancestors may have been running creatures for long ages. Moreover, it is to be noted that he does not swim naturally; he has to learn to swim, and that seems to point to a long-standing separation from rivers and lakes and the sea. Almost certainly that ancestor was a smaller and slighter creature than its human descendants. Conceivably the human ancestor at the opening of the Cainozoic period was a running ape, living chiefly on the ground, hiding among rocks rather than trees. It could still climb trees well and hold things between its great toe and its second toe (as the Japanese can to this day), but it was already coming down to the ground again from a still remoter, a Mesozoic arboreal ancestry. It is quite understandable that such a creature would very rarely die in water in such circumstances as to leave bones to become fossilized.

It must always be borne in mind that among its many other imperfections the Geological Record necessarily contains abundant traces only of water or marsh creatures or of creatures easily and frequently drowned. The same reasons that make any traces of the ancestors of the mammals rare and relatively unprocurable in the Mesozoic rocks, probably make the traces of possible human ancestors rare and relatively unprocurable in the Cainozoic rocks. Such knowledge as we have of the earliest men, for example, is almost entirely got from a few caves, into which they went and in which they left their traces. Until the hard Pleistocene times they lived and died in the open, and their bodies were consumed or decayed altogether.

But it is well to bear in mind also that the Record of the Rocks has still to be thoroughly examined. It has been studied only for a few generations, and by only a few men in each generation. Most men have been too busy making war, making profits out of their neighbours, toiling at work that machinery could do for them in a tenth of the time, or simply playing about, to give any attention to these more interesting things. There may be, there probably are, thousands of deposits still untouched containing countless fragments and vestiges of man and his progenitors. In Asia particularly, in India or the East Indies, there may be hidden the most illuminating clues. What we know to-day of early men is the merest scrap of what will presently be known.

The apes and monkeys already appear to have been differentiated at the beginning of the Cainozoic Age, and there are a number of Oligocene and Miocene apes whose relations to one another and to the human line have still to be made out. Among these we may mention _Dryopithecus_ of the Miocene Age, with a very human-looking jaw. In the Siwalik Hills of northern India remains of some very interesting apes have been found, of which _Sivapithecus_ and _Palæopithecus_ were possibly related closely to the human ancestor. Possibly these animals already used implements. Charles Darwin represents baboons as opening nuts by breaking them with stones, using stakes to prize up rocks in the hunt for insects, and striking blows with sticks and stones.[21] The chimpanzee makes itself a sort of tree hut by intertwining branches. Stones apparently chipped for use have been found in strata of Oligocene Age at Boncelles in Belgium. Possibly the implement-using disposition was already present in the Mesozoic ancestry from which we are descended.[22]

§ 2

Among the earliest evidences of some creature, either human or at least more man-like than any living ape upon earth, are a number of flints and stones very roughly chipped and shaped so as to be held in the hand. These were probably used as hand-axes. These early implements (“Eoliths”) are often so crude and simple that there was for a long time a controversy whether they were to be regarded as natural or artificial productions.[23] The date of the earliest of them is put by geologists as Pliocene--that is to say, _before the First Glacial Age_. They occur also throughout the First Interglacial period. We know of no bones or other remains in Europe or America of the quasi-human beings of half a million years ago, who made and used these implements. They used them to hammer with, perhaps they used them to fight with, and perhaps they used bits of wood for similar purposes.[24]

But at Trinil, in Java, in strata which are said to correspond either to the later Pliocene or to the American and European First Ice Age, there have been found some scattered bones of a creature, such as the makers of these early implements may have been. The top of a skull, some teeth, and a thigh-bone have been found. The skull shows a brain-case about half-way in size between that of the chimpanzee and man, but the thigh-bone is that of a creature as well adapted to standing and running as a man, and as free, therefore, to use its hands. The creature was not a man, nor was it an arboreal ape like the chimpanzee. It was a walking ape. It has been named by naturalists _Pithecanthropus erectus_ (the walking ape-man). We cannot say that it is a direct human ancestor, but we may guess that the creatures who scattered these first stone tools over the world must have been closely similar and kindred, and that our ancestor was a beast of like kind. This little trayful of bony fragments from Trinil is, at present, apart from stone implements, the oldest relic of early humanity, or of the close blood relations of early humanity, that is known.

While these early men or “sub-men” were running about Europe four or five hundred thousand years ago, there were mammoths, rhinoceroses, a huge hippopotamus, a giant beaver, and a bison and wild cattle in their world. There were also wild horses, and the sabre-toothed tiger still abounded. There are no traces of lions or true tigers at that time in Europe, but there were bears, otters, wolves, and a wild boar. It may be that the early sub-man sometimes played jackal to the sabre-toothed tiger, and finished up the bodies on which the latter had gorged itself.[25]

§ 3

After this first glimpse of something at least sub-human in the record of geology, there is not another fragment of human or man-like bone yet known from that record for an interval of hundreds of thousands of years. It is not until we reach deposits which are stated to be of the Second Interglacial period, 200,000 years later, 200,000 or 250,000 years ago, that another little scrap of bone comes to hand. Then we find a jaw-bone.

This jaw-bone was found in a sandpit near Heidelberg, at a depth of eighty feet from the surface,[26] and it is not the jaw-bone of a man as we understand man, but it is man-like in every respect, except that it has absolutely no trace of a chin; it is more massive than a man’s, and its narrowness behind could not, it is thought, have given the tongue sufficient play for articulate speech. It is not

an ape's jaw-bone; the teeth are human. The owner of this jaw-bone has been variously named _Homo Heidelbergensis_ and _Palæoanthropus Heidelbergensis_, according to the estimate formed of its humanity or sub-humanity by various authorities. He lived in a world not remotely unlike the world of the still earlier sub-man of the first implements; the deposits in which it is found show that there were elephants, horses, rhinoceroses, bison, a moose, and so forth with it in the world, but the sabre-toothed tiger was declining and the lion was spreading over Europe. The implements of this period (known as the Chellean period) are a very considerable advance upon those of the Pliocene Age. They are well made but _very much bigger_ than any truly human implements. The Heidelberg man may have had a very big body and large forelimbs. He may have been a woolly strange-looking creature.

§ 4

We must turn over the Record for, it may be, another 100,000 years for the next remains of anything human or sub-human. Then in a deposit ascribed to the Third Interglacial period, which may have begun 100,000 years ago and lasted 50,000 years,[27] the smashed pieces of a whole skull turn up. The deposit is a gravel which may have been derived from the washing out of still earlier gravel strata and this skull fragment may be in reality as old as the First Glacial period. The bony remains discovered at Piltdown in Sussex display a creature still ascending only very gradually from the sub-human.

The first scraps of this skull were found in an excavation for road gravel in Sussex. Bit by bit other fragments of this skull were hunted out from the quarry heaps until most of it could be pieced together. It is a thick skull, thicker than that of any living race of men, and it has a brain capacity intermediate between that of Pithecanthropus and man. This creature has been named _Eoanthropus_, the dawn man. In the same gravel-pits were found teeth of rhinoceros, hippopotamus, and the leg-bone of a deer with marks upon it that may be cuts. A curious bat-shaped instrument of elephant bone has also been found.[28]

There was, moreover, a jaw-bone among these scattered remains, which was at first assumed naturally enough to belong to _Eoanthropus_, but which it was afterwards suggested was probably that of a chimpanzee. It is extraordinarily like that of a chimpanzee, but Dr. Keith, one of the greatest authorities in these questions, assigns it, after an exhaustive analysis in his _Antiquity of Man_ (1915), to the skull with which it is found. It is, as a jaw-bone, far less human in character than the jaw of the much more ancient _Homo Heidelbergensis_, but the teeth are in some respects more like those of living men.

[Illustration: DIAGRAM TO ILLUSTRATE THE RIDDLE OF THE PILTDOWN SUB-MAN.]

Dr. Keith, swayed by the jaw-bone, does not think that _Eoanthropus_, in spite of its name, is a creature in the direct ancestry of man. Much less is it an intermediate form between the Heidelberg man and the Neanderthal man we shall presently describe. It was only related to the true ancestor of man as the orang is related to the chimpanzee. It was one of a number of sub-human running apes of more than ape-like intelligence, and if it was not on the line royal, it was at any rate a very close collateral.

After this glimpse of a skull, the Record for very many centuries gives nothing but flint implements, which improve steadily in quality. A very characteristic form is shaped like a sole, with one flat side stricken off at one blow and the other side worked. The archæologists, as the Record continues, are presently able to distinguish scrapers, borers, knives, darts, throwing stones, and the like. Progress is now more rapid; in a few centuries the shape of the hand-axe shows distinct and recognizable improvements. And then comes quite a number of remains. The Fourth Glacial Age is rising towards its maximum. Man is taking to caves and leaving vestiges there; at Krapina in Croatia, at Neanderthal near Düsseldorf, at Spy, human remains have been found, skulls and bones of a creature that is certainly a man. Somewhere about 50,000 years ago, if not earlier, appeared _Homo Neanderthalensis_ (also called _Homo antiquus_ and _Homo primigenius_), a quite passable human being. His thumb was not quite equal in flexibility and usefulness to a human thumb, he stooped forward, and could not hold his head erect, as all living men do, he was chinless and perhaps incapable of speech, there were curious differences about the enamel and the roots of his teeth from those of all living men, he was very thick-set, he was, indeed, not quite of the human species; but there is no dispute about his attribution to the genus _Homo_. He was certainly not descended from Eoanthropus, but his jaw-bone is so like the Heidelberg jaw-bone as to make it possible that the clumsier and heavier _Homo Heidelbergensis_, a thousand centuries before him, was of his blood and race.

§ 5

Upon this question of the Piltdown jaw-bone, it may be of interest to quote here a letter to the writer from Sir Ray Lankester, discussing the question in a familiar and luminous manner. It will enable the reader to gauge the extent and quality of the evidence that we possess at present upon the nature of these early human and sub-human animals. Upon these fragile Piltdown fragments

alone more than a hundred books, pamphlets, and papers have been written. These scraps of bone are guarded more carefully from theft and wilful damage than the most precious jewels, and in the museum cases one sees only carefully executed _fac-similes_.

“As to the Piltdown jaw-bone, the best study of it is that by Smith Woodward, who first described it and the canine found later. The jaw is imperfect in front, but has the broad, flat symphysis of the Apes. G. S. Miller, an American anthropologist, has made a very good comparison of it with a chimpanzee’s jaw, and concludes that it is a chimpanzee’s. (His monograph is in the _Am. Jour. of Phys. Anthrop._, vol. i, no. 1.) The one point in the Piltdown jaw itself against chimpanzee identification is the smooth, flat, worn surface of the molars. This is a human character, and is due to lateral movement of the jaw, and hence rubbing down of the tubercles of the molars. This is not worth much. But the serious question is, are we to associate this jaw with the cranium found close by it? If so, it is certainly not chimpanzee nor close to the Apes, but decidedly hominid. Two other small fragments of crania and a few more teeth have been found in the gravel two miles from Piltdown, which agree with the Piltdown cranium in having superciliary ridges fairly strong for a human skull, but not anything like the great superciliary ridges of Apes. The fact one has to face is this; here you have an imperfect cranium, very thick-walled and of small cubical contents (1100 or so), but much larger in that respect than any ape’s. A few yards distant from it in the same layer of gravel is found a jaw-bone having rather large pointed canines, a flat, broad symphysis, and other points about the inner face of the ramus and ridges which resemble those of the chimpanzee. Which is the more likely: (_a_) that these two novel fragments tending apewards from man were parts of the same individual; or (_b_), that the sweeping of the Wealden valley has brought there together a half-jaw and a broken cranium _both_ more ape-like in character than any known human corresponding bits, and yet derived from two separate anthropoid beasts, one (the jaw) more simian, and the other (the cranium) much less so? As to the probabilities, we must remember that this patch of gravel at Piltdown, clearly and definitely, is a wash-up of remains of various later tertiary and post-tertiary deposits. It contains fragments of Miocene mastodon and rhinoceros teeth. These latter differ entirely in mineral character from the Eoanthropus jaw and the cranium. But (and this needs re-examination and _chemical_ analysis) the Piltdown jaw and the Piltdown cranium do not seem to me to be quite alike in their mineral condition. The jaw is more deeply iron-stained, and I should say (but not confidently), harder than the cranium. Now, it is easy to attribute too much importance to that difference, since in a patch of iron-stained gravel, such as that at Piltdown, the soaking of water and iron salts into bones embedded may be much greater in one spot than in another only a yard off, or a few inches deeper!

“So I think we are stumped and baffled! The most prudent way is to keep the jaw and the cranium apart in all argument about them. On the other hand, on the principle that hypotheses are not to be multiplied beyond necessity, there is a case for regarding the two--jaw and cranium--as having been parts of one beast--or man.”

To which Sir H. H. Johnston adds: “Against the chimpanzee hypothesis it must be borne in mind that so far no living chimpanzee or fossil chimpanzee-like remains have been found nearer England than north equatorial Africa or North-west India, and no remains of great apes at all nearer than Southern France and the upper Rhine--and those widely different from the _Eoanthropus_ jaw.”

IX

THE NEANDERTHAL MEN, AN EXTINCT RACE

(The Early Palæolithic Age[29])

§ 1. _The World 50,000 Years Ago._ § 2. _The Daily Life of the First Men._ § 3. _The Last Palæolithic Men._

§ 1

In the time of the Third Interglacial period the outline of Europe and western Asia was very different from what it is to-day. Vast areas to the west and northwest which are now under the Atlantic waters were then dry land; the Irish Sea and the North Sea were river valleys. Over these northern areas there spread and receded and spread again a great ice cap such as covers central Greenland to-day (see Map, on page 77). This vast ice cap, which covered both polar regions of the earth, withdrew huge masses of water from the ocean, and the sea-level consequently fell, exposing great areas of land that are now submerged again. The Mediterranean area was probably a great valley below the general sea-level, containing two inland seas cut off from the general ocean. The climate of this Mediterranean basin was perhaps cold temperate, and the region of the Sahara to the south was not then a desert of baked rock and blown sand, but a well-watered and fertile country. Between the ice sheets to the north and the Alps and Mediterranean valley to the south stretched a bleak wilderness whose climate changed from harshness to a mild

kindliness and then hardened again for the Fourth Glacial Age.

Across this wilderness, which is now the great plain of Europe, wandered a various fauna. At first there were hippopotami, rhinoceroses, mammoths, and elephants. The sabre-toothed tiger was diminishing towards extinction. Then, as the air chilled, the hippopotamus, and then other warmth-loving creatures, ceased to come so far north, and the sabre-toothed tiger disappeared altogether. The woolly mammoth, the woolly rhinoceros, the musk ox, the bison, the aurochs, and the reindeer became prevalent, and the temperate vegetation gave place to plants of a more arctic type. The glaciers spread southward to the maximum of the Fourth Glacial Age (about 50,000 years ago), and then receded again. In the earlier phase, the Third Interglacial period, a certain number of small family groups of men (_Homo Neanderthalensis_) and probably of sub-men (_Eoanthropus_) wandered over the land, leaving nothing but their flint implements to witness to their presence. They probably used a multitude and variety of wooden implements also; they had probably learnt much about the shapes of objects and the use of different shapes from wood, knowledge which they afterwards applied to stone; but none of this wooden material has survived; we can only speculate about its forms and uses. As the weather hardened to its maximum of severity, the Neanderthal men, already it would seem acquainted with the use of fire, began to seek shelter under rock ledges and in caves--and so leave remains behind them. Hitherto they had been accustomed to squat in the open about the fire, and near their water supply. But they were sufficiently intelligent to adapt themselves to the new and harder conditions. (As for the sub-men, they seem to have succumbed to the stresses of this Fourth Glacial Age altogether. At any rate, the rudest type of Palæolithic implements presently disappears.)

[Illustration: THIS MAP REPRESENTS THE PRESENT STATE OF OUR KNOWLEDGE OF THE GEOGRAPHY OF EUROPE AND WESTERN ASIA AT A PERIOD WHICH WE GUESS TO BE ABOUT 50,000 YEARS AGO, THE NEANDERTHALER AGE.

Much of this map is of course speculative, but its broad outlines must be fairly like those of the world in which men first became men.]

Not merely man was taking to the caves. This period also had a cave lion, a cave bear, and a cave hyæna. These creatures had to be driven out of the caves and kept out of the caves in which these early men wanted to squat and hide; and no doubt fire was an effective method of eviction and protection. Probably early men did not go deeply into the caves, because they had no means of lighting their recesses. They got in far enough to be out of the weather, and stored wood and food in odd corners. Perhaps they barricaded the cave mouths. Their only available light for going deeply into the caverns would be torches.

[Illustration: Neanderthal Man]

What did these Neanderthal men hunt? Their only possible weapons for killing such giant creatures as the mammoth or the cave bear, or even the reindeer, were spears of wood, wooden clubs, and those big pieces of flint they left behind them, the “Chellean” and “Mousterian” implements;[30] and probably their usual quarry was smaller game. But they did certainly eat the flesh of the big beasts when they had a chance, and perhaps they followed them when sick or when wounded by combats, or took advantage of them when they were bogged or in trouble with ice or water. (The Labrador Indians still kill the caribou with spears at awkward river crossings.) At Dewlish in Dorset, an artificial trench has been found which is supposed to have been a Palæolithic trap for elephants.[31] We know that the Neanderthalers partly ate their kill where it fell; but they brought back the big marrow bones to the cave to crack and eat at leisure, because few ribs and vertebræ are found in the caves, but great quantities of cracked and split long bones. They used skins to wrap about them, and the women probably dressed the skins.

We know also that they were right-handed like modern men, because the left side of the brain (which serves the right side of the body) is bigger than the right. But while the back parts of the brain which deal with sight and touch and the energy of the body are well developed, the front parts, which are connected with thought and speech, are comparatively small. It was as big a brain as ours, but different. This species of _Homo_ had certainly a very different mentality from ours; its individuals were not merely simpler and lower than we are, they were on another line. It may be they did not speak at all, or very sparingly. They had nothing that we should call a language.

§ 2

In Worthington Smith’s _Man the Primeval Savage_ there is a very vividly written description of early Palæolithic life, from which much of the following account is borrowed. In the original, Mr. Worthington Smith assumes a more extensive social life, a larger community, and a more definite division of labour among its members than is altogether justifiable in the face of such subsequent writings as J. J. Atkinson’s memorable essay on Primal Law.[32] For the little tribe Mr. Worthington Smith described there has been

substituted, therefore, a family group under the leadership of one Old Man, and the suggestions of Mr. Atkinson as to the behaviour of the Old Man have been worked into the sketch.

Mr. Worthington Smith describes a squatting-place near a stream, because primitive man, having no pots or other vessels, must needs have kept close to a water supply, and with some chalk cliffs adjacent from which flints could be got to work. The air was bleak, and the fire was of great importance, because fires once out were not easily relit in those days. When not required to blaze it was probably banked down with ashes. The most probable way in which fires were started was by hacking a bit of iron pyrites with a flint amidst dry dead leaves; concretions of iron pyrites and flints are found together in England where the gault and chalk approach each other.[33] The little group of people would be squatting about amidst a litter of fern, moss, and such-like dry material. Some of the women and children would need to be continually gathering fuel to keep up the fires. It would be a tradition that had grown up. The young would imitate their elders in this task. Perhaps there would be rude wind shelters of boughs on one side of the encampment.

The Old Man, the father and master of the group, would perhaps be engaged in hammering flints beside the fire. The children would imitate him and learn to use the sharpened fragments. Probably some of the women would hunt good flints; they would fish them out of the chalk with sticks and bring them to the squatting-place.

There would be skins about. It seems probable that at a very early time primitive men took to using skins. Probably they were wrapped about the children, and used to lie upon when the ground was damp and cold. A woman would perhaps be preparing a skin. The inside of the skin would be well scraped free of superfluous flesh with trimmed flints, and then strained and pulled and pegged out flat on the grass, and dried in the rays of the sun.

[Illustration: EARLY STONE IMPLEMENTS.

The Mousterian Age implements, and all above it, are those of Neanderthal men or, possibly in the case of the rostro-carinates, of sub-men. The lower row (Reindeer Age) are the work of true men. The student should compare this diagram with the time diagram attached to Chapter VII, § 6, and he should note the relatively _large size_ of the pre-human implements.]

Away from the fire other members of the family group prowl in search of food, but at night they all gather closely round the fire and build it up, for it is their protection against the wandering bear and such-like beasts of prey. The Old Man is the only fully adult male in the little group. There are women, boys and girls, but so soon as the boys are big enough to rouse the Old Man’s jealousy, he will fall foul of them and either drive them off or kill them. Some girls may perhaps go off with these exiles, or two or three of these youths may keep together for a time, wandering until they come upon some other group, from which they may try to steal a mate. Then they would probably fall out among themselves. Some day, when he is forty years old perhaps or even older, and his teeth are worn down and his energy abating, some younger male will stand up to the Old Man and kill him and reign in his stead. There is probably short shrift for the old at the squatting-place. So soon as they grow weak and bad-tempered, trouble and death come upon them.

What did they eat at the squatting-place?

“Primeval man is commonly described as a hunter of the great hairy mammoth, of the bear, and the lion, but it is in the highest degree improbable that the human savage ever hunted animals much larger than the hare, the rabbit, and the rat. Man was probably the hunted rather than the hunter.

[Illustration: AUSTRALIA & the Western Pacific in the Glacial Age]

“The primeval savage was both herbivorous and carnivorous. He had for food hazel-nuts, beech-nuts, sweet chestnuts, earth-nuts, and acorns. He had crab-apples, wild pears, wild cherries, wild gooseberries, bullaces, sorbs, sloes, blackberries, yewberries, hips and haws, water-cress, fungi, the larger and softer leaf-buds, Nostoc (the vegetable substance called ‘fallen stars’ by country-folk), the fleshy, juicy, asparagus-like rhizomes or subterranean stems of the _Labiatæ_ and like plants, as well as other delicacies of the vegetable kingdom. He had birds’ eggs, young birds, and the honey and honeycomb of wild bees. He had newts, snails, and frogs--the two latter delicacies are still highly esteemed in Normandy and Brittany. He had fish, dead and alive, and fresh-water mussels; he could easily catch fish with his hands and paddle and dive for and trap them. By the seaside he would have fish, mollusca, and seaweed. He would have many of the larger birds and smaller mammals, which he could easily secure by throwing stones and sticks, or by setting simple snares. He would have the snake, the slow-worm, and the crayfish. He would have various grubs and insects, the large larvæ of beetles and various caterpillars. The taste for caterpillars still survives in China, where they

are sold in dried bundles in the markets. A chief and highly nourishing object of food would doubtlessly be bones smashed up into a stiff and gritty paste.

“A fact of great importance is this--primeval man would not be particular about having his flesh food over-fresh. He would constantly find it in a dead state, and, if semi-putrid, he would relish it none the less--the taste for high or half-putrid game still survives. If driven by hunger and hard pressed, he would perhaps sometimes eat his weaker companions or unhealthy children who happened to be feeble or unsightly or burthensome. The larger animals in a weak and dying state would no doubt be much sought for; when these were not forthcoming, dead and half-rotten examples would be made to suffice. An unpleasant odour would not be objected to; it is not objected to now in many continental hotels.

“The savages sat huddled close together round their fire, with fruits, bones, and half-putrid flesh. We can imagine the old man and his women twitching the skin of their shoulders, brows, and muzzles as they were annoyed or bitten by flies or other insects. We can imagine the large human nostrils, indicative of keen scent, giving rapidly repeated sniffs at the foul meat before it was consumed; the bad odour of the meat, and the various other disgusting odours belonging to a haunt of savages, being not in the least disapproved.

“Man at that time was not a _degraded_ animal, for he had never been higher; he was therefore an exalted animal, and, low as we esteem him now, he yet represented the highest stage of development of the animal kingdom of his time.”

That is at least an acceptable sketch of a Neanderthal squatting-place. But before extinction overtook them, even the Neanderthalers learnt much and went far.

Whatever the older Palæolithic men did with their dead, there is reason to suppose that the later _Homo Neanderthalensis_ buried some individuals at least with respect and ceremony. One of the best-known Neanderthal skeletons is that of a youth who apparently had been deliberately interred. He had been placed in a sleeping posture, head on the right fore-arm. The head lay on a number of flint fragments carefully piled together “pillow fashion.” A big hand-axe lay near his head, and around him were numerous charred and split ox bones, as though there had been a feast or an offering.

To this appearance of burial during the later Neanderthal age we shall return when we are considering the ideas that were inside the heads of primitive men.

This sort of men may have wandered, squatted about their fires, and died in Europe for a period extending over 100,000 years, if we assume, that is, that the Heidelberg jaw-bone belongs to a member of the species, a period so vast that all the subsequent history of our race becomes a thing of yesterday. Along its own line this species of men was accumulating a dim tradition, and working out its limited possibilities. Its thick skull imprisoned its brain, and to the end it was low-browed and brutish.

§ 3

When the Dutch discovered Tasmania, they found a detached human race not very greatly advanced beyond this Lower Palæolithic stage. But over most of the world the Lower Palæolithic culture had developed into a more complicated and higher life twenty or thirty thousand years ago. The Tasmanians were not racially Neanderthalers;[34] their brain-cases, their neck-bones, their jaws and teeth, show that; they had no Neanderthal affinities; they were of the same species as ourselves. There can be little doubt that throughout the hundreds of centuries during which the scattered little groups of Neanderthal men were all that represented men in Europe, real men, of our own species, in some other part of the world, were working their way along parallel lines from much the same stage as the Neanderthalers ended at, and which the Tasmanians preserved, to a higher level of power and achievement. The Tasmanians, living under unstimulating conditions, remote from any other human competition or example, lagged behind the rest of the human brotherhood.[35]

About 200 centuries ago or earlier, real men of our own species, if not of our own race, came drifting into the European area.

X

THE LATER POSTGLACIAL PALÆOLITHIC MEN, THE FIRST TRUE MEN

(Later Palæolithic Age)

§ 1. _The Coming of Men Like Ourselves._ § 2. _Subdivision of the Later Palæolithic._ § 3. _The Earliest True Men Were Splendid Savages._ § 4. _Hunters Give Place to Herdsmen._ § 5. _No Sub-men in America._

§ 1

The Neanderthal type of man prevailed in Europe at least for tens of thousands of years. For ages that make all history seem a thing of yesterday, these nearly human creatures prevailed. If the Heidelberg jaw was that of a Neanderthaler, and if there is no error in the estimate of the age of that jaw, then the Neanderthal Race lasted out for more than 200,000 years! Finally, between 40,000 and 25,000 years ago, as the Fourth Glacial Age softened towards more temperate conditions (see Map on p. 89), a different human type came upon the scene, and, it would seem, exterminated _Homo Neanderthalensis_.[36] This new type was probably developed in South Asia or North Africa, or in lands now submerged in the Mediterranean basin, and, as more remains are collected and evidence accumulates, men will learn more of their early stages. At present we can only guess where and how, through the slow ages, parallel with the Neanderthal cousin, these first _true men_ arose out of some more ape-like progenitor. For hundreds of centuries they were acquiring skill of hand and limb, and power and bulk of brain, in that still unknown environment. They were already far above the Neanderthal level of achievement and intelligence, when first they come into our ken, and they had already split into two or more very distinctive races.

[Illustration: Cromagnon

Man]

These new-comers did not migrate into Europe in the strict sense of the word, but rather, as century by century the climate ameliorated, they followed the food and plants to which they were accustomed, as those spread into the new realms that opened to them. The ice was receding, vegetation was increasing, big game of all sorts was becoming more abundant. Steppe-like conditions, conditions of pasture and shrub, were bringing with them vast herds of wild horse. Ethnologists (students of race) class these new human races in one same species as ourselves, and with all human races subsequent to them, under one common specific name of _Homo sapiens_. They had quite human brain-cases and hands. Their teeth and their necks were anatomically as ours are.

Now here again, with every desire to be plain and explicit with the reader, we have still to trouble him with qualified statements and notes of interrogation. There is now an enormous literature about these earliest true men, the men of the Later Palæolithic Age, and it is still for the general reader a very confusing literature indeed. It is confusing because it is still confused at the source. We know of two distinct sorts of skeletal remains in this period, the first of these known as the Cro-Magnon race, and the second the Grimaldi race; but the great bulk of the human traces and appliances we find are either without human bones or with insufficient bones for us to define their associated physical type. There may have been many more distinct races than these two. There may have been intermediate types. In the grotto of Cro-Magnon it was that complete skeletons of one main type of these Newer Palæolithic men, these true men, were first found, and so it is that they are spoken of as Cro-Magnards.

[Illustration: MAP SHOWING EUROPE AND WESTERN ASIA ABOUT THE TIME THE TRUE MEN WERE REPLACING THE NEANDERTHALERS IN WESTERN EUROPE]

Throwing-stick (_reindeer horn_)]

These Cro-Magnards were a tall people with very broad faces, prominent noses, and, all things considered, astonishingly big brains. The brain capacity of the woman in the Cro-Magnon cave exceeded that of the average male to-day. Her head had been smashed by a heavy blow. There were also in the same cave with her the complete skeleton of an older man, nearly six feet high, the fragments of a child's skeleton, and the skeletons of two young men. There were also flint implements and perforated sea-shells, used no doubt as ornaments. Such is one sample of the earliest true men. But at the Grimaldi cave, near Mentone, were discovered two skeletons also of the Later Palæolithic period, but of a widely contrasted type, with negroid characteristics that point rather to the negroid type. There can be no doubt that we have to deal in this period with at least two, and probably more, highly divergent races of true men. They may have overlapped in time, or Cro-Magnards may have followed the Grimaldi race, and either or both may have been contemporary with the late Neanderthal men. Various authorities have very strong opinions upon these points, but they are, at most, opinions. The whole story is further fogged at present by our inability to distinguish, in the absence of skeletons, which race has been at work in any particular case. In what follows the reader will ask of this or that particular statement, "Yes, but is this the Cro-Magnard or the Grimaldi man or some other that you are writing about?" To which in most cases the honest answer is, "As yet we do not know." Confessedly our account of the newer Palæolithic is a jumbled account. There are probably two or three concurrent and only roughly similar histories of these newer Palæolithic men as yet, inextricably mixed up together. Some authorities appear to favour the Cro-Magnards unduly and to dismiss the Grimaldi people with as little as possible of the record.

The appearance of these truly human postglacial Palæolithic peoples was certainly an enormous leap forward in the history of mankind. Both of these main races had a human fore-brain, a human hand, an intelligence very like our own. They dispossessed _Homo Neanderthalensis_ from his caverns and his stone quarries. And they agreed with modern ethnologists, it would seem, in regarding him as a different species. Unlike most savage conquerors, who take the women of the defeated side for their own and interbreed with them, it would seem that the true men would have nothing to do with the Neanderthal race, women or men. There is no trace of any intermixture between the races, in spite of the fact that the newcomers, being also flint users, were establishing themselves in the very same spots that their predecessors had occupied. We know nothing of the appearance of the Neanderthal man, but this absence of intermixture seems to suggest an extreme hairiness, an ugliness, or a repulsive strangeness in his appearance over and above his low forehead, his beetle brows, his ape neck, and his inferior stature. Or he--and she--may have been too fierce to tame. Says Sir Harry Johnston, in a survey of the rise of modern man in his _Views and Reviews_: "The dim racial remembrance of such gorilla-like monsters, with cunning brains, shambling gait, hairy bodies, strong teeth, and possibly cannibalistic tendencies, may be the germ of the ogre in folklore...."

These true men of the Palæolithic Age, who replaced the Neanderthalers, were coming into a milder climate, and although they used the caves and shelters of their predecessors, they lived largely in the open. They were hunting peoples, and some or all of them appear to have hunted the mammoth and the wild horse as well as the reindeer, bison, and aurochs. They ate much horse. At a great open-air camp at Solutré, where they seem to have had animal gatherings for many centuries, it is estimated that there are the bones of 100,000 horses, besides reindeer, mammoth, and bison bones. They probably followed herds of horses, the little bearded ponies of that age, as these moved after pasture. They hung about on the flanks of the herd, and became very wise about its habits and dispositions. A large part of these men's lives must have been spent in watching animals.

Whether they tamed and domesticated the horse is still an open question. Perhaps they learnt to do so by degrees as the centuries passed. At any rate, we find late Palæolithic drawings of horses with marks about the heads that are strongly suggestive of bridles, and there exists a carving of a horse's head showing what is perhaps a rope of twisted skin or tendon. But even if they tamed the horse, it is still more doubtful whether they rode it or had much use for it when it was tamed. The horse they knew was a wild pony with a beard under its chin, not up to carrying a man for any distance. It is improbable that these men had yet learnt the rather unnatural use of animal's milk as food. If they tamed the horse at last, it was the only animal they seem to have tamed. They had no dogs, and they had little to do with any sort of domesticated sheep or cattle.

It greatly aids us to realize their common humanity that these earliest true men could draw. Both races, it would seem, drew astonishingly well. They were by all standards savages, but they were artistic savages. They drew better than any of their successors down to the beginnings of history. They drew and painted on the cliffs and cave walls that they had wrested from the Neanderthal men. And the surviving drawings come to the ethnologist, puzzling over bones and scraps, with the effect of a plain message shining through guesswork and darkness. They drew on bones and antlers; they carved little figures.

These late Palæolithic people not only drew remarkably well for our information, and with an increasing skill as the centuries passed, but they have also left us other information about their lives in their graves. They buried. They buried their dead, often with ornaments, weapons, and food; they used a lot of colour in the burial, and evidently painted the body. From that one may infer that they painted their bodies during life. Paint was a big fact in their lives. They were inveterate painters; they used black, brown, red, yellow, and white pigments, and the pigments they used endure to this day in the caves of France and Spain. Of all modern races, none have shown so pictorial a disposition; the nearest approach to it has been among the American Indians.

[Illustration: A Reindeer Age Masterpiece]

[Illustration:

Reindeer Age (_Aurignacian_)

Engravings & Carvings]

These drawings and paintings of the later Palæolithic people went on through a long period of time, and present wide fluctuations in artistic merit. We give here some early sketches, from which we learn of the interest taken by these early men in the bison, horse, ibex, cave bear, and reindeer. In its early stages the drawing is often primitive like the drawing of clever children; quadrupeds are usually drawn with one hindleg and one foreleg, as children draw them to this day. The legs on the other side were too much for the artist's technique. Possibly the first drawings began as children's drawings begin, out of idle scratchings. The savage scratched with a flint on a smooth rock surface, and was reminded of some line or gesture. But their solid carvings are at least as old as their first pictures. The earlier drawings betray a complete incapacity to group animals. As the centuries progressed, more skilful artists appeared. The representation of beasts became at last astonishingly vivid and like. But even at the crest of their artistic time they still drew in profile as children do; perspective and the fore-shortening needed for back and front views were too much for them.[37] They rarely drew themselves. The vast majority of their drawings represent animals. The mammoth and the horse are among the commonest themes. Some of the people, whether Grimaldi people or Cro-Magnon people, also made little ivory and soapstone statuettes, and among these are some very fat female figures. These latter suggest the physique of Grimaldi rather than of Cro-Magnon artists. They are like Bushmen women. The human sculpture of the earlier times inclined to caricature, and generally such human figures as they represent are far below the animal studies in vigour and veracity.

Later on there was more grace and less coarseness in the human representations. One little ivory head discovered is that of a girl with an elaborate coiffure. These people at a later stage also scratched and engraved designs on ivory and bone. Some of the most interesting groups of figures are carved very curiously round bone, and especially round rods of deer bone, so that it is impossible to see the entire design all together. Figures have also been found modelled in clay, although no Palæolithic people made any use of pottery.

Many of the paintings are found in the depths of unlit caves. They are often difficult of access. The artists must have employed lamps to do their work, and shallow soapstone lamps in which fat could have been burnt have been found. Whether the seeing of these cavern paintings was in some way ceremonial or under what circumstances they were seen, we are now altogether at a loss to imagine.

§ 2

Archæologists distinguish at present three chief stages in the history of these newer Palæolithic men in Europe, and we must name these stages here. But it may be as well to note at the same time that it is a matter of the utmost difficulty to distinguish which of two deposits in different places is the older or newer. We may very well be dealing with the work of more or less contemporary and different races when we think we are dealing with successive ones. We are dealing, the reader must bear in mind, with little disconnected patches of material, a few score all together. The earliest stage usually distinguished by the experts is the _Aurignacian_ (from the grotto of Aurignac); it is characterized by very well-made flint implements, and by a rapid development of art and more particularly of statuettes and wall paintings. The most esteemed of the painted caves is ascribed to the latter part of this the first of the three subdivisions of the newer Palæolithic. The second subdivision of this period is called the _Solutrian_ (from Solutré), and is distinguished particularly by the quality and beauty of its stone implements; some of its razor-like blades are only equalled and not surpassed by the very best of the Neolithic work. They are of course unpolished, but the best specimens are as thin as steel blades and almost as sharp. Finally, it would seem, came the _Magdalenian_ (from La Madeleine) stage, in which the horse and reindeer were dwindling in numbers and the red deer coming into Europe.[38] The stone implements are smaller, and

there is a great quantity of bone harpoons, spearheads, needles, and the like. The hunters of the third and last stage of the later Palæolithic Age appear to have supplemented a diminishing food supply by fishing. The characteristic art of the period consists of deep reliefs done upon bone and line engraving upon bone. It is to this period that the designs drawn round bones belong, and it has been suggested that these designs upon round bones were used to print coloured designs upon leather. Some of the workmanship on bone was extraordinarily fine. Parkyn quotes from de Mortillet, about the Reindeer Age (Magdalenian) bone needles, that they “are much superior to those of later, even historical, times, down to the Renaissance. The Romans, for example, never had needles comparable to those of the Magdalenian epoch.”

[Illustration: TIME DIAGRAM SHOWING THE ESTIMATED DURATION OF THE TRUE HUMAN PERIODS.

This time diagram again is on a larger scale than its predecessors. The time diagram on page 60, if it were on this scale, would be nearly 4 feet long, and the diagram of the whole geological time on page 14, between 500 and 5000 feet long (or perhaps even as much as 10,000 feet long).]

It is quite impossible at present to guess at the relative lengths of these ages. We are not even positive about their relative relationship. Each lasted perhaps for four or five more thousand years, more than double the time from the Christian Era to our own day.

At last it would seem that circumstances began to turn altogether against these hunting Newer Palæolithic people who had flourished for so long in Europe. They disappeared. New kinds of men appeared in Europe, replacing them. These latter seem to have brought in bow and arrows; they had domesticated animals and cultivated the soil. A new way of living, the Neolithic way of living, spread over the European area; and the life of the Reindeer Age and of the races of Reindeer Men, the Later Palæolithic men, after a reign vastly greater than the time between ourselves and the very earliest beginnings of recorded history, passed off the European stage.

§ 3

There is a disposition on the part of many writers to exaggerate the intellectual and physical qualities of these later Palæolithic men and make a wonder of them.[39] Collectively considered, these people had remarkable gifts, but a little reflection will show they had almost as remarkable deficiencies. The tremendous advance they display upon their Neanderthalian predecessors and their special artistic gift must not blind us to their very obvious limitations. For all the quantity of their brains, the quality was narrow and special. They had vivid perceptions, an acute sense of animal form, they had the real artist’s impulse to render; so far they were fully grown human beings. But that disposition to paint and draw is shown to-day by the Bushmen, by Californian Indians, and by Australian black fellows; it is not a mark of all-round high intellectual quality. The cumulative effect of their drawings and paintings is very great, but we must not make the mistake of crowding all these achievements together in our minds as though they had suddenly flashed out upon the world in a brief interval of time, or as though they were all the achievements of one people. These races of Reindeer Men were in undisturbed possession of western Europe for a period at least ten times as long as the interval between ourselves and the beginning of the Christian Era, and through all that immense time they were free to develop and vary their life to its utmost possibilities. Their art constitutes their one claim to be accounted more than common savages.

They were in close contact with animals, but they never seemed to have got to terms with any animal unless it was the horse. They had no dogs. They had no properly domesticated animals at all. They watched and drew and killed and ate. They do not seem to have cooked their food. Perhaps they scorched and grilled it, but they could not have done much more, because they had no cooking implements. Although they had clay available, and although there are several Palæolithic clay figures on record, they had _no pottery_. Although they had a great variety of flint and bone implements, they never rose to the possibilities of using timber for permanent shelters or such-like structures. They never made hafted axes or the like that would enable them to deal with timber. There is a suggestion in some of the drawings of a fence of stakes in which a mammoth seems to be entangled. But here we may be dealing with superimposed scratchings. They had _no buildings_. It is not even certain that they had tents or huts. They may have had simple skin tents. Some of the drawings seem to suggest as much. It is doubtful if they knew of the bow. They left no good arrowheads behind them. Certain of their implements are said to be “arrow-straighteners” by distinguished authorities, but that is about as much evidence as we have of arrows. They may have used sharpened sticks as arrows. They had _no cultivation_ of grain or vegetables of any sort. Their women were probably squaws, smaller than the men; the earlier statuettes represent them as grossly fat, almost as the Bushmen women are often fat to-day. (But this may not be true of the Cro-Magnards.)

They clothed themselves, it would seem, in skins, if they clothed themselves at all. These skins they prepared with skill and elaboration, and towards the end of the age they used bone needles, no doubt to sew these pelts. One may guess pretty safely that they painted these skins, and it has even been supposed, printed off designs upon them from bone cylinders. But their garments were mere wraps; there are no clasps or catches to be found. They do not seem to have used grass or such-like fibre for textiles. Their statuettes are naked. They were, in fact, except for a fur wrap in cold weather, naked painted savages.

These hunters lived on open steppes for two hundred centuries or so, ten times the length of the Christian era. They were, perhaps, overtaken by the growth of the European forests, as the climate became milder and damper. When the wild horse and the reindeer diminished in Europe, and a newer type of human culture, with a greater power over food supply, a greater tenacity of settlement, and probably a larger social organization, arose, the Reindeer Men had to learn fresh ways of living or disappear. How far they learnt and mingled their strain with the new European populations, and how far they went under we cannot yet guess. Opinions differ widely. Wright lays much stress on the “great hiatus” between the Palæolithic and Neolithic remains, while Osborn traces the likeness of the former in several living populations. In the region of the Doubs and of the Dordogne in France, many individuals are to be met with to this day with skulls of the “Cro-Magnon” type. Apparently the Grimaldi type of men has disappeared altogether from Europe. Whether the Cro-Magnon type of men mingled completely with the Neolithic peoples, or whether they remained distinct and held their own in favourable localities to the north and west, following the reindeer over Siberia and towards America, which at that time was continuous with Siberia, or whether they disappeared altogether from the world, is a matter that can be only speculated about at present. There is not enough evidence for a judgment. Possibly they mingled to a certain extent. There is little to prevent our believing that they survived without much intermixture for a long time in north Asia, that “pockets” of them remained here and there in Europe, that there is a streak of their blood in most European peoples to-day, and that there is a much stronger streak, if not a predominant strain, in the Mongolian and American races.[40]

§ 4

It was about 12,000 or fewer years ago that, with the spread of forests and a great change of the fauna, the long prevalence of the hunting life in Europe drew to its end. Reindeer vanished. Changing conditions frequently bring with them new diseases. There may have been prehistoric pestilences. For many centuries there may have been no men in Britain or Central Europe (Wright). For a time there were in Southern Europe drifting communities of some little known people who are called the Azilians.[41] They may have been transition generations; they may have been a different race. We do not know. Some authorities incline to the view that the Azilians were the first wave of a race which, as we shall see later, has played a great part in populating Europe, the dark-white or Mediterranean or Iberian race. These Azilian people have left behind them a multitude of pebbles, roughly daubed with markings of an unknown purport (see illus., p. 94). The use or significance of these Azilian pebbles is still a profound mystery. Was this some sort of token writing? Were they counters in some game? Did the Azilians play with these pebbles or tell a story with them, as imaginative children will do with bits of wood and stone nowadays? At present we are unable to cope with any of these questions.

We will not deal here with the other various peoples who left their scanty traces in the world during the close of the New Palæolithic period, the spread of the forests where formerly there had been steppes, and the wane of the hunters, some 10,000 or 12,000 years ago. We will go on to describe the new sort of human community that was now spreading over the northern hemisphere, whose appearance marks what is called the _Neolithic Age_. The map of the world was assuming something like its present outlines, the landscape and the flora and fauna were taking on their existing characteristics. The prevailing animals in the spreading woods of Europe were the royal stag, the great ox, and the bison; the mammoth and the musk ox had gone. The great ox, or aurochs, is now extinct, but it survived in the German forests up to the time of the Roman Empire. It was never domesticated.[42] It stood eleven feet high at the shoulder, as high as an elephant. There were still lions in the Balkan peninsula, and they remained there until about 1000 or 1200 B.C. The lions of Württemberg and South Germany in those days were twice the size of the modern lion. South Russia and Central Asia were thickly wooded then, and there were elephants in Mesopotamia and Syria, and a fauna in Algeria that was tropical African in character.

Hitherto men in Europe had never gone farther north than the Baltic Sea or the English midlands, but now Ireland, the Scandinavian peninsula, and perhaps Great Russia were becoming possible regions for human occupation. There are no Palæolithic remains in Sweden or Norway, nor in Ireland or Scotland. Man, when he entered these countries, was apparently already at the Neolithic stage of social development.

§ 5

Nor is there any convincing evidence of man in America before the end of the Pleistocene.[43] The same relaxation of the climate that permitted the retreat of the reindeer hunters into Russia and Siberia, as the Neolithic tribes advanced, may have allowed them to wander across the land that is now cut by Bering Strait, and so reach the American continent. They spread thence southward, age by age. When they reached South America, they found the giant sloth (the _Megatherium_), the glyptodon, and many other extinct creatures, still flourishing. The glyptodon was a monstrous South American armadillo, and a human skeleton has been found by Roth buried beneath its huge tortoise-like shell.[44]

All the human remains in America, even the earliest, it is to be noted, are of an Amer-Indian character. In America there does not seem to have been any preceding races of sub-men. Man was fully man when he entered America. The old world was the nursery of the sub-races of mankind.

XI

NEOLITHIC MAN IN EUROPE[45]

§ 1. _The Age of Cultivation Begins._ § 2. _Where Did the Neolithic Culture Arise?_ § 3. _Everyday Neolithic Life._ § 4. _How Did Sowing Begin?_ § 5. _Primitive Trade._ § 6. _The Flooding of the Mediterranean Valley._

§ 1

THE Neolithic phase of human affairs began in Europe about 10,000 or 12,000 years ago. But probably men had reached the Neolithic stage elsewhere some thousands of years earlier.[46] Neolithic men came slowly into Europe from the south or south-east as the reindeer and the open steppes gave way to forest and modern European conditions.

The Neolithic stage in culture is characterized by: (1) the presence of polished stone implements, and in particular the stone _axe_, which was perforated so as to be the more effectually fastened to a wooden handle, and which was probably used rather for working wood than in conflict. There are also abundant arrow heads. The fact that some implements are polished does not preclude the presence of great quantities of implements of unpolished stone. But there are differences in the make between even the unpolished tools of the Neolithic and of the Palæolithic Period. (2) The beginning of a sort of agriculture, and the use of plants and seeds. But at first there are abundant evidences that hunting was still of great importance in the Neolithic Age. Neolithic man did not at first sit down to his agriculture. He took snatch crops. He settled later. (3) Pottery and proper cooking. The horse is no longer eaten. (4) Domesticated animals. The dog appears very early. The Neolithic man had domesticated cattle, sheep, goats, and pigs. He was a huntsman turned herdsman of the herds he once hunted.[47] (5) Plaiting and weaving.

These Neolithic people probably “migrated” into Europe, in the same way that the Reindeer Men had migrated before them; that is to say, generation by generation and century by century, as the climate changed, they spread after their accustomed food. They were not “nomads.” Nomadism, like civilization, had still to be developed. At present we are quite unable to estimate how far the Neolithic peoples were new-comers and how far their arts were developed or acquired by the descendants of some of the hunters and fishers of the Later Palæolithic Age.

Whatever our conclusions in that matter, this much we may say with certainty; there is no great break, no further sweeping away of one kind of man and replacement by another kind between the appearance of the Neolithic way of living and our own time. There are invasions, conquests, extensive emigrations and intermixtures, but the races as a whole carry on and continue to adapt themselves to the areas into which they began to settle in the opening of the Neolithic Age. The Neolithic men of Europe were white men ancestral to the modern Europeans. They may have been of a darker complexion than many of their descendants; of that we cannot speak with certainty. But there is no real break in culture from their time onward until we reach the age of coal, steam, and power-driven machinery that began in the eighteenth century.

After a long time gold, the first known of the metals, appears among the bone ornaments with jet and amber. Irish Neolithic remains are particularly rich in gold. Then, perhaps 6000 or 7000 years ago in Europe, Neolithic people began to use copper in certain centres, making out of it implements of much the same pattern as their stone ones. They cast the copper in moulds made to the shape of the stone implements. Possibly they first found native copper and hammered it into shape.[48] Later--we will not venture upon figures--men had found out how to get copper from its ore. Perhaps, as Lord Avebury suggested, they discovered the secret of smelting by the chance putting of lumps of copper ore among the ordinary stones with which they built the fire pits they used for cooking. In China, Hungary, Cornwall, and elsewhere copper ore and tinstone occur in the same veins; it is a very common

association, and so, rather through dirtiness than skill, the ancient smelters, it may be, hit upon the harder and better bronze, which is an alloy of copper and tin.[49] Bronze is not only harder than copper, but the mixture of tin and copper is more fusible and easier to reduce. The so-called “pure-copper” implements usually contain a small proportion of tin, and there are no tin implements known, nor very much evidence to show that early men knew of tin as a separate metal.[50][51] The plant of a prehistoric copper smelter has been found in Spain, and the material of bronze foundries in various localities. The method of smelting revealed by these finds carries out Lord Avebury’s suggestion. In India, where zinc and copper ore occur together, brass (which is an alloy of the two metals) was similarly hit upon.

So slight was the change in fashions and methods produced by the appearance of bronze, that for a long time such bronze axes and so forth as were made were cast in moulds to the shape of the stone implements they were superseding.

[Illustration: Neolithic Implements]

Finally, perhaps as early as 3000 years ago in Europe, and even earlier in Asia Minor, men began to smelt iron. Once smelting was known to men, there is no great marvel in the finding of iron. They smelted iron by blowing up a charcoal fire, and wrought it by heating and hammering. They produced it at first in comparatively small pieces;[52] its appearance worked a gradual revolution in weapons and implements; but it did not suffice to change the general character of men’s surroundings. Much the same daily life that was being led by the more settled Neolithic men 10,000 years ago was being led by peasants in out-of-the-way places all over Europe at the beginning of the eighteenth century.[53]

People talk of the Stone Age, the Bronze Age, and the Iron Age in Europe, but it is misleading to put these ages as if they were of equal importance in history. Much truer is it to say that there was:

(1) An _Early Palæolithic Age_, of vast duration; (2) a _Later Palæolithic Age_, that lasted not a tithe of the time; and (3) the Age of Cultivation, the age of the white men in Europe, which began 10,000 or at most 12,000 years ago, of which the Neolithic Period was the beginning, and which is still going on.

§ 2

We do not know yet the region in which the ancestors of the white and whitish Neolithic peoples worked their way up from the Palæolithic stage of human development. Probably it was somewhere about south-western Asia, or in some region now submerged beneath the Mediterranean Sea or the Indian Ocean, that, while the Neanderthal men still lived their hard lives in the bleak climate of a glaciated Europe, the ancestors of the white men developed the rude arts of _their_ Later Palæolithic period. But they do not seem to have developed the artistic skill of their more northerly kindred, the European Later Palæolithic races. And through the hundred centuries or so while Reindeer Men were living under comparatively unprogressive conditions upon the steppes of France, Germany, and Spain, these more-favoured and progressive people to the south were mastering agriculture, learning to develop their appliances, taming the dog, domesticating cattle, and, as the climate to the north mitigated and the equatorial climate grew more tropical, spreading northward. All these early chapters of our story have yet to be disinterred. They will probably be found in Asia Minor, Persia, Arabia, India, or north Africa, or they lie beneath the Mediterranean waters. Twelve thousand years ago, or thereabouts--we are still too early for anything but the roughest chronology--Neolithic peoples were scattered all over Europe, north Africa, and Asia. They were peoples at about the level of many of the Polynesian islanders of the last century, and they were the most advanced peoples in the world.

§ 3

It will be of interest here to give a brief account of the life of the European Neolithic people before the appearance of metals. We get our light upon that life from various sources. They scattered their refuse about, and in some places (_e.g._ on the Danish coast) it accumulated in great heaps, known as the kitchen middens. They buried some of their people, but not the common herd, with great care and distinction, and made huge heaps of earth over their sepulchres; these heaps are the barrows or dolmens which contribute a feature to the European, Indian, and American scenery in many districts to this day. In connection with these mounds, or independently of them, they set up great stones (megaliths), either singly or in groups, of which Stonehenge in Wiltshire and Carnac in Brittany are among the best-known examples. In various places their villages are still traceable.

One fruitful source of knowledge about Neolithic life comes from Switzerland, and was first revealed by the very dry winter of 1854, when the water level of one of the lakes, sinking to an unheard-of lowness, revealed the foundations of prehistoric pile dwellings of

the Neolithic and early Bronze Ages, built out over the water after the fashion of similar homes that exist to-day in Celebes and elsewhere. Not only were the timbers of those ancient platforms preserved, but a great multitude of wooden, bone, stone, and earthenware utensils and ornaments, remains of food and the like, were found in the peaty accumulations below them. Even pieces of net and garments have been recovered. Similar lake dwellings existed in Scotland, Ireland, and elsewhere--there are well-known remains at Glastonbury in Somersetshire; in Ireland lake dwellings were inhabited from prehistoric times up to the days when O'Neil of Tyrone was fighting against the English before the plantation of Scotch colonists to replace the Irish in Ulster in the reign of James I of England. These lake villages had considerable defensive value, and there was a sanitary advantage in living over flowing water.

Probably these Neolithic Swiss pile dwellings did not shelter the largest communities that existed in those days. They were the homes of small patriarchal groups. Elsewhere upon fertile plains and in more open country there were probably already much larger assemblies of homes than in those mountain valleys. There are traces of such a large community of families in Wiltshire in England, for example; the remains of the stone circle of Avebury near Silbury mound were once the "finest megalithic ruin in Europe."[54] It consisted of two circles of stones surrounded by a larger circle and a ditch, and covering all together twenty-eight and a half acres. From it two avenues of stones, each a mile and a half long, ran west and south on either side of Silbury Hill. Silbury Hill is the largest prehistoric artificial mound in England. The dimensions of this centre of a faith and a social life now forgotten altogether by men indicate the concerted efforts and interests of a very large number of people, widely scattered though they may have been over the west and south and centre of England. Possibly they assembled at some particular season of the year in a primitive sort of fair. The whole community "lent a hand" in building the mounds and hauling the stones. The Swiss pile-dwellers, on the contrary, seem to have lived in practically self-contained villages.

[Illustration: Restoration of a Lake dwelling]

These lake-village people were considerably more advanced in methods and knowledge, and probably much later in time than the early Neolithic people who accumulated the shell mounds, known as kitchen middens, on the Danish and Scotch coasts. These kitchen midden folk may have been as early as 10,000 B.C. or earlier; the lake dwellings were probably occupied continuously from 5000 or 4000 B.C. down almost to historic times. Those early kitchen-midden people were among the most barbaric of Neolithic peoples, their stone axes were rough, and they had no domesticated animal except the dog. The lake-dwellers, on the other hand, had, in addition to the dog, which was of a medium-sized breed, oxen, goats, and sheep. Later on, as they were approaching the Bronze Age, they got swine. The remains of cattle and goats prevail in their débris, and, having regard to the climate and country about them, it seems probable that these beasts were sheltered in the buildings upon the piles in winter, and that fodder was stored for them. Probably the beasts lived in the same houses with the people, as the men and beasts do now in Swiss chalets. The people in the houses possibly milked the cows and goats, and milk perhaps played as important a part in their economy as it does in that of the mountain Swiss of to-day. But of that we are not sure at present. Milk is not a natural food for adults; it must have seemed queer stuff to take at first; and it may have been only after much breeding that a continuous supply of milk was secured from cows and goats. Some people think that the use of milk, cheese, butter, and other milk products came later into human life when men became nomadic. The writer is, however, disposed to give the Neolithic men credit for having discovered milking. The milk, if they did use it (and, no doubt, in that case sour curdled milk also, but not well-made cheese and butter), they must have kept in earthenware pots, for they had pottery, though it was roughly hand-made pottery and not the shapely product of the potter's wheel. They eked out this food supply by hunting. They killed and ate red deer and roe deer, bison and wild boar. And they ate the fox, a rather high-flavoured meat, and not what any one would eat in a world of plenty. Oddly enough, they do not seem to have eaten the hare, although it was available as food. They are supposed to have avoided eating it, as some savages are said to avoid eating it to this day, because they feared that the flesh of so timid a creature might make them, by a sort of infection, cowardly.[55]

Of their agricultural methods we know very little. No ploughs and no hoes have been found. They were of wood and have perished. Neolithic men cultivated and ate wheat, barley, and millet, but they knew nothing of oats or rye. Their grain they roasted, ground between stones and stored in pots, to be eaten when needed. And they made exceedingly solid and heavy bread, because round flat slabs of it have been got out of these deposits. Apparently they had no yeast. If they had no yeast, then they had no fermented

drink. One sort of barley that they had is the sort that was cultivated by the ancient Greeks, Romans, and Egyptians, and they also had an Egyptian variety of wheat, showing that their ancestors had brought or derived this cultivation from the south-east. The centre of diffusion of wheat was somewhere in the eastern Mediterranean region. A wild form is still found in the neighbourhood of Mt. Hermon (see footnote to Ch. XVI, § 1). When the lake dwellers sowed their little patches of wheat in Switzerland, they were already following the immemorial practice of mankind. The seed must have been brought age by age from that distant centre of diffusion. In the ancestral lands of the south-east men had already been sowing wheat perhaps for thousands of years.[56] Those lake dwellers also ate peas, and crab-apples--the only apples that then existed in the world. Cultivation and selection had not yet produced the apple of to-day.

They dressed chiefly in skins, but they also made a rough cloth of flax. Fragments of that flaxen cloth have been discovered. Their nets were made of flax; they had as yet no knowledge of hemp and hempen rope. With the coming of bronze, their pins and ornaments increased in number. There is reason to believe they set great store upon their hair, wearing it in large shocks with pins of bone and afterwards of metal. To judge from the absence of realistic carvings or engravings or paintings, they either did not decorate their garments or decorated them with plaids, spots, interlacing designs, or similar conventional ornament. Before the coming of bronze there is no evidence of stools or tables; the Neolithic people probably squatted on their clay floors. There were no cats in these lake dwellings; no mice or rats had yet adapted themselves to human dwellings; the cluck of the hen was not as yet added to the sounds of human life, nor the domestic egg to its diet.[57]

The chief tool and weapon of Neolithic man was his axe; his next the bow and arrow. His arrow heads were of flint, beautifully made, and he lashed them tightly to their shafts. Probably he prepared the ground for his sowing with a pole, or a pole upon which he had stuck a stag’s horn. Fish he hooked or harpooned. These implements no doubt stood about in the interior of the house, from the walls of which hung his fowling-nets. On the floor, which was of clay or trodden cow-dung (after the fashion of hut floors in India to-day), stood pots and jars and woven baskets containing grain, milk, and such-like food. Some of the pots and pans hung by rope loops to the walls. At one end of the room, and helping to keep it warm in winter by their animal heat, stabled the beasts. The children took the cows and goats out to graze, and brought them in at night before the wolves and bears came prowling.

[Illustration: _Hut urns, the first probably representing a lake-dwelling.... After Lubbock._]

Since Neolithic man had the bow, he probably also had stringed instruments, for the rhythmic twanging of a bow-string seems almost inevitably to lead to that. He also had earthenware drums across which skins were stretched; perhaps also he made drums by stretching skins over hollow tree stems.[58] We do not know when man began to sing, but evidently he was making music, and since he had words, songs were no doubt being made. To begin with, perhaps, he just let his voice loose as one may hear Italian peasants now behind their ploughs singing songs without words. After dark in the winter he sat in his house and talked and sang and made implements by touch rather than sight. His lighting must have been poor, and chiefly firelight, but there was probably always some fire in the village, summer or winter. Fire was too troublesome to make for men to be willing to let it out readily. Sometimes a great disaster happened to those pile villages, the fire got free, and they were burnt out. The Swiss deposits contain clear evidence of such catastrophes.

All this we gather from the remains of the Swiss pile dwellings, and such was the character of the human life that spread over Europe, coming from the south and from the east with the forests as, 10,000 or 12,000 years ago, the reindeer and the Reindeer Men passed away. It is evident that we have here a way of life already separated by a great gap of thousands of years of invention from its original Palæolithic stage. The steps by which it rose from that condition we can only guess at. From being a hunter hovering upon the outskirts of flocks and herds of wild cattle and sheep, and from being a co-hunter with the dog, man by insensible degrees may have developed a sense of proprietorship in the beasts and struck up a friendship with his canine competitor. He learnt to turn the cattle when they wandered too far; he brought his better brain to bear to guide them to fresh pasture. He hemmed the beasts into valleys and enclosures where he could be sure to find them again. He fed them when they starved, and so slowly he tamed them. Perhaps his agriculture began with the storage of fodder. He reaped, no doubt, before he sowed. The Palæolithic ancestor away in that unknown land of origin to the south-east first supplemented the precarious meat supply of the hunter by eating roots and fruits and wild grains. Man storing graminiferous grasses for his cattle might easily come to beat out the grain for himself.

§ 4

How did man learn to sow in order that he might reap?

We may hesitate here to guess at the answer to that question. But a very great deal has been made of the fact that wherever sowing occurs among primitive people in any part of the world, it is accompanied by a human sacrifice or by some ceremony which may be interpreted as the mitigation and vestige of an ancient sacrificial custom. This is the theme of Sir J. G. Frazer's _Golden Bough_. From this it has been supposed that the first sowings were in connection with the burial of a human being, either through wild grain being put with the dead body as food or through the scattering of grain over the body. It may be argued that there is only one reason why man should have disturbed the surface of the earth before he took to agriculture, and that was to bury his dead; and in order to bury a dead body and make a mound over it, it was probably necessary for him to disturb the surface over a considerable area. Neolithic man's chief apparatus for mound-making consisted of picks of deer's horn and shovels of their shoulder-blades, and with this he would have found great difficulty in making a deep excavation. Nor do we find such excavations beside the barrows. Instead of going down into tough sub-soil, the mound-makers probably scraped up some of the surface soil and carried it to the mound. All this seems probable, and it gives just that wide area of bared and turned-over earth upon which an eared grass, such as barley, millet, or primitive wheat, might have seeded and grown. Moreover, the mound-makers, being busy with the mound, would not have time to hunt meat, and if they were accustomed to store and eat wild grain, they would be likely to scatter grain, and the grain would be blown by the wind out of their rude vessels over the area they were disturbing. And if they were bringing up seed in any quantity in baskets and pots to bury with the corpse, some of it might easily blow and be scattered over the fresh earth. Returning later to the region of the mound, they would discover an exceptionally vigorous growth of food grain, and it would be a natural thing to associate it with the buried person, and regard it as a consequence of his death and burial. He had given them back the grain they gave him increased a hundredfold.

At any rate, there is apparently all over the world a traceable association in ancient ceremonial and in the minds of barbaric people between the death and burial of a person and the ploughing and sowing of grain. From this it is assumed that there was once a world-wide persuasion that it was necessary that some one should be buried before a crop could be sown, and that out of this persuasion arose a practice and tradition of human sacrifice at seedtime, which has produced profound effects in the religious development of the race. There may have been some idea of refreshing the earth by a blood draught or revivifying it with the life of the sacrificed person. We state these considerations here merely as suggestions that have been made of the way in which the association of seedtime and sacrifice arose. They are, at the best, speculations; they have a considerable vogue at the present time, and we have to note them, but we have neither the space nor the time here to examine them at length. The valuable accumulations of suggestions due to the industry and ingenuity of Sir J. G. Frazer still await a thorough critical examination, and to his works the reader must go for the indefatigable expansion of this idea.

§ 5

All these early beginnings must have taken place far back in time, and in regions of the world that have still to be effectively explored by the archæologists. They were probably going on in Asia or Africa, in what is now the bed of the Mediterranean, or in the region of the Indian Ocean, while the Reindeer man was developing his art in Europe. The Neolithic men who drifted over Europe and western Asia 12,000 or 10,000 years ago were long past these beginnings; they were already close, a few thousand years, to the dawn of written tradition and the remembered history of mankind. Without any very great shock or break, bronze came at last into human life, giving a great advantage in warfare to those tribes who first obtained it. Written history had already begun before weapons of iron came into Europe to supersede bronze.

Already in those days a sort of primitive trade had sprung up. Bronze and bronze weapons, and such rare and hard stones as jade, gold because of its plastic and ornamental possibilities, and skins and flax-net and cloth, were being swapped and stolen and passed from hand to hand over great stretches of country. Salt also was probably being traded. On a meat dietary men can live without salt, but grain-consuming people need it just as herbivorous animals need it. Hopf says that bitter tribal wars have been carried on by the desert tribes of the Soudan in recent years for the possession of the salt deposits between Fezzan and Murzuk. To begin with, barter, blackmail, tribute, and robbery by violence passed into each other by insensible degrees. Men got what they wanted by such means as they could.[59]

§ 6

So far we have been telling of a history without events, a history of ages and periods and stages in development. But before we conclude this portion of the human story, we must record what was probably an event of primary importance and at first perhaps of tragic importance to developing mankind, and that was the breaking in of the Atlantic waters to the great Mediterranean valley.

The reader must keep in mind that we are endeavouring to give him plain statements that he can take hold of comfortably. But both in the matter of our time charts and the three maps we have given of prehistoric geography there is necessarily much speculative matter. We have dated the last Glacial Age and the appearance of the true men as about 40,000 or 35,000 years ago. Please bear that “about” in mind. The truth may be 60,000 or 20,000. But it is no good saying “a very long time” or “ages” ago, because then the reader will not know whether we mean centuries or millions of years. And similarly in these maps we give, they represent not the truth, but something like the truth. The outline of the land was “some such outline.” There were such seas and such land masses. But both Mr. Horrabin, who has drawn these maps, and I, who have incited him to do so, have preferred to err on the timid side.[60] We are not geologists enough to launch out into original research in these matters, and so we have stuck to the 40-fathom line and the recent deposits as our guides for our post-glacial map and for the map of 12,000 to 10,000 B.C. But in one matter we have gone beyond these guides. It is practically certain that at the end of the last Glacial Age the Mediterranean was a couple of land-locked sea basins, not connected--or only connected by a torrential overflow river. The eastern basin was the fresher; it was fed by the Nile, the “Adriatic” river, the “Red-Sea” river, and perhaps by a river that poured down amidst the mountains that are now the Greek Archipelago from the very much bigger Sea of Central Asia that then existed. Almost certainly human beings, and possibly even Neolithic men, wandered over that now lost Mediterranean valley.

The reasons for believing this are very good and plain. To this day the Mediterranean is a sea of evaporation. The rivers that flow into it do not make up for the evaporation from its surface. There is a constant current of water pouring into the Mediterranean from the Atlantic, and another current streaming in from the Bosphorus and Black Sea. For the Black Sea gets more water than it needs from the big rivers that flow into it; it is an overflowing sea, while the Mediterranean is a thirsty sea. From which it must be plain that when the Mediterranean was cut off both from the Atlantic Ocean and the Black Sea it must have been a shrinking sea with its waters sinking to a much lower level than those of the ocean outside. This is the case of the Caspian Sea to-day. Still more so is it the case with the Dead Sea.

But if this reasoning is sound, then where to-day roll the blue waters of the Mediterranean there must once have been great areas of land, and land with a very agreeable climate. This was probably the case during the last Glacial Age, and we do not know how near it was to our time when the change occurred that brought back the ocean waters into the Mediterranean basin. Certainly there must have been Grimaldi people, and perhaps even Azilian and Neolithic people going about in the valleys and forests of these regions that are now submerged. The Neolithic Dark Whites, the people of the Mediterranean race, may have gone far towards the beginnings of settlement and civilization in that great lost Mediterranean Valley.

Mr. W. B. Wright[61] gives us some very stimulating suggestions here. He suggests that in the Mediterranean basin there were two lakes, “one a fresh-water lake, in the eastern depression, which drained into the other in the western depression. It is interesting to think what must have happened when the ocean level rose once more as a result of the dissipation of the ice-sheets, and its waters began to pour over into the Mediterranean area. The inflow, small at first, must have ultimately increased to enormous dimensions, as the channel was slowly lowered by erosion and the ocean level slowly rose. If there were any unconsolidated materials on the sill of the Strait, the result must have been a genuine debacle, and if we consider the length of time which even an enormous torrent would take to fill such a basin as that of the Mediterranean, we must conclude that this result was likely to have been attained in any case. Now, this may seem all the wildest speculation, but it is not entirely so, for if we examine a submarine contour map of the Straits of Gibraltar, we find there is an enormous valley running up from the Mediterranean deep, right through the Straits, and trenching some distance out on to the Atlantic shelf. This valley or gorge is probably the work of the inflowing waters of the ocean at the termination of the period of interior drainage.”

This refilling of the Mediterranean, which by the rough chronology we are employing in this book may have happened somewhen between 30,000 and 10,000 B.C., must have been one of the greatest single events in the pre-history of our race. If the later date is the truer, then, as the reader will see plainly enough after reading the next two chapters, the crude beginnings of civilization, the first lake dwellings and the first cultivation, were probably round that eastern Levantine Lake into which there flowed not only the Nile, but the two great rivers that are now the Adriatic and the Red Sea. Suddenly the ocean waters began to break through over the westward hills and to pour in upon these primitive peoples--the lake that had been their home and friend became their enemy; its waters rose and never abated; their settlements were submerged; the waters pursued them in their flight. Day by day and year by year the waters spread up the valleys and drove mankind before them. Many must have been surrounded and caught by the continually rising salt flood. It knew no check; it came faster and faster; it rose over the treetops, over the hills, until it had filled the whole basin of the present Mediterranean and until it lapped the mountain cliffs of Arabia and Africa. Far away, long before the dawn of history, this catastrophe occurred.

XII

EARLY THOUGHT[62]

§ 1. _Primitive Philosophy._ § 2. _The Old Man in Religion._ § 3. _Fear and Hope in Religion._ § 4. _Stars and Seasons._ § 5. _Story-telling and Myth-making._ § 6. _Complex Origins of Religion._

§ 1

Before we go on to tell how 6000 or 7000 years ago men began to gather into the first towns and to develop something more than the loose-knit tribes that had hitherto been their highest political association, something must be said about the things that were going on inside these brains of which we have traced the growth and development through a period of 500,000 years from the Pithecanthropus stage.

What was man thinking about himself and about the world in those remote days?

At first he thought very little about anything but immediate things. At first he was busy thinking such things as: “Here is a bear; what shall I do?” Or “There is a squirrel; how can I get it?” Until language had developed to some extent there could have been little thinking beyond the range of actual experience, for language is the instrument of thought as book-keeping is the instrument of business. It records and fixes and enables thought to get on to more and more complex ideas. It is the hand of the mind to hold and keep. Primordial man, before he could talk, probably saw very vividly, mimicked very cleverly, gestured, laughed, danced, and lived, without much speculation about whence he came or why he lived. He feared the dark, no doubt, and thunderstorms and big animals and queer things and whatever he dreamt about, and no doubt he did things to propitiate what he feared or to change his luck and please the imaginary powers in rock and beast and river. He made no clear distinction between animate and inanimate things; if a stick hurt him, he kicked it; if the river foamed and flooded, he thought it was hostile. His thought was probably very much at the level of a bright little contemporary boy of four or five. He had the same subtle unreasonableness of transition and the same limitations. But since he had little or no speech he would do little to pass on the fancies that came to him, and develop any tradition or concerted acts about them.

The drawings even of Late Palæolithic man do not suggest that he paid any attention to sun or moon or stars or trees. He was preoccupied only with animals and men. Probably he took day and night, sun and stars, trees and mountains, as being in the nature of things--as a child takes its meal times and its nursery staircase for granted. So far as we can judge, he drew no fantasies, no ghosts or anything of that sort. The Reindeer Men’s drawings are fearless familiar things, with no hint about them of any religious or occult feelings. There is scarcely anything that we can suppose to be a religious or mystical symbol at all in his productions. No doubt he had a certain amount of what is called _fetishism_ in his life; he did things we should now think unreasonable to produce desired ends, for that is all fetishism amounts to; it is only incorrect science based on guess-work or false analogy, and entirely different in its nature from religion. No doubt he was excited by his dreams, and his dreams mixed up at times in his mind with his waking impressions and puzzled him. Since he buried his dead, and since even the later Neanderthal men seem to have buried their dead, and apparently with food and weapons, it has been argued that he had a belief in a future life. But it is just as reasonable to suppose that early men buried their dead with food and weapons because they doubted if they were dead, which is not the same thing as believing them to have immortal spirits, and that their belief in their continuing vitality was reinforced by dreams of the departed. They may have ascribed a sort of were-wolf existence to the dead, and wished to propitiate them.

The Reindeer man, we feel, was too intelligent and too like ourselves not to have had some speech, but quite probably it was not very serviceable for anything beyond direct statement or matter of fact narrative. He lived in a larger community than the Neanderthaler, but how large we do not know. Except when game is swarming, hunting communities must not keep together in large bodies or they will starve. The Indians who depend upon the caribou in Labrador must be living under circumstances rather like those of the Reindeer men. They scatter in small family groups, as the caribou scatter in search of food; but when the deer collect for the seasonal migration, the Indians also collect. That is the time for trade and feasts and marriages. The simplest American Indian is 10,000 years more sophisticated than the Reindeer man, but probably that sort of gathering and dispersal was also the way of Reindeer men. At Solutré in France there are traces of a great camping and feasting-place. There was no doubt an exchange of news there, but one may doubt if there was anything like an exchange of ideas. One sees no scope in such a life for theology or philosophy or superstition or speculation. Fears, yes; but unsystematic fears; fancies and freaks of the imagination, but personal and transitory freaks and fancies.

Perhaps there was a certain power of suggestion in these encounters. A fear really felt needs few words for its transmission; a value set upon something may be very simply conveyed.

In these questions of primitive thought and religion, we must remember that the lowly and savage peoples of to-day probably throw very little light on the mental state of men before the days of fully developed language. Primordial man could have had little or no tradition before the development of speech. All savage and primitive peoples of to-day, on the contrary, are soaked in tradition--the tradition of thousands of generations. They may have weapons like their remote ancestors and methods like them, but what were slight and shallow impressions on the minds of their predecessors are now deep and intricate grooves worn throughout the intervening centuries generation by generation.

§ 2

Certain very fundamental things there may have been in men's minds long before the coming of speech. Chief among these must have been fear of the Old Man of the tribe. The young of the primitive squatting-place grew up under that fear. Objects associated with him were probably forbidden. Every one was forbidden to touch his spear or to sit in his place, just as to-day little boys must not touch father's pipe or sit in his chair. He was probably the master of all the women. The youths of the little community had to remember that. The idea of _something forbidden_, the idea of things being, as it is called, _tabu_, not to be touched, not to be looked at, may thus have got well into the human mind at a very early stage indeed. J. J. Atkinson, in an ingenious analysis of these primitive tabus which are found among savage peoples all over the world, the tabus that separate brother and sister, the tabus that make a man run and hide from his stepmother, traces them to such a fundamental cause as this.[63] Only by respecting this primal law could the young male hope to escape the Old Man's wrath. And the Old Man must have been an actor in many a primordial nightmare. A disposition to propitiate him even after he was dead is quite understandable. One was not sure that he _was_ dead. He might only be asleep or shamming. Long after an Old Man was dead, when there was nothing to represent him but a mound and a megalith, the women would convey to their children how awful and wonderful he was. And being still a terror to his own little tribe, it was easy to go on to hoping that he would be a terror to other and hostile people. In his life he had fought for his tribe, even if he had bullied it. Why not when he was dead? One sees that the Old Man idea was an idea very natural to the primitive mind and capable of great development.[64]

§ 3

Another idea probably arose early out of the mysterious visitation of infectious diseases, and that was the idea of uncleanness and of being accurst. From that, too, there may have come an idea of avoiding particular places and persons, and persons in particular phases of health. Here was the root of another set of tabus. Then man, from the very dawn of his mental life, may have had a feeling of the sinister about places and things. Animals, who dread traps, have that feeling. A tiger will abandon its usual jungle route at the sight of a few threads of cotton.[65] Like most young animals, young human beings are easily made fearful of this or that by their nurses and seniors. Here is another set of ideas, ideas of repulsion and avoidance, that sprang up almost inevitably in men.

As soon as speech began to develop, it must have got to work upon such fundamental feelings and begun to systematize them, and keep them in mind. By talking together men would reinforce each other's fears, and establish a common tradition of tabus of things forbidden and of things unclean. With the idea of uncleanness would come ideas of cleansing and of removing a curse. The cleansing would be conducted through the advice and with the aid of wise old men or wise old women, and in such cleansing would lie the germ of the earliest priestcraft and witchcraft.

Speech from the first would be a powerful supplement to the merely imitative education and to the education of cuffs and blows conducted by a speechless parent. Mothers would tell their young and scold their young. As speech developed, men would find they had experiences and persuasions that gave them or seemed to give them power. They would make secrets of these things. There is a double streak in the human mind, a streak of cunning secretiveness and a streak perhaps of later origin that makes us all anxious to tell and astonish and impress each other. Many people make secrets in order to have secrets to tell. These secrets of early men they would convey to younger, more impressionable people, more or less honestly and impressively in some process of initiation. Moreover, the pedagogic spirit overflows in the human mind; most people like "telling other people not to." Extensive arbitrary prohibitions for the boys, for the girls, for the women, also probably came very early into human history.

Then the idea of the sinister has for its correlative the idea of the propitious, and from that to the idea of making things propitious by ceremonies is an easy step.[66]

§ 4

Out of such ideas and a jumble of kindred ones grew the first quasi-religious elements in human life. With every development of speech it became possible to intensify and develop the tradition of tabus and restraints and ceremonies. There is not a savage or barbaric race to-day that is not held in a net of such tradition. And with the coming of the primitive herdsman there would be a considerable broadening out of all this sort of practice. Things hitherto unheeded would be found of importance in human affairs. Neolithic man was nomadic in a different spirit from the mere daylight drift after food of the primordial hunter. He was a herdsman, upon whose mind a sense of direction and the lie of the land had been forced. He watched his flock by night as well as by day. The sun by day and presently the stars by night helped to guide his migrations; he began to find after many ages that the stars are steadier guides than the sun. He would begin to note particular stars and star groups, and to distinguish any individual thing was, for primitive man, to believe it individualized and personal. He would begin to think of the chief stars as persons, very shining and dignified and trustworthy persons looking at him like bright eyes in the night. His primitive tillage strengthened his sense of the seasons. Particular stars ruled his heavens when seedtime was due. The beginnings of agriculture were in the sub-tropical zone, or even nearer the equator, where stars of the first magnitude shine with a splendour unknown in more temperate latitudes.

And Neolithic man was counting, and falling under the spell of numbers. There are savage languages that have no word for any number above five. Some peoples cannot go above two. But Neolithic man in the lands of his origin in Asia and Africa even more than in Europe was already counting his accumulating possessions. He was beginning to use tallies, and wondering at the triangularity of three and the squareness of four, and why some quantities like twelve were easy to divide in all sorts of ways, and others, like thirteen, impossible. Twelve became a noble, generous, and familiar number to him, and thirteen rather an outcast and disreputable one.

[Illustration: A CARVED STATUE (“MENHIR”) OF THE NEOLITHIC PERIOD--A CONTRAST TO THE FREEDOM AND VIGOUR OF PALÆOLITHIC ART.]

Probably man began reckoning time by the clock of the full and new moons. Moonlight is an important thing to herdsmen who no longer merely hunt their herds, but watch and guard them. Moonlight, too, was perhaps his time for love-making, as indeed it may have been for primordial man and the ground ape ancestor before him. But from the phases of the moon, as his tillage increased, man’s attitude would go on to the greater cycle of the seasons. Primordial man probably only drifted before the winter as the days grew cold. Neolithic man knew surely that the winter would come, and stored his fodder and presently his grain. He had to fix a seedtime, a propitious seedtime, or his sowing was a failure. The earliest recorded reckoning is by moons and by generations of men. The former seems to be the case in the Book of Genesis, where, if one reads the great ages of the patriarchs who lived before the flood as lunar months instead of years, Methusaleh and the others are reduced to a credible length of life. But with agriculture began the difficult task of squaring the lunar month with the solar year; a task which has left its scars on our calendar to-day. Easter shifts uneasily from year to year, to the great discomfort of holiday-makers; it is now inconveniently early and now late in the season because of this ancient reference of time to the moon.

And when men began to move with set intention from place to place with their animal and other possessions, then they would begin to develop the idea of other places in which they were not, and to think of what might be in those other places. And in any valley where they lingered for a time, they would, remembering how they got there, ask, “How did this or that other thing get here?” They would begin to wonder what was beyond the mountains, and where the sun went when it set, and what was above the clouds.

§ 5

The capacity for telling things increased with their vocabulary. The simple individual fancies, the unsystematic fetish tricks and fundamental tabus of Palæolithic man began to be handed on and made into a more consistent system. Men began to tell stories about themselves, about the tribe, about its tabus and why they had to be, about the world and the why for the world. A tribal mind came into existence, a tradition. Palæolithic man was certainly more of a free individualist, more of an artist, as well as more of a savage, than Neolithic man. Neolithic man was coming under prescription; he could be trained from his youth and told to do things and not to do things; he was not so free to form independent ideas of his own about things. He had thoughts given to him; he was under a new power of suggestion. And to have more words and to attend more to words is not simply to increase mental power;

words themselves are powerful things and dangerous things. Palæolithic man's words, perhaps, were chiefly just names. He used them for what they were. But Neolithic man was thinking about these words, he was thinking about a number of things with a great deal of verbal confusion, and getting to some odd conclusions. In speech he had woven a net to bind his race together, but also it was a net about his feet. Man was binding himself into new and larger and more efficient combinations indeed, but at a price. One of the most notable things about the Neolithic Age is the total absence of that free direct artistic impulse which was the supreme quality of later Palæolithic man. We find much industry, much skill, polished implements, pottery with conventional designs, co-operation upon all sorts of things, but no evidence of personal creativeness.[67] Self-suppression is beginning for men. Man has entered upon the long and tortuous and difficult path towards a life for the common good, with all its sacrifice of personal impulse, which he is still treading to-day.

Certain things appear in the mythology of mankind again and again. Neolithic man was enormously impressed by serpents--and he no longer took the sun for granted. Nearly everywhere that Neolithic culture went, there went a disposition to associate the sun and the serpent in decoration and worship. This primitive serpent worship spread ultimately far beyond the regions where the snake is of serious practical importance in human life.

§ 6

With the beginnings of agriculture a fresh set of ideas arose in men's minds. We have already indicated how easily and naturally men may have come to associate the idea of sowing with a burial. Sir J. G. Frazer has pursued the development of this association in the human mind, linking up with it the conception of special sacrificial persons who are killed at seedtime, the conception of a specially purified class of people to kill these sacrifices, the first priests, and the conception of a _sacrament_, a ceremonial feast in which the tribe eats portions of the body of the victim in order to share in the sacrificial benefits.

Out of all these factors, out of the Old Man tradition, out of the desire to escape infection and uncleanness, out of the desire for power and success through magic, out of the sacrificial tradition of seedtime, and out of a number of like beliefs and mental experiments and misconceptions, a complex something was growing up in the lives of men which was beginning to bind them together mentally and emotionally in a common life and action. This something we may call _religion_ (Lat. _religare_, to bind[68]). It was not a simple or logical something, it was a tangle of ideas about commanding beings and spirits, about gods, about all sorts of "musts" and "must-nots." Like all other human matters, religion has grown. It must be clear from what has gone before that primitive man--much less his ancestral apes and his ancestral Mesozoic mammals--could have had no idea of God or Religion; only very slowly did his brain and his powers of comprehension become capable of such general conceptions. Religion is something that has grown up with and through human association, and God has been and is still being discovered by man.

[Illustration: Bronze Age Implements

(drawn to differing scales)]

This book is not a theological book, and it is not for us to embark upon theological discussion; but it is a part, a necessary and central part, of the history of man to describe the dawn and development of his religious ideas and their influence upon his activities. All these factors we have noted must have contributed to this development, and various writers have laid most stress upon one or other of them. Sir J. G. Frazer we have already noted as the leading student of the derivation of sacraments from magic sacrifices. Grant Allen, in his _Evolution of the Idea of God_, laid stress chiefly on the posthumous worship of the "Old Man." Sir E. B. Tylor (_Primitive Culture_) gave his attention mainly to the disposition of primitive man to ascribe a soul to every object animate and inanimate. Mr. A. E. Crawley, in _The Tree of Life_, has called attention to other centres of impulse and emotion, and particularly to sex as a source of deep excitement. The thing we have to bear in mind is that Neolithic man was still mentally undeveloped, he could be confused and illogical to a degree quite impossible to an educated modern person. Conflicting and contradictory ideas could lie in his mind without challenging one another; now one thing ruled his thoughts intensely and vividly and now another; his fears, his acts, were still disconnected as children's are.

[Illustration: TIME DIAGRAM SHOWING THE GENERAL DURATION OF THE NEOLITHIC PERIOD IN WHICH EARLY THOUGHT DEVELOPED.]

Confusedly under the stimulus of the need and possibility of co-operation and a combined life, Neolithic mankind was feeling out for guidance and knowledge. Men were becoming aware that personally they needed protection and direction, cleansing from impurity, power beyond their own strength. Confusedly in response to that demand, bold men, wise men, shrewd and cunning men were

arising to become magicians, priests, chiefs, and kings. They are not to be thought of as cheats or usurpers of power, nor the rest of mankind as their dupes. All men are mixed in their motives; a hundred things move men to seek ascendancy over other men, but not all such motives are base or bad. The magicians usually believed more or less in their own magic, the priests in their ceremonies, the chiefs in their right. The history of mankind henceforth is a history of more or less blind endeavours to conceive a common purpose in relation to which all men may live happily, and to create and develop a common consciousness and a common stock of knowledge which may serve and illuminate that purpose. In a vast variety of forms this appearance of kings and priests and magic men was happening all over the world under Neolithic conditions. Everywhere mankind was seeking where knowledge and mastery and magic power might reside; everywhere individual men were willing, honestly or dishonestly, to rule, to direct, or to be the magic beings who would reconcile the confusions of the community.

In many ways the simplicity, directness, and detachment of a later Palæolithic rock-painter appeal more to modern sympathies than does the state of mind of these Neolithic men, full of the fear of some ancient Old Man who had developed into a tribal God, obsessed by ideas of sacrificial propitiation and magic murder. No doubt the reindeer hunter was a ruthless hunter and a combative and passionate creature, but he killed for reasons we can still understand; Neolithic man, under the sway of talk and a confused thought process, killed on theory, he killed for monstrous and now incredible ideas, he killed those he loved through fear and under direction. Those Neolithic men not only made human sacrifices at seedtime; there is every reason to suppose they sacrificed wives and slaves at the burial of their chieftains; they killed men, women, and children whenever they were under adversity and thought the gods were athirst. They practised infanticide.[69] All these things passed on into the Bronze Age.

Hitherto a social consciousness had been asleep and not even dreaming in human history. Before it awakened it produced nightmares.

Away beyond the dawn of history, 3000 or 4000 years ago, one thinks of the Wiltshire uplands in the twilight of a midsummer day's morning. The torches pale in the growing light. One has a dim apprehension of a procession through the avenue of stone, of priests, perhaps fantastically dressed with skins and horns and horrible painted masks--not the robed and bearded dignitaries our artists represent the Druids to have been--of chiefs in skins adorned with necklaces of teeth and bearing spears and axes, their great heads of hair held up with pins of bone, of women in skins or flaxen robes, of a great peering crowd of shock-headed men and naked children. They have assembled from many distant places; the ground between the avenues and Silbury Hill is dotted with their encampments. A certain festive cheerfulness prevails. And amidst the throng march the appointed human victims, submissive, helpless, staring towards the distant smoking altar at which they are to die--that the harvests may be good and the tribe increase.... To that had life progressed 3000 or 4000 years ago from its starting-place in the slime of the tidal beaches.

XIII

THE RACES OF MANKIND

§1. Is Mankind Still Differentiating? §2. The Main Races of Mankind. §3. Was There an Alpine Race? §4. The Brunet Peoples. §5. How Existing Races may be Related to Each Other.

§ 1

It is necessary now to discuss plainly what is meant by a phrase, used often very carelessly, "The Races of Mankind."

It must be evident from what has already been explained in Chapter III that man, so widely spread and subjected therefore to great differences of climate, consuming very different food in different regions, attacked by different enemies, must always have been undergoing considerable local modification and differentiation. Man, like every other species of living thing, has constantly been tending to differentiate into several species; wherever a body of men has been cut off, in islands or oceans or by deserts or mountains, from the rest of humanity, it must have begun very soon to develop special characteristics, specially adapted to the local conditions. But, on the other hand, man is usually a wandering and enterprising animal, for whom there exist few insurmountable barriers. Men imitate men, fight and conquer them, interbreed, one people with another. Concurrently for thousands of years there have been two sets of forces at work, one tending to separate men into a multitude of local varieties, and another to remix and blend these varieties together before a separate species has been established.

These two sets of forces may have fluctuated in this relative effect in the past. Palæolithic man, for instance, may have been more of a wanderer, he may have drifted about over a much greater area, than later Neolithic man; he was less fixed to any sort of home

or lair, he was tied by fewer possessions. Being a hunter, he was obliged to follow the migrations of his ordinary quarry. A few bad seasons may have shifted him hundreds of miles. He may therefore have mixed very widely and developed few varieties over the greater part of the world.

The appearance of agriculture tended to tie those communities of mankind that took it up to the region in which it was most conveniently carried on, and so to favour differentiation. Mixing or differentiation is not dependent upon a higher or lower stage of civilization; many savage tribes wander now for hundreds of miles; many English villagers in the eighteenth century, on the other hand, had never been more than eight or ten miles from their villages, neither they nor their fathers nor grandfathers before them. Hunting peoples often have enormous range. The Labrador country, for instance, is inhabited by a few thousand Indians,[70] who follow the one great herd of caribou as it wanders yearly north and then south again in pursuit of food. This mere handful of people covers a territory as large as France. Nomad peoples also range very widely. Some Kalmuck tribes are said to travel nearly a thousand miles between summer and winter pasture.

It carries out this suggestion, that Palæolithic man ranged widely and was distributed, thinly indeed but uniformly, throughout the world, that the Palæolithic remains we find are everywhere astonishingly uniform. To quote Sir John Evans,[71] “The implements in distant lands are so identical in form and character with the British specimens that they might have been manufactured by the same hands.... On the banks of the Nile, many hundreds of feet above its present level, implements of the European types have been discovered; while in Somaliland, in an ancient river-valley at a great elevation above the sea, Sir H. W. Seton-Karr has collected a large number of implements formed of flint and quartzite, which, judging from their form and character, might have been dug out of the drift-deposits of the Somme and the Seine, the Thames or the ancient Solent.”

Phases of spreading and intermixture have probably alternated with phases of settlement and specialization in the history of mankind. But up to a few hundred years ago it is probable that since the days of the Palæolithic Age at least mankind has on the whole been differentiating. The species has differentiated in that period into a very great number of varieties, many of which have reblended with others, which have spread and undergone further differentiation or become extinct. Wherever there has been a strongly marked local difference of conditions and a check upon intermixture, there one is almost obliged to assume a variety of mankind must have appeared. Of such local varieties there must have been a great multitude.

In one remote corner of the world, Tasmania, a little cut-off population of people remained in the early Palæolithic stage until the discovery of that island by the Dutch in 1642. They are now, unhappily, extinct. The last Tasmanian died in 1877. They may have been cut off from the rest of mankind for 15,000 or 20,000 or 25,000 years.

But among the numerous obstacles and interruptions to intermixture there have been certain main barriers, such as the Atlantic Ocean, the highlands, once higher, and the now vanished seas of central Asia and the like, which have cut off great groups of varieties from other great groups of varieties over long periods of time. These separated groups of varieties developed very early certain broad resemblances and differences. Most of the varieties of men in eastern Asia and America, but not all, have now this in common, that they have yellowish buff skins, straight black hair, and often high cheek-bones. Most of the native peoples of Africa south of the Sahara, but not all, have black or blackish skins, flat noses, thick lips, and frizzy hair. In north and western Europe a great number of peoples have fair hair, blue eyes, and ruddy complexions; and about the Mediterranean there is a prevalence of white-skinned peoples with dark eyes and black hair. The black hair of many of these dark whites is straight, but never so strong and waveless as the hair of the yellow peoples. It is straighter in the east than in the west. In southern India we find brownish and darker peoples with straight black hair, and these as we pass eastward give place to more distinctly yellow peoples. In scattered islands and in Papua and New Guinea we find another series of black and brownish peoples of a more lowly type with frizzy hair.

[Illustration: Australoid types]

But it must be borne in mind that these are very loose-fitting generalizations. Some of the areas and isolated pockets of mankind in the Asiatic area may have been under conditions more like those in the European area; some of the African areas are of a more Asiatic and less distinctively African type. We find a wavy-haired, fairish, hairy-skinned race, the Ainu, in Japan. They are more like the Europeans in their facial type than the surrounding yellow Japanese. They may be a drifted patch of the whites or they may be a quite distinct people. We find primitive black people in the Andaman Islands far away from Australia and far away from Africa. There is a streak of very negroid blood traceable in south Persia and some parts of India. These are the “Asiatic” negroids. There is little or no proof that all black people, the Australians, the Asiatic negroids and the negroes, derive from one origin, but only that they have lived for vast periods under similar conditions. We must not assume that human beings in the eastern Asiatic area were

all differentiating in one direction and all the human beings in Africa in another. There were great currents of tendency, it is true, but there were also backwaters, eddies, admixtures, readmixtures, and leakages from one main area to the other. A coloured map of the world to show the races would not present just four great areas of colour; it would have to be dabbed over with a multitude of tints and intermediate shades, simple here, mixed and overlapping there.

In the early Neolithic Period in Europe--it may be 10,000 or 12,000 years ago or so--man was differentiating all over the world, and he had already differentiated into a number of varieties, but he has never differentiated into different _species_. A “species,” we must remember, in biological language is distinguished from a “variety” by the fact that varieties can interbreed, while species either do not do so or produce offspring which, like mules, are sterile. All mankind can interbreed freely, can learn to understand the same speech, can adapt itself to co-operation. And in the present age, man is probably no longer undergoing differentiation at all. Readmixture is now a far stronger force than differentiation. Men mingle more and more. Mankind from the view of a biologist is an animal species in a state of arrested differentiation and possible readmixture.

§ 2

It is only in the last fifty or sixty years that the varieties of men came to be regarded in this light, as a tangle of differentiations recently arrested or still in progress. Before that time students of mankind, influenced, consciously or unconsciously, by the story of Noah and the Ark and his three sons, Shem, Ham, and Japhet, were inclined to classify men into three or four great races, and they were disposed to regard these races as having always been separate things, descended from originally separate ancestors. They ignored the great possibilities of blended races and of special local isolations and variations. The classification has varied considerably, but there has been rather too much readiness to assume that mankind _must_ be completely divisible into three or four main groups. Ethnologists (students of race) have fallen into grievous disputes about a multitude of minor peoples, as to whether they were of this or that primary race or “mixed,” or strayed early forms, or what not. But all races are more or less mixed. There are, no doubt, four main groups, but each is a miscellany, and there are little groups that will not go into any of the four main divisions.

[Illustration: Bushwoman]

Subject to these reservations, when it is clearly understood that when we speak of these main divisions we mean not simple and pure races, but groups of races, then they have a certain convenience in discussion. Over the European and Mediterranean area and western Asia there are, and have been for many thousand years, white peoples, usually called the CAUCASIANS,[72] subdivided into two or three subdivisions, the northern blonds, an alleged intermediate race about which many authorities are doubtful, and the southern dark whites; over eastern Asia and America a second group of races prevails, the MONGOLIANS, generally with yellow skins, straight black hair, and sturdy bodies; over Africa the NEGROES, and in the region of Australia and New Guinea the black, primitive AUSTRALOIDS. These are convenient terms, provided the student bears in mind that they are not exactly defined terms. They represent only the common characteristics of certain main groups of races; they leave out a number of little peoples who belong properly to none of these divisions, and they disregard the perpetual mixing where the main groups overlap.

§ 3

[Illustration: Negro types]

[Illustration: Mongolian Types]

Whether the “Caucasian” race is to be divided into two or three main subdivisions depends upon the classificatory value to be attached to certain differences in the skeleton and particularly to the shape of the skull. The student in his further reading will meet with constant references to round-skulled (Brachycephalic) and long-skulled peoples (Dolichocephalic). No skull looked at from above is completely round, but some skulls (the dolichocephalic) are much more oblong than others; when the width of a skull is four-fifths or more of its length from back to front, that skull is called brachycephalic; when the width is less than four-fifths of the length, the skull is dolichocephalic. While some ethnologists regard the difference between brachycephaly and dolichocephaly as a difference of quite primary importance, another school--which the writer must confess has entirely captured his convictions--dismisses this as a mere secondary distinction. It seems probable that the skull shapes of a people may under special circumstances vary in comparatively few generations.[73]

We do not know what influences alter the shape of the skull, just as we do not know why people of British descent in the Darling region of Australia (“Cornstalks”) grow exceptionally tall, or why in New England their jaw-bones seem to become slighter and their teeth in consequence rather crowded. Even in Neolithic times dolichocephalic and brachycephalic skulls are found in the same group of remains and often buried together, and that is true of most peoples to-day. Some peoples, such as the mountain people of central Europe, have more brachycephalic individuals per cent. than others; some, as the Scandinavians, are more prevalently dolichocephalic. In Neolithic Britain and in Scandinavia the earliest barrows (= tomb mounds) are long grave-shaped barrows and the late ones round, and the skulls found in the former are usually dolichocephalic and in the latter most frequently brachycephalic. This points perhaps to a succession of races in western Europe in the Neolithic Period (see Chapter XLV), but it may also point to changes of diet, habit, or climate.

[Illustration: Caucasian Types]

But it is this study of skull shapes which has led many ethnologists to divide the Caucasian race, not, as it was divided by Huxley, into two, the northern _blonds_ and the Mediterranean and North African _dark whites_ or brunets, but into three. They split his blonds into two classes. They distinguish a northern European type, blond and dolichocephalic, the Nordic; a Mediterranean or Iberian race, Huxley’s dark whites, which is dark-haired and dolichocephalic, and between these two they descry this third race, their brachycephalic race, the Alpine race. The opposite school would treat the alleged Alpine race simply as a number of local brachycephalic varieties of Nordic or Iberian peoples. The Iberian peoples were the Neolithic people of the long barrows, and seem at first to have pervaded most of Europe and western Asia.

[Illustration: Map of EUROPE, Western ASIA & Northern AFRICA in the Forest (Pluvial) Period (about 15,000 or 12,000 years ago)

Showing probable range of the main races before the dawn of history. Mountain barriers are indicated thus [symbol] Sea barriers [symbol]]

§ 4

This Mediterranean or Iberian race certainly had a wider range in early times, and was a less specialized and distinctive race than the Nordic. It is very hard to define its southward boundaries from the Negro, or to mark off its early traces in central Asia from those of early Dravidians or Mongolians. Wilfred Scawen Blunt[74] says that Huxley “had long suspected a common origin of the Egyptians and the Dravidians of India, perhaps a long belt of brown-skinned men from India to Spain in very early days.” Across France and Great Britain these dark-white Iberian or Mediterranean people were ousted by a round-barrow-making “Alpine” or Alpine-Nordic race, and the dawn of history in Europe sees them being pressed westward and southward everywhere by the expansion of the fairer northern peoples.

It is possible that this “belt” of Huxley’s of dark-white and brown-skinned men, this race of brunet-brown folk, ultimately spread even farther than India; that they reached to the shores of the Pacific, and that they were everywhere the original possessors of the Neolithic culture and the beginners of what we call civilization. The Nordic and the Mongolian peoples may have been but north-western and north-eastern branches from this more fundamental stem. Or the Nordic race may have been a branch, while the Mongolian, like the Negro, may have been another equal and distinct stem with which the brunet-browns met and mingled in South China. Or the Nordic peoples also may have developed separately from a palæolithic stage.

[Illustration: The Swastika]

At some period in human history (see Elliot Smith’s _Migrations of Early Culture_) there seems to have been a special type of Neolithic culture widely distributed in the world which had a group of features so curious and so unlikely to have been independently developed in different regions of the earth, as to compel us to believe that it was in effect one culture. It reached through all the regions inhabited by the brunet Mediterranean race, and beyond through India, Further India, up the Pacific coast of China, and it spread at last across the Pacific and to Mexico and Peru. It was a coastal culture not reaching deeply inland. (Here again we cover the ground of Huxley’s “belt of brown-skinned men,” and extend it far to the east across the stepping-stones of Polynesia. There are, we may note, some very striking resemblances between early Japanese pottery and so forth and similar Peruvian productions.) This peculiar development of the Neolithic culture, which, Elliot Smith called the _heliolithic_[75] culture, included many or all of the following odd practices: (1) circumcision, (2) the very queer custom of sending the _father_ to bed when a child is born, known as the _couvade_, (3) the practice of massage, (4) the making of mummies, (5) megalithic monuments[76] (_e.g._ Stonehenge), (6) artificial deformation of the heads of the young by bandages, (7) tattooing, (8) religious association of the

sun and the serpent, and (9) the use of the symbol known as the swastika (see figure) for good luck. This odd little symbol spins gaily round the world; it seems incredible that men would have invented and made a pet of it twice over. Elliot Smith traces these practices in a sort of constellation all over this great Mediterranean-Indian Ocean-Pacific area. Where one occurs, most of the others occur. They link Brittany with Borneo and Peru. But this constellation of practices does not crop up in the primitive homes of Nordic or Mongolian peoples, nor does it extend southward much beyond equatorial Africa. For thousands of years, from 15,000 to 1000 B.C., such a heliolithic Neolithic culture and its brownish possessors may have been oozing round the world through the warmer regions of the world, drifting by canoes often across wide stretches of sea. And its region of origin may have been, as Elliot Smith suggests, the Mediterranean and North-African region. It must have been spreading up the Pacific Coast and across the island stepping-stones to America, long after it had passed on into other developments in its areas of origin. Many of the peoples of the East Indies, Melanesia and Polynesia were still in this heliolithic stage of development when they were discovered by European navigators in the eighteenth century. The first civilizations in Egypt and the Euphrates-Tigris valley probably developed directly out of this widespread culture.[77] We will discuss later whether the Chinese civilization had a different origin. The Semitic nomads of the Arabian desert seem also to have had a heliolithic stage.

§ 5

It may clear up the necessarily rather confused discussion of this chapter to give a summary of the views expressed here in a diagram. This, on page 149, should be compared later with the language diagram on page 155.

We have put the Australoids as a Negroid branch, but many authorities would set back the Australoid stem closer to the Tasmanian, and there may even be sound reasons for transferring both Australoids and Tasmanians as separate branches to the left of the “Later Palæolithic Races.” To avoid crowding we have omitted the Hairy Ainu. They may be the last vestiges of an ancient primitive Pre-Nordic Pre-Mongolian strain from which the Nordic races are descended.

[Illustration: A Diagrammatic Summary of Current Ideas of the RELATIONSHIP of HUMAN RACES

(It must be borne in mind that human races interbreed freely.)]

XIV

THE LANGUAGES OF MANKIND

§ 1. _No one Primitive Language._ § 2. _The Aryan Languages._ § 3. _The Semitic Languages._ § 4. _The Hamitic Languages._ § 5. _The Ural Altaic Languages._ § 6. _The Chinese Languages._ § 7. _Other Language Groups._ § 8. _Submerged and Lost Languages._ § 9. _How Languages may be Related._

§ 1

It is improbable that there was ever such a thing as a common human language. We know nothing of the language of Palæolithic man; we do not even know whether Palæolithic man talked freely.

We know that Palæolithic man had a keen sense of form and attitude, because of his drawings; and it has been suggested that he communicated his ideas very largely by gesture. Probably such words as the earlier men used were mainly cries of alarm or passion or names for concrete things, and in many cases they were probably imitative sounds made by or associated with the things named.[78]

The first languages were probably small collections of such words; they consisted of interjections and nouns. Probably the nouns were said in different intonations to convey different meanings. If Palæolithic man had a word for “horse” or “bear,” he probably showed by tone or gesture whether he meant “bear is coming,” “bear is going,” “bear is to be hunted,” “dead bear,” “bear has been here,” “bear did this,” and so on. Only very slowly did the human mind develop methods of indicating action and relationship in a formal manner. Modern languages contain many thousands of words, but the earlier languages could have consisted only of a few hundred. It is said that even modern European peasants can get along with something less than a thousand words, and it is quite conceivable that so late as the Early Neolithic Period that was the limit of the available vocabulary. Probably men did not indulge in those days in conversation or description. For narrative purposes they danced and acted rather than told. They had no method of counting beyond a method of indicating two by a dual number, and some way of expressing many. The growth of speech was at first a very slow process indeed, and grammatical forms and the expression of abstract ideas may have come very late in human

history, perhaps only 400 or 500 generations ago.

§ 2

The students of languages (philologists) tell us that they are unable to trace with certainty any common features in all the languages of mankind. They cannot even find any elements common to all the Caucasian languages. They find over great areas groups of languages which have similar root words and similar ways of expressing the same idea, but then they find in other areas languages which appear to be dissimilar down to their fundamental structure, which express action and relation by entirely dissimilar devices, and have an altogether different grammatical scheme.[79] One great group of languages, for example, now covers nearly all Europe and stretches out to India; it includes English, French, German, Spanish, Italian, Greek, Russian, Armenian, Persian, and various Indian tongues. It is called the Indo-European or ARYAN family. The same fundamental roots, the same grammatical ideas, are traceable through all this family. Compare, for example, English _father, mother_, Gothic _fadar, moutar_, German _vater, mutter_, Latin _pater, mater_, Greek _pater, meter_, French _père, mère_, Armenian _hair, mair_, Sanscrit _pitar, matar_, etc., etc. In a similar manner the Aryan languages ring the changes on a great number of fundamental words, _f_ in the Germanic languages becoming _p_ in Latin, and so on. They follow a law of variation called Grimm's Law. These languages are not different things, they are variations of one thing. The people who use these languages think in the same way.

At one time in the remote past, in the Neolithic Age, that is to say 6000[80] years or more ago, there may have been one simple original speech from which all these Aryan languages have differentiated. Somewhere between central Europe and western Asia there must have wandered a number of tribes sufficiently intermingled to develop and use one tongue. It is convenient here to call them the Aryan peoples. Sir H. H. Johnston has called them "Aryan Russians." They belonged mostly to the Caucasian group of races and to the blond and northern subdivision of the group, to the Nordic race that is.

Here one must sound a note of warning. There was a time when the philologists were disposed to confuse languages and races, and to suppose that people who once all spoke the same tongue must be all of the same blood. That, however, is not the case, as the reader will understand if he will think of the negroes of the United States who now all speak English, or of the Irish, who--except for purposes of political demonstration--no longer speak the old Erse language but English, or of the Cornish people, who have lost their ancient Keltic speech. But what a common language does do, is to show that a common intercourse has existed, and the possibility of intermixture; and if it does not point to a common origin, it points at least to a common future.

But even this original Aryan language, which was a spoken speech perhaps 4000 or 3000 B.C., was by no means a _primordial_ language or the language of a savage race. Its speakers were in or past the Neolithic stage of civilization. It had grammatical forms and verbal devices of some complexity. The vanished methods of expression of the later Palæolithic peoples, of the Azilians, or of the early Neolithic kitchen-midden people for instance, were probably much cruder than the most elementary form of Aryan.

Probably the Aryan group of languages became distinct in a wide region of which the Danube, Dnieper, Don, and Volga were the main rivers, a region that extended eastward beyond the Ural mountains north of the Caspian Sea. The area over which the Aryan speakers roamed probably did not for a long time reach to the Atlantic or to the south of the Black Sea beyond Asia Minor. There was no effectual separation of Europe from Asia then at the Bosphorus.[81] The Danube flowed eastward to a great sea that extended across the Volga region of south-eastern Russia right into Turkestan, and included the Black, Caspian, and Aral Seas of to-day. Perhaps it sent out arms to the Arctic Ocean. It must have been a pretty effective barrier between the Aryan speakers and the people in north-eastern Asia. South of this sea stretched a continuous shore from the Balkans to Afghanistan.[82] North-west of it a region of swamps and lagoons reached to the Baltic.

§ 3

Next to Aryan, philologists distinguish another group of languages which seem to have been made quite separately from the Aryan languages, the Semitic. Hebrew and Arabic are kindred, but they seem to have even a different set of root words from the Aryan tongues; they express their ideas of relationship in a different way; the fundamental ideas of their grammars are generally different. They were in all probability made by human communities quite out of touch with the Aryans, separately and independently. Hebrew, Arabic, Abyssinian, ancient Assyrian, ancient Phœnician, and a number of associated tongues are put together, therefore, as being derived from a second primary language, which is called the SEMITIC. In the very beginnings of recorded history we find Aryan-speaking peoples and Semitic-speaking peoples carrying on the liveliest intercourse of war and trade round and about the eastern end of the Mediterranean, but the fundamental differences of the primary Aryan and primary Semitic languages oblige us to

believe that in early Neolithic times, before the historical period, there must for thousands of years have been an almost complete separation of the Aryan-speaking and the Semitic-speaking peoples. The latter seem to have lived either in south Arabia or in north-east Africa. In the opening centuries of the Neolithic Age the original Aryan speakers and the original Semitic speakers were probably living, so to speak, in different worlds, with a minimum of intercourse. Racially, it would seem, they had a remote common origin; both Aryan speakers and Semites are classed as Caucasians; but while the original Aryan speakers seem to have been of Nordic race, the original Semites were rather of the Mediterranean type.

§ 4

Philologists speak with less unanimity of a third group of languages, the HAMITIC, which some declare to be distinct from, and others allied to, the Semitic. The weight of opinion inclines now towards the idea of some primordial connection of these two groups. The Hamitic group is certainly a much wider and more various language group than the Semitic or the Aryan, and the Semitic tongues are more of a family, have more of a common likeness, than the Aryan. The Semitic languages may have arisen as some specialized proto-Hamitic group, just as the birds arose from a special group of reptiles (Chap. IV). It is a tempting speculation, but one for which there is really no basis of justifying fact, to suppose that the rude primordial ancestor group of the Aryan tongues branched off from the proto-Hamitic speech forms at some still earlier date than the separation and specialization of Semitic. The Hamitic speakers to-day, like the Semitic speakers, are mainly of the Mediterranean Caucasian race. Among the Hamitic languages are the ancient Egyptian and Coptic, the Berber languages (of the mountain people of north Africa, the Masked Tuaregs, and other such peoples), and what are called the Ethiopic group of African languages in eastern Africa, including the speech of the Gallas and the Somalis. The general grouping of these various tongues suggests that they originated over some great area to the west, as the primitive Semitic may have arisen to the east of the Red Sea divide. That divide was probably much more effective in Pleistocene times; the sea extended across to the west of the Isthmus of Suez, and a great part of lower Egypt was under water. Long before the dawn of history, however, Asia and Africa had joined at Suez, and these two language systems were in contact in that region. And if Asia and Africa were separated then at Suez, they may, on the other hand, have been joined by way of Arabia and Abyssinia.

[Illustration: Possible Development of LANGUAGES

disregarding admixtures, e.g. Turkish elements in Russian, Latin in English, Hamitic in Keltic, & so forth; & omitting various Indian, Melanesian & other groups.]

These Hamitic languages may have radiated from a centre on the African coast of the Mediterranean, and they may have extended over the then existing land connections very widely into western Europe.

All these three great groups of languages, it may be noted, the Aryan, Semitic, and Hamitic, have one feature in common which they do not share with any other language, and that is grammatical gender; but whether that has much weight as evidence of a remote common origin of Aryan, Semitic, and Hamitic, is a question for the philologist rather than for the general student. It does not affect the clear evidence of a very long and very ancient prehistoric separation of the speakers of these three diverse groups of tongues.

The bulk of the Semitic and Hamitic-speaking peoples are put by ethnologists with the Aryans among the Caucasian group of races. They are “white.” The Semitic and Nordic “races” have a much more distinctive physiognomy; they seem, like their characteristic languages, to be more marked and specialized than the Hamitic-speaking peoples.

§ 5

Across to the north-east of the Aryan and Semitic areas there must once have spread a further distinct language system which is now represented by a group of languages known as the TURANIAN, or URAL-ALTAIC group. This included the Lappish of Lapland and the Samoyed speech of Siberia, the Finnish language, Magyar, Turkish or Tartar, Manchu and Mongol; it has not as a group been so exhaustively studied by European philologists, and there is insufficient evidence yet whether it does or does not include the Korean and Japanese languages. (A Japanese writer, Mr. K. Hirai, has attempted to show that Japanese and Aryan may have had a common parent tongue.[83])

§ 6

A fifth region of language formation was south-eastern Asia, where there still prevails a group of languages consisting of monosyllables without any inflections, in which the tone used in uttering a word determines its meaning. This may be called the Chinese or MONOSYLLABIC group, and it includes Chinese, Burmese, Siamese, and Tibetan. The difference between any of these Chinese tongues and the more western languages is profound. In the Pekinese form of Chinese there are only about 420 primary monosyllables, and consequently each of these has to do duty for a great number of things, and the different meanings are indicated either by the context or by saying the word in a distinctive tone. The relations of these words to each other are expressed by quite different methods from the Aryan methods; Chinese grammar is a thing different in nature from English grammar; it is a separate and different invention. Many writers declare there is no Chinese grammar at all, and that is true if we mean by grammar anything in the European sense of inflections and concords. Consequently any such thing as a literal translation from Chinese into English is an impossibility. The very method of the thought is different.[84] Their philosophy remains still largely a sealed book to the European on this account, and vice versa, because of the different nature of the expressions.

§ 7

In addition the following other great language families are distinguished by the philologist. All the American-Indian languages, which vary widely among themselves, are separable from any Old World group. Here we may lump them together not so much as a family as a miscellany.[85] There is one great group of languages in Africa, from a little way north of the equator to its southern extremity, the BANTU, and in addition a complex of other languages across the centre of the continent about which we will not trouble here.[86] There are also two probably separate groups, the DRAVIDIAN in South India, and the MALAY-POLYNESIAN stretched over Polynesia, and also now including Indian tongues.

Now it seems reasonable to conclude from these fundamental differences that about the time when men were passing from the Palæolithic to Neolithic conditions, and beginning to form rather larger communities than the family herd, when they were beginning to tell each other long stories and argue and exchange ideas, human beings were distributed about the world in a number of areas which communicated very little with each other. They were separated by oceans, seas, thick forests, deserts or mountains from one another. There may have been in that remote time, it may be 10,000 years ago or more, Aryan, Semitic, Hamitic, Turanian, American, and Chinese-speaking tribes and families, wandering over their several areas of hunting and pasture, all at very much the same stage of culture, and each developing its linguistic instrument in its own way. Probably each of these original tribes was not more numerous altogether than the Indians in Hudson Bay Territory to-day. Agriculture was barely beginning, and until agriculture made a denser population possible men may have been almost as rare as the great apes have always been.

In addition to these early Neolithic tribes, there must have been various varieties of still more primitive forest folk in Africa and in India. Central Africa, from the Upper Nile, was then a vast forest, impenetrable to ordinary human life, a forest of which the Congo forests of to-day are the last shrunken remains.

Possibly the spread of men of a race higher than primitive Australoids into the East Indies,[87] and the development of the languages of the Malay-Polynesian type came later in time than the origination of these other language groups.

The language divisions of the philologist do tally, it is manifest, in a broad sort of way with the main race classes of the ethnologist, and they carry out the same idea of age-long separations between great divisions of mankind. In the Glacial Age, ice, or at least a climate too severe for the free spreading of peoples, extended from the north pole into central Europe and across Russia and Siberia to the great tablelands of central Asia. After the last Glacial Age, this cold north mitigated its severities very slowly, and was for long without any other population than the wandering hunters who spread eastward and across Bering Strait. North and central Europe and Asia did not become sufficiently temperate for agriculture until quite recent times, times that is within the limit of 12,000 or possibly even 10,000 years, and a dense forest period intervened between the age of the hunter and the agricultural clearings.

This forest period was also a very wet period. It has been called the Pluvial or Lacustrine Age, the rain or pond period. It has to be remembered that the outlines of the land of the world have changed greatly even in the last hundred centuries. Across European Russia, from the Baltic to the Caspian Sea, as the ice receded there certainly spread much water and many impassable swamps; the Caspian Sea and the Sea of Aral and parts of the Desert of Turkestan, are the vestiges of a great extent of sea that reached far up to the Volga valley and sent an arm westward to join the Black Sea. Mountain barriers much higher than they are now, and the arm of the sea that is now the region of the Indus, completed the separation of the early Caucasian races from the Mongolians and the Dravidians, and made the broad racial differentiation of those groups possible.

Again the blown-sand Desert of Sahara--it is not a dried-up sea, but a wind desert, and was once fertile and rich in life--becoming more and more dry and sandy, cut the Caucasians off from the sparse primitive Negro population in the central forest region of Africa.

The Persian Gulf extended very far to the north of its present head, and combined with the Syrian desert to cut off the Semitic peoples from the eastern areas, while on the other hand the south of Arabia, much more fertile than it is to-day, may have reached across what is now the Gulf of Aden towards Abyssinia and Somaliland. The Mediterranean and Red Sea were probably still joined at Suez. The Himalayas and the higher and vaster massif of central Asia and the northward extension of the Bay of Bengal up to the present Ganges valley divided off the Dravidians from the Mongolians, the canoe was the chief link between Dravidian and Southern Mongol, and the Gobi system of seas and lakes which presently became the Gobi desert, and the great system of mountain chains which follow one another across Asia from the center to the north-east, split the Mongolian races into the Chinese and the Ural-Altaic language groups.

Bering Strait, when this came into existence, before or after the Pluvial Period, isolated the Amer-Indians.

These ancient separations must have remained effectual well into Neolithic times. The barriers between Africa, Asia, and Europe were lowered or bridged by that time, but mixing had not gone far. The practical separation of the west from Dravidian India and China continued indeed down almost into historical times; but the Semite, the Hamite, and the Aryan were already in close contact and vigorous reaction again in the very dawn of history.

We are not suggesting here, be it noted, that these ancient separations were absolute separations, but that they were effectual enough at least to prevent any great intermixture of blood or any great intermixture of speech in those days of man’s social beginnings. There was, nevertheless, some amount of meeting and exchange even then, some drift of knowledge that spread the crude patterns and use of various implements, and the seeds of a primitive agriculture about the world.

§ 8

The fundamental tongues of these nine main language groups we have noted were not by any means all the human speech beginnings of the Neolithic Age. There may have been other, and possibly many other, ineffective centres of speech which were afterwards overrun by the speakers of still surviving tongues, and of elementary languages which faded out. We find strange little patches of speech still in the world which do not seem to be connected with any other language about them. Sometimes, however, an exhaustive inquiry seems to affiliate these disconnected patches, seems to open out to us tantalizing glimpses of some simpler, wider, and more fundamental and universal form of human speech. One language group that has been keenly discussed is the Basque group of dialects. The Basques live now on the north and south slopes of the Pyrenees; they number perhaps 600,000 altogether in Europe, and to this day they are a very sturdy and independent-spirited people. Their language, as it exists to-day, is a fully developed one. But it is developed upon lines absolutely different from those of the Aryan languages about it. Basque newspapers have been published in the Argentine and in the United States to supply groups of prosperous emigrants. The earliest “French” settlers in Canada were Basque, and Basque names are frequent among the French Canadians to this day. Ancient remains point to a much wider distribution of the Basque speech and people over Spain. For a long time this Basque language was a profound perplexity to scholars, and its structural character led to the suggestion that it might be related to some Amer-Indian tongue. A. H. Keane, in _Man Past and Present_, assembles reasons for linking it--though remotely--with the Berber language of North Africa, and through the Berber with the general body of Hamitic languages, but this relationship is questioned by other philologists. They find Basque more akin to certain similarly stranded vestiges of speech found in the Caucasian Mountains, and they are disposed to regard it as a last surviving member, much changed and specialized, of a once very widely extended group of pre-Hamitic languages, otherwise extinct, spoken chiefly by peoples of that brunet Mediterranean race (round-barrow men) which once occupied most of western and southern Europe and western Asia, and which may have been very closely related to the Dravidians of India and the peoples with a heliolithic culture who spread eastward thence through the East Indies to Polynesia and beyond.

It is quite possible that over western and southern Europe language groups extended 10,000 years ago that have completely vanished before Aryan tongues. Later on we shall note, in passing, the possibility of three lost language groups represented by (1) Ancient Cretan, Lydian, and the like (though these may have belonged, says Sir H. H. Johnston, to the “Basque-Caucasian-Dravidian (!) group”), (2) Sumerian, and (3) Elamite. The suggestion has been made--it is a mere guess--that ancient Sumerian may have been a linking language between the early Basque-Caucasian and early Mongolian groups. If this is

true, then we have in this “Basque-Caucasian-Dravidian-Sumerian-proto-Mongolian” group a still more ancient and more ancestral system of speech than the fundamental Hamitic.

The Hottentot language is said to have affinities with the Hamitic tongues, from which it is separated by the whole breadth of Bantu-speaking central Africa. A Hottentot-like language with Bushman affinities is still spoken in equatorial east Africa, and this strengthens the idea that the whole of east Africa was once Hamitic-speaking. The Bantu languages and peoples spread, in comparatively recent times, from some center of origin in west central Africa and cut off the Hottentots from the other Hamitic peoples. But it is at least equally probable that the Hottentot is a separate language group.

Among other remote and isolated little patches of language are the Papuan speech of New Guinea and the native Australian. The now extinct Tasmanian language is little known. What we know of it is in support of what we have guessed about the comparative speechlessness of Palæolithic man.

We may quote a passage from Hutchinson’s _Living Races of Mankind_ upon this matter:--

“The language of the natives is irretrievably lost, only imperfect indication of its structure and a small proportion of its words having been preserved. In the absence of sibilants and some other features, their dialects resembled the Australian, but were of ruder, of less developed structure, and so imperfect that, according to Joseph Milligan, our best authority on the subject, they observed no settled order or arrangement of words in the construction of their sentences, but conveyed in a supplementary fashion by tone, manner, and gesture those modifications of meaning which we express by mood, tense, number, etc. Abstract terms were rare; for every variety of gum-tree or wattle-tree there was a name, but no word for ‘tree’ in general, nor for qualities such as hard, soft, warm, cold, long, short, round, etc. Anything hard was ‘like a stone,’ anything round ‘like the moon,’ and so on, usually suiting the action to the word and confirming by some sign the meaning to be understood.”

[Illustration: Racial Types ... From Egyptian tomb-paintings. (After Champollion.)]

§ 9

In reading this chapter it is well to remember how laborious and difficult are the tasks of comparative philology, and how necessary it is to understand the qualifications and limitations that are to be put upon its conclusions. The Aryan group of languages is much better understood than any other, for the simple reason that it has been more familiar and accessible to European science. The other groups have been less thoroughly investigated, because so far they have not been studied exhaustively by men accustomed to use them, and whose minds are set in the key of their structure. Even the Semitic languages have been approached at a disadvantage because few Jews think in Hebrew. But a time is fast approaching when Japanese, Chinese, Arabic, and Indian philologists will come to the rescue in these matters, and good reason may be found for revising much that has been said above about the native American, Ural-Altaic, primitive Chinese, and Polynesian groups of tongues.

BOOK III

THE DAWN OF HISTORY

XV

THE ARYAN-SPEAKING PEOPLES IN PREHISTORIC TIMES

§ 1. _The Spreading of the Aryan-Speakers._ § 2. _Primitive Aryan Life._ § 3. _Early Aryan Daily Life._

§ 1

We have spoken of the Aryan language as probably arising in the region of the Danube and South Russia and spreading from that region of origin. We say “probably,” because it is by no means certainly proved that that was the centre; there have been vast discussions upon this point and wide divergences of opinion. We give the prevalent view. As it spread widely, Aryan began to differentiate into a number of subordinate languages. To the west and south it encountered the Basque language, which was then widely spread in Spain, and also possibly various Hamitic Mediterranean languages.

The Neolithic Mediterranean race, the Iberian race, was distributed over Great Britain, Ireland, France, Spain, north Africa, south Italy, and, in a more civilized state, Greece and Asia Minor. It was probably closely related to the Egyptian. To judge by its

European vestiges it was a rather small human type, generally with an oval face and a long head. It buried its chiefs and important people in megalithic chambers--_i.e._ made of big stones--covered over by great mounds of earth; and these mounds of earth, being much longer than they are broad, are spoken of as the long barrows. These people sheltered at times in caves, and also buried some of their dead therein; and from the traces of charred, broken, and cut human bones, including the bones of children, it is inferred that they were cannibals. These short dark Iberian tribes (and the Basques also if they were a different race) were thrust back westward, and conquered and enslaved by slowly advancing waves of a taller and fairer Aryan-speaking people, coming southward and westward through central Europe, who are spoken of as the Kelts. Only the Basque resisted the conquering Aryan speech. Gradually these Keltic-speakers made their way to the Atlantic, and all that now remains of the Iberians is mixed into the Keltic population. How far the Keltic invasion affected the Irish population is a matter of debate at the present time; the Kelts may have been a mere caste of conquerors who imposed their language on a larger subject population. It is even doubtful if the north of England is more Aryan than pre-Keltic in blood. There is a sort of short dark Welshman, and certain types of Irishmen, who are Iberians by race. The modern Portuguese are also largely of Iberian blood.

The Kelts spoke a language, Keltic,[88] which was also in its turn to differentiate into the language of Gaul, Welsh, Breton, Scotch and Irish Gaelic, and other tongues. They buried the ashes of their chiefs and important people in round barrows. While these Nordic Kelts were spreading westward, other Nordic Aryan peoples were pressing down upon the dark white Mediterranean race in the Italian and Greek peninsulas, and developing the Latin and Greek groups of tongues. Certain other Aryan tribes were drifting towards the Baltic and across into Scandinavia, speaking varieties of the Aryan which became ancient Norse--the parent of Swedish, Danish, Norwegian, and Icelandic--Gothic, and Low and High German.

While the primitive Aryan speech was thus spreading and breaking up into daughter languages to the west, it was also spreading and breaking up to the east. North of the Carpathians and the Black Sea, Aryan-speaking tribes were increasing and spreading and using a distinctive dialect called Slavonian, from which came Russian, Serbian, Polish, Bulgarian, and other tongues; other variations of Aryan distributed over Asia Minor and Persia were also being individualized as Armenian and Indo-Iranian, the parent of Sanscrit and Persian. In this book we have used the word Aryan for all this family of languages, but the term Indo-European is sometimes used for the entire family, and “Aryan” itself restricted in a narrower sense to the Indo-Iranian speech.[89] This Indo-Iranian speech was destined to split later into a number of languages, including Persian and Sanscrit, the latter being the language of certain tribes of fair-complexioned Aryan speakers who pushed eastward into India somewhen between 3000 and 1000 B.C. and conquered dark Dravidian peoples who were then in possession of that land.

§ 2

What sort of life did these prehistoric Aryans lead, these Nordic Aryans who were the chief ancestors of most Europeans and most white Americans and European colonists of to-day, as well as of the Armenians,[90] Persians, and high-caste Hindus?

In answering that question we are able to resort to a new source of knowledge in addition to the dug-up remains and vestiges upon which we have had to rely in the case of Palæolithic man. We have language. By careful study of the Aryan languages it has been found possible to deduce a number of conclusions about the life of these Aryan peoples 5000 or 4000 years ago. All these languages have a common resemblance, as each, as we have already explained, rings the changes upon a number of common roots. When we find the same root word running through all or most of these tongues, it seems reasonable to conclude that the thing that root word signifies must have been known to the common ancestors. Of course, if they have _exactly the same word_ in their languages, this may not be the case; it may be the new name of a new thing or of a new idea that has spread over the world quite recently. “Gas,” for instance is a word that was made by Van Helmont, a Dutch chemist, about 1625, and has spread into most civilized tongues, and “tobacco” again is an American-Indian word which followed the introduction of smoking almost everywhere. But if the same word turns up in a number of languages, and _if it follows the characteristic modifications of each language_, we may feel sure that it has been in that language, and a part of that language, since the beginning, suffering the same changes with the rest of it. We know, for example, that the words for waggon and wheel run in this fashion through the Aryan tongues, and so we are able to conclude that the primitive Aryans, the more purely Nordic Aryans, had waggons, though it would seem from the absence of any common roots for spokes, rim, or axle that their wheels were not wheelwright’s wheels with spokes, but made of the trunks of trees shaped out with an axe between the ends.

These primitive waggons were drawn by oxen. The early Aryans did not ride or drive horses; they had very little to do with horses. The Reindeer men were a horse-people, but the Neolithic Aryans were a cow-people. They ate beef, not horse; and after many ages they began this use of draught cattle. They reckoned wealth by cows. They wandered, following pasture, and “trekking” their

goods, as the South African Boers do, in ox-waggons, though of course their waggons were much clumsier than any to be found in the world to-day. They probably ranged over very wide areas. They were migratory, but not in the strict sense of the word “nomadic”; they moved in a slower, clumsier fashion than did the later, more specialized nomadic peoples. They were forest and parkland people without horses. They were developing a migratory life out of the more settled “forest clearing” life of the earlier Neolithic period. Changes of climate which were replacing forest by pasture, and the accidental burning of forests by fire may have assisted this development.

When these early “Aryans” came to big rivers or open water, they built boats, at first hollow tree trunks and then skin-covered frameworks of lighter wood. Before history began there was already some Aryan canoe-traffic across the English Channel and in the Baltic, and also among the Greek islands. But the Aryans, as we shall see later, were probably not the first peoples to take to the sea.

We have already described the sort of home the primitive Aryan occupied and his household life, so far as the remains of the Swiss pile-dwellings enable us to describe these things. Mostly his houses were of too flimsy a sort, probably of wattle and mud, to have survived, and possibly he left them and trekked on for very slight reasons. The Aryan peoples burnt their dead, a custom they still preserve in India, but their predecessors, the long-barrow people, the Iberians, buried their dead in a sitting position. In some ancient Aryan burial mounds (round barrows) the urns containing the ashes of the departed are shaped like houses, and these represent rounded huts with thatched roofs. See Fig. p. 57.

The grazing of the primitive Aryan was far more important to him than his agriculture. At first he cultivated with a rough wooden hoe; then, after he had found out the use of cattle for draught purposes, he began real ploughing with oxen, using at first a suitably bent tree bough as his plough. His first cultivation before that came about must have been rather in the form of garden patches near the house buildings than of fields. Most of the land his tribe occupied was common land on which the cattle grazed together.

He never used stone for building house walls until upon the very verge of history. He used stone for hearths (_e.g._ at Glastonbury) and sometimes stone sub-structures. He did, however, make a sort of stone house in the centre of the great mounds in which he buried his illustrious dead. He may have learnt this custom from his Iberian neighbours and predecessors. It was these dark whites of the heliolithic culture, and not the primitive Aryans, who were responsible for such primitive temples as Stonehenge or Carnac in Brittany.

His social life was growing. Man was now living in clans and tribal communities. These clans and communities clashed; they took each other’s grazing land, they sought to rob each other; there began a new thing in human life, _war_. For war is not a primeval thing; it has not been in this world for more than 20,000 years. To this day very primitive peoples, such as the Australian black-fellows, do not understand war. The Palæolithic Age was an age of fights and murder, no doubt, but not of the organized collective fighting of numbers of men.[91] But now men could talk together and group themselves under leaders, and they found a need of centres where they could come together with their cattle in time of raids and danger. They began to make camps with walls of earth and palisades, many of which are still to be traced in the history-worn contours of the European scenery. The leaders under whom men fought in war were often the same men as the sacrificial purifiers who were their early priests.

The knowledge of bronze spread late in Europe. Neolithic man had been making his slow advances age by age for 7000 or 8000 years before the metals came. By that time his social life had developed so that there were men of various occupations and men and women of different ranks in the community. There were men who worked wood and leather, potters and carvers. The women span and wove and embroidered. There were chiefs and families that were distinguished as leaderly and noble; and man varied the monotony of his herding and wandering, he consecrated undertakings and celebrated triumphs, held funeral assemblies, and distinguished the traditional seasons of the year, by _feasts_. His meats we have already glanced at; but somewhen between 10,000 B.C. and the broadening separation of the Aryan peoples towards 2000 or 1000 B.C., mankind discovered fermentation, and began to brew intoxicating drinks. He made these of honey, of barley, and, as the Aryan tribes spread southward, of the grape. And he got merry and drunken. Whether he first used yeast to make his bread light or to ferment his drink we do not know.

At his feasts there were individuals with a gift for “playing the fool,” who did so no doubt to win the laughter of their friends,[92] but there was also another sort of men, of great importance in their time, and still more important to the historian, certain singers of songs and stories, the bards or rhapsodists. These _bards_ existed among all the Aryan-speaking peoples; they were a consequence of and a further factor in that development of spoken language which was the chief of all the human advances made in Neolithic times. They chanted or recited stories of the past, or stories of the living chief and his people; they told other stories that

they invented; they memorized jokes and catches. They found and seized upon and improved the rhythms, rhymes, alliterations, and such-like possibilities latent in language; they probably did much to elaborate and fix grammatical forms. They were the first great artists of the ear, as the later Aurignacian rock painters were the first great artists of the eye and hand. No doubt they used much gesture; probably they learnt appropriate gestures when they learnt their songs; but the order and sweetness and power of language was their primary concern.

And they mark a new step forward in the power and range of the human mind. They sustained and developed in men's minds a sense of a greater something than themselves, the tribe, and of a life that extended back into the past. They not only recalled old hatreds and battles, they recalled old alliances and a common inheritance. The feats of dead heroes lived again. A new thought came into men's minds, the desire to be remembered. Men began to live in thought before they were born and after they were dead.

Like most human things, this bardic tradition grew first slowly and then more rapidly. By the time bronze was coming into Europe there was not an Aryan people that had not a profession and training of bards. In their hands language became as beautiful as it is ever likely to be. These bards were living books, man-histories, guardians and makers of a new and more powerful tradition in human life. Every Aryan people had its long poetical records thus handed down, its sagas (Teutonic), its epics (Greek), its vedas (Old Sanscrit). The earliest Aryan people were essentially a people of the voice. The recitation seems to have predominated even in those ceremonial and dramatic dances and that "dressing-up" which among most human races have also served for the transmission of tradition.[93]

At that time there was no writing, and when first the art of writing crept into Europe, as we shall tell later, it must have seemed far too slow, clumsy, and lifeless a method of record for men to trouble very much about writing down these glowing and beautiful treasures of the memory. Writing was at first kept for accounts and matters of fact. The bards and rhapsodists flourished for long after the introduction of writing. They survived, indeed, in Europe as the minstrels into the Middle Ages.

Unhappily their tradition had not the fixity of a written record. They amended and reconstructed, they had their fashions and their phases of negligence. Accordingly we have now only the very much altered and revised vestiges of that spoken literature of prehistoric times. One of the most interesting and informing of these prehistoric compositions of the Aryans survives in the Greek _Iliad_. An early form of _Iliad_ was probably recited by 1000 B.C., but it was not written down until perhaps 700 or 600 B.C. Many men must have had to do with it as authors and improvers, but later Greek tradition attributed it to a blind bard named Homer, to whom also is ascribed the _Odyssey_, a composition of a very different spirit and outlook. To be a bard was naturally a blind man's occupation.[94] The Slavs called all bards _sliepac_, which was also their word for a blind man. The original recited version of the _Iliad_ was older than that of the _Odyssey_. "The _Iliad_ as a complete poem is older than the _Odyssey_, though the material of the _Odyssey_, being largely undatable folk-lore, is older than any of the historical material in the _Iliad_."[95] Both epics were probably written over and rewritten by some poet of a later date, in much the same manner that Lord Tennyson, the poet laureate of Queen Victoria, in his _Idylls of the King_, wrote over the _Morte d'Arthur_ (which was itself a writing over by Sir Thomas Malory, _circ._ 1450, of pre-existing legends), making the speeches and sentiments and the characters more in accordance with those of his own time. But the events of the _Iliad_ and the _Odyssey_, the way of living they describe, the spirit of the acts recorded, belong to the closing centuries of the prehistoric age. These sagas, epics, and vedas do supply, in addition to archæology and philology, a third source of information about those vanished times.

Here, for example, is the concluding passage of the _Iliad_, describing very exactly the making of a prehistoric barrow. (We have taken here Chapman's rhymed translation, correcting certain words with the help of the prose version of Lang, Leaf, and Myers.)

" ... Thus oxen, mules, in waggons straight they put, Went forth, and an unmeasur'd pile of sylvan matter cut; Nine days employ'd in carriage, but when the tenth morn shin'd On wretched mortals, then they brought the bravest of his kind Forth to be burned. Troy swam in tears. Upon the pile's most height They laid the body, and gave fire. All day it burn'd, all night. But when th' eleventh morn let on earth her rosy fingers shine, The people flock'd about the pile, and first with gleaming wine Quench'd all the flames. His brothers then, and friends, the snowy bones, Gather'd into an urn of gold, still pouring out their moans. Then wrapt they in soft purple veils the rich urn, digg'd a pit, Grav'd it, built up the grave with stones, and quickly piled on it A barrow.... ... The barrow heap'd once, all the town In Jove-nurs'd Priam's Court partook a sumptuous fun'ral feast, And so horse-taming Hector's rites gave up his soul to rest."

There remains also an old English saga, _Beowulf_, made long before the English had crossed from Germany into England, which winds up with a similar burial. The preparation of a pyre is first described. It is hung round with shields and coats of mail. The body is brought and the pyre fired, and then for ten days the warriors built a mighty mound to be seen afar by the traveller on sea or land. _Beowulf_, which is at least a thousand years later than the _Iliad_, is also interesting because one of the main adventures in it is the looting of the treasures of a barrow already ancient in those days.

§ 3

The Greek epics reveal the early Greeks with no knowledge of iron, without writing, and before any Greek-founded cities existed in the land into which they had evidently come quite recently as conquerors. They were spreading southward from the Aryan region of origin. They seem to have been a fair people, newcomers in Greece, newcomers to a land that had been held hitherto by a darker people, people who are now supposed to have belonged to a dark white “aboriginal” race, a “Mediterranean” people allied to those Iberians whom the Kelts pressed westward, and to the Hamitic white people of North Africa.

[Illustration: Combat between Menelaus & Hector (in the Iliad)

From a platter ascribed to the end of the seventh century in the British Museum. This is probably the earliest known vase bearing a Greek inscription. Greek writing was just beginning. Note the Swastika.]

Let us, at the risk of a slight repetition, be perfectly clear upon one point. The _Iliad_ does not give us the primitive neolithic life of that Aryan region of origin; it gives us that life already well on the move towards a new state of affairs. The primitive neolithic way of living, with its tame and domesticated animals, its pottery and cooking, and its patches of rude cultivation, we have sketched in Chapter XI. We have already discussed in § 4 of Chapter XIII the probability of a widespread _heliolithic_ culture, a sort of sub-civilization, very like the Polynesian and Indonesian life of a hundred years ago, an elaboration of the earlier Neolithic stage. Between 15,000 and 6000 B.C. the neolithic way of living had spread with the forests and abundant vegetation of the Pluvial Period, over the greater part of the old world, from the Niger to the Hwang-ho and from Ireland to the south of India. Now, as the climate of great portions of the earth was swinging towards drier and more open conditions again, the primitive neolithic life was developing along two divergent directions. One was leading to a more wandering life, towards at last a constantly migratory life between summer and winter pasture, which is called NOMADISM; the other, in certain sunlit river valleys, was towards a water-treasuring life of irrigation, in which men gathered into the first towns and made the first CIVILIZATION. The nature and development of civilization we shall consider more fully in the next chapter, but here we have to note that the Greeks, as the _Iliad_ presents them, are neither simple neolithic nomads, innocent of civilization, nor are they civilized men. They are primitive nomads in an excited state, because they have just come upon civilization, and regard it as an opportunity for war and loot.[96] So far they are exceptional and not representative. But our interest in them in this chapter is not in their distinctively Greek and predatory aspect, but in what they reveal of the ordinary northward life from which they are coming.

These early Greeks of the _Iliad_ are sturdy fighters, but without discipline--their battles are a confusion of single combats. They have horses, but no cavalry; they use the horse, which is a comparatively recent addition to Aryan resources, to drag a rude fighting chariot into battle. The horse is still novel enough to be something of a terror in itself. For ordinary draught purposes, as in the quotation from the _Iliad_ we have just made, oxen were employed.

The only priests of these Aryans are the keepers of shrines and sacred places. There are chiefs, who are heads of families and who also perform sacrifices, but there does not seem to be much mystery or sacramental feeling in their religion. When the Greeks go to war, these heads and elders meet in council and appoint a king, whose powers are very loosely defined. There are no laws, but only customs; and no exact standards of conduct.

[Illustration: Horses & chariots--(from an archaic Greek vase)]

The social life of the early Greeks centred about the households of these leading men. There were no doubt huts for herds and the like, and outlying farm buildings; but the hall of the chief was a comprehensive centre, to which everyone went to feast, to hear the bards, to take part in games and exercises. The primitive craftsmen were gathered there. About it were cowsheds and stabling and such-like offices. Unimportant people slept about anywhere as retainers did in the mediæval castles and as people still do in Indian households. Except for quite personal possessions, there was still an air of patriarchal communism about the tribe. The tribe, or the chief as the head of the tribe, owned the grazing lands; forest and rivers were the wild.

The Aryan civilization seems, and indeed all early communities seem, to have been without the little separate households that make up the mass of the population in western Europe or America to-day. The tribe was a big family; the nation a group of tribal families; a household often contained hundreds of people. Human society began, just as herds and droves begin among animals, by the family delaying its breaking up. Nowadays the lions in East Africa are apparently becoming social animals in this way, by the young keeping with the mother after they are fully grown, and hunting in a group. Hitherto the lion has been much more of a solitary beast. If men and women do not cling to their families nowadays as much as they did, it is because the state and the community now supply safety and help and facilities that were once only possible in the family group.

In the Hindu community of to-day these great households of the earlier stages of human society are still to be found. Mr. Bhupendranath Basu has recently described a typical Hindu household.[97] It is an Aryan household refined and made gentle by thousands of years of civilization, but its social structure is the same as that of the households of which the Aryan epics tell.

“The joint family system,” he said, “has descended to us from time immemorial, the Aryan patriarchal system of old still holding sway in India. The structure, though ancient, remains full of life. The joint family is a co-operative corporation, in which men and women have a well-defined place. At the head of the corporation is the senior member of the family, generally the eldest male member, but in his absence the senior female member often assumes control.” (Cp. Penelope in the _Odyssey_.)

“All able-bodied members must contribute their labour and earnings, whether of personal skill or agriculture and trade, to the common stock; weaker members, widows, orphans, and destitute relations, all must be maintained and supported; sons, nephews, brothers, cousins, all must be treated equally, for any undue preference is apt to break up the family. We have no word for cousins--they are either brothers or sisters, and we do not know what are cousins two degrees removed. The children of a first cousin are your nephews and nieces, just the same as the children of your brothers and sisters. A man can no more marry a cousin, however removed, than he can marry his own sister, except in certain parts of Madras, where a man may marry his maternal uncle’s daughter. The family affections, the family ties, are always very strong, and therefore the maintenance of an equal standard among so many members is not so difficult as it may appear at first sight. Moreover, life is very simple. Until recently shoes were not in general use at home, but sandals without any leather fastenings. I have known of a well-to-do middle-class family of several brothers and cousins who had two or three pairs of leather shoes between them, these shoes being only used when they had occasion to go out, and the same practice is still followed in the case of the more expensive garments, like shawls, which last for generations, and with their age are treated with loving care, as having been used by ancestors of revered memory.

“The joint family remains together sometimes for several generations, until it becomes too unwieldy, when it breaks up into smaller families, and you thus see whole villages peopled by members of the same clan. I have said that the family is a co-operative society, and it may be likened to a small state, and is kept in its place by strong discipline based on love and obedience. You see nearly every day the younger members coming to the head of the family and taking the dust of his feet as a token of benediction; whenever they go on an enterprise, they take his leave and carry his blessing.... There are many bonds which bind the family together--the bonds of sympathy, of common pleasures, of common sorrows; when a death occurs, all the members go into mourning; when there is a birth or a wedding, the whole family rejoices. Then above all is the family deity, some image of Vishnu, the preserver; his place is in a separate room, generally known as the room of God, or in well-to-do families in a temple attached to the house, where the family performs its daily worship. There is a sense of personal attachment between this image of the deity and the family, for the image generally comes down from past generations, often miraculously acquired by a pious ancestor at some remote time.... With the household gods is intimately associated the family priest.... The Hindu priest is a part of the family life of his flock, between whom and himself the tie has existed for many generations. The priest is not generally a man of much learning; he knows, however, the traditions of his faith.... He is not a very heavy burden, for he is satisfied with little--a few handfuls of rice, a few home-grown bananas or vegetables, a little unrefined sugar made in the village, and sometimes a few pieces of copper are all that is needed.... A picture of our family life would be incomplete without the household servants. A female servant is known as the ‘jhi,’ or daughter, in Bengal--she is like the daughter of the house; she calls the master and the mistress father and mother, and the young men and women of the family brothers and sisters. She participates in the life of the family; she goes to the holy places along with her mistress, for she could not go alone, and generally she spends her life with the family of her adoption; her children are looked after by the family. The treatment of men servants is very similar. These servants, men and women, are generally people of the humbler castes, but a sense of personal attachment grows up between them and the members of the family, and as they get on in years they are affectionately called by the younger members elder brothers, uncles, aunts, etc.... In a well-to-do house there is always a resident teacher, who instructs the children of the family as well as other boys of the village; there is no expensive school building, but room is found in some veranda or shed in the courtyard for the children and their teacher,

and into this school low-caste boys are freely admitted. These indigenous schools were not of a very high order, but they supplied an agency of instruction for the masses which was probably not available in many other countries....

“With Hindu life is bound up its traditional duty of hospitality. It is the duty of a householder to offer a meal to any stranger who may come before midday and ask for one; the mistress of the house does not sit down to her meal until every member is fed, and, as sometimes her food is all that is left, she does not take her meal until well after midday lest a hungry stranger should come and claim one.” ...

We have been tempted to quote Mr. Basu at some length, because here we do get to something like a living understanding of the type of household which has prevailed in human communities since Neolithic days, which still prevails to-day in India, China, and the Far East, but which in the west is rapidly giving ground before a state and municipal organization of education and a large-scale industrialism within which an amount of individual detachment and freedom is possible, such as these great households never knew....

But let us return now to the history preserved for us in the Aryan epics.

The Sanscrit epics tell a very similar story to that underlying the _Iliad_, the story of a fair, beef-eating people--only later did they become vegetarians--coming down from Persia into the plain of North India and conquering their way slowly towards the Indus. From the Indus they spread over India, but as they spread they acquired much from the dark Dravidians they conquered, and they seem to have lost their bardic tradition. The vedas, says Mr. Basu, were transmitted chiefly in the households by the women....

The oral literature of the Keltic peoples who pressed westward has not been preserved so completely as that of the Greeks or Indians; it was written down many centuries later, and so, like the barbaric, primitive English _Beowulf_, has lost any clear evidence of a period of migration into the lands of an antecedent people. If the pre-Aryans figure in it at all, it is as the fairy folk of the Irish stories. Ireland, most cut off of all the Keltic-speaking communities, retained to the latest date its primitive life; and the _Táin_, the Irish _Iliad_, describes a cattle-keeping life in which war chariots are still used, and war dogs also, and the heads of the slain are carried off slung round the horses’ necks. The _Táin_ is the story of a cattle raid. Here too the same social order appears as in the _Iliad_; the chiefs sit and feast in great halls, they build halls for themselves, there is singing and story-telling by the bards and drinking and intoxication.[98] Priests are not very much in evidence, but there is a sort of medicine man who deals in spells and prophecy.

XVI

THE FIRST CIVILIZATIONS

§ 1. _Early Cities and Early Nomads._ § 2A. _The Riddle of the Sumerians._ § 2B. _The Empire of Sargon the First._ § 2C. _The Empire of Hammurabi._ § 2D. _The Assyrians and their Empire._ § 2E. _The Chaldean Empire._ § 3. _The Early History of Egypt._ § 4. _The Early Civilization of India._ § 5. _The Early History of China._ § 6. _While the Civilizations were Growing._

§ 1

When the Aryan way of speech and life was beginning to spread to the east and west of the region in which it began, and breaking up as it spread into a number of languages and nations, considerable communities of much more civilized men were already in existence in Egypt and in Mesopotamia, and probably also in China and in (still purely Dravidian) India. Our story has overshot itself in its account of the Aryans and of their slow progress from early Neolithic conditions to the heroic barbarism of the Bronze Age. We must now go back. Such a pre-Keltic gathering as we sketched at Avebury would have happened about 2000 B.C., and the building of the barrow for Hector as the _Iliad_ describes it, 1300 B.C. or even later. It is perhaps natural for a European writer writing primarily for English-reading students to overrun his subject in this way. No great harm is done if the student does clearly grasp that there has been an overlap.

Here then we take up the main thread of human history again. We must hark back to 6000 B.C. or even earlier. But although we shall go back so far, the people we shall describe are people already in some respects beyond the Neolithic Aryans of three thousand years later, more particularly in their social organization and their material welfare. While in Central Europe and Central Asia the primitive Neolithic way of life was becoming more migratory and developing into nomadism, in the great river valleys it is becoming more settled and localized. It is still doubtful whether we are to consider Mesopotamia or Egypt the earlier scene of the two parallel beginnings of settled communities living in towns. By 4000 B.C., in both these regions of the earth, such communities

existed, and had been going on for a very considerable time. The excavations of the American expedition[99] at Nippur have unearthed evidence of a city community existing there at least as early as 5000 B.C., and probably as early as 6000 B.C., an earlier date than anything we know of in Egypt. De Candolle asserts that it is only in the Euphrates-Tigris district that wheat has ever been found growing wild.[100] It may be that from Mesopotamia as a centre the cultivation of wheat spread over the entire eastern hemisphere. Or it may be that wheat grew wild in some regions now submerged. There may have been a wild wheat region in what is now the sea bottom of the eastern Mediterranean. But cultivation is not civilization; the growing of wheat had spread from the Atlantic to the Pacific with the distribution of the Neolithic culture by perhaps 10,000 or 9000 B.C., before the beginnings of civilization. Civilization is something more than the occasional seasonal growing of wheat. It is the settlement of men upon an area continuously cultivated and possessed, who live in buildings continuously inhabited with a common rule and a common city or citadel. For a long time civilization may quite possibly have developed in Mesopotamia without any relations with the parallel beginnings in Egypt. The two settlements may have been quite independent, arising separately out of the widely diffused Heliolithic Neolithic culture. Or they may have had a common origin in the region of the Mediterranean, the Red Sea, and southern Arabia.

[Illustration: Map of The CRADLE of WESTERN CIVILIZATION

6,000 to 4,000 B.C.

J.F.H.]

The first condition necessary to a real settling down of Neolithic men, as distinguished from a mere temporary settlement among abundant food, was of course a trustworthy all-the-year-round supply of water, fodder for the animals, food for themselves, and building material for their homes. There had to be everything they could need at any season, and no want that would tempt them to wander further. This was a possible state of affairs, no doubt, in many European and Asiatic valleys; and in many such valleys, as in the case of the Swiss lake-dwellings, men settled from a very early date indeed; but nowhere, of any countries now known to us, were these favourable conditions found upon such a scale, and nowhere did they hold good so surely year in and year out as in Egypt and in the country between the upper waters of the Euphrates and Tigris and the Persian Gulf.[101] Here was a constant water supply under enduring sunlight; trustworthy harvests year by year; in Mesopotamia wheat yielded, says Herodotus, two hundredfold to the sower; Pliny says that it was cut twice and afterwards yielded good fodder for sheep; there were abundant palms and many sorts of fruits; and as for building material, in Egypt there was clay and easily worked stone, and in Mesopotamia a clay that becomes a brick in the sunshine. In such countries men would cease to wander and settle down almost unawares; they would multiply and discover themselves numerous and by their numbers safe from any casual assailant. They multiplied, producing a denser human population than the earth had ever known before; their houses became more substantial, wild beasts were exterminated over great areas, the security of life increased so that ordinary men went about in the towns and fields without encumbering themselves with weapons, and, among themselves at least, they became peaceful peoples. Men took root as man had never taken root before.

But in the less fertile and more seasonal lands outside these favoured areas, there developed on the other hand a thinner, more active population of peoples, the primitive nomadic peoples. In contrast with the settled folk, the agriculturists, these nomads lived freely and dangerously. They were in comparison lean and hungry men. Their herding was still blended with hunting; they fought constantly for their pastures against hostile families. The discoveries in the elaboration of implements and the use of metals made by the settled peoples spread to them and improved their weapons. They followed the settled folk from Neolithic phase to Bronze phase. It is possible that, in the case of iron, the first users were nomadic. They became more warlike with better arms, and more capable of rapid movements with the improvement of their transport. One must not think of a nomadic stage as a predecessor of a settled stage in human affairs. To begin with, man was a slow drifter, following food. Then one sort of men began to settle down, and another sort became more distinctly nomadic. The settled sort began to rely more and more upon grain for food; the nomad began to make a greater use of milk for food. He bred his cows for milk. The two ways of life specialized in opposite directions. It was inevitable that nomad folk and the settled folk should clash, that the nomads should seem hard barbarians to the settled peoples, and the settled peoples soft and effeminate and very good plunder to the nomad peoples. Along the fringes of the developing civilizations there must have been a constant raiding and bickering between hardy nomad tribes and mountain tribes and the more numerous and less warlike peoples in the towns and villages.

For the most part this was a mere raiding of the borders. The settled folk had the weight of numbers on their side; the herdsmen might raid and loot, but they could not stay. That sort of mutual friction might go on for many generations. But ever and again we find some leader or some tribe amidst the disorder of free and independent nomads, powerful enough to force a sort of unity upon

its kindred tribes, and then woe betide the nearest civilization. Down pour the united nomads on the unwarlike, unarmed plains, and there ensues a war of conquest. Instead of carrying off the booty, the conquerors settle down on the conquered land, which becomes all booty for them; the villagers and townsmen are reduced to servitude and tribute-paying, they become hewers of wood and drawers of water, and the leaders of the nomads become kings and princes, masters and aristocrats. They too settle down, they learn many of the arts and refinements of the conquered, they cease to be lean and hungry, but for many generations they retain traces of their old nomadic habits, they hunt and indulge in open-air sports, they drive and race chariots, they regard work, especially agricultural work, as the lot of an inferior race and class.

This in a thousand variations has been one of the main stories in history for the last seventy centuries or more. In the first history that we can clearly decipher we find already in all the civilized regions a distinction between a non-working ruler class and the working mass of the population. And we find too that after some generations, the aristocrat, having settled down, begins to respect the arts and refinements and law-abidingness of settlement, and to lose something of his original hardihood. He intermarries, he patches up a sort of toleration between conqueror and conquered; he exchanges religious ideas and learns the lessons upon which soil and climate insist. He becomes a part of the civilization he has captured. And as he does so, events gather towards a fresh invasion by the free adventurers of the outer world.[102]

§ 2A

[Illustration: A very early Sumerian stone carving showing Sumerian warriors in phalanx]

This alternation of settlement, conquest, refinement, fresh conquest, refinement, is particularly to be noted in the region of the Euphrates and Tigris, which lay open in every direction to great areas which are not arid enough to be complete deserts, but which were not fertile enough to support civilized populations. Perhaps the earliest people to form real cities in this part of the world, or indeed in any part of the world, were a people of mysterious origin called the Sumerians. They were neither Semites nor Aryans, and whence they came we do not know. Whether they were dark whites of Iberian or Dravidian affinities is less certainly to be denied.[103] They used a kind of writing which they scratched upon clay, and their language has been deciphered.[104] It was a language more like the unclassified Caucasic language groups than any others that now exist. These languages may be connected with Basque, and may represent what was once a widespread group extending from Spain and western Europe to eastern India, and reaching southwards to Central Africa. These people shaved their heads and wore simple tunic-like garments of wool. They settled first on the lower courses of the great river and not very far from the Persian Gulf, which in those days ran up for a hundred and thirty miles[105] and more beyond its present head. They fertilized their fields by letting water run through irrigation trenches, and they gradually became very skilful hydraulic engineers; they had cattle, asses, sheep, and goats, but no horses; their collections of mud huts grew into towns, and their religion raised up towerlike temple buildings.

Clay, dried in the sun, was a very great fact in the lives of these people. This lower country of the Euphrates-Tigris valleys had little or no stone. They built of brick, they made pottery and earthenware images, and they drew and presently wrote upon thin tile-like cakes of clay. They do not seem to have had paper or to have used parchment. Their books and memoranda, even their letters, were potsherds.

At Nippur they built a great tower of brick to their chief god, El-lil (Enlil), the memory of which is supposed to be preserved in the story of the Tower of Babel. They seem to have been divided up into city states, which warred among themselves and maintained for many centuries their military capacity. Their soldiers carried long spears and shields, and fought in close formation. Sumerians conquered Sumerians. Sumeria remained unconquered by any stranger race for a very long period of time indeed. They developed their civilization, their writing, and their shipping, through a period that may be twice as long as the whole period from the Christian era to the present time.

The first of all known empires was that founded by the high priest of the god of the Sumerian city of Erech. It reached, says an inscription at Nippur, from the Lower (Persian Gulf) to the Upper (Mediterranean or Red?) Sea. Among the mud heaps of the Euphrates-Tigris valley the record of that vast period of history, that first half of the Age of Cultivation, is buried. There flourished the first temples and the first priest-rulers that we know of among mankind.

§ 2B

Upon the western edge of this country appeared nomadic tribes of Semitic-speaking peoples who traded, raided, and fought with the Sumerians for many generations. Then arose at last a great leader among these Semites, Sargon (2750 B.C.),[106] who united

them, and not only conquered the Sumerians, but extended his rule from beyond the Persian Gulf on the east to the Mediterranean on the west. His own people were called the Akkadians and his empire is called the Sumerian Akkadian Empire. It endured for over two hundred years.

But though the Semites conquered and gave a king to the Sumerian cities, it was the Sumerian civilization which prevailed over the simpler Semitic culture. The newcomers learnt the Sumerian writing (the “cuneiform” writing) and the Sumerian language; they set up no Semitic writing of their own. The Sumerian language became for these barbarians the language of knowledge and power, as Latin was the language of knowledge and power among the barbaric peoples of the middle ages in Europe. This Sumerian learning had a very great vitality. It was destined to survive through a long series of conquests and changes that now began in the valley of the two rivers.

§ 2C

As the people of the Sumerian Akkadian Empire lost their political and military vigour, fresh inundations of a warlike people began from the east, the Elamites,[107] while from the west came the Semitic Amorites, pinching the Sumerian Akkadian Empire between them. The Amorites settled in what was at first a small up-river town, named Babylon; and after a hundred years of warfare became masters of all Mesopotamia under a great king, Hammurabi (2100 B.C.), who founded the first Babylonian Empire.

Again came peace and security and a decline in aggressive prowess, and in another hundred years fresh nomads from the east were invading Babylonia, bringing with them the horse and the war chariot, and setting up their own king in Babylon....

§2D

Higher up the Tigris, above the clay lands and with easy supplies of workable stone, a Semitic people, the Assyrians, while the Sumerians were still unconquered by the Semites, were settling about a number of cities of which Assur and Nineveh were the chief. Their peculiar physiognomy, the long nose and thick lips, was very like that of the commoner type of Polish Jew to-day. They wore great beards and ringletted long hair, tall caps and long robes. They were constantly engaged in mutual raiding with the Hittites to the west; they were conquered by Sargon I and became free again; a certain Tushratta, King of Mitanni, to the north-west, captured and held their capital, Nineveh, for a time; they intrigued with Egypt against Babylon and were in the pay of Egypt; they developed the military art to a very high pitch, and became mighty raiders and exacters of tribute; and at last, adopting the horse and the war chariot, they settled accounts for a time with the Hittites, and then, under Tiglath Pileser I, conquered Babylon for themselves (about 1100 B.C.[108]). But their hold on the lower, older, and more civilized land was not secure, and Nineveh, the stone city, as distinguished from Babylon, the brick city, remained their capital. For many centuries power swayed between Nineveh and Babylon, and sometimes it was an Assyrian and sometimes a Babylonian who claimed to be “king of the world.”

For four centuries Assyria was restrained from expansion towards Egypt by a fresh northward thrust and settlement of another group of Semitic peoples, the Arameans, whose chief city was Damascus, and whose descendants are the Syrians of to-day. (There is, we may note, no connection whatever between the words Assyrian and Syrian. It is an accidental similarity.) Across these Syrians the Assyrian kings fought for power and expansion south-westward. In 745 B.C. arose another Tiglath Pileser, Tiglath Pileser III, the Tiglath Pileser of the Bible.[109] He not only directed the transfer of the Israelites to Media (the “Lost Ten Tribes” whose ultimate fate has exercised so many curious minds), but he conquered and ruled Babylon, so founding what historians know as the New Assyrian Empire. His son, Shalmaneser IV,[110] died during the siege of Samaria, and was succeeded by a usurper, who, no doubt to flatter Babylonian susceptibilities, took the ancient Akkadian Sumerian name of Sargon, Sargon II. He seems to have armed the Assyrian forces for the first time with iron weapons. It was probably Sargon II who actually carried out the deportation of the Ten Tribes.

Such shiftings about of population became a very distinctive part of the political methods of the Assyrian new empire. Whole nations who were difficult to control in their native country would be shifted en _masse_ to unaccustomed regions and amidst strange neighbours, where their only hope of survival would lie in obedience to the supreme power.

[Illustration: Assyrian warrior

(Bas-relief from the palace of Sargon II)]

Sargon's son, Sennacherib, led the Assyrian hosts to the borders of Egypt. There Sennacherib's army was smitten by a pestilence, a disaster described in the nineteenth chapter of the Second Book of Kings.

"And it came to pass that night, that the angel of the Lord went out, and smote in the camp of the Assyrians an hundred fourscore and five thousand; and when they arose early in the morning, behold, they were all dead corpses. So Sennacherib king of Assyria departed, and went and returned, and dwelt at Nineveh."[111]

Sennacherib's grandson, Assurbanipal (called by the Greeks Sardanapalus), did succeed in conquering and for a time holding lower Egypt.

§2E

The Assyrian Empire lasted only a hundred and fifty years after Sargon II. Fresh nomadic Semites coming from the south-east, the Chaldeans, assisted by two Aryan peoples from the north, the Medes and Persians, combined against it, and took Nineveh in 606 B.C.

The Chaldean Empire, with its capital at Babylon (Second Babylonian Empire), lasted under Nebuchadnezzar the Great (Nebuchadnezzar II) and his successors until 539 B.C., when it collapsed before the attack of Cyrus, the founder of the Persian power....

So the story goes on. In 330 B.C., as we shall tell later in some detail, a Greek conqueror, Alexander the Great, is looking on the murdered body of the last of the Persian rulers.

The story of the Tigris and Euphrates civilizations, of which we have given as yet only the bare outline, is a story of conquest following after conquest, and each conquest replaces old rulers and ruling classes by new; races like the Sumerian and the Elamite are swallowed up, their languages vanish, they interbreed and are lost, the Assyrian melts away into Chaldean and Syrian, the Hittites become Aryanized and lose distinction, the Semites who swallowed up the Sumerians give place to Aryan rulers, Medes and Persians appear in the place of the Elamites, the Aryan Persian language dominates the empire until the Aryan Greek ousts it from official life. Meanwhile the plough does its work year by year, the harvests are gathered, the builders build as they are told, the tradesmen work and acquire fresh devices; the knowledge of writing spreads, novel things, the horse and wheeled vehicles and iron, are introduced and become part of the permanent inheritance of mankind; the volume of trade upon sea and desert increases, men's ideas widen, and knowledge grows. There are set-backs, massacres, pestilence; but the story is, on the whole, one of enlargement. For four thousand years this new thing, civilization, which had set its root into the soil of the two rivers, grew as a tree grows; now losing a limb, now stripped by a storm, but always growing and resuming its growth. After four thousand years the warriors and conquerors were still going to and fro over this growing thing they did not understand, but men had now (330 B.C.) got iron, horses, writing and computation, money, a greater variety of foods and textiles, a wider knowledge of their world.

The time that elapsed between the empire of Sargon I and the conquest of Babylon by Alexander the Great was as long, be it noted, at the least estimate, as the time from Alexander the Great to the present day. And before the time of Sargon, men had been settled in the Sumerian land, living in towns, worshipping in temples, following an orderly Neolithic agricultural life in an organized community for at least as long again. "Eridu, Lagash, Ur, Uruk, Larsa, have already an immemorial past when first they appear in history."[112]

One of the most difficult things for both the writer and student of history is to sustain the sense of these time intervals and prevent these ages becoming shortened by perspective in his imagination. Half the duration of human civilization and the keys to all its chief institutions are to be found _before_ Sargon I. Moreover, the reader cannot too often compare the scale of the dates in these latter fuller pages of man's history with the succession of countless generations to which the time diagrams given on pages 14, 60, and 89 bear witness.

§ 3

The story of the Nile valley from the dawn of its traceable history until the time of Alexander the Great is not very dissimilar from that of Babylonia; but while Babylonia lay open on every side to invasion, Egypt was protected by desert to the west and by desert and sea to the east, while to the south she had only negro peoples. Consequently her history is less broken by the invasions of strange races than is the history of Assyria and Babylon, and until towards the eighth century B.C., when she fell under an Ethiopian

dynasty, whenever a conqueror did come into her story, he came in from Asia by way of the Isthmus of Suez.

[Illustration: Iron Weapons]

The Stone Age remains in Egypt are of very uncertain date; there are Palæolithic and then Neolithic remains. It is not certain whether the Neolithic pastoral people who left those remains were the direct ancestors of the later Egyptians. In many respects they differed entirely from their successors. They buried their dead, but before they buried them they cut up the bodies and apparently ate portions of the flesh. They seem to have done this out of a feeling of reverence for the departed; the dead were "eaten with honour" according to the phrase of Mr. Flinders Petrie. It may have been that the survivors hoped to retain thereby some vestige of the strength and virtue that had died. Traces of similar savage customs have been found in the long barrows that were scattered over western Europe before the spreading of the Aryan peoples, and they have pervaded negro Africa, where they are only dying out at the present time.

[Illustration: Early figure of the Egyptian hippopotamus goddess.]

About 5000 B.C., or earlier, the traces of these primitive peoples cease, and the true Egyptians appear on the scene. The former people were hut builders and at a comparatively low stage of Neolithic culture, the latter were already a civilized Neolithic people; they used brick and wood buildings instead of their predecessors' hovels, and they were working stone. Very soon they passed into the Bronze Age. They possessed a system of picture writing almost as developed as the contemporary writing of the Sumerians, but quite different in character. Possibly there was an irruption from southern Arabia by way of Aden, of a fresh people, who came into upper Egypt and descended slowly towards the delta of the Nile. Dr. Wallis Budge writes of them as "conquerors from the East." But their gods and their ways, like their picture writing, were very different indeed from the Sumerian. One of the earliest known figures of a deity is that of a hippopotamus goddess, and so very distinctively African.[113]

The clay of the Nile is not so fine and plastic as the Sumerian clay, and the Egyptians made no use of it for writing. But they early resorted to strips of the papyrus reed fastened together, from whose name comes our word "paper."

The broad outline of the history of Egypt is simpler than the history of Mesopotamia. It has long been the custom to divide the rulers of Egypt into a succession of Dynasties, and in speaking of the periods of Egyptian history it is usual to speak of the first, fourth, fourteenth, and so on, Dynasty. The Egyptians were ultimately conquered by the Persians after their establishment in Babylon, and when finally Egypt fell to Alexander the Great in 332 B.C., it was Dynasty XXXI that came to an end. In that long history of over 4000 years, a much longer period than that between the career of Alexander the Great and the present day, certain broad phases of development may be noted here. There was a phase known as the "old kingdom," which culminated in the IVth Dynasty; this Dynasty marks a period of wealth and splendour, and its monarchs were obsessed by such a passion for making monuments for themselves as no men have ever before or since had a chance to display and gratify. It was Cheops[114] and Chephren and Mycerinus of this IVth Dynasty who raised the vast piles of the great and the second and the third pyramids at Gizeh. These unmeaning[115] sepulchral piles, of an almost incredible vastness,[116] erected in an age when engineering science had scarcely begun, exhausted the resources of Egypt through three long reigns, and left her wasted as if by a war.

The story of Egypt from the IVth to the XVth Dynasty is a story of conflicts between alternative capitals and competing religions, of separations into several kingdoms and reunions. It is, so to speak, an internal history. Here we can name only one of that long series of Pharaohs, Pepi II, who reigned ninety years, the longest reign in history, and left a great abundance of inscriptions and buildings. At last there happened to Egypt what happened so frequently to the civilizations of Mesopotamia. Egypt was conquered by nomadic Semites, who founded a "shepherd" dynasty, the Hyksos (XVIth), which was finally expelled by native Egyptians. This invasion probably happened while that first Babylonian Empire which Hammurabi founded was flourishing, but the exact correspondences of dates between early Egypt and Babylonia are still very doubtful. Only after a long period of servitude did a popular uprising expel these foreigners again.

After the war of liberation (circa 1600 B.C.) there followed a period of great prosperity in Egypt, _the New Empire_. Egypt became a great and united military state, and pushed her expeditions at last as far as the Euphrates, and so the age-long struggle between the Egyptian and Babylonian-Assyrian power began.

For a time Egypt was the ascendant power. Thothmes III[117] and his son Amenophis III (XVIIIth Dynasty) ruled from Ethiopia to the Euphrates in the fifteenth century B.C. For various reasons these names stand out with unusual distinctness in the Egyptian record. They were great builders, and left many monuments and inscriptions. Amenophis III founded Luxor, and added greatly to

Karnak. At Tel-el-Amarna a mass of letters has been found, the royal correspondence with Babylonian and Hittite and other monarchs, including that Tushratta who took Nineveh, throwing a flood of light upon the political and social affairs of this particular age. Of Amenophis IV we shall have more to tell later, but of one, the most extraordinary and able of Egyptian monarchs, Queen Hatasu, the aunt and stepmother of Thotmes III, we have no space to tell. She is represented upon her monuments in masculine garb, and with a long beard as a symbol of wisdom.

Thereafter there was a brief Syrian conquest of Egypt, a series, of changing dynasties, among which we may note the XIXth, which included Rameses II, a great builder of temples, who reigned seventy-seven years (about 1317 to 1250 B.C.), and who is supposed by some to have been the Pharaoh of Moses, and the XXIInd, which included Shishak, who plundered Solomon's temple (circa 930 B.C.). An Ethiopian conqueror from the Upper Nile founded the XXVth Dynasty, a foreign dynasty, which went down (670 B.C.) before the new Assyrian Empire created by Tiglath Pileser III, Sargon II, and Sennacherib, of which we have already made mention.

The days of any Egyptian predominance over foreign nations were drawing to an end. For a time under Psammetichus I of the XXVIth Dynasty (664-610 B.C.) native rule was restored, and Necho II recovered for a time the old Egyptian possessions in Syria up to the Euphrates while the Medes and Chaldeans were attacking Nineveh. From those gains Necho II was routed out again after the fall of Nineveh and the Assyrians by Nebuchadnezzar II, the great Chaldean king, the Nebuchadnezzar of the Bible. The Jews, who had been the allies of Necho II, were taken into captivity by Nebuchadnezzar to Babylon.

When, in the sixth century B.C., Chaldea fell to the Persians, Egypt followed suit, a rebellion later made Egypt independent once more for sixty years, and in 332 B.C. she welcomed Alexander the Great as her conqueror, to be ruled thereafter by foreigners, first by Greeks, then by Romans, then in succession by Arabs, Turks, and British, until the present day.

Such briefly is the history of Egypt from its beginnings; a history first of isolation and then of increasing entanglement with the affairs of other nations, as increasing facilities of communication drew the peoples of the world into closer and closer interaction.

§ 4

The history we need to tell here of India is simpler even than this brief record of Egypt. Somewhere about the time of Hammurabi or later, a branch of the Aryan-speaking people who then occupied North Persia and Afghanistan, pushed down the northwest passes into India. They conquered their way until they prevailed over all the darker populations of North India, and spread their rule or influence over the whole peninsula. They never achieved any unity in India; their history is a history of warring kings and republics. The Persian empire, in the days of its expansion after the capture of Babylon, pushed its boundaries beyond the Indus, and later Alexander the Great marched as far as the border of the desert that separates the Punjab from the Ganges valley. But with this bare statement we will for a time leave the history of India.

§ 5

[Illustration: The Cradle of CHINESE CIVILIZATION]

Meanwhile, as this triple system of White Man civilization developed in India and in the lands about the meeting-places of Asia, Africa, and Europe, another and quite distinct civilization was developing and spreading out from the then fertile but now dry and desolate valley of the Tarim and from the slopes of the Kuen-lun mountains in two directions, down the course of the Hwang-ho, and into the valley of the Yang-tse-kiang. We know practically nothing as yet of the archæology of China, we do not know anything of the Stone Age in that part of the world, and at present our ideas of this early civilization are derived from the still very imperfectly explored Chinese literature. It has evidently been from the first and throughout a Mongolian civilization. Until after the time of Alexander the Great there are few traces of any Aryan or Semitic, much less of Hamitic influence. All such influences were still in another world, separated by mountains, deserts, and wild nomadic tribes until that time. The Chinese seem to have made their civilization spontaneously and unassisted. Some recent writers suppose indeed a connection with ancient Sumeria. Of course both China and Sumeria arose on the basis of the almost world-wide early Neolithic culture, but the Tarim valley and the lower Euphrates are separated by such vast obstacles of mountain and desert as to forbid the idea of any migration or interchange of peoples who had once settled down.

But though the civilization of China is wholly Mongolian (as we have defined Mongolian), it does not follow that the northern roots are the only ones from which it grew. If it grew first in the Tarim valley, then unlike all other civilizations (including the Mexican and

Peruvian) it did not grow out of the heliolithic culture. We Europeans know very little as yet of the ethnology and pre-history of southern China. There the Chinese mingle with such kindred peoples as the Siamese and Burmese, and seem to bridge over towards the darker Dravidian peoples and towards the Malays. It is quite clear from the Chinese records that there were southern as well as northern beginnings of a civilization, and that the Chinese civilization that comes into history 2000 years B.C. is the result of a long process of conflicts, minglings, and interchanges between a southern and a northern culture of which the southern may have been the earlier. The southern Chinese perhaps played the rôle towards the northern Chinese that the Hamites or Sumerians played to the Aryan and Semitic peoples in the west, or that the settled Dravidians played towards the Aryans in India. They may have been the first agriculturists and the first temple builders. But so little is known as yet of this attractive chapter in pre-history, that we cannot dwell upon it further here.

The chief foreigners mentioned in the early annals of China were a Ural-Altaic people on the north-east frontier, the Huns, against whom certain of the earlier emperors made war.

Chinese history is still very imperfectly known to European students, and our accounts of the early records are particularly unsatisfactory. About 2700 to 2400 B.C. reigned five emperors, who seem to have been almost incredibly exemplary beings.

There follows upon these first five emperors a series of dynasties, of which the accounts become more and more exact and convincing as they become more recent. China has to tell a long history of border warfare and of graver struggles between the settled and nomad peoples. To begin with, China, like Sumer and like Egypt, was a land of city states. The government was at first a government of numerous kings; they became loosely feudal under an emperor, as the Egyptians did; and then later, as with the Egyptians, came a centralizing empire. Shang (1750 to 1125 B.C.) and Chow (1125 to 250 B.C.) are named as being the two great dynasties of the feudal period. Bronze vessels of these earlier dynasties, beautiful, splendid, and with a distinctive style of their own, still exist, and there can be no doubt of the existence of a high state of culture even before the days of Shang.

It is perhaps a sense of symmetry that made the later historians of Egypt and China talk of the earlier phases of their national history as being under dynasties comparable to the dynasties of the later empires, and of such early “Emperors” as Menes (in Egypt) or the First Five Emperors (in China). The early dynasties exercised far less centralized powers than the later ones. Such unity as China possessed under the Shang dynasty was a religious rather than an effective political union. The “Son of Heaven” offered sacrifices for all the Chinese. There was a common script, a common civilization, and a common enemy in the Huns of the north-western borders.

The last of the Shang Dynasty was a cruel and foolish monarch who burnt himself alive (1125 B.C.) in his palace after a decisive defeat by Wu Wang, the founder of the Chow Dynasty. Wu Wang seems to have been helped by allies from among the south-western tribes as well as by a popular revolt.

For a time China remained loosely united under the Chow emperors, as loosely united as was Christendom under the popes in the Middle Ages; the Chow emperors had become the traditional high priests of the land in the place of the Shang Dynasty and claimed a sort of overlordship in Chinese affairs, but gradually the loose ties of usage and sentiment that held the empire together lost their hold upon men’s minds. Hunnish peoples to the north and west took on the Chinese civilization without acquiring a sense of its unity. Feudal princes began to regard themselves as independent. Mr. Liang-Chi-Chao,[118] one of the Chinese representatives at the Paris Conference of 1919, states that between the eighth and fourth centuries B.C. “there were in the Hwang-ho and Yang-tse valleys no less than five or six thousand small states with about a dozen powerful states dominating over them.” The land was subjected to perpetual warfare (“Age of Confusion”). In the sixth century B.C. the great powers in conflict were Ts’i and Ts’in, which were northern Hwang-ho states, and Ch’u, which was a vigorous, aggressive power in the Yang-tse valley. A confederation against Ch’u laid the foundation for a league that kept the peace for a hundred years; the league subdued and incorporated Ch’u and made a general treaty of disarmament. It became the foundation of a new pacific empire.

The knowledge of iron entered China at some unknown date, but iron weapons began to be commonly used only about 500 B.C., that is to say two or three hundred years or more after this had become customary in Assyria, Egypt, and Europe. Iron was probably introduced from the north into China by the Huns.

The last rulers of the Chow Dynasty were ousted by the kings of Ts’in, the latter seized upon the sacred sacrificial bronze tripods, and so were able to take over the imperial duty of offering sacrifices to Heaven. In this manner was the Ts’in Dynasty established. It ruled with far more vigour and effect than any previous family. The reign of Shi-Hwang-ti (meaning “first universal emperor”) of this dynasty is usually taken to mark the end of feudal and divided China. He seems to have played the unifying rôle in the east that

Alexander the Great might have played in the west, but he lived longer, and the unity he made (or restored) was comparatively permanent, while the empire of Alexander the Great fell to pieces, as we shall tell, at his death. Shi-Hwang-ti, among other feats in the direction of common effort, organized the building of the Great Wall of China against the Huns. A civil war followed close upon his reign, and ended in the establishment of the Han Dynasty. Under this Han Dynasty the empire grew greatly beyond its original two river valleys, the Huns were effectively restrained, and the Chinese penetrated westward until they began to learn at last of civilized races and civilizations other than their own.

By 100 B.C. the Chinese had heard of India, their power had spread across Tibet and into Western Turkestan, and they were trading by camel caravans with Persia and the western world. So much for the present must suffice for our account of China. We shall return to the distinctive characters of its civilization later.

§ 6

And in these thousands of years during which man was making his way step by step from the barbarism of the heliolithic culture to civilization at these old-world centres, what was happening in the rest of the world? To the north of these centres, from the Rhine to the Pacific, the Nordic and Mongolian peoples, as we have told, were also learning the use of metals; but while the civilizations were settling down these men of the great plains were becoming migratory and developing from a slow wandering life towards a complete seasonal nomadism. To the south of the civilized zone, in central and southern Africa, the negro was making a slower progress, and that, it would seem, under the stimulus of invasion by whiter tribes from the Mediterranean regions, bringing with them in succession cultivation and the use of metals. These white men came to the black by two routes: across the Sahara to the west as Berbers and Tuaregs and the like, to mix with the negro and create such quasi-white races as the Fulas; and also by way of the Nile, where the Baganda (= Gandafolk) of Uganda, for example, may possibly be of remote white origin. The African forests were denser then, and spread eastward and northward from the Upper Nile.

The islands of the East Indies, three thousand years ago, were probably still only inhabited here and there by stranded patches of Palæolithic Australoids, who had wandered thither in those immemorial ages when there was a nearly complete land bridge by way of the East Indies to Australia. The islands of Oceania were uninhabited. The spreading of the heliolithic peoples by sea-going canoes into the islands of the Pacific came much later in the history of man, at earliest a thousand years B.C. Still later did they reach Madagascar. The beauty of New Zealand also was as yet wasted upon mankind; its highest living creatures were a great ostrich-like bird, the moa, now extinct, and the little kiwi which has feathers like coarse hair and the merest rudiment of wings.

In North America a group of Mongoloid tribes were now cut off altogether from the old world. They were spreading slowly southward, hunting the innumerable bison of the plains. They had still to learn for themselves the secrets of a separate agriculture based on maize, and in South America to tame the lama to their service and so build up in Mexico and Peru two civilizations roughly parallel in their nature to that of Sumer, but different in many respects, and later by six or seven thousand years....

When men reached the southern extremity of America, the _Megatherium_, the giant sloth, and the _Glyptodon_, the giant armadillo, were still living....

There is a considerable imaginative appeal in the obscure story of the early American civilizations. It was largely a separate development.[119] Somewhen at last the southward drift of the Amerindians must have met and mingled with the eastward, canoe-borne drift of the heliolithic culture. But it was the heliolithic culture still at a very lowly stage and probably before the use of metals. It has to be noted as evidence of this canoe-borne origin of American culture, that elephant-headed figures are found in Central American drawings. American metallurgy may have arisen independently of the old-world use of metal, or it may have been brought by these elephant carvers. These American peoples got to the use of bronze and copper, but not to the use of iron; they had gold and silver; and their stonework, their pottery, weaving, and dyeing were carried to a very high level. In all these things the American product resembles the old-world product generally, but always it has characteristics that are distinctive. The American civilizations had picture-writing of a primitive sort, but it never developed even to the pitch of the earliest Egyptian hieroglyphics. In Yucatan only was there a kind of script, the Maya writing, but it was used simply for keeping a calendar. In Peru the beginnings of writing were superseded by a curious and complicated method of keeping records by means of knots tied upon strings of various colours and shapes. It is said that even laws and orders could be conveyed by this code. These string bundles were called _quipus_, but though quipus are still to be found in collections, the art of reading them is altogether lost. The Chinese histories, Mr. L. Y. Chen informs us, state that a similar method of record by knots was used in China before the invention of writing there. The Peruvians also got to making maps and the use of counting-frames. “But with all this there was no means of handing on knowledge

and experience from one generation to another, nor was anything done to fix and summarize these intellectual possessions, which are the basis of literature and science."[120]

When the Spaniards came to America, the Mexicans knew nothing of the Peruvians nor the Peruvians of the Mexicans. Intercourse there was none. Whatever links had ever existed were lost and forgotten. The Mexicans had never heard of the potato, which was a principal article of Peruvian diet. In 5000 B.C. the Sumerians and Egyptians probably knew as little of one another. America was 6000 years behind the Old World.

XVII

SEA PEOPLES AND TRADING PEOPLES

§ 1. _The Earliest Ships and Sailors._ § 2. _The Ægean Cities before History._ § 3. _The First Voyages of Exploration._ § 4. _Early Traders._ § 5. _Early Travellers._

§ 1

The first boats were made very early indeed in the Neolithic stage of culture by riverside and lakeside peoples. They were no more than trees and floating wood, used to assist the imperfect natural swimming powers of men. Then came the hollowing out of the trees, and then, with the development of tools and a primitive carpentry, the building of boats. Men in Egypt and Mesopotamia also developed a primitive type of basket-work boat, caulked with bitumen. Such was the "ark of bulrushes" in which Moses was hidden by his mother. A kindred sort of vessel grew up by the use of skins and hides expanded upon a wicker framework. To this day cow-hide wicker boats (coracles) are used upon the west coast of Ireland, where there is plenty of cattle and a poverty of big trees. They are also still used on the Euphrates, and on the Towy in South Wales. Inflated skins may have preceded the coracle, and are still used on the Euphrates and upper Ganges. In the valleys of the great rivers, boats must early have become an important means of communication; and it seems natural to suppose that it was from the mouths of the great rivers that man, already in a reasonably seaworthy vessel, first ventured out upon what must have seemed to him then the trackless and homeless sea.

No doubt he ventured at first as a fisherman, having learnt the elements of seacraft in creeks and lagoons. Men may have navigated boats upon the Levantine lake before the refilling of the Mediterranean by the Atlantic waters. The canoe was an integral part of the heliolithic culture, it drifted with that culture upon the warm waters of the earth from the Mediterranean to (at last) America. There were not only canoes, but Sumerian boats and ships upon the Euphrates and Tigris, when these rivers in 7000 B.C. fell by separate mouths into the Persian Gulf. The Sumerian city of Eridu, which stood at the head of the Persian Gulf (from which it is now separated by a hundred and thirty miles of alluvium[121]), had ships upon the sea then. We also find evidence of a fully developed sea life six thousand years ago at the eastern end of the Mediterranean, and possibly at that time there were already canoes on the seas among the islands of the nearer East Indies. There are pre-dynastic Neolithic Egyptian representations of Nile ships of a fair size, capable of carrying elephants.[122]

Very soon the seafaring men must have realized the peculiar freedom and opportunities the ship gave them. They could get away to islands; no chief nor king could pursue a boat or ship with any certainty; every captain was a king. The seamen would find it easy to make nests upon islands and in strong positions on the mainland. There they could harbour, there they could carry on a certain agriculture and fishery; but their speciality and their main business was, of course, the expedition across the sea. That was not usually a trading expedition; it was much more frequently a piratical raid. From what we know of mankind, we are bound to conclude that the first sailors plundered when they could, and traded when they had to.

[Illustration: Boats on the Nile, about 2500 B.C. [From Torr's "Ancient Ships".]]

Because it developed in the comparatively warm and tranquil waters of the eastern Mediterranean, the Red Sea, the Persian Gulf, and the western horn of the Indian Ocean, the shipping of the ancient world retained throughout certain characteristics that make it differ very widely from the ocean-going sailing shipping, with its vast spread of canvas, of the last four hundred years. "The Mediterranean," says Mr. Torr,[123] "is a sea where a vessel with sails may lie becalmed for days together, while a vessel with oars would easily be traversing the smooth waters, with coasts and islands everywhere at hand to give her shelter in case of storm. In that sea, therefore, oars became the characteristic instruments of navigation, and the arrangement of oars the chief problem in shipbuilding. And so long as the Mediterranean nations dominated Western Europe, vessels of the southern type were built upon the northern coasts, though there generally was wind enough here for sails and too much wave for oars.... The art of rowing can

first be discerned upon the Nile. Boats with oars are represented in the earliest pictorial monuments of Egypt, dating from about 2500 B.C.; and although some crews are paddling with their faces towards the bow, others are rowing with their faces towards the stern. The paddling is certainly the older practice, for the hieroglyph chen depicts two arms grasping an oar in the attitude of paddling, and the hieroglyphs were invented in the earliest ages. And that practice may really have ceased before 2500 B.C., despite the testimony of monuments of that date; for in monuments dating from about 1250 B.C. crews are represented unmistakably rowing with their faces towards the stern and yet grasping their oars in the attitude of paddling, so that even then Egyptian artists mechanically followed the turn of the hieroglyph to which their hands were accustomed. In these reliefs there are twenty rowers on the boats on the Nile, and thirty on the ships on the Red Sea; but in the earliest reliefs the number varies considerably, and seems dependent on the amount of space at the sculptor's disposal."

[Illustration: Egyptian ship on the Red Sea, about 1250 B.C. (From Torr's "Ancient Ships.")

Mr. Langton Cole calls attention to the rope truss in this illustration, stiffening the beam of the ship. No other such use of the truss is known until the days of modern engineering.]

The Aryan peoples came late to the sea. The earliest ships on the sea were either Sumerian or Hamitic; the Semitic peoples followed close upon these pioneers. Along the eastern end of the Mediterranean, the Phœnicians, a Semitic people, set up a string of independent harbour towns of which Acre, Tyre, and Sidon were the chief; and later they pushed their voyages westward and founded Carthage and Utica in North Africa. Possibly Phœnician keels were already in the Mediterranean by 2000 B.C. Both Tyre and Sidon wee originally on islands, an so easily defensible against a land raid. But before we go on to the marine exploits of this great sea-going race, we must note a very remarkable and curious nest of early sea people whose remains have been discovered in Crete.[124]

§ 2

These early Cretans were of unknown race, but probably of a race akin to the Iberians of Spain and Western Europe and the dark whites of Asia Minor and North Africa, and their language is unknown. This race lived not only in Crete, but in Cyprus, Greece, Asia Minor, Sicily, and South Italy. It was a civilized people for long ages before the fair Aryan Greeks spread southward through Macedonia. At Cnossos, in Crete, there have been found the most astonishing ruins and remains, and Cnossos, therefore, is apt to overshadow the rest of these settlements in people's imaginations, but it is well to bear in mind that, though Cnossos was no doubt a chief city of this Ægean civilization, these "Ægeans" had in the fullness of their time many cities and a wide range. Possibly, all that we know of them now are but the vestiges of a far more extensive heliolithic Neolithic civilization which is now submerged under the waters of the Mediterranean.

At Cnossos there are Neolithic remains as old or older than any of the pre-dynastic remains of Egypt. The Bronze Age began in Crete as soon as it did in Egypt, and there have been vases found by Flinders Petrie in Egypt and referred by him to the Ist Dynasty, which he declared to be importations from Crete. Stone vessels have been found in Crete of forms characteristic of the IVth (pyramid-building) Dynasty, and there can be no doubt that there was a vigorous trade between Crete and Egypt in the time of the XIIth Dynasty. This continued until about 1000 B.C. It is clear that this island civilization arising upon the soil of Crete is at least as old as the Egyptian, and that it was already launched upon the sea as early as 4000 B.C.

The great days of Crete were not so early as this. It was only about 2500 B.C. that the island appears to have been unified under one ruler. Then began an age of peace and prosperity unexampled in the history of the ancient world. Secure from invasion, living in a delightful climate, trading with every civilized community in the world, the Cretans were free to develop all the arts and amenities of life. This Cnossos was not so much a town as the vast palace of the king and his people. It was not even fortified. The kings, it would seem, were called Minos always, as the kings of Egypt were all called Pharaoh; the king of Cnossos figures in the early legends of the Greeks as King Minos, who lived in the Labyrinth and kept there a horrible monster, half man, half bull, the Minotaur, to feed which he levied a tribute of youths and maidens from the Athenians. Those stories are a part of Greek literature, and have always been known, but it is only in the last few decades that the excavations at Cnossos have revealed how close these legends were to the reality. The Cretan labyrinth was a building as stately, complex, and luxurious as any in the ancient world. Among other details we find waterpipes, bathrooms, and the like conveniences, such as have hitherto been regarded as the latest refinements of modern life. The pottery, the textile manufactures, the sculpture and painting of these people, their gem and ivory work, their metal and inlaid work, is as admirable as any that mankind has produced. They were much given to festivals and shows, and, in particular, they were addicted to bull-fights and gymnastic entertainments. Their female costume became astonishingly

“modern” in style; their women wore corsets and flounced dresses. They had a system of writing which has not yet been deciphered.

[Illustration: ÆGEAN CIVILIZATION]

It is the custom nowadays to make a sort of wonder of these achievements of the Cretans, as though they were a people of incredible artistic ability living in the dawn of civilization. But their great time was long past that dawn; as late as 2000 B.C. It took them many centuries to reach their best in art and skill, and their art and luxury are by no means so great a wonder if we reflect that for 3000 years they were immune from invasion, that for a thousand years they were at peace. Century after century their artizans could perfect their skill, and their men and women refine upon refinement. Wherever men of almost any race have been comparatively safe in this fashion for such a length of time, they have developed much artistic beauty. Given the opportunity, all races are artistic. Green legend has it that it was in Crete that Dædalus attempted to make the first flying machine. Dædalus (= cunning artificer) was a sort of personified summary of mechanical skill. It is curious to speculate what germ of fact lies behind him and those waxen wings that, according to the legend, melted and plunged his son Icarus in the sea.

[Illustration: J.F.H. from photos by British School at Athens

Faience figure from Cnossos ... A votary of the Snake Goddess....]

There came at last a change in the condition of the lives of these Cretans, for other peoples, the Greeks and the Phœnicians, were also coming out with powerful fleets upon the seas. We do not know what led to the disaster nor who inflicted it; but somewhen about 1400 B.C. Cnossos was sacked and burnt, and though the Cretan life struggled on there rather lamely for another four centuries, there came at last a final blow about 1000 B.C. (that is to say, in the days of the Assyrian ascendancy in the East). The palace at Cnossos was destroyed, and never rebuilt nor reinhabited. Possibly this was done by the ships of those newcomers into the Mediterranean, the barbaric Greeks, a group of Aryan tribes, who may have wiped out Cnossos as they wiped out the city of Troy. The legend of Theseus tells of such a raid. He entered the Labyrinth (which may have been the Cnossos Palace) by the aid of Ariadne, the daughter of Minos, and slew the Minotaur.

The _Iliad_ makes it clear that destruction came upon Troy because the Trojans stole Greek women. Modern writers, with modern ideas in their heads, have tried to make out that the Greeks assailed Troy in order to secure a trade route or some such fine-spun commercial advantage. If so, the authors of the _Iliad_ hid the motives of their characters very skilfully. It would be about as reasonable to say that the Homeric Greeks went to war with the Trojans in order to be well ahead with a station on the Berlin to Bagdad railway. The Homeric Greeks were a healthy barbaric Aryan people, with very poor ideas about trade and “trade routes”; they went to war with the Trojans because they were thoroughly annoyed about this stealing of women. It is fairly clear from the Minos legend and from the evidence of the Cnossos remains, that the Cretans kidnapped or stole youths and maidens to be slaves, bull-fighters, athletes, and perhaps sacrifices. They traded fairly with the Egyptians, but it may be they did not realize the gathering strength of the Greek barbarians; they “traded” violently with them, and so brought sword and flame upon themselves.[125]

Another great sea people were the Phœnicians. They were great seamen because they were great traders. Their colony of Carthage (founded before 800 B.C. by Tyre) became at last greater than any of the older Phœnician cities, but already before 1500 B.C. both Sidon and Tyre had settlements upon the African coast. Carthage was comparatively inaccessible to the Assyrian and Babylonian hosts, and, profiting greatly by the long siege of Tyre by Nebuchadnezzar II, became the greatest maritime power the world had hitherto seen. She claimed the Western Mediterranean as her own, and seized every ship she could catch west of Sardinia. Roman writers accuse her of great cruelties. She fought the Greeks for Sicily, and later (in the second century B.C.) she fought the Romans. Alexander the Great formed plans for her conquest; but he died, as we shall tell later, before he could carry them out.

§ 3

At her zenith Carthage probably had the hitherto unheard-of population of a million. This population was largely industrial, and her woven goods were universally famous. As well as a coasting trade, she had a considerable land trade with Central Africa,[126] and she sold negro slaves, ivory, metals, precious stones and the like, to all the Mediterranean people; she worked Spanish copper mines, and her ships went out into the Atlantic and coasted along Portugal and France northward as far as the Cassiterides (the Scilly Isles, or Cornwall, in England) to get tin. About 520 B.C. a certain Hanno made a voyage that is still one of the most notable in the world. This Hanno, if we may trust the _Periplus of Hanno_, the Greek translation of his account which still survives, followed

the African coast southward from the Straits of Gibraltar as far as the confines of Liberia. He had sixty big ships, and his main task was to found or reinforce certain Carthaginian stations upon the Morocco coast. Then he pushed southward. He founded a settlement in the Rio de Oro (on Kerne or Herne Island), and sailed on past the Senegal river. The voyagers passed on for seven days beyond the Gambia, and landed at last upon some island. This they left in a panic, because, although the day was silent with the silence of the tropical forest, at night they heard the sound of flutes, drums, and gongs, and the sky was red with the blaze of the bush fires. The coast country for the rest of the voyage was one blaze of fire, from the burning of the bush. Streams of fire ran down the hills into the sea, and at length a blaze arose so loftily that it touched the skies. Three days further brought them to an island containing a lake (? Sherbro Island). In this lake was another island (? Macaulay Island), and on this were wild, hairy men and women, “whom the interpreters called gorilla.” The Carthaginians, having caught some of the females of these “gorillas”--they were probably chimpanzees--turned back and eventually deposited the skins of their captives--who had proved impossibly violent guests to entertain on board ship--in the Temple of Juno.

A still more wonderful Phœnician sea voyage, long doubted, but now supported by some archæological evidence, is related by Herodotus, who declares that the Pharaoh Necho of the XXVIth Dynasty commissioned some Phœnicians to attempt the circumnavigation of Africa, and that starting from the Gulf of Suez southward, they did finally come back through the Mediterranean to the Nile delta. They took nearly three years to complete their voyage. Each year they landed, and sowed and harvested a crop of wheat before going on.

§ 4

The great trading cities of the Phœnicians are the most striking of the early manifestations of the peculiar and characteristic gift of the Semitic peoples to mankind, trade and exchange.[127] While the Semitic Phœnician peoples were spreading themselves upon the seas, another kindred Semitic people, the Arameans, whose occupation of Damascus we have already noted, were developing the caravan routes of the Arabian and Persian deserts, and becoming the chief trading people of Western Asia. The Semitic peoples, earlier civilized than the Aryan, have always shown, and still show to-day, a far greater sense of quality and quantity in marketable goods than the latter; it is to their need of account-keeping that the development of alphabetical writing is to be ascribed, and it is to them that most of the great advances in computation are due. Our modern numerals are Arabic; our arithmetic and algebra are essentially Semitic sciences.

The Semitic peoples, we may point out here, are to this day _counting peoples_ strong in their sense of equivalents and reparation. The moral teaching of the Hebrews was saturated by such ideas. “With what measure ye mete, the same shall be meted unto you.” Other races and peoples have imagined diverse and fitful and marvellous gods, but it was the trading Semites who first began to think of God as a Righteous Dealer, whose promises were kept, who failed not the humblest creditor, and called to account every spurious act.

The trade that was going on in the ancient world before the sixth or seventh century B.C. was almost entirely a barter trade. There was little or no credit or coined money. The ordinary standard of value with the early Aryans was cattle, as it still is with the Zulus and Kaffirs to-day. In the _Iliad_, the respective values of two shields are stated in head of cattle, and the Roman word for moneys, _pecunia_, is derived from _pecus_, cattle. Cattle as money had this advantage; it did not need to be carried from one owner to another, and if it needed attention and food, at any rate it bred. But it was inconvenient for ship or caravan transit. Many other substances have at various times been found convenient as a standard; tobacco was once legal tender in the colonial days in North America, and in West Africa fines are paid and bargains made in bottles of trade gin. The early Asiatic trade included metals; and weighed lumps of metal, since they were in general demand and were convenient for hoarding and storage, costing nothing for fodder and needing small house-room, soon asserted their superiority over cattle and sheep. Iron, which seems to have been first reduced from its ores by the Hittites, was, to begin with, a rare and much-desired substance.[128] It is stated by Aristotle to have supplied the first currency. In the collection of letters found at Tel-el-Amarna, addressed to and from Amenophis III (already mentioned) and his successor Amenophis IV, one from a Hittite king promises iron as an extremely valuable gift. Gold, then as now, was the most precious and therefore most portable, security. In early Egypt silver was almost as rare as gold until after the XVIIIth Dynasty. Later the general standard of value in the Eastern world became silver, measured by weight.

To begin with, metals were handed about in ingots and weighed at each transaction. Then they were stamped to indicate their fineness and guarantee their purity. The first recorded coins were minted about 600 B.C. in Lydia, a gold-producing country in the west of Asia Minor. The first-known gold coins were minted in Lydia by Crœsus, whose name has become a proverb for wealth; he was conquered, as we shall tell later, by that same Cyrus the Persian who took Babylon in 539 B.C. But very probably coined

money had been used in Babylonia before that time. The “sealed shekel,” a stamped piece of silver, came very near to being a coin. The promise to pay so much silver or gold on “leather” (= parchment) with the seal of some established firm is probably as old or older than coinage. The Carthaginians used such “leather money.” We know very little of the way in which small traffic was conducted. Common people, who in those ancient times were in dependent positions, seem to have had no money at all; they did their business by barter. Early Egyptian paintings show this going on.[129]

§ 5

When one realizes the absence of small money or of any conveniently portable means of exchange in the pre-Alexandrian world, one perceives how impossible was private travel in those days.[130] The first “inns”--no doubt a sort of caravanserai--are commonly said to have come into existence in Lydia in the third or fourth century B.C. That, however, is too late a date. They are certainly older than that. There is good evidence of them at least as early as the sixth century. Æschylus twice mentions inns. His word is “all-receiver,” or “all-receiving house.”[131] Private travellers must have been fairly common in the Greek world, including its colonies, by this time. But such private travel was a comparatively new thing then. The early historians Hecatæus and Herodotus travelled widely. “I suspect,” says Professor Gilbert Murray, “that this sort of travel ‘for Historie’ or ‘for discovery’ was rather a Greek invention. Solon is supposed to have practiced it; and even Lycurgus.”... The earlier travellers were traders travelling in a caravan or in a shipload, and carrying their goods and their minas and shekels of metal or gems or bales of fine stuff with them, or government officials travelling with letters of introduction and a proper retinue. Possibly there were a few mendicants, and, in some restricted regions, religious pilgrims.

That earlier world before 600 B.C. was one in which a lonely “stranger” was a rare and suspected and endangered being. He might suffer horrible cruelties, for there was little law to protect such as he. Few individuals strayed therefore. One lived and died attached and tied to some patriarchal tribe if one was a nomad, or to some great household if one was civilized, or to one of the big temple establishments which we will presently discuss. Or one was a herded slave. One knew nothing, except for a few monstrous legends, of the rest of the world in which one lived. We know more to-day, indeed, of the world of 600 B.C. than any single living being knew at that time. We map it out, see it as a whole in relation to past and future. We begin to learn precisely what was going on at the same time in Egypt and Spain and Media and India and China. We can share in imagination, not only the wonder of Hanno’s sailors, but of the men who lit the warning beacons on the shore. We know that those “mountains flaming to the sky” were only the customary burning of the dry grass at that season of the year. Year by year, more and more rapidly, our common knowledge increases. In the years to come men will understand still more of those lives in the past until perhaps they will understand them altogether.

XVIII

WRITING

§ 1. _Picture Writing._ § 2. _Syllable Writing._ § 3. _Alphabet Writing._ § 4. _The Place of Writing in Human Life._

§ 1

In the five preceding chapters (XIII to XVII) we have sketched in broad outline the development of the chief human communities from the primitive beginnings of the heliolithic culture to the great historical kingdoms and empires in the sixth century B.C. We must now study a little more closely the general process of social change, the growth of human ideas, and the elaboration of human relationships that were going on during these ages between 10,000 B.C. and 500 B.C. What we have done so far is to draw the map and name the chief kings and empires, to define the relations in time and space of Babylonia, Assyria, Egypt, Phœnicia, Cnossos, and the like; we come now to the real business of history, which is to get down below these outer forms to the thoughts and lives of individual men.

By far the most important thing that was going on during those fifty or sixty centuries of social development was the invention of writing and its gradual progress to importance in human affairs. It was a new instrument for the human mind, an enormous enlargement of its range of action, a new means of continuity. We have seen how in later Palæolithic and early Neolithic times the elaboration of articulate speech gave men a mental handhold for consecutive thought and a vast enlargement of their powers of co-operation. For a time this new acquirement seems to have overshadowed their earlier achievement of drawing, and possibly it checked the use of gesture. But drawing presently reappeared again, for record, for signs, for the joy of drawing. Before real writing

came picture-writing, such as is still practised by the Amerindians, the Bushmen, and savage and barbaric people in all parts of the world. It is essentially a drawing of things and acts, helped out by heraldic indications of proper names, and by strokes and dots to represent days and distances and such-like quantitative ideas.

Quite kindred to such picture-writing is the pictograph that one finds still in use to-day in international railway time-tables upon the continent of Europe, where a little black sign of a cup indicates a stand-up buffet for light refreshments; a crossed knife and fork, a restaurant; a little steamboat, a transfer to a steamboat; and a postilion's horn, a diligence. Similar signs are used in the well-known Michelin guides for automobilists in Europe, to show a post-office (envelope) or a telephone (telephone receiver). The quality of hotels is shown by an inn with one, two, three, or four gables, and so forth. Similarly, the roads of Europe are marked with wayside signs representing a gate, to indicate a level crossing ahead, a sinuous bend for a dangerous curve, and the like. From such pictographic signs to the first elements of Chinese writing is not a very long stretch.

In Chinese writing there are still traceable a number of pictographs. Most are now difficult to recognize. A mouth was originally written as a mouth-shaped hole and is now, for convenience of brushwork, squared; a child, originally a recognizable little mannikin, is now a hasty wriggle and a cross; the sun, originally a large circle with a dot in the centre, has been converted, for the sake of convenience of combination, into a crossed oblong, which is easier to make with a brush. By combining these pictographs, a second order of ideas is expressed. For example, the pictograph for mouth combined with pictograph for vapour expressed "words."[132]

[Illustration: _Specimens of American Indian picture-writing_

(_after Schoolcraft ..._)]

No. 1, painted on a rock on the shore of Lake Superior, records an expedition across the lake, in which five canoes took part. The upright strokes in each indicate the number of the crew, and the bird represents a chief, "The Kingfisher." The three circles (suns) under the arch (of heaven) indicate that the voyage lasted three days, and the tortoise, a symbol of land, denotes a safe arrival. No. 2 is a petition sent to the United States Congress by a group of Indian tribes, asking for fishing rights in certain small lakes. The tribes are represented by their totems, martens, bear, manfish, and catfish, led by the crane. Lines running from the heart and eye of each animal to the heart and eye of the crane denote that they are all of one mind; and a line runs from the eye of the crane to the lakes, shown in the crude little "map" in the lower left-hand corner.]

From such combinations one passes to what are called _ideograms_: the sign for "words" and the sign for "tongue" combine to make "speech"; the sign for "roof" and the sign for "pig" make "home"--for in the early domestic economy of China the pig was as important as it used to be in Ireland. But, as we have already noted earlier, the Chinese language consists of a comparatively few elementary monosyllabic sounds, which are all used in a great variety of meanings, and the Chinese soon discovered that a number of these _pictographs_ and _ideographs_ could be used also to express other ideas, not so conveniently pictured, but having the same sound. Characters so used are called _phonograms_. For example, the sound fang meant not only "boat," but "a place," "spinning," "fragrant," "inquire," and several other meanings according to the context. But while a boat is easy to draw most of the other meanings are undrawable. How can one draw "fragrant" or "inquire"? The Chinese, therefore, took the same sign for all these meanings of _fang_, but added to each of them another distinctive sign, the determinative, to show what sort of _fang_ was intended. A "place" was indicated by the same sign as for "boat" (_fang_) and the determinative sign for "earth"; "spinning" by the sign for _fang_ and the sign for "silk"; "inquire" by the sign for _fang_ and the sign for "words," and so on.

One may perhaps make this development of pictographs, ideographs, and phonograms a little clearer by taking an analogous case in English. Suppose we were making up a sort of picture-writing in English, then it would be very natural to use a square with a slanting line to suggest a lid, for the word and thing _box_. That would be a pictograph. But now suppose we had a round sign for money, and suppose we put this sign inside the box sign, that would do for "cash-box" or "treasury." That would be an ideogram. But the word "box" is used for other things than boxes. There is the box shrub which gives us boxwood. It would be hard to draw a recognizable box-tree distinct from other trees, but it is quite easy to put our sign "box," and add our sign for shrub as a determinative to determine that it is that sort of box and not a common box that we want to express. And then there is "box," the verb, meaning to fight with fists. Here, again, we need a determinative; we might add the two crossed swords, a sign which is used very often upon maps to denote a battle. A box at a theatre needs yet another determinative, and so we go on, through a long series of phonograms.

Now it is manifest that here in the Chinese writing is a very peculiar and complex system of sign-writing. A very great number of characters have to be learnt and the mind habituated to their use. The power it possesses to carry ideas and discussion is still ungauged by western standards, but we may doubt whether with this instrument it will ever be possible to establish such a wide, common mentality as the simpler and swifter alphabets of the western civilizations permit. In China it created a special reading-class, the mandarins, who were also the ruling and official class. Their necessary concentration upon words and classical forms, rather than upon ideas and realities, seems, in spite of her comparative peacefulness and the very high individual intellectual quality of her people, to have greatly hampered the social and economic development of China. Probably it is the complexity of her speech and writing, more than any other imaginable cause, that has made China to-day politically, socially, and individually a vast pool of backward people rather than the foremost power in the whole world.[133]

§ 2

But while the Chinese mind thus made for itself an instrument which is probably too elaborate in structure, too laborious in use, and too inflexible in its form to meet the modern need for simple, swift, exact, and lucid communications, the growing civilizations of the west were working out the problem of a written record upon rather different and, on the whole, more advantageous lines. They did not seek to improve their script to make it swift and easy, but circumstances conspired to make it so. The Sumerian picture-writing, which had to be done upon clay and with little styles, which made curved marks with difficulty and inaccurately, rapidly degenerated by a conventionalized dabbing down of wedged-shaped marks (cuneiform = wedge-shaped) into almost unrecognizable hints of the shapes intended. It helped the Sumerians greatly to learn to write, that they had to draw so badly. They got very soon to the Chinese pictographs, ideographs, and phonograms, and beyond them.

Most people know a sort of puzzle called a rebus. It is a way of representing words by pictures, not of the things the words represent, but by the pictures of other things having a similar sound. For example, two gates and a head is a rebus for Gates-head; a little streamlet (beck), a crowned monarch, and a ham, Beckingham. The Sumerian language was a language well adapted to this sort of representation. It was apparently a language of often quite vast polysyllables, made up of very distinct inalterable syllables; and many of the syllables taken separately were the names of concrete things. So that this cuneiform writing developed very readily into a syllabic way of writing, in which each sign conveys a syllable just as each act in a charade conveys a syllable. When presently the Semites conquered Sumeria, they adapted the syllabic system to their own speech, and so this writing became entirely a sign-for-a-sound writing. It was so used by the Assyrians and by the Chaldeans. But it was not a letter-writing, it was a syllable-writing. This cuneiform script prevailed for long ages over Assyria, Babylonia, and the Near East generally; there are vestiges of it in some of the letters of our alphabet to-day.

§ 3

But, meanwhile, in Egypt and upon the Mediterranean coast another system of writing grew up. Its beginnings are probably to be found in the priestly picture-writing (hieroglyphics) of the Egyptians, which also in the usual way became partly a sound-sign system. As we see it on the Egyptian monuments, the hieroglyphic writing consists of decorative but stiff and elaborate forms, but for such purpose as letter-writing and the keeping of recipes and the like, the Egyptian priests used a much simplified and flowing form of these characters, the _hieratic script_. Side by side with this hieratic script rose another, probably also derivative from the hieroglyphs, a script now lost to us, which was taken over by various non-Egyptian peoples in the Mediterranean, the Phœnicians, Libyans, Lydians, Cretans, and Celt-Iberians, and used for business purposes. Possibly a few letters were borrowed from the later cuneiform. In the hands of these foreigners this writing was, so to speak, cut off from its roots; it lost all but a few traces of its early pictorial character. It ceased to be pictographic or ideographic; it became simply a pure sound-sign system, an _alphabet_.

There were a number of such alphabets in the Mediterranean differing widely from each other.[134] It may be noted that the Phœnician alphabet (and perhaps others) omitted vowels. Possibly they pronounced their consonants very hard and had rather indeterminate vowels, as is said to be still the case with tribes of South Arabia. Quite probably, too, the Phœnicians used their alphabet at first not so much for writing as for single initial letters in their business accounts and tallies. One of these Mediterranean alphabets reached the Greeks, long after the time of the Iliad, who presently set to work to make it express the clear and beautiful sounds of their own highly developed Aryan speech. It consisted at first of consonants, and the Greeks added the vowels. They began to write for record, to help and fix their bardic tradition....

§ 4

So it was by a series of very natural steps that writing grew out of the life of man. At first and for long ages it was the interest and the secret of only a few people in a special class, a mere accessory to the record of pictures. But there were certain very manifest advantages, quite apart from the increased expressiveness of mood and qualification, to be gained by making writing a little less plain than straightforward pictures, and in conventionalizing and codifying it. One of these was that so messages might be sent understandable by the sender and receiver, but not plain to the uninitiated. Another was that so one might put down various matters and help one's memory and the memory of one's friends, without giving away too much to the common herd. Among some of the earliest Egyptian writings, for example, are medical recipes and magic formulæ. Accounts, letters, recipes, name lists, itineraries; these were the earliest of written documents. Then, as the art of writing and reading spread, came that odd desire, that pathetic desire so common among human beings, to astonish some strange and remote person by writing down something striking, some secret one knew, some strange thought, or even one's name, so that long after one had gone one's way, it might strike upon the sight and mind of another reader. Even in Sumeria men scratched on walls, and all that remains to us of the ancient world, its rocks, its buildings, is plastered thickly with the names and the boasting of those foremost among human advertisers, its kings. Perhaps half the early inscriptions in that ancient world are of this nature, if, that is, we group with the name-writing and boasting the epitaphs, which were probably in many cases prearranged by the deceased.

For long the desire for crude self-assertion of the name-scrawling sort and the love of secret understandings kept writing within a narrow scope; but that other, more truly social desire in men, the desire to _tell_, was also at work. The profounder possibilities of writing, the possibilities of a vast extension and definition and settlement of knowledge and tradition, only grew apparent after long ages. But it will be interesting at this point and in this connection to recapitulate certain elemental facts about life, upon which we laid stress in our earlier chapters, because they illuminate not only the huge value of writing in the whole field of man's history, but also the rôle it is likely to play in his future.

1. Life had at first, it must be remembered, only a discontinuous repetition of consciousness, as the old died and the young were born.

Such a creature as a reptile has in its brain a capacity for experience, but when the individual dies, its experience dies with it. Most of its motives are purely instinctive, and all the mental life that it has is the result of heredity (birth inheritance).

2. But ordinary mammals have added to pure instinct _tradition_, a tradition of experience imparted by the imitated example of the mother, and in the case of such mentally developed animals as dogs, cats, or apes, by a sort of mute precept also. For example, the mother cat chastises her young for misbehaviour. So do mother apes and baboons.

3. Primitive man added to his powers of transmitting experience, representative art and speech. Pictorial and sculptured record and _verbal tradition_ began.

Verbal tradition was developed to its highest possibility by the bards. They did much to make language what it is to the world to-day.

4. With the invention of writing, which developed out of pictorial record, human tradition was able to become fuller and much more exact. Verbal tradition, which had hitherto changed from age to age, began to be fixed. Men separated by hundreds of miles could now communicate their thoughts. An increasing number of human beings began to share a common written knowledge and a common sense of a past and a future. Human thinking became a larger operation in which hundreds of minds in different places and in different ages could react upon one another; it became a process constantly more continuous and sustained....

5. For hundreds of generations the full power of writing was not revealed to the world, because for a long time the idea of multiplying writings by taking prints of a first copy did not become effective. The only way of multiplying writings was by copying one copy at a time, and this made books costly and rare. Moreover, the tendency to keep things secret, to make a cult and mystery of them, and so to gain an advantage over the generality of men, has always been very strong in men's minds. It is only nowadays that the great masses of mankind are learning to read, and reaching out towards the treasures of knowledge and thought already stored in books.

Nevertheless, from the first writings onward a new sort of tradition, an enduring and immortal tradition, began in the minds of men. Life, through mankind, grew thereafter more and more distinctly conscious of itself and its world. It is a thin streak of intellectual growth we trace in history, at first in a world of tumultuous ignorance and forgetfulness; it is like a mere line of light coming through the chink of an opening door into a darkened room; but slowly it widens, it grows. At last came a time in the history of Europe when

the door, at the push of the printer, began to open more rapidly. Knowledge flared up, and as it flared it ceased to be the privilege of a favoured minority. For us now that door swings wider, and the light behind grows brighter. Misty it is still, glowing through clouds of dust and reek.

The door is not half open; the light is but a light new lit. Our world to-day is only in the beginning of knowledge.

GODS AND STARS, PRIESTS AND KINGS

§ 1. _Nomadic and Settled Religion._ § 2. _The Priest Comes into History._ § 3. _Priests and the Stars._ § 4. _Priests and the Dawn of Learning._ § 5. _King against Priest._ § 6. _How Bel-Marduk Struggled against the Kings._ § 7. _The God-Kings of Egypt._ § 8. _Shi Hwang-ti Destroys the Books._

§ 1

We have already told what there is to tell of the social life of the Aryan tribes when they were settling down to the beginnings of civilized life; we have seen how they were associated in great households, grouped together under tribal leaders, who made a sort of informal aristocracy rather like that of the sixth form and prefects in an English boys' school; we have considered the rôle of the bards in the creation of an oral tradition, and we have glanced at their not very complex religious ideas. We may note one or two points of difference from the equivalent life of the nomadic Semites.

Like the early Aryan life, it was a life in a sort of family-tribe household. But it had differences due originally perhaps to the warmer, drier climate. Though both groups of races had cattle and sheep, the Aryans were rather herdsmen, the Semites, shepherds. The Semites had no long winter evenings and no bardic singing. They never sat in hall. They have consequently no epics. They had stories, camp-fire stories, but not verbally beautified story-recitations. The Semite also was more polygamous than the Aryan, his women less self-assertive,[135] and the tendency of his government more patriarchal. The head of the household or the tribe was less of a leader and more of a master, more like the Palæolithic Old Man. And the Semitic nomads were closer to the earlier civilizations, a thing that fitted in with their greater aptitude for trade and counting. But the religion of the nomadic Semite was as little organized as the religion of the Aryan. In either case the leading man performed most of the functions of the priest. The Aryan gods were little more than a kind of magical super-prince; they were supposed to sit in hall together, and to talk and make scenes with one another under Jupiter or Thor. The early Semitic gods, on the other hand, were thought of as tribal patriarchs. As peoples develop towards nomadism, they seem to lose even such primitive religion and magic as their Neolithic ancestors professed. Nomadism cuts men off from fixed temples and intense local associations; they take a broader and simpler view of the world. They tend towards religious simplification.

We write here of the nomadic peoples, the Aryan herdsmen and Semitic shepherds, and we write in the most general terms. They had their undercurrent of fables and superstitions, their phases of fear and abjection and sacrificial fury. These people were people like ourselves, with brains as busy and moody and inconsistent, and with even less training and discipline. It is absurd to suppose--as so many writers about early religion do seem to suppose--that their religious notions can be reduced to the consistent logical development of some one simple idea. We have already glanced, in Chapter XII, at the elements of religion that must have arisen necessarily in the minds of those early peoples. But for most of the twenty-four hours these nomads were busy upon other things, and there is no sign that their houses, their daily routines, their ordinary acts, were dominated or their social order shaped, by any ideas that we should now call religious. As yet life and its ideas were too elementary for that.

But directly we turn our attention to these new accumulations of human beings that are beginning in Egypt and Mesopotamia, we find that one of the most conspicuous objects in every city is a temple or a group of temples. In some cases there arises beside it in these regions a royal palace, but as often the temple towers over the palace. This presence of the temple is equally true of the Phœnician cities and of the Greek and Roman as they arise. The palace of Cnossos, with its signs of comfort and pleasure-seeking, and the kindred cities of the Ægean peoples, include religious shrines, but in Crete there are also temples standing apart from the palatial city-households. All over the ancient civilized world we find them; wherever primitive civilization set its foot in Africa, Europe, or western Asia, a temple arose, and where the civilization is most ancient, in Egypt and in Sumer, there the temple is most in evidence. When Hanno reached what he thought was the most westerly point of Africa, he set up a temple to Hercules. We have, in fact, come now to a new stage in the history of mankind, the temple stage.

§ 2

In all these temples there was a shrine; dominating the shrine there was commonly a great figure, usually of some monstrous half-animal form, before which stood an altar for sacrifices. This figure was either regarded as the god or as the image or symbol of the god, for whose worship the temple existed. And connected with the temple there were a number, and often a considerable number, of priests or priestesses, and temple servants, generally wearing a distinctive costume and forming an important part of the city population. They belonged to no household, as did the simple priest of the primitive Aryan; they made up a new kind of household of their own. They were a caste and a class apart, attracting intelligent recruits from the general population.

The primary duty of this priesthood was concerned with the worship of and the sacrifices to the god of the temple. And these things were done, not at any time, but at particular times and seasons. There had come into the life of man with his herding and agriculture a sense of a difference between the parts of the year and of a difference between day and day. Men were beginning to work--and to need days of rest. The temple, by its festivals, kept count. The temple in the ancient city was like the clock and calendar upon a writing-desk.

But it was a centre of other functions. It was in the early temples that the records and tallies of events were kept and that writing began. And there was knowledge there. The people went to the temple not only _en masse_ for festivals, but individually for help. The early priests were also doctors and magicians. In the earliest temples we already find those little offerings for some private and particular end, which are still made in the chapels of Catholic churches to-day, _ex votos_, little models of hearts relieved and limbs restored, acknowledgment of prayers answered and accepted vows.

It is clear that here we have that comparatively unimportant element in the life of the early nomad, the medicine-man, the shrine-keeper, and the memorist, developed, with the development of the community and as a part of the development of the community from barbarism to civilized settlement, into something of very much greater importance. And it is equally evident that those primitive fears of (and hopes of help from) strange beings, the desire to propitiate unknown forces, the primitive desire for cleansing and the primitive craving for power and knowledge have all contributed to crystallize out this new social fact of the temple.

The temple was accumulated by complex necessities, it grew from many roots and needs, and the god that dominated the temple was the creation of many imaginations and made up of all sorts of impulses, ideas, and half ideas. Here there was a god in which one sort of ideas predominated, and there another. It is necessary to lay some stress upon this confusion and variety of origin in gods, because there is a very abundant literature now in existence upon religious origins, in which a number of writers insist, some on this leading idea and some on that--we have noted several in our Chapter XII on “Early Thought”--as though it were the only idea. Professor Max Müller in his time, for example, harped perpetually on the idea of sun stories and sun worship. He would have had us think that early man never had lusts or fears, cravings for power, nightmares or fantasies, but that he meditated perpetually on the beneficent source of light and life in the sky. Now dawn and sunset are very moving facts in the daily life, but they are only two among many.

[Illustration:

J.F.H.]

Early men, three or four hundred generations ago, had brains very like our own. The fancies of our childhood and youth are perhaps the best clue we have to the ground-stuff of early religion, and anyone who can recall those early mental experiences will understand very easily the vagueness, the monstrosity, and the incoherent variety of the first gods. There were sun gods, no doubt, early in the history of temples, but there were also hippopotamus gods and hawk gods; there were cow deities, there were monstrous male and female gods, there were gods of terror and gods of an adorable quaintness, there were gods who were nothing but lumps of meteoric stone that had fallen amazingly out of the sky, and gods who were mere natural stones that had

chanced to have a queer and impressive shape. Some gods, like Marduk of Babylon and the Baal (= the Lord) of the Phœnicians, Canaanites, and the like, were quite probably at bottom just legendary wonder beings, such as little boys will invent for themselves to-day. The early Semites, it is said, as soon as they thought of a god, invented a wife for him; most of the Egyptian and Babylonian gods were married. But the gods of the nomadic Semites had not this marrying disposition. Children were less eagerly sought by the inhabitants of the food-grudging steppes.

Even more natural than to provide a wife for a god is to give him a house to live in to which offerings can be brought. Of this house the knowing man, the magician, would naturally become the custodian. A certain seclusion, a certain aloofness, would add greatly to the prestige of the god. The steps by which the early temple and the early priesthood developed so soon as an agricultural population settled and increased are all quite natural and understandable, up to the stage of the long temple with the image, shrine and altar at one end and the long nave in which the worshippers stood. And this temple, because it had records and secrets, because it was a centre of power, advice, and instruction, because it sought and attracted imaginative and clever people for its service, naturally became a kind of brain in the growing community. The attitude of the common people who tilled the fields and herded the beasts towards the temple would remain simple and credulous. There, rarely seen and so imaginatively enhanced, lived the god whose approval gave prosperity, whose anger meant misfortune; he could be propitiated by little presents and the help of his servants could be obtained. He was wonderful, and of such power and knowledge that it did not do to be disrespectful to him even in one's thoughts. Within the priesthood, however, a certain amount of thinking went on at a rather higher level than that.

§ 3[136]

And now we have to note a very interesting fact about the chief temples of Egypt and, so far as we know--because the ruins are not so distinct--of Babylonia, and that is that they were "oriented"--that is to say, that the same sort of temple was built so that the shrine and entrance always faced in the same direction.[137] In Babylonian temples this was most often due east, facing the sunrise on March 21st and September 21st, the equinoxes; and it is to be noted that it was at the spring equinox that the Euphrates and Tigris came down in flood. The Pyramids of Gizeh are also oriented east and west, and the Sphinx faces due east, but very many of the Egyptian temples to the south of the delta of the Nile do not point due east, but to the point where the sun rises at the longest day--and in Egypt the inundation comes close to that date. Others, however, pointed nearly northward, and others again pointed to the rising of the star Sirius or to the rising-point of other conspicuous stars. The fact of orientation links up with the fact that there early arose a close association between various gods and the sun and various fixed stars. Whatever the mass of people outside were thinking, the priests of the temples were beginning to link the movements of those heavenly bodies with the power in the shrine. They were thinking about the gods they served and thinking new meanings into them. They were brooding upon the mystery of the stars. It was very natural for them to suppose that these shining bodies, so irregularly distributed and circling so solemnly and silently, must be charged with portents to mankind.

[Illustration:

Hathor (Isis) the Egyptian cow goddess ...

Chnemu creator-god, married to Hekt, a frog goddess.]

Among other things, this orientation of the temples served to fix and help the great annual festival of the New Year. On one morning in the year, and one morning alone, in a temple oriented to the rising-place of the sun at Midsummer Day, the sun's first rays would smite down through the gloom of the temple and the long alley of the temple pillars, and light up the god above the altar and irradiate him with glory. The narrow, darkened structure of the ancient temples seems to be deliberately planned for such an effect. No doubt the people were gathered in the darkness before the dawn; in the darkness there was chanting and perhaps the offering of sacrifices; the god alone stood mute and invisible. Prayers and invocations would be made. Then upon the eyes of the worshippers, sensitized by the darkness, as the sun rose behind them, the god would suddenly shine.

So, at least, one explanation of orientation is found by such students of orientation as Sir Norman Lockyer.[138] Not only is orientation apparent in most of the temples of Egypt, Assyria, Babylonia, and the east, it is found in the Greek temples; Stonehenge is oriented to the midsummer sunrise, and so are most of the megalithic circles of Europe; the Temple of Heaven in Peking is oriented to midwinter. In the days of the Chinese Empire, up to a few years ago, one of the most important of all the duties of the Emperor of China was to sacrifice and pray in this temple upon midwinter's day for a propitious year.

The Egyptian priests had mapped out the stars into the constellations, and divided up the zodiac into twelve signs, by 3000 B.C. ...

§ 4

This clear evidence of astronomical inquiry and of a development of astronomical ideas is the most obvious, but only the most obvious, evidence of the very considerable intellectual activities that went on within the temple precincts in ancient times. There is a curious disposition among many modern writers to deprecate priesthoods and to speak of priests as though they had always been impostors and tricksters, preying upon the simplicity of mankind. But, indeed, they were for long the only writing class, the only reading public, the only learned and the only thinkers; they were all the professional classes of the time. You could have no intellectual life at all, you could not get access to literature or any knowledge except through the priesthood. The temples were not only observatories and libraries and clinics, they were museums and treasure-houses. The original _Periplus_ of Hanno hung in one temple in Carthage, skins of his “gorillas” were hung and treasured in another. Whatever there was of abiding worth in the life of the community sheltered there. Herodotus, the early Greek historian (485-425 B.C.), collected most of his material from the priests of the countries in which he travelled, and it is evident they met him generously and put their very considerable resources completely at his disposal. Outside the temples the world was still a world of blankly illiterate and unspeculative human beings, living from day to day entirely for themselves. Moreover, there is little evidence that the commonalty felt cheated by the priests, or had anything but trust and affection for the early priesthoods. Even the great conquerors of later times were anxious to keep themselves upon the right side of the priests of the nations and cities whose obedience they desired, because of the immense popular influence of these priests.

No doubt there were great differences between temple and temple and cult and cult in the spirit and quality of the priesthood. Some probably were cruel, some vicious and greedy, many dull and doctrinaire, stupid with tradition, but it has to be kept in mind that there were distinct limits to the degeneracy or inefficiency of a priesthood. It had to keep its grip upon the general mind. It could not go beyond what people would stand--either towards the darkness or towards the light. Its authority rested, in the end, on the persuasion that its activities were propitious.

§ 5[139]

It is clear that the earliest civilized governments were essentially priestly governments. It was not kings and captains who first set men to the plough and a settled life. It was the ideas of the gods and plenty, working with the acquiescence of common men. The early rulers of Sumer we know were all priests, kings only because they were chief priests. And priestly government had its own weaknesses as well as its peculiar deep-rooted strength. The power of a priesthood is a power over their own people alone. It is a subjugation through mysterious fears and hopes. The priesthood can gather its people together for war, but its traditionalism and all its methods unfit it for military control. Against the enemy without, a priest-led people is feeble.

Moreover, a priest is a man vowed, trained, and consecrated, a man belonging to a special corps, and necessarily with an intense _esprit de corps_. He has given up his life to his temple and his god. This is a very excellent thing for the internal vigour of his own priesthood, his own temple. He lives or dies for the honour of his particular god. But in the next town or village is another temple with another god. It is his constant preoccupation to keep his people from that god. Religious cults and priesthoods are sectarian by nature; they will convert, they will overcome, but they will never coalesce. Our first perceptions of events in Sumer, in the dim uncertain light before history began, is of priests and gods in conflict; until the Sumerians were conquered by the Semites they were never united; and the same incurable conflict of priesthoods scars all the temple ruins of Egypt. It was impossible that it could have been otherwise, having regard to the elements out of which religion arose.

[Illustration: An Assyrian King & his Chief Minister]

It was out of those two main weaknesses of all priesthoods, namely, the incapacity for efficient military leadership and their inevitable jealousy of all other religious cults, that the power of secular kingship arose. The foreign enemy either prevailed and set up a king over the people, or the priesthoods who would not give way to each other set up a common fighting captain, who retained more or less power in peace time. This secular king developed a group of officials about him and began, in relation to military organization, to take a share in the priestly administration of the people’s affairs. So, growing out of priestcraft and beside the priest, the king, the protagonist of the priest, appears upon the stage of human history, and a very large amount of the subsequent experiences of mankind is only to be understood as an elaboration, complication, and distortion of the struggle, unconscious or deliberate, between these two systems of human control, the temple and the palace. And it was in the original centres of civilization

that this antagonism was most completely developed. The Aryan peoples never passed through a phase of temple rule on their way to civilization; they came to civilization late; they found that drama already half-played. They took over the ideas of both temple and kingship, when those ideas were already elaborately developed, from the more civilized Hamitic or Semitic people they conquered.

The greater importance of the gods and the priests in the earlier history of the Mesopotamian civilization is very apparent, but gradually the palace won its way until it was at last in a position to struggle definitely for the supreme power. At first, in the story, the palace is ignorant and friendless in the face of the temple; the priests alone read, the priests alone know, the people are afraid of him. But in the dissensions of the various cults comes the opportunity of the palace. From other cities, from among captives, from defeated or suppressed religious cults, the palace gets men who also can read and who can do magic things.[140] The court also becomes a centre of writing and record; the king thinks for himself and becomes politic. Traders and foreigners drift to the court, and if the king has not the full records and the finished scholarship of the priests, he has a wider and fresher first-hand knowledge of many things. The priest comes into the temple when he is very young; he passes many years as a neophyte; the path of learning the clumsy letters of primitive times is slow and toilsome; he becomes erudite and prejudiced rather than a man of the world. Some of the more active-minded young priests may even cast envious eyes at the king's service. There are many complications and variations in this ages-long drama of the struggle going on beneath the outward conflicts of priest and king, between the made man and the born man, between learning and originality, between established knowledge and settled usage on the one hand, and creative will and imagination on the other. It is not always, as we shall find later, the priest who is the conservative and unimaginative antagonist. Sometimes a king struggles against narrow and obstructive priesthoods; sometimes priesthoods uphold the standards of civilization against savage, egotistical, or reactionary kings.

One or two outstanding facts and incidents of the early stages of this fundamental struggle in political affairs are all that we can note here between 4000 B.C. and the days of Alexander.

§ 6

In the early days of Sumeria and Akkadia the city-kings were priests and medicine-men rather than kings, and it was only when foreign conquerors sought to establish their hold in relation to existing institutions that the distinction of priest and king became definite. But the god of the priests remained as the real overlord of the land and of priest and king alike. He was the universal landlord; the wealth and authority of his temples and establishments outshone those of the king. Especially was this the case within the city walls. Hammurabi, the founder of the first Babylonian Empire, is one of the earlier monarchs whom we find taking a firm grip upon the affairs of the community. He does it with the utmost politeness to the gods. In an inscription recording his irrigation work in Sumeria and Akkadia, he begins: "When Anu and Bel entrusted me with the rule of Sumer and Akkad----." We possess a code of laws made by this same Hammurabi--it is the earliest known code of law--and at the head of this code we see the figure of Hammurabi receiving the law from its nominal promulgator, the god Shamash.

An act of great political importance in the conquest of any city was the carrying off of its god to become a subordinate in the temple of its conqueror. This was far more important than the subjugation of king by king. Merodach, the Babylonian Jupiter, was carried off by the Elamites, and Babylon did not feel independent until its return. But sometimes a conqueror was afraid of the god he had conquered. In the collection of letters addressed to Amenophis III and IV at Tel-Amarna in Egypt, to which allusion has already been made, is one from a certain king, Tushratta, King of Mitani, who has conquered Assyria and taken the statue of the goddess Ishtar. Apparently he has sent this statue into Egypt, partly to acknowledge the overlordship of Amenophis, but partly because he fears her anger. (Winckler.) In the Bible is related (Sam. i. v. 1) how the Ark of the Covenant of the God of the Hebrews was carried off by the Philistines, as a token of conquest, into the temple of the fish god, Dagon, at Ashdod, and how Dagon fell down and was broken, and how the people of Ashdod were smitten with disease. In the latter story particularly the gods and priests fill the scene; there is no king in evidence at all.

Right through the history of the Babylonian and Assyrian empires no monarch seems to have felt his tenure of power secure in Babylon until he had "taken the hand of Bel"--that is to say, that he had been adopted by the priesthood of "Bel" as the god's son and representative. As our knowledge of Assyrian and Babylonian history grows clearer, it becomes plainer that the politics of that world, the revolutions, usurpations, changes of dynasty, intrigues with foreign powers, turned largely upon issues between the great wealthy priesthoods and the growing but still inadequate power of the monarchy. The king relied on his army, and this was usually a mercenary army of foreigners, speedily mutinous if there was no pay or plunder, and easily bribed. We have already noted the name of Sennacherib, the son of Sargon II, among the monarchs of the Assyrian Empire. Sennacherib was involved in a violent quarrel with the priesthood of Babylon; he never "took the hand of Bel"; and finally struck at that power by destroying altogether the

holy part of the city of Babylon (691 B.C.) and removing the statue of Bel-Marduk to Assyria. He was assassinated by one of his sons, and his successor, Esarhaddon (his son, but not the son who was his assassin), found it expedient to restore Bel-Marduk and rebuild his temple, and make his peace with the god.[141]

Assurbanipal (Greek, Sardanapalus), the son of this Esarhaddon, is a particularly interesting figure from this point of view of the relationship of priesthood and king. His father's reconciliation with the priests of Bel-Marduk went so far that Sardanapalus was given a Babylonian instead of a military Assyrian education. He became a great collector of the clay documents of the past, and his library, which has been unearthed, is now the most precious source of historical material in the world. But for all his learning he kept his grip on the Assyrian army; he made a temporary conquest of Egypt, suppressed a rebellion in Babylon, and carried out a number of successful expeditions. As we have already told in Chapter XVI, he was almost the last of the Assyrian monarchs. The Aryan tribes, who knew more of war than of priestcraft, and particularly the Scythians, the Medes and Persians, had long been pressing upon Assyria from the north and north-east. The Medes and Persians formed an alliance with the nomadic Semitic Chaldeans of the south for the joint undoing of Assyria. Nineveh, the Assyrian capital, fell to these Aryans in 606 B.C.

Sixty-seven years after the taking of Nineveh by the Aryans, which left Babylonia to the Semitic Chaldeans, the last monarch of the Chaldean Empire (the Second Babylonian Empire), Nabonidus, the father of Belshazzar, was overthrown by Cyrus, the Persian. This Nabonidus, again, was a highly educated monarch, who brought far too much intelligence and imagination and not enough of the short range wisdom of this world to affairs of state. He conducted antiquarian researches, and to his researches it is that we owe the date of 3750 B.C., assigned to Sargon I and still accepted by many authorities. He was proud of this determination, and left inscriptions to record it. It is clear he was a religious innovator; he built and rearranged temples and attempted to centralize religion in Babylon by bringing a number of local gods to the temple of Bel-Marduk. No doubt he realized the weakness and disunion of his empire due to these conflicting cults, and had some conception of unification in his mind.

Events were marching too rapidly for any such development. His innovation had manifestly raised the suspicion and hostility of the priesthood of Bel. They sided with the Persians. "The soldiers of Cyrus entered Babylon without fighting." Nabonidus was taken prisoner, and Persian sentinels were set at the gates of the temple of Bel, "where the services continued without intermission."

Cyrus did, in fact, set up the Persian Empire in Babylon with the blessing of Bel-Marduk. He gratified the conservative instincts of the priests by packing off the local gods back to their ancestral temples. He also restored the Jews to Jerusalem.[142] These were merely matters of immediate policy to him. But in bringing in the irreligious Aryans, the ancient priesthood was paying too highly for the continuation of its temple services. It would have been wiser to have dealt with the innovations of Nabonidus, that earnest heretic, to have listened to his ideas, and to have met the needs of a changing world. Cyrus entered Babylon 539 B.C.; by 521 B.C. Babylon was in insurrection again, and in 520 B.C. another Persian monarch, Darius, was pulling down her walls. Within two hundred years the life had altogether gone out of those venerable rituals of Bel-Marduk, and the temple of Bel-Marduk was being used by builders as a quarry.

[Illustration: CHEPHREN]

§ 7[143]

The story of priest and king in Egypt is similar to, but by no means parallel with, that of Babylonia. The kings of Sumeria and Assyria were priests who had become kings; they were secularized priests. The Pharaoh of Egypt does not appear to have followed precisely that line. Already in the very oldest records the Pharaoh has a power and importance exceeding that of any priest. He is, in fact, a god, and more than either priest or king. We do not know how he got to that position. No monarch of Sumeria or Babylonia or Assyria could have induced his people to do for him what the great pyramid-building Pharaohs of the IVth Dynasty made their people do in those vast erections. The earlier Pharaohs were not improbably regarded as incarnations of the dominant god. The falcon god Horus sits behind the head of the great statue of Chephren. So late a monarch as Rameses III (XIXth Dynasty) is represented upon his sarcophagus (now at Cambridge) bearing the distinctive symbols of the three great gods of the Egyptian system.[144] He carries the two sceptres of Osiris, the god of Day and Resurrection; upon his head are the horns of the cow goddess Hathor, and also the sun ball and feathers of Ammon Ra. He is not merely wearing the symbols of these gods as a devout Babylonian might wear the symbols of Bel-Marduk; he is these three gods in one.

[Illustration: Ramses III as Osiris--between the goddesses Nephthys and Isis....

Relief on the cover of the sarcophagus (at Cambridge). After Sharpe.

Inscription (round the edges of cover), as far as decipherable.

“Osiris, King of Upper and Lower Egypt, lord of the two countries ... son of the Sun, beloved of the gods, lord of diadems, Rameses, prince of Heliopolis, triumphant! Thou art in the condition of a god, thou shalt arise as Usr, there is no enemy to thee, I give to thee triumph among them....” BUDGE, _Catalogue, Egyptian Collection, Fitzwilliam Museum, Cambridge_.]

The student will find much more in Sir J. G. Frazer’s _Golden Bough_ about the ancient use of human beings as well as statues to represent gods. Here we have merely to point to an apparent difference of idea between the Asiatic and African monarchies in this respect.

We find also a number of sculptures and paintings to enforce the idea that the Pharaohs were the actual sons of gods. The divine fathering and birth of Amenophis III, for instance (of the XVIIIth Dynasty), is displayed in extraordinary detail in a series of sculptures at Luxor. Moreover, it was held that the Pharaohs, being of so divine a strain, could not marry common clay, and consequently they were accustomed to marry blood relations within the degrees of consanguinity now prohibited, even marrying their sisters.

The struggle between palace and temple came into Egyptian history, therefore, at a different angle from that at which it came into Babylonia. Nevertheless, it came in. Professor Maspero (in his _New Light on Ancient Egypt_) gives a very interesting account of the struggle of Amenophis IV with the priesthoods, and particularly with priests of the great god, Ammon Ra, Lord of Karnak. The mother of Amenophis IV was not of the race of Pharaoh; it would seem that his father, Amenophis III, made a love match with a subject, a beautiful Syrian named Tii, and Professor Maspero finds in the possible opposition to and annoyance of this queen by the priests of Ammon Ra the beginnings of the quarrel. She may, he thinks, have inspired her son with a fanatical hatred of Ammon Ra. But Amenophis IV may have had a wider view. Like the Babylonian Nabonidus, who lived a thousand years later, he may have had in mind the problem of moral unity in his empire. We have already noted that Amenophis III ruled from Ethiopia to the Euphrates, and that the store of letters to himself and his son found at Tel Amarna show a very wide range of interest and influence. At any rate, Amenophis IV set himself to close all the Egyptian and Syrian temples, to put an end to all sectarian worship throughout his dominions, and to establish everywhere the worship of one god, Aton, the solar disk. He left his capital, Thebes, which was even more the city of Ammon Ra than later Babylon was the city of Bel-Marduk, and set up his capital at Tel Amarna; he altered his name from “Amenophis,” which consecrated him to Ammon (Amen) to “Akhnaton,” the Sun’s Glory; and he held his own against all the priesthoods of his empire for eighteen years and died a Pharaoh.

[Illustration: Akhnaton(Amenophis IV)

[based on the cast at Cairo, & the reliefs in the Berlin Museum.]]

Opinions upon Amenophis IV, or Akhnaton, differ very widely. There are those who regard him as the creature of his mother’s hatred of Ammon and the uxorious spouse of a beautiful wife. Certainly he loved his wife very passionately; he showed her great honour--Egypt honoured women, and was ruled at different times by several queens--and he was sculptured in one instance with his wife seated upon his knees, and in another in the act of kissing her in a chariot; but men who live under the sway of their womenkind do not sustain great empires in the face of the bitter hostility of the most influential organized bodies in their realm.[145] Others write of him as a “gloomy fanatic.” Matrimonial bliss is rare in the cases of gloomy fanatics. It is much more reasonable to regard him as the Pharaoh who refused to be a god. It is not simply his religious policy and his frank display of natural affection that seem to mark a strong and very original personality. His æsthetic ideas were his own. He refused to have his portrait conventionalized into the customary smooth beauty of the Pharaoh god, and his face looks out at us across an interval of thirty-four centuries, a man amidst ranks of divine insipidities.

A reign of eighteen years was not long enough for the revolution he contemplated, and his son-in-law who succeeded him went back to Thebes and made his peace with Ammon Ra.

To the very end of the story the divinity of kings haunted the Egyptian mind, and infected the thoughts of intellectually healthier races. When Alexander the Great reached Babylon, the prestige of Bel-Marduk was already far gone in decay, but in Egypt, Ammon Ra was still god enough to make a snob of the conquering Grecian. The priests of Ammon Ra, about the time of the XVIIIth or XIXth Dynasty (_circa_ 1400 B.C.), had set up in an oasis of the desert a temple and oracle. Here was an image of the god which could speak, move its head, and accept or reject scrolls of inquiry. This oracle was still flourishing in 332 B.C. The young master of the world, it is related, made a special journey to visit it; he came into the sanctuary, and the image advanced out of the

darkness at the back to meet him. There was an impressive exchange of salutations. Some such formula as this must have been used (says Professor Maspero): “Come, son of my loins, who loves me so that I give thee the royalty of Ra and the royalty of Horus! I give thee valiance, I give thee to hold all countries and all religions under thy feet; I give thee to strike all the peoples united together with thy arm!”

So it was that the priests of Egypt conquered their conqueror, and an Aryan monarch first became a god....[146]

§ 8

The struggle of priest and king in China cannot be discussed here at any length. It was different again, as in Egypt it was different from Babylonia, but we find the same effort on the part of the ruler to break up tradition because it divides up the people. The Chinese Emperor, the “Son of Heaven,” was himself a high-priest, and his chief duty was sacrificial; in the more disorderly phases of Chinese history he ceases to rule and continues only to sacrifice. The literary class was detached from the priestly class at an early date. It became a bureaucratic body serving the local kings and rulers. That is a fundamental difference between the history of China and any Western history. While Alexander was overrunning Western Asia, China, under the last priest-emperors of the Chow Dynasty, was sinking into a state of great disorder. Each province clung to its separate nationality and traditions, and the Huns spread from province to province. The King of Ts’in (who lived about eighty years after Alexander the Great), impressed by the mischief tradition was doing in the land, resolved to destroy the entire Chinese literature, and his son, Shi Hwang-ti, the “first universal Emperor,” made a strenuous attempt to seek out and destroy all the existing classics.[147] They vanished while he ruled, and he ruled without tradition, and welded China into a unity that endured for some centuries; but when he had passed, the hidden books crept out again. China remained united, though not under his descendants, but after a civil war under a fresh dynasty, the Han Dynasty (206 B.C.). The first Han monarch did not sustain this campaign of Shi Hwang-ti against the _literati_, and his successor made his peace with them and restored the texts of the classics.

SERFS, SLAVES, SOCIAL CLASSES, AND FREE INDIVIDUALS

§ 1. _The Common Man in Ancient Times._ § 2. _The Earliest Slaves._ § 3. _The first “Independent” Persons._ § 4. _Social Classes Three Thousand Years Ago._ § 5. _Classes Hardening into Castes._ § 6. _Caste in India._ § 7. _The System of the Mandarins._ § 8. _A Summary of Five Thousand Years._

§ 1

We have been sketching in the last four chapters the growth of civilized states out of the primitive Neolithic agriculture that began in Mesopotamia perhaps 15,000, perhaps 20,000, years ago. It was at first horticulture rather than agriculture; it was done with the hoe before the plough, and at first it was quite supplementary to the sheep, goat, and cattle tending that made the “living” of the family tribe. We have traced the broad outlines of the development in regions of exceptional fruitfulness of the first settled village communities into more populous towns and cities, and the growth of the village shrine and the village medicine-man into the city temple and the city priesthood. We have noted the beginnings of organized war, first as a bickering between villages, and then as a more disciplined struggle between the priest-king and god of one city and those of another. Our story has passed on rapidly from the first indications of conquest and empire in Sumer, perhaps 6000 or 7000 B.C., to the spectacle of great empires growing up, with roads and armies, with inscriptions and written documents, with educated priesthoods and kings and rulers sustained by a tradition already ancient. We have traced in broad outline the appearance and conflicts and replacements of these empires of the great rivers. We have directed attention, in particular, to the evidence of a development of still wider political ideas as we find it betrayed by the actions and utterances of such men as Nabonidus and Amenophis IV. It has been an outline of the accumulations of human experience for ten or fifteen thousand years, a vast space of time in comparison with all subsequent history, but a brief period when we measure it against the succession of endless generations that intervenes between us and the first rude flint-using human creatures of the Pleistocene dawn. But for these last four chapters we have been writing almost entirely not about mankind generally, but only about the men who thought, the men who could draw and read and write, the men who were altering their world. Beneath their activities what was the life of the mute multitude?

The life of the common man was, of course, affected and changed by these things, just as the lives of the domestic animals and the face of the cultivated country were changed; but for the most part it was a change suffered and not a change in which the common

man upon the land had any voice or will. Reading and writing were not yet for the likes of him. He went on cultivating his patch, loving his wife and children, beating his dog and tending his beasts, grumbling at hard times, fearing the magic of the priests and the power of the gods, desiring little more except to be left alone by the powers above him. So he was in 10,000 B.C.; so he was, unchanged in nature and outlook, in the time of Alexander the Great; so over the greater part of the world he remains to-day. He got rather better tools, better seeds, better methods, a slightly sounder house, he sold his produce in a more organized market as civilization progressed. A certain freedom and a certain equality passed out of human life when men ceased to wander. Men paid in liberty for safety, shelter, and regular meals. By imperceptible degrees the common man found the patch he cultivated was not his own; it belonged to the god; and he had to pay a fraction of his produce to the god. Or the god had given it to the king, who exacted his rent and tax. Or the king had given it to an official, who was the lord of the common man. And sometimes the god or the king or the noble had work to be done, and then the common man had to leave his patch and work for his master.

How far the patch he cultivated was his own was never very clear to him. In ancient Assyria the land seems to have been held as a sort of freehold and the occupier paid taxes; in Babylonia the land was the god's, and he permitted the cultivator to work thereon. In Egypt the temples or Pharaoh-the-god or the nobles under Pharaoh were the owners and rent receivers. But the cultivator was not a slave; he was a peasant, and only bound to the land in so far that there was nothing else for him to do but cultivate, and nowhere else for him to go. He lived in a village or town, and went out to his work. The village, to begin with, was often merely a big household of related people under a patriarch headman, the early town a group of householders under its elders. There was no process of enslavement as civilization grew, but the headmen and leaderly men grew in power and authority, and the common men did not keep pace with them, and fell into a tradition of dependence and subordination.

On the whole, the common men were probably well content to live under lord or king or god and obey their bidding. It was safer. It was easier. All animals--and man is no exception--begin life as dependents. Most men never shake themselves loose from the desire for leading and protection.[148]

§ 2

[Illustration: Egyptian peasants seized for non-payment of taxes ... (Pyramid Age)]

The earlier wars did not involve remote or prolonged campaigns, and they were waged by levies of the common people. But war brought in a new source of possessions, plunder, and a new social factor, the captive. In the earlier, simpler days of war, the captive man was kept only to be tortured or sacrificed to the victorious god; the captive women and children were assimilated into the tribe. But later many captives were spared to be slaves because they had exceptional gifts or peculiar arts. It would be the kings and captains who would take these slaves at first, and it would speedily become apparent to them that these men were much more their own than were the peasant cultivators and common men of their own race.[149] The slave could be commanded to do all sorts of things for his master that the quasi-free common man would not do so willingly because of his attachment to his own patch of cultivation. From a very early period the artificer was often a household slave, and the manufacture of trade goods, pottery, textiles, metal ware, and so forth, such as went on vigorously in the household city of the Minos of Cnossos, was probably a slave industry from the beginning. Sayce, in his _Babylonians and Assyrians_,[150] quotes Babylonian agreements for the teaching of trades to slaves, and dealing with the exploitation of slave products. Slaves produced slave children, enslavement in discharge of debts added to the slave population; it is probable that as the cities grew larger, a larger part of the new population consisted of these slave artificers and slave servants in the large households. They were by no means abject slaves; in later Babylon their lives and property were protected by elaborate laws. Nor were they all outlanders. Parents might sell their children into slavery, and brothers their orphan sisters. Free men who had no means of livelihood would even sell themselves into slavery. And slavery was the fate of the insolvent debtor. Craft apprenticeship, again, was a sort of fixed-term slavery. Out of the slave population, by a converse process, arose the freed-man and freed-woman, who worked for wages and had still more definite individual rights. Since in Babylon slaves could themselves own property, many slaves saved up and bought themselves. Probably the town slave was often better off and practically as free as the cultivator of the soil, and as the rural population increased, its sons and daughters came to mix with and swell the growing ranks of artificers, some bound, some free.

As the extent and complexity of government increased, the number of households multiplied. Under the king's household grew up the households of his great ministers and officials, under the temple grew up the personal households of temple functionaries; it is not difficult to realize how houses and patches of land would become more and more distinctly the property of the occupiers, and more and more definitely alienated from the original owner-god. The earlier empires in Egypt and China both passed into a feudal stage, in which families, originally official, became for a time independent noble families. In the later stages of Babylonian

civilization we find an increasing propertied class of people appearing in the social structure, neither slaves nor peasants nor priests nor officials, but widows and descendants of such people, or successful traders and the like, and all _masterless_ folk. Traders came in from the outside. Babylon was full of Aramean traders, who had great establishments, with slaves, freed-men, employees of all sorts. (Their book-keeping was a serious undertaking. It involved storing a great multitude of earthenware tablets in huge earthenware jars.) Upon this gathering mixture of more or less free and detached people would live other people, traders, merchants, small dealers, catering for their needs. Sayce (_op. cit._) gives the particulars of an agreement for the setting up and stocking of a tavern and beerhouse, for example. The passer-by, the man who happened to be about, had come into existence.

But another and far less kindly sort of slavery also arose in the old civilization, and that was gang slavery. If it did not figure very largely in the cities, it was very much in evidence elsewhere. The king was, to begin with, the chief _entrepreneur_. He made the canals and organized the irrigation (_e.g._ Hammurabi's enterprises noted in the previous chapter). He exploited mines. He seems (at Cnossos, _e.g._) to have organized manufactures for export. The Pharaohs of the 1st Dynasty were already working the copper and turquoise mines in the peninsula of Sinai. For many such purposes gangs of captives were cheaper and far more controllable than levies of the king's own people. From an early period, too, captives may have tugged the oars of the galleys, though Torr (_Ancient Ships_) notes that up to the age of Pericles (450 B.C.) the free Athenians were not above this task. And the monarch also found slaves convenient for his military expeditions. They were uprooted men; they did not fret to go home, because they had no homes to go to. The Pharaohs hunted slaves in Nubia, in order to have black troops for their Syrian expeditions. Closely allied to such slave troops were the mercenary barbaric troops the monarchs caught into their service, not by positive compulsion, but by the bribes of food and plunder and under the pressure of need. As the old civilization developed, these mercenary armies replaced the national levies of the old order more and more, and servile gang labour became a more and more important and significant factor in the economic system. From mines and canal and wall building, the servile gang spread into cultivation. Nobles and temples adopted the gang slave system for their works. Plantation gangs began to oust the patch cultivation of the labourer-serf in the case of some staple products....

§ 3

So, in a few paragraphs, we trace the development of the simple social structure of the early Sumerian cities to the complex city crowds, the multitude of individuals varying in race, tradition, education, and function, varying in wealth, freedom, authority, and usefulness, in the great cities of the last thousand years B.C. The most notable thing of all is the gradual increase amidst this heterogeneous multitude of what we may call _free individuals_, detached persons who are neither priests, nor kings, nor officials, nor serfs, nor slaves, who are under no great pressure to work, who have time to read and inquire. They appear side by side with the development of social security and private property. Coined money and monetary reckoning developed. The operations of the Arameans and such-like Semitic trading people led to the organization of credit and monetary security. In the earlier days almost the only property, except a few movables, consisted of rights in land and in houses; later, one could deposit and lend securities, could go away and return to find one's property faithfully held and secure. Towards the middle of the period of the Persian Empire there lived one free individual, Herodotus, who has a great interest for us because he was among the first writers of critical and intelligent history, as distinguished from a mere priestly or court chronicle. It is worth while to glance here very briefly at the circumstances of his life. Later on we shall quote from his history.

[Illustration: Brawl among boatmen ... (From tomb of Ptah-hetep----Pyramid Age)]

We have already noted the conquest of Babylonia by the Aryan Persians under Cyrus in 539 B.C. We have noted, further, that the Persian Empire spread into Egypt, where its hold was precarious; and it extended also over Asia Minor. Herodotus was born about 484 B.C. in a Greek city of Asia Minor, Halicarnassus, which was under the overlordship of the Persians, and directly under the rule of a political boss or tyrant. There is no sign that he was obliged either to work for a living or spend very much time in the administration of his property. We do not know the particulars of his affairs, but it is clear that in this minor Greek city, under foreign rule, he was able to obtain and read and study manuscripts of nearly everything that had been written in the Greek language before his time. He travelled, so far as one can gather, with freedom and comfort about the Greek archipelagoes; he stayed wherever he wanted to stay, and he seems to have found comfortable accommodation; he went to Babylon and to Susa, the new capital the Persians had set up in Babylonia to the east of the Tigris; he toured along the coast of the Black Sea, and accumulated a considerable amount of knowledge about the Scythians, the Aryan people who were then distributed over South Russia; he went to the south of Italy, explored the antiquities of Tyre, coasted Palestine, landed at Gaza, and made a long stay in Egypt. He went about Egypt looking at temples and monuments and gathering information. We know, not only from him, but from other evidence,

that in those days the older temples and the pyramids (which were already nearly three thousand years old) were visited by strings of tourists, a special sort of priests acting as guides. The inscriptions the sightseers scribbled upon the walls remain to this day, and many of them have been deciphered and published.

[Illustration: STATUETTES FROM MIDDLE-CLASS EGYPTIAN TOMBS SHOWING LOW CLASS SOCIAL TYPES IN THE ANCIENT COMMUNITIES.]

As his knowledge accumulated, he conceived the idea of writing a great history of the attempts of Persia to subdue Greece. But in order to introduce that history he composed an account of the past of Greece, Persia, Assyria, Babylonia, Egypt, Scythia, and of the geography and peoples of those countries. He then set himself, it is said, to make his history known among his friends in Halicarnassus by reciting it to them, but they failed to appreciate it; and he then betook himself to Athens, the most flourishing of all Greek cities at that time. There his work was received with applause. We find him in the centre of a brilliant circle of intelligent and active-minded people, and the city authorities voted him a reward of ten talents (a sum of money equivalent to £2,400) in recognition of his literary achievement....

But we will not complete the biography of this most interesting man, nor will we enter into any criticism of his garrulous, marvel-telling, and most entertaining history. It is a book to which all intelligent readers come sooner or later, abounding as it does in illuminating errors and Boswellian charm. We give these particulars here simply to show that in the fifth century B.C. a new factor was becoming evident in human affairs. Reading and writing had already long escaped from the temple precincts and the ranks of the court scribes. Record was no longer confined to court and temple. A new sort of people, these people of leisure and independent means, were asking questions, exchanging knowledge and views, and developing ideas. So beneath the march of armies and the policies of monarchs, and above the common lives of illiterate and incurious men, we note the beginnings of what is becoming at last nowadays a dominant power in human affairs, the _free intelligence of mankind_.

Of that free intelligence we shall have more to say when in a subsequent chapter we tell of the Greeks.

§ 4

We may summarize the discussion of the last two chapters here by making a list of the chief elements in this complicated accumulation of human beings which made up the later Babylonian and Egyptian civilizations of from two thousand five hundred to three thousand years ago. These elements grew up and became distinct one from another in the great river valleys of the world in the course of five or six thousand years. They developed mental dispositions and traditions and attitudes of thought one to another. The civilization in which we live to-day is simply carrying on and still further developing and working out and rearranging these relationships. This is the world from which we inherit. It is only by the attentive study of their origins that we can detach ourselves from the prejudices and immediate ideas of the particular class to which we may belong, and begin to understand the social and political questions of our own time.

(1) First, then, came the priesthood, _the temple system_, which was the nucleus and the guiding intelligence about which the primitive civilizations grew. It was still in these later days a great power in the world, the chief repository of knowledge and tradition, an influence over the lives of every one, and a binding force to hold the community together. But it was no longer all-powerful, because its nature made it conservative and inadaptable. It no longer monopolized knowledge nor initiated fresh ideas. Learning had already leaked out to other less pledged and controlled people, who thought for themselves. About the temple system were grouped its priests and priestesses, its scribes, its physicians, its magicians, its lay brethren, treasurers, managers, directors, and the like. It owned great properties and often hoarded huge treasures.

(2) Over against the priesthood, and originally arising out of it, was the _court system_, headed by a king or a “king of kings,” who was in later Assyria and Babylonia a sort of captain and lay controller of affairs, and in Egypt a god-man, who had released himself from the control of his priests. About the monarch were accumulated his scribes, counsellors, record keepers, agents, captains, and guards. Many of his officials, particularly his provincial officials, had great subordinate establishments, and were constantly tending to become independent. The nobility of the old river valley civilizations arose out of the court system. It was, therefore, a different thing in its origins from the nobility of the early Aryans, which was a republican nobility of elders and leading men.

(3) At the base of the social pyramid was the large and most necessary class in the community, _the tillers of the soil_. Their status varied from age to age and in different lands; they were free peasants paying taxes, or serfs of the god, or serfs or tenants of king or noble, or of a private owner, paying him a rent; in most cases tax or rent was paid in produce. In the states of the river valleys

they were high cultivators, cultivating comparatively small holdings; they lived together for safety in villages, and had a common interest in maintaining their irrigation channels and a sense of community in their village life. The cultivation of the soil is an exacting occupation; the seasons and the harvest sunsets will not wait for men; children can be utilized at an early age, and so the cultivator class is generally a poorly educated, close-toiling class, superstitious by reason of ignorance and the uncertainty of the seasons, ill-informed and easily put upon. It is capable at times of great passive resistance, but it has no purpose in its round but crops and crops, to keep out of debt and hoard against bad times. So it has remained to our own days over the greater part of Europe and Asia.

(4) Differing widely in origin and quality from the tillers of the soil was _the artisan class_. At first, this was probably in part a town-slave class, in part it consisted of peasants who had specialized upon a craft. But in developing an art and mystery of its own, a technique that had to be learnt before it could be practised, each sort of craft probably developed a certain independence and a certain sense of community of its own. The artisans were able to get together and discuss their affairs more readily than the toilers on the land, and they were able to form guilds to restrict output, maintain rates of pay, and protect their common interest.

(5) As the power of the Babylonian rulers spread out beyond the original areas of good husbandry into grazing regions and less fertile districts, a class of _herdsmen_ came into existence. In the case of Babylonia these were nomadic Semites, the Bedouin, like the Bedouin of to-day. They probably grazed their flocks over great areas much as the sheep ranchers of California do.[151] They were paid and esteemed much more highly than the husbandmen.

(6) The first _merchants_ in the world were shipowners, like the people of Tyre and Cnossos, or nomads who carried and traded goods as they wandered between one area of primitive civilization and another. In the Babylonian and Assyrian world the traders were predominantly the Semitic Arameans, the ancestors of the modern Syrians. They became a distinct factor in the life of the community; they formed great households of their own. Usury developed largely in the last thousand years B.C. Traders needed accommodation; cultivators wished to anticipate their crops. Sayce (_op. cit._) gives an account of the Babylonian banking-house of Egibi, which lasted through several generations and outlived the Chaldean Empire.

(7) A class of _small retailers_, one must suppose, came into existence with the complication of society during the later days of the first empires, but it was not probably of any great importance. It is difficult to understand how there could be much active retailing without small change, and there is little evidence of small change to be found either in Egypt or Mesopotamia.[152] Shekels and half-shekels of silver, weighing something between a quarter and half an ounce, are the lightest weights of stamped metal of which we find mention.

(8) A growing class of _independent property owners_.

(9) As the amenities of life increased, there grew up in the court, temples, and prosperous private houses a class of _domestic servants_, slaves or freed slaves, or young peasants taken into the household.

(10) _Gang workers._--These were prisoners of war or debt slaves, or impressed or deported men.

(11) _Mercenary soldiers._--These also were often captives or impressed men. Sometimes they were enlisted from friendly foreign populations in which the military spirit still prevailed.

(12) _Seamen._

In modern political and economic discussions we are apt to talk rather glibly of “labour.” Much has been made of the _solidarity of labour_ and its sense of community. It is well to note that in these first civilizations, what we speak of as “labour” is represented by five distinct classes dissimilar in origin, traditions, and outlook--namely, classes 3, 4, 5, 9, 10, and the oar-tugging part of 12. The “solidarity of labour” is, we shall find when we come to study the mechanical revolution of the nineteenth century A.D., a new idea and a new possibility in human affairs.

§ 5

Let us, before we leave this discussion of the social classes that were developing in these first civilizations, devote a little attention to their fixity. How far did they stand aloof from each other, and how far did they intermingle? So far as the classes we have counted as 9, 10, 11, and 12 go, the servants, the gang labourers and slaves, the gang soldiers, and, to a lesser extent, the sailors, or at any rate the galley rowers among the sailors, they were largely recruited classes, they did not readily and easily form homes, they were not distinctively breeding classes; they were probably replenished generation after generation by captives, by the failures

of other classes, and especially from the failures of the class of small retailers, and by persuasion and impressment from among the cultivators. But so far as the sailors go, we have to distinguish between the mere rower and the navigating and shipowning seamen of such ports as Tyre and Sidon. The shipowners pass, no doubt, by insensible gradations into the mercantile class, but the navigators must have made a peculiar community in the great seaports, having homes there and handing on the secrets of seacraft to their sons. The eighth class we have distinguished was certainly a precarious class, continually increased by the accession of the heirs and dependents, the widows and retired members of the wealthy and powerful, and continually diminished by the deaths or speculative losses of these people and the dispersal of their properties. The priests and priestesses too, so far as all this world west of India went, were not a very reproductive class; many priesthoods were celibate, and that class, too, may also be counted as a recruited class. Nor are servants, as a rule, reproductive. They live in the households of other people; they do not have households and rear large families of their own. This leaves us as the really vital classes of the ancient civilized community:

(_a_) The royal and aristocratic class, officials, military officers, and the like;

(_b_) The mercantile class;

(_c_) The town artisans;

(_d_) The cultivators of the soil; and

(_e_) The herdsmen.

Each of these classes reared its own children in its own fashion, and so naturally kept itself more or less continuously distinct from the others. General education was not organized in those ancient states, education was mainly a household matter (as it is still in many parts of India to-day), and so it was natural and necessary for the sons to follow in the footsteps of their father and to marry women accustomed to their own sort of household. Except during times of great political disturbance therefore, there would be a natural and continuous separation of classes; which would not, however, prevent exceptional individuals from intermarrying or passing from one class to another. Poor aristocrats would marry rich members of the mercantile class; ambitious herdsmen, artisans, or sailors would become rich merchants. So far as one can gather, that was the general state of affairs in both Egypt and Babylonia. The idea was formerly entertained that in Egypt there was a fixity of classes, but this appears to be a misconception due to a misreading of Herodotus. The only exclusive class in Egypt which did not intermarry was, as in England to-day, the semi-divine royal family.

At various points in the social system there were probably developments of exclusiveness, an actual barring out of interlopers. Artisans of particular crafts possessing secrets, for example, have among all races and in all ages tended to develop guild organizations restricting the practice of their craft and the marriage of members outside their guild. Conquering people have also, and especially when there were marked physical differences of race, been disposed to keep themselves aloof from the conquered peoples, and have developed an aristocratic exclusiveness. Such organizations of restriction upon free intercourse have come and gone in great variety in the history of all long-standing civilizations. The natural boundaries of function were always there, but sometimes they have been drawn sharply and laid stress upon, and sometimes they have been made little of. There has been a general tendency among the Aryan peoples to distinguish noble (patrician) from common (plebeian) families; the traces of it are evident throughout the literature and life of Europe to-day, and it has received a picturesque enforcement in the “science” of heraldry. This tradition is still active even in democratic America. Germany, the most methodical of European countries, had in the Middle Ages a very clear conception of the fixity of such distinctions. Below the princes (who themselves constituted an exclusive class which did not marry beneath itself) there were the:

(_a_) Knights, the military and official caste, with heraldic coats-of-arms;

(_b_ and _c_) The Bürgerstand, the merchants, shipping people, and artisans; and

(_d_) The Bauernstand, the cultivating serfs or peasants.

Mediæval Germany went as far as any of the Western heirs of the first great civilizations towards a fixation of classes. The idea is far less congenial both to the English-speaking people and to the French and Italians, who, by a sort of instinct, favour a free movement from class to class. Such exclusive ideas began at first among, and were promoted chiefly by, the upper classes, but it is a natural response and a natural Nemesis to such ideas that the mass of the excluded should presently range themselves in antagonism to their superiors. It was in Germany, as we shall see in the concluding chapters of this story, that the conception of a

natural and necessary conflict, “the class war,” between the miscellaneous multitudes of the disinherited (“the class-conscious proletariat” of the Marxist) and the rulers and merchants first arose. It was an idea more acceptable to the German mind than to the British or French.... But before we come to that conflict, we must traverse a long history of many centuries.

§ 6

If now we turn eastward from this main development of civilization in the world between Central Asia and the Atlantic, to the social development of India in the 2000 years next before the Christian era, we find certain broad and very interesting differences. The first of these is that we find such a fixity of classes in process of establishment as no other part of the world can present. This fixity of classes is known to Europeans as the institution of _caste_;[153] its origins are still in complete obscurity, but it was certainly well rooted in the Ganges valley before the days of Alexander the Great. It is a complicated horizontal division of the social structure into classes or castes, the members of which may neither eat nor intermarry with persons of a lower caste under penalty of becoming outcasts, and who may also “lose caste” for various ceremonial negligences and defilements. By losing caste a man does not sink to a lower caste; he becomes outcast. The various subdivisions of caste are very complex; many are practically trade organizations. Each caste has its local organization which maintains discipline, distributes various charities, looks after its own poor, protects the common interests of its members, and examines the credentials of newcomers from other districts. (There is little to check the pretensions of a travelling Hindu to be of a higher caste than is legitimately his.) Originally, the four main castes seem to have been:

The Brahmins--the priests and teachers;

The Kshatriyas--the warriors;

The Vaisyas--herdsmen, merchants, money-lenders, and land-owners;

The Sudras;

And, outside the castes, the Pariahs.

But these primary divisions have long been superseded by the disappearance of the second and third primary castes, and the subdivision of the Brahmins and Sudras into a multitude of minor castes, all exclusive, each holding its members to one definite way of living and one group of associates.

Next to this extraordinary fission and complication of the social body we have to note that the Brahmins, the priests and teachers of the Indian world, unlike so many Western priesthoods, are a reproductive and exclusive class, taking no recruits from any other social stratum.

Whatever may have been the original incentive to this extensive fixation of class in India, there can be little doubt of the rôle played by the Brahmins as the custodians of tradition and the only teachers of the people in sustaining it. By some it is supposed that the first three of the four original castes, known also as the “twice born,” were the descendants of the Vedic Aryan conquerors of India, who established these hard-and-fast separations to prevent racial mixing with the conquered Sudras and Pariahs. The Sudras are represented as a previous wave of northern conquerors, and the Pariahs are the original Dravidian inhabitants of India. But those speculations are not universally accepted, and it is, perhaps, rather the case that the uniform conditions of life in the Ganges valley throughout long centuries served to stereotype a difference of classes that have never had the same steadfastness of definition under the more various and variable conditions of the greater world to the west.

However caste arose, there can be no doubt of its extraordinary hold upon the Indian mind. In the sixth century B.C. arose Gautama, the great teacher of Buddhism, proclaiming, “As the four streams that flow into the Ganges lose their names as soon as they mingle their waters in the holy river, so all who believe in Buddha cease to be Brahmins, Kshatriyas, Vaisyas, and Sudras.” His teaching prevailed in India for some centuries; it spread over China, Tibet, Japan, Burmah, Ceylon, Turkestan, Manchuria; it is to-day the religion of one-third of the human race, but it was finally defeated and driven out of Indian life by the vitality and persistence of the Brahmins and of their caste ideas....

§ 7

In China we find a social system travelling along yet another and only a very roughly parallel line to that followed by the Indian and Western civilizations. The Chinese civilization even more than the Hindu is organized for peace, and the warrior plays a small part

in its social scheme. As in the Indian civilization, the leading class is an intellectual one; less priestly than the Brahmin and more official. But unlike the Brahmins, the mandarins, who are the literate men of China, are not a caste; one is not a mandarin by birth, but by education; they are drawn by education and examination from all classes of the community, and the son of a mandarin has no prescriptive right to succeed his father.[154] As a consequence of these differences, while the Brahmins of India are, as a class, ignorant even of their own sacred books, mentally slack, and full of a pretentious assurance, the Chinese mandarin has the energy that comes from hard mental work. But since his education so far has been almost entirely a scholarly study of the classical Chinese literature, his influence has been entirely conservative. Before the days of Alexander the Great, China had already formed itself and set its feet in the way in which it was still walking in the year 1900 A.D. Invaders and dynasties had come and gone, but the routine of life of the yellow civilization remained unchanged.

The traditional Chinese social system recognized four main classes below the priest-emperor.

(_a_) The literary class, which was equivalent partly to the officials of the Western world and partly to its teachers and clerics. In the time of Confucius its education included archery and horsemanship. Rites and music, history and mathematics completed the “Six Accomplishments.”

(_b_) The cultivators of the land.

(_c_) The artisans.

(_d_) The mercantile class.

But since from the earliest times it has been the Chinese way to divide the landed possessions of a man among all his sons, there has never been in Chinese history any class of great land-owners, renting their land to tenants, such as most other countries have displayed. The Chinese land has always been cut up into small holdings, which are chiefly freeholds, and cultivated intensively. There are landlords in China who own one or a few farms and rent them to tenants, but there are no great, permanent estates. When a patch of land, by repeated division, is too small to sustain a man, it is sold to some prospering neighbour, and the former owner drifts to one of the great towns of China to join the mass of wage-earning workers there. In China, for many centuries, there have been these masses of town population with scarcely any property at all, men neither serfs nor slaves, but held to their daily work by their utter impecuniousness. From such masses it is that the soldiers needed by the Chinese government are recruited, and also such gang labour as has been needed for the making of canals, the building of walls, and the like has been drawn.[155] The war captive and the slave class play a smaller part in Chinese history than in any more westerly record of these ages before the Christian era.

One fact, we may note, is common to all these three stories of developing social structure, and that is the immense power exercised by the educated class in the early stages before the crown or the commonalty began to read and, consequently, to think for itself. In India, by reason of their exclusiveness, the Brahmins, the educated class, retain their influence to this day; over the masses of China, along entirely different lines and because of the complexities of the written language, the mandarinate has prevailed. The diversity of race and tradition in the more various and eventful world of the West has delayed, and perhaps arrested for ever, any parallel organization of the specially intellectual elements of society into a class ascendancy. In the Western world, as we have already noted, education early “slopped over,” and soaked away out of the control of any special class; it escaped from the limitation of castes and priesthoods and traditions into the general life of the community. Writing and reading had been simplified down to a point when it was no longer possible to make a cult and mystery of them. It may be due to the peculiar elaboration and difficulty of the Chinese characters, rather than to any racial difference, that the same thing did not happen to the same extent in China.

§ 8

In these last six chapters we have traced in outline the whole process by which, in the course of 5000 or 6000 years--that is to say, in something between 150 and 200 generations--mankind passed from the stage of early Neolithic husbandry, in which the primitive skin-clad family tribe reaped and stored in their rude mud huts the wild-growing fodder and grain-bearing grasses with sickles of stone, to the days of the fourth century B.C., when all round the shores of the Mediterranean and up the Nile, and across Asia to India, and again over the great alluvial areas of China, spread the fields of human cultivation and busy cities, great temples, and the coming and going of human commerce. Galleys and lateen-sailed ships entered and left crowded harbours, and made their careful way from headland to headland and from headland to island, keeping always close to the land. Phœnician shipping under

Egyptian owners was making its way into the East Indies and perhaps even further into the Pacific. Across the deserts of Africa and Arabia and through Turkestan toiled the caravans with their remote trade; silk was already coming from China, ivory from Central Africa, and tin from Britain to the centres of this new life in the world. Men had learnt to weave fine linen[156] and delicate fabrics of coloured wool; they could bleach and dye; they had iron as well as copper, bronze, silver, and gold; they had made the most beautiful pottery and porcelain; there was hardly a variety of precious stone in the world that they had not found and cut and polished; they could read and write; divert the course of rivers, pile pyramids, and make walls a thousand miles long. The fifty or sixty centuries in which all this had to be achieved may seem a long time in comparison with the threescore and ten years of a single human life, but it is utterly inconsiderable in comparison with the stretches of geological time. Measuring backward from these Alexandrian cities to the days of the first stone implements, the _rostro-carinate_ implements of the Pliocene Age, gives us an extent of time fully a hundred times as long.

We have tried in this account, and with the help of maps and figures and time charts, to give a just idea of the order and shape of these fifty or sixty centuries. Our business is with that outline. We have named but a few names of individuals; though henceforth the personal names must increase in number. But the content of this outline that we have drawn here in a few diagrams and charts cannot but touch the imagination. If only we could look closelier, we should see through all these sixty centuries a procession of lives more and more akin in their fashion to our own. We have shown how the naked Palæolithic savage gave place to the Neolithic cultivator, a type of man still to be found in the backward places of the world. We have given an illustration of Sumerian soldiers copied from a carved stone that was set up long before the days when the Semitic Sargon I conquered the land. Day by day some busy brownish man carved those figures, and, no doubt, whistled as he carved. In those days the plain of the Egyptian delta was crowded with gangs of swarthy workmen unloading the stone that had come down the Nile to add a fresh course to the current pyramid. One might paint a thousand scenes from those ages: of some hawker merchant in Egypt spreading his stock of Babylonish garments before the eyes of some pretty, rich lady; of a miscellaneous crowd swarming between the pylons to some temple festival at Thebes; of an excited, dark-eyed audience of Cretans like the Spaniards of to-day, watching a bull-fight, with the bull-fighters in trousers and tightly girded, exactly like any contemporary bull-fighter; of children learning their cuneiform signs--at Nippur the clay exercise tiles of a school have been found; of a woman with a sick husband at home slipping into some great temple in Carthage to make a vow for his recovery. Or perhaps it is a wild Greek, skin-clad and armed with a bronze axe, standing motionless on some Illyrian mountain crest, struck with amazement at his first vision of a many-oared Cretan galley crawling like a great insect across the amethystine mirror of the Adriatic Sea. He went home to tell his folk a strange story of a monster, Briareus with his hundred arms. Of millions of such stitches in each of these 200 generations is the fabric of this history woven. But unless they mark the presence of a primary seam or join, we cannot pause now to examine any of these stitches.

BOOK IV

JUDEA, GREECE, AND INDIA

XXI

THE HEBREW SCRIPTURES AND THE PROPHETS[157]

§ 1. _The Place of the Israelites in History._ § 2. _Saul, David, and Solomon._ § 3. _The Jews a People of Mixed Origin._ § 4. _The Importance of the Hebrew Prophets._

§ 1

We are now in a position to place in their proper relationship to this general outline of human history the Israelites, and the most remarkable collection of ancient documents in the world, that collection which is known to all Christian peoples as the Old Testament. We find in these documents the most interesting and valuable lights upon the development of civilization, and the clearest indications of a new spirit that was coming into human affairs during the struggles of Egypt and Assyria for predominance in the world of men.

All the books that constitute the Old Testament were certainly in existence, and in very much their present form, at latest by the year 100 B.C. They were probably already recognized as sacred writings in the time of Alexander the Great (330 B.C.), and known and read with the utmost respect a hundred years before his time.[158] At that time some of them were of comparatively recent composition; others were already of very considerable antiquity. They were the sacred literature of a people, the Jews, who, except

for a small remnant of common people, had recently been deported to Babylonia from their own country in 587 B.C. by Nebuchadnezzar II, the Chaldean. They had returned to their city, Jerusalem, and had rebuilt their temple there under the auspices of Cyrus, that Persian conqueror who, we have already noted, in 539 B.C. overthrew Nabonidus, the last of the Chaldean rulers in Babylon. The Babylonian Captivity had lasted about fifty years, and many authorities are of opinion that there was a considerable admixture during that period both of race and ideas with the Babylonians.

The position of the land of Judea and of Jerusalem, its capital, is a peculiar one. The country is a band-shaped strip between the Mediterranean to the west and the desert beyond the Jordan to the east; through it lies the natural high road between the Hittites, Syria, Assyria, and Babylonia to the north and Egypt to the south. It was a country predestined, therefore, to a stormy history. Across it Egypt, and whatever power was ascendant in the north, fought for empire; against its people they fought for a trade route. It had itself neither the area, the agricultural possibilities, nor the mineral wealth to be important. The story of its people that these scriptures have preserved runs like a commentary to the greater history of the two systems of civilization to the north and south and of the sea peoples to the west.

These scriptures consist of a number of different elements. The first five books, the _Pentateuch_, were early regarded with peculiar respect. They begin in the form of a universal history with a double account of the Creation of the world and mankind, of the early life of the race, and of a great Flood by which, except for certain favoured individuals, mankind was destroyed. Excavations have revealed Babylonian versions of both the Creation story and the Flood story of prior date to the restoration of the Jews, and it is therefore argued by Biblical critics that these opening chapters were acquired by the Jews during their captivity. They constitute the first ten chapters of Genesis. There follows a history of the fathers and founders of the Hebrew nation, Abraham, Isaac, and Jacob. They are presented as patriarchal Bedouin chiefs, living the life of nomadic shepherds in the country between Babylonia and Egypt. The existing Biblical account is said by the critics to be made up out of several pre-existing versions; but whatever its origins, the story, as we have it to-day, is full of colour and vitality. What is called Palestine to-day was at that time the land of Canaan, inhabited by a Semitic people called the Canaanites, closely related to the Phœnicians who founded Tyre and Sidon, and to the Amorites who took Babylon and, under Hammurabi, founded the first Babylonian Empire. The Canaanites were a settled folk in the days--which were perhaps contemporary with the days of Hammurabi--when Abraham's flocks and herds passed through the land. The God of Abraham, says the Bible narrative, promised this smiling land of prosperous cities to him and to his children. To the book of Genesis the reader must go to read how Abraham, being childless, doubted this promise, and of the births of Ishmael and Isaac. And in Genesis too, he will find the lives of Isaac and Jacob, whose name was changed to Israel, and of the twelve sons of Israel; and how in the days of a great famine they went down into Egypt. With that, Genesis, the first book of the Pentateuch, ends. The next book, Exodus, is concerned with the story of Moses.

The story of the settlement and slavery of the children of Israel in Egypt is a difficult one. There is an Egyptian record of a settlement of certain Semitic peoples in the land of Goshen by the Pharaoh Rameses II, and it is stated that they were drawn into Egypt by want of food. But of the life and career of Moses there is no Egyptian record at all; there is no account of any plagues of Egypt or of any Pharaoh who was drowned in the Red Sea. There is much about the story of Moses that has a mythical flavour, and one of the most remarkable incidents in it, his concealment by his mother in an ark of bulrushes, has also been found in an ancient Sumerian inscription made at least a thousand years before his time by that Sargon I who founded the ancient Akkadian Sumerian Empire. It runs:

"Sargon, the powerful king, the king of Akkadia am I, my mother was poor, my father I knew not; the brother of my father lived in the mountains.... My mother, who was poor, secretly gave birth to me; she placed me in a _basket of reeds_, she shut up the mouth of it with bitumen, she abandoned me to the river, which did not overwhelm me. The river bore me away and brought me to Akki the irrigator. Akki the irrigator received me in the goodness of his heart. Akki the irrigator reared me to boyhood. Akki the irrigator made me a gardener. My service as a gardener was pleasing unto Istar and I became king."

[Illustration: The LAND of the HEBREWS]

This is perplexing. Still more perplexing is the discovery of a clay tablet written by the Egyptian governors of a city in Canaan to the Pharaoh Amenophis IV, who came in the XVIIIth Dynasty before Rameses II, apparently mentioning the Hebrews by name and declaring that they are overrunning Canaan. Manifestly, if the Hebrews were conquering Canaan in the time of the XVIIIth Dynasty, they could not have been made captive and oppressed, before they conquered Canaan, by Rameses II of the XIXth Dynasty. But it is quite understandable that the Exodus story, written long after the events it narrates, may have concentrated and simplified, and perhaps personified and symbolized, what was really a long and complicated history of tribal invasions. One Hebrew tribe may

have drifted down into Egypt and become enslaved, while the others were already attacking the outlying Canaanite cities. It is even possible that the land of the captivity was not Egypt (Hebrew, Misraim), but Misrim in the north of Arabia, on the other side of the Red Sea. These questions are discussed fully and acutely in the _Encyclopædia Biblica_ (articles _Moses_ and _Exodus_), to which the curious reader must be referred.[159]

Two other books of the Pentateuch, Deuteronomy and Leviticus, are concerned with the Law and the priestly rules. The book of Numbers takes up the wanderings of the Israelites in the desert and their invasion of Canaan.

Whatever the true particulars of the Hebrew invasion of Canaan may be, there can be no doubt that the country they invaded had changed very greatly since the days of the legendary promise, made centuries before, to Abraham. Then it seems to have been largely a Semitic land, with many prosperous trading cities. But great waves of strange peoples had washed along this coast. We have already told how the dark Iberian or Mediterranean peoples of Italy and Greece, the peoples of that Ægean civilization which culminated at Cnossos, were being assailed by the southward movement of Aryan-speaking races, such as the Italians and Greeks, and how Cnossos was sacked about 1400 B.C., and destroyed altogether about 1000 B.C. It is now evident that the people of these Ægean seaports were crossing the sea in search of securer land nests. They invaded the Egyptian delta and the African coast to the west, they formed alliances with the Hittites and other Aryan or Aryanized races. This happened after the time of Rameses II, in the time of Rameses III. Egyptian monuments record great sea fights, and also a march of these people along the coast of Palestine towards Egypt. Their transport was in the ox-carts characteristic of the Aryan tribes, and it is clear that these Cretans were acting in alliance with some early Aryan invaders. No connected narrative of these conflicts that went on between 1300 B.C. and 1000 B.C. has yet been made out, but it is evident from the Bible narrative, that when the Hebrews under Joshua pursued their slow subjugation of the promised land, they came against a new people, the Philistines, unknown to Abraham,[160] who were settling along the coast in a series of cities of which Gaza, Gath, Ashdod, Ascalon, and Joppa became the chief, who were really, like the Hebrews, newcomers, and probably chiefly these Cretans from the sea and from the north. The invasion, therefore, that began as an attack upon the Canaanites, speedily became a long and not very successful struggle for the coveted and promised land with these much more formidable newcomers, the Philistines.

It cannot be said that the promised land was ever completely in the grasp of the Hebrews. Following after the Pentateuch in the Bible come the books of Joshua, Judges, Ruth (a digression), Samuel I and II, and Kings I and II, with Chronicles repeating with variation much of the matter of Samuel II and Kings; there is a growing flavour of reality in most of this latter history, and in these books we find the Philistines steadfastly in possession of the fertile lowlands of the south, and the Canaanites and Phœnicians holding out against the Israelites in the north. The first triumphs of Joshua are not repeated. The book of Judges is a melancholy catalogue of failures. The people lose heart. They desert the worship of their own god Jehovah,[161] and worship Baal and Ashtaroth (= Bel and Ishtar). They mixed their race with the Philistines, with the Hittites, and so forth, and became, as they have always subsequently been, a racially mixed people. Under a series of wise men and heroes they wage a generally unsuccessful and never very united warfare against their enemies. In succession they are conquered by the Moabites, the Canaanites, the Midianites, and the Philistines. The story of these conflicts, of Gideon and of Samson and the other heroes who now and then cast a gleam of hope upon the distresses of Israel, is told in the book of Judges. In the first book of Samuel is told the story of their great disaster at Ebenezer in the days when Eli was judge.

This was a real pitched battle in which the Israelites lost 30,000 (!) men. They had previously suffered a reverse and lost 4000 men, and then they brought out their most sacred symbol, the Ark of the Covenant of God.

“And when the ark of the covenant of the Lord came into the camp, all Israel shouted with a great shout, so that the earth rang again. And when the Philistines heard the noise of the shout, they said, ‘What meaneth the noise of this great shout in the camp of the Hebrews?’ And they understood, that the ark of the Lord was come into the camp. And the Philistines were afraid, for they said, ‘God is come into the camp,’ And they said, ‘Woe unto us! for there hath not been such a thing heretofore. Woe unto us! who shall deliver us out of the hand of these mighty Gods? these are the Gods that smote the Egyptians with all the plagues in the wilderness. Be strong, and quit yourselves like men, O ye Philistines, that ye be not servants unto the Hebrews, as they have been to you: quit yourselves like men, and fight.’

“And the Philistines fought, and Israel was smitten, and they fled every man into his tent: and there was a very great slaughter for there fell of Israel thirty thousand[162] footmen. And the ark of God was taken; and the two sons of Eli, Hophni and Phinehas, were slain.

“And there ran a man of Benjamin out of the army, and came to Shiloh the same day with his clothes rent, and with earth upon his head. And when he came, lo, Eli sat upon a seat by the wayside watching: for his heart trembled for the ark of God. And when the man came into the city and told it, all the city cried out. And when Eli heard the noise of the crying, he said, ‘What meaneth the noise of this tumult?’ And the man came in hastily, and told Eli. Now Eli was ninety and eight years old; and his eyes were dim, that he could not see. And the man said unto Eli, ‘I am he that came out of the army, and I fled to-day out of the army.’ And he said, ‘What is there done, my son?’ And the messenger answered and said, ‘Israel is fled before the Philistines, and there hath been also a great slaughter among the people, and thy two sons also, Hophni and Phinehas, are dead, and the ark of God is taken.’ And it came to pass when he made mention of the ark of God, that Eli fell from off his seat backward by the side of the gate, and his neck brake, and he died: for he was an old man, and heavy. And he had judged Israel forty years.

“And his daughter in law, Phinehas’ wife, was with child, near to be delivered: and when she heard the tidings that the ark of God was taken, and that her father in law and her husband were dead, she bowed herself and travailed; for her pains came upon her. And about the time of her death the women that stood by her said unto her, ‘Fear not; for thou hast born a son! But she answered not, neither did she regard it. And she named the child I-chabod,[163] saying, ‘The glory is departed from Israel:’ because the ark of God was taken, and because of her father in law and her husband.” (1 Sam., chap. iv.)

The successor of Eli and the last of the Judges was Samuel, and at the end of his rule came an event in the history of Israel which paralleled and was suggested by the experience of the greater nations around. A king arose. We are told in vivid language the plain issue between the more ancient rule of priestcraft and the newer fashion in human affairs. It is impossible to avoid a second quotation.

“Then all the elders of Israel gathered themselves together, and came to Samuel unto Ramah, and said unto him: ‘Behold, thou art old, and thy sons walk not in thy ways: now make us a king to judge us like all the nations.’

“But the thing displeased Samuel, when they said, ‘Give us a king to judge us.’ And Samuel prayed unto the Lord. And the Lord said unto Samuel, ‘Hearken unto the voice of the people in all that they say unto thee: for they have not rejected thee, but they have rejected me, that I should not reign over them. According to all the works which they have done since the day that I brought them up out of Egypt even unto this day, wherewith they have forsaken me, and served other gods, so do they also unto thee. Now therefore hearken unto their voice: howbeit yet protest solemnly unto them, and shew them the manner of the king that shall reign over them.’

“And Samuel told all the words of the Lord unto the people that asked of him a king. And he said, ‘This will be the manner of the king that shall reign over you: He will take your sons, and appoint them for himself, for his chariots, and to be his horsemen; and some shall run before his chariots. And he will appoint him captains over thousands, and captains over fifties; and will set them to ear his ground, and to reap his harvest, and to make his instruments of war, and instruments of his chariots. And he will take your daughters to be confectioners, and to be cooks, and to be bakers. And he will take your fields, and your vineyards, and your oliveyards, even the best of them, and give them to his servants. And he will take the tenth of your seed, and of your vineyards, and give to his officers, and to his servants. And he will take your menservants, and your maidservants, and your goodliest young men, and your asses, and put them to his work. He will take the tenth of your sheep: and ye shall be his servants. And ye shall cry out in that day because of your king which ye shall have chosen you; and the Lord will not hear you in that day.’

“Nevertheless the people refused to obey the voice of Samuel; and they said, ‘Nay; but we will have a king over us; that we also may be like all the nations; and that our king may judge us, and go out before us, and fight our battles.’” (I Sam., chap. viii.)

§ 2

But the nature and position of their land was against the Hebrews, and their first king Saul was no more successful than their judges. The long intrigues of the adventurer David against Saul are told in the rest of the first book of Samuel, and the end of Saul was utter defeat upon Mount Gilboa. His army was overwhelmed by the Philistine archers.

“And it came to pass on the morrow, when the Philistines came to strip the slain, that they found Saul and his three sons fallen in Mount Gilboa. And they cut off his head, and stripped off his armour, and sent into the land of the Philistines round about, to publish it in the house of their idols, and among the people. And they put his armour in the house of Ashtaroth; and they fastened his body to the wall of Beth-shan.” (I Sam., chap, xxxi.)

David (990 B.C. roughly) was more politic and successful than his predecessor, and he seems to have placed himself under the protection of Hiram, King of Tyre. This Phœnician alliance sustained him, and was the essential element in the greatness of his son Solomon. His story, with its constant assassinations and executions, reads rather like the history of some savage chief than of a civilized monarch. It is told with great vividness in the second book of Samuel.

The first book of Kings begins with the reign of King Solomon (960 B.C. roughly). The most interesting thing in that story, from the point of view of the general historian, is the relationship of Solomon to the national religion and the priesthood, and his dealings with the tabernacle, the priest Zadok, and the prophet Nathan.

The opening of Solomon's reign is as bloody as his father's. The last recorded speech of David arranges for the murder of Shimei; his last recorded word is "blood." "But his hoar head bring thou down to the grave with blood," he says, pointing out that though old Shimei is protected by a vow David had made to the Lord so long as David lives, there is nothing to bind Solomon in that matter. Solomon proceeds to murder his brother, who has sought the throne but quailed and made submission. He then deals freely with his brother's party. The weak hold of religion upon the racially and mentally confused Hebrews at that time is shown by the ease with which he replaces the hostile chief priest by his own adherent Zadok, and still more strikingly by the murder of Joab by Benaiah, Solomon's chief ruffian, in the Tabernacle, while the victim is claiming sanctuary and holding to the very horns of Jehovah's altar. Then Solomon sets to work, in what was for that time a thoroughly modern spirit, to recast the religion of his people. He continues the alliance with Hiram, King of Sidon, who uses Solomon's kingdom as a high road by which to reach and build shipping upon the Red Sea, and a hitherto unheard-of wealth accumulates in Jerusalem as a result of this partnership. Gang labour appears in Israel; Solomon sends relays of men to cut cedarwood in Lebanon under Hiram, and organizes a service of porters through the land. (There is much in all this to remind the reader of the relations of some Central African chief to a European trading concern.) Solomon then builds a palace for himself, and a temple not nearly as big for Jehovah. Hitherto, the Ark of the Covenant, the divine symbol of these ancient Hebrews, had abode in a large tent, which had been shifted from one high place to another, and sacrifices had been offered to the God of Israel upon a number of different high places. Now the ark is brought into the golden splendours of the inner chamber of a temple of cedar-sheathed stone, and put between two great winged figures of gilded olivewood, and sacrifices are henceforth to be made only upon the altar before it.

This centralizing innovation will remind the reader of both Akhnaton and Nabonidus. Such things as this are done successfully only when the prestige and tradition and learning of the priestly order has sunken to a very low level.[164]

"And he appointed, according to the order of David his father, the courses of the priests to their service, and the Levites to their charges, to praise and minister before the priests, as the duty of every day required; the porters also by their courses at every gate; for so had David the man of God commanded. And they departed not from the commandment of the king unto the priests and Levites concerning any matter, or concerning the treasures."

Neither Solomon's establishment of the worship of Jehovah in Jerusalem upon this new footing, nor his vision of and conversation with his God at the opening of his reign, stood in the way of his developing a sort of theological flirtatiousness in his declining years. He married widely, if only for reasons of state and splendour, and he entertained his numerous wives by sacrificing to their national deities, to the Sidonian goddess Ashtaroth (Ishtar), to Chemosh (a Moabitish god), to Moloch, and so forth. The Bible account of Solomon does, in fact, show us a king and a confused people, both superstitious and mentally unstable, in no way more religious than any other people of the surrounding world.

A point of considerable interest in the story of Solomon, because it marks a phase in Egyptian affairs, is his marriage to a daughter of Pharaoh: This must have been one of the Pharaohs of the XXIst Dynasty: In the great days of Amenophis III, as the Tel Amarna letters witness, Pharaoh could condescend to receive a Babylonian princess into his harem, but he refused absolutely to grant so divine a creature as an Egyptian princess in marriage to the Babylonian monarch. It points to the steady decline of Egyptian prestige that now, three centuries later, such a petty monarch as Solomon could wed on equal terms with an Egyptian princess. There was, however, a revival with the next Egyptian dynasty (XXII); and the Pharaoh Shishak, the founder, taking advantage of the cleavage between Israel and Judah, which had been developing through the reigns of both David and Solomon, took Jerusalem and looted the all-too-brief splendours both of the new temple and of the king's house.

Shishak seems also to have subjugated Philistia. From this time onward it is to be noted that the Philistines fade in importance. They had already lost their Cretan language and adopted that of the Semites they had conquered, and although their cities remain more or less independent, they merge gradually into the general Semitic life of Palestine.

There is evidence that the original rude but convincing narrative of Solomon's rule, of his various murders, of his association with Hiram, of his palace and temple building, and the extravagances that weakened and finally tore his kingdom in twain, has been subjected to extensive interpolations and expansions by a later writer, anxious to exaggerate his prosperity and glorify his wisdom. It is not the place here to deal with the criticism of Bible origins, but it is a matter of ordinary common sense rather than of scholarship to note the manifest reality and veracity of the main substance of the account of David and Solomon, an account explaining sometimes and justifying sometimes, but nevertheless relating facts, even the harshest facts, as only a contemporary or almost contemporary writer, convinced that they cannot be concealed, would relate them, and then to remark the sudden lapse into adulation when the inserted passages occur. It is a striking tribute to the power of the written assertion over realities in men's minds that this Bible narrative has imposed, not only upon the Christian, but upon the Moslim world, the belief that King Solomon was not only one of the most magnificent, but one of the wisest of men. Yet the first book of Kings tells in detail his utmost splendours, and beside the beauty and wonder of the buildings and organizations of such great monarchs as Thotmes III or Rameses II or half a dozen other Pharaohs, or of Sargon II or Sardanapalus or Nebuchadnezzar the Great, they are trivial. His temple, measured internally, was twenty cubits broad, about 35 feet[165]--that is, the breadth of a small villa residence--and sixty cubits, say, 100 feet, long. And as for his wisdom and statescraft, one need go no further than the Bible to see that Solomon was a mere helper in the wide-reaching schemes of the trader-king Hiram, and his kingdom a pawn between Phœnicia and Egypt. His importance was due largely to the temporary enfeeblement of Egypt, which encouraged the ambition of the Phœnician and made it necessary to propitiate the holder of the key to an alternate trade route to the East. To his own people Solomon was a wasteful and oppressive monarch, and already before his death his kingdom was splitting, visibly to all men.

With the reign of King Solomon the brief glory of the Hebrews ends; the northern and richer section of his kingdom, long oppressed by taxation to sustain his splendours, breaks off from Jerusalem to become the separate kingdom of Israel, and this split ruptures that linking connection between Sidon and the Red Sea by which Solomon's gleam of wealth was possible. There is no more wealth in Hebrew history. Jerusalem remains the capital of one tribe, the tribe of Judah, the capital of a land of barren hills, cut off by Philistia from the sea and surrounded by enemies.

The tales of wars, of religious conflicts, of usurpations, assassinations, and of fratricidal murders to secure the throne goes on for three centuries. It is a tale frankly barbaric. Israel wars with Judah and the neighbouring states; forms alliances first with one and then with the other. The power of Aramean Syria burns like a baleful star over the affairs of the Hebrews, and then there rises behind it the great and growing power of the last Assyrian Empire. For three centuries the life of the Hebrews was like the life of a man who insists upon living in the middle of a busy thoroughfare, and is consequently being run over constantly by omnibuses and motor-lorries.

"Pul" (apparently the same person as Tiglath Pileser III) is, according to the Bible narrative, the first Assyrian monarch to appear upon the Hebrew horizon, and Menahem buys him off with a thousand talents of silver (738 B.C.). But the power of Assyria is heading straight for the now aged and decadent land of Egypt, and the line of attack lies through Judea; Tiglath Pileser III returns and Shalmaneser follows in his steps, the King of Israel intrigues for help with Egypt, that "broken reed," and in 721 B.C., as we have already noted, his kingdom is swept off into captivity and utterly lost to history. The same fate hung over Judah, but for a little while it was averted. The fate of Sennacherib's army in the reign of King Hezekiah (701 B.C.), and how he was murdered by his sons (II Kings xix. 37), we have already mentioned. The subsequent subjugation of Egypt by Assyria finds no mention in Holy Writ, but it is clear that before the reign of Sennacherib, King Hezekiah had carried on a diplomatic correspondence with Babylon (700 B.C.), which was in revolt against Sargon II of Assyria. There followed the conquest of Egypt by Esarhaddon, and then for a time Assyria was occupied with her own troubles; the Scythians and Medes and Persians were pressing her on the north, and Babylon was in insurrection. As we have already noted, Egypt, relieved for a time from Assyrian pressure, entered upon a phase of revival, first under Psammetichus and then under Necho II.

Again the little country in between made mistakes in its alliances. But on neither side was there safety. Josiah opposed Necho, and was slain at the battle of Megiddo (608 B.C.). The king of Judah became an Egyptian tributary. Then when Necho, after pushing as far as the Euphrates, fell before Nebuchadnezzar II, Judah fell with him (604 B.C.). Nebuchadnezzar, after a trial of three puppet kings, carried off the greater part of the people into captivity in Babylon (586 B.C.), and the rest, after a rising and a massacre of Babylonian officials, took refuge from the vengeance of Chaldea in Egypt.

"And all the vessels of the house of God, great and small, and the treasures of the house of the Lord, and the treasures of the king, and of his princes; all these he brought to Babylon. And they burnt the house of God and brake down the wall of Jerusalem, and burnt all the palaces thereof with fire, and destroyed all the goodly vessels thereof. And them that had escaped from the sword

carried he away to Babylon; where they were servants to him and his sons until the reign of the kingdom of Persia." (II Chron. xxxvi. 18, 19, 20.)

Chapter 1

It began in a Woman's Club in London on a February afternoon—an uncomfortable club, and a miserable afternoon—when Mrs. Wilkins, who had come down from Hampstead to shop and had lunched at her club, took up _The Times_ from the table in the smoking-room, and running her listless eye down the Agony Column saw this:

To Those who Appreciate Wistaria and Sunshine. Small mediaeval Italian Castle on the shores of the Mediterranean to be Let Furnished for the month of April. Necessary servants remain. Z, Box 1000, _The Times_.

That was its conception; yet, as in the case of many another, the conceiver was unaware of it at the moment.

So entirely unaware was Mrs. Wilkins that her April for that year had then and there been settled for her that she dropped the newspaper with a gesture that was both irritated and resigned, and went over to the window and stared drearily out at the dripping street.

Not for her were mediaeval castles, even those that are specially described as small. Not for her the shores in April of the Mediterranean, and the wistaria and sunshine. Such delights were only for the rich. Yet the advertisement had been addressed to persons who appreciate these things, so that it had been, anyhow, addressed too to her, for she certainly appreciated them; more than anybody knew; more than she had ever told. But she was poor. In the whole world she possessed of her very own only ninety pounds, saved from year to year, put by carefully pound by pound, out of her dress allowance. She had scraped this sum together at the suggestion of her husband as a shield and refuge against a rainy day. Her dress allowance, given her by her father, was £100 a year, so that Mrs. Wilkins's clothes were what her husband, urging her to save, called modest and becoming, and her acquaintance to each other, when they spoke of her at all, which was seldom for she was very negligible, called a perfect sight.

Mr. Wilkins, a solicitor, encouraged thrift, except that branch of it which got into his food. He did not call that thrift, he called it bad housekeeping. But for the thrift which, like moth, penetrated into Mrs. Wilkins's clothes and spoilt them, he had much praise. "You never know," he said, "when there will be a rainy day, and you may be very glad to find you have a nest-egg. Indeed we both may."

Looking out of the club window into Shaftesbury Avenue—hers was an economical club, but convenient for Hampstead, where she lived, and for Shoolbred's, where she shopped—Mrs. Wilkins, having stood there some time very drearily, her mind's eye on the Mediterranean in April, and the wistaria, and the enviable opportunities of the rich, while her bodily eye watched the really extremely horrible sooty rain falling steadily on the hurrying umbrellas and splashing omnibuses, suddenly wondered whether perhaps this was not the rainy day Mellersh—Mellersh was Mr. Wilkins—had so often encouraged her to prepare for, and whether to get out of such a climate and into the small mediaeval castle wasn't perhaps what Providence had all along intended her to do with her savings. Part of her savings, of course; perhaps quite a small part. The castle, being mediaeval, might also be dilapidated, and dilapidations were surely cheap. She wouldn't in the least mind a few of them, because you didn't pay for dilapidations which were already there; on the contrary—by reducing the price you had to pay they really paid you. But what nonsense to think of it . . .

She turned away from the window with the same gesture of mingled irritation and resignation with which she had laid down _The Times_, and crossed the room towards the door with the intention of getting her mackintosh and umbrella and fighting her way into one of the overcrowded omnibuses and going to Shoolbred's on her way home and buying some soles for Mellersh's dinner—Mellersh was difficult with fish and liked only soles, except salmon—when she beheld Mrs. Arbuthnot, a woman she knew by sight as also living in Hampstead and belonging to the club, sitting at the table in the middle of the room on which the newspapers and magazines were kept, absorbed, in her turn, in the first page of _The Times_.

Mrs. Wilkins had never yet spoken to Mrs. Arbuthnot, who belonged to one of the various church sets, and who analysed, classified, divided and registered the poor; whereas she and Mellersh, when they did go out, went to the parties of impressionist painters, of whom in Hampstead there were many. Mellersh had a sister who had married one of them and lived up on the Heath, and because of this alliance Mrs. Wilkins was drawn into a circle which was highly unnatural to her, and she had learned to dread pictures. She had to say things about them, and she didn't know what to say. She used to murmur, "Marvellous," and feel that it was not enough. But nobody minded. Nobody listened. Nobody took any notice of Mrs. Wilkins. She was the kind of person who is not noticed at parties. Her clothes, infested by thrift, made her practically invisible; her face was non-arresting; her conversation was reluctant; she was shy. And if one's clothes and face and conversation are all negligible, thought Mrs. Wilkins, who recognised her disabilities, what, at parties, is there left of one?

Also she was always with Wilkins, that clean-shaven, fine-looking man, who gave a party, merely by coming to it, a great air. Wilkins was very respectable. He was known to be highly thought of by his senior partners. His sister's circle admired him. He pronounced adequately intelligent judgments on art and artists. He was pithy; he was prudent; he never said a word too much, nor, on the other hand, did he ever say a word too little. He produced the impression of keeping copies of everything he said; and he was so obviously reliable that it often happened that people who met him at these parties became discontented with their own solicitors, and after a period of restlessness extricated themselves and went to Wilkins.

Naturally Mrs. Wilkins was blotted out. "She," said his sister, with something herself of the judicial, the digested, and the final in her manner, "should stay at home." But Wilkins could not leave his wife at home. He was a family solicitor, and all such have wives and show them. With his in the week he went to parties, and with his on Sundays he went to church. Being still fairly young—he was thirty-nine—and ambitious of old ladies, of whom he had not yet acquired in his practice a sufficient number, he could not afford to miss church, and it was there that Mrs. Wilkins became familiar, though never through words, with Mrs. Arbuthnot.

She saw her marshalling the children of the poor into pews. She would come in at the head of the procession from the Sunday School exactly five minutes before the choir, and get her boys and girls neatly fitted into their allotted seats, and down on their little knees in their preliminary prayer, and up again on their feet just as, to the swelling organ, the vestry door opened, and the choir and clergy, big with the litanies and commandments they were presently to roll out, emerged. She had a sad face, yet she was evidently efficient. The combination used to make Mrs. Wilkins wonder, for she had been told by Mellersh, on days when she had only been able to get plaice, that if one were efficient one wouldn't be depressed, and that if one does one's job well one becomes automatically bright and brisk.

About Mrs. Arbuthnot there was nothing bright and brisk, though much in her way with the Sunday School children that was automatic; but when Mrs. Wilkins, turning from the window, caught sight of her in the club she was not being automatic at all, but

was looking fixedly at one portion of the first page of _The Times_, holding the paper quite still, her eyes not moving. She was just staring; and her face, as usual, was the face of a patient and disappointed Madonna.

Obeying an impulse she wondered at even while obeying it, Mrs. Wilkins, the shy and the reluctant, instead of proceeding as she had intended to the cloakroom and from thence to Schoolbred's in search of Mellersh's fish, stopped at the table and sat down exactly opposite Mrs. Arbuthnot, to whom she had never yet spoken in her life.

It was one of those long, narrow refectory tables, so that they were quite close to each other.

Mrs. Arbuthnot, however, did not look up. She continued to gaze, with eyes that seemed to be dreaming, at one spot only of The Times.

Mrs. Wilkins watched her a minute, trying to screw up courage to speak to her. She wanted to ask her if she had seen the advertisement. She did not know why she wanted to ask her this, but she wanted to. How stupid not to be able to speak to her. She looked so kind. She looked so unhappy. Why couldn't two unhappy people refresh each other on their way through this dusty business of life by a little talk—real, natural talk, about what they felt, what they would have liked, what they still tried to hope? And she could not help thinking that Mrs. Arbuthnot, too, was reading that very same advertisement. Her eyes were on the very part of the paper. Was she, too, picturing what it would be like—the colour, the fragrance, the light, the soft lapping of the sea among little hot rocks? Colour, fragrance, light, sea; instead of Shaftesbury Avenue, and the wet omnibuses, and the fish department at Shoolbred's, and the Tube to Hampstead, and dinner, and to-morrow the same and the day after the same and always the same . . .

Suddenly Mrs. Wilkins found herself leaning across the table. "Are you reading about the mediaeval castle and the wistaria?" she heard herself asking.

Naturally Mrs. Arbuthnot was surprised; but she was not half so much surprised as Mrs. Wilkins was at herself for asking.

Mrs. Arbuthnot had not yet to her knowledge set eyes on the shabby, lank, loosely-put-together figure sitting opposite her, with its small freckled face and big grey eyes almost disappearing under a smashed-down wet-weather hat, and she gazed at her a moment without answering. She _was_ reading about the mediaeval castle and the wistaria, or rather had read about it ten minutes before, and since then had been lost in dreams—of light, of colour, of fragrance, of the soft lapping of the sea among little hot rocks . . .

"Why do you ask me that?" she said in her grave voice, for her training of and by the poor had made her grave and patient.

Mrs. Wilkins flushed and looked excessively shy and frightened. "Oh, only because I saw it too, and I thought perhaps—I thought somehow—" she stammered.

Whereupon Mrs. Arbuthnot, her mind being used to getting people into lists and divisions, from habit considered, as she gazed thoughtfully at Mrs. Wilkins, under what heading, supposing she had to classify her, she could most properly be put.

"And I know you by sight," went on Mrs. Wilkins, who, like all the shy, once she was started plunged on, frightening herself to more and more speech by the sheer sound of what she had said last in her ears. "Every Sunday—I see you every Sunday in church—"

"In church?" echoed Mrs. Arbuthnot.

"And this seems such a wonderful thing—this advertisement about the wistaria—and—"

Mrs. Wilkins, who must have been at least thirty, broke off and wriggled in her chair with the movement of an awkward and embarrassed schoolgirl.

"It seems _so_ wonderful," she went on in a kind of burst, "and—it is such a miserable day . . ."

And then she sat looking at Mrs. Arbuthnot with the eyes of an imprisoned dog.

"This poor thing," thought Mrs. Arbuthnot, whose life was spent in helping and alleviating, "needs advice."

She accordingly prepared herself patiently to give it.

"If you see me in church," she said, kindly and attentively, "I suppose you live in Hampstead too?"

“Oh yes,” said Mrs. Wilkins. And she repeated, her head on its long thin neck drooping a little as if the recollection of Hampstead bowed her, “Oh yes.”

“Where?” asked Mrs. Arbuthnot, who, when advice was needed, naturally first proceeded to collect the facts.

But Mrs. Wilkins, laying her hand softly and caressingly on the part of _The Times_ where the advertisement was, as though the mere printed words of it were precious, only said, “Perhaps that’s why _this_ seems so wonderful.”

“No—I think _that’s_ wonderful anyhow,” said Mrs. Arbuthnot, forgetting facts and faintly sighing.

“Then you _were_ reading it?”

“Yes,” said Mrs. Arbuthnot, her eyes going dreamy again.

“Wouldn’t it be wonderful?” murmured Mrs. Wilkins.

“Wonderful,” said Mrs. Arbuthnot. Her face, which had lit up, faded into patience again. “Very wonderful,” she said. “But it’s no use wasting one’s time thinking of such things.”

“Oh, but it _is_,” was Mrs. Wilkins’s quick, surprising reply; surprising because it was so much unlike the rest of her—the characterless coat and skirt, the crumpled hat, the undecided wisp of hair straggling out. “And just the considering of them is worth while in itself—such a change from Hampstead—and sometimes I believe—I really do believe—if one considers hard enough one gets things.”

Mrs. Arbuthnot observed her patiently. In what category would she, supposing she had to, put her?

“Perhaps,” she said, leaning forward a little, “you will tell me your name. If we are to be friends”—she smiled her grave smile—“as I hope we are, we had better begin at the beginning.”

“Oh yes—how kind of you. I’m Mrs. Wilkins,” said Mrs. Wilkins. “I don’t expect,” she added, flushing, as Mrs. Arbuthnot said nothing, “that it conveys anything to you. Sometimes it—it doesn’t seem to convey anything to me either. But”—she looked round with a movement of seeking help—“I _am_ Mrs. Wilkins.”

She did not like her name. It was a mean, small name, with a kind of facetious twist, she thought, about its end like the upward curve of a pugdog’s tail. There it was, however. There was no doing anything with it. Wilkins she was and Wilkins she would remain; and though her husband encouraged her to give it on all occasions as Mrs. Mellersh-Wilkins she only did that when he was within earshot, for she thought Mellersh made Wilkins worse, emphasising it in the way Chatsworth on the gate-posts of a villa emphasises the villa.

When first he suggested she should add Mellersh she had objected for the above reason, and after a pause—Mellersh was much too prudent to speak except after a pause, during which presumably he was taking a careful mental copy of his coming observation—he said, much displeased, “But I am not a villa,” and looked at her as he looks who hopes, for perhaps the hundredth time, that he may not have married a fool.

Of course he was not a villa, Mrs. Wilkins assured him; she had never supposed he was; she had not dreamed of meaning . . . she was only just thinking . . .

The more she explained the more earnest became Mellersh’s hope, familiar to him by this time, for he had then been a husband for two years, that he might not by any chance have married a fool; and they had a prolonged quarrel, if that can be called a quarrel which is conducted with dignified silence on one side and earnest apology on the other, as to whether or no Mrs. Wilkins had intended to suggest that Mr. Wilkins was a villa.

“I believe,” she had thought when it was at last over—it took a long while—“that _anybody_ would quarrel about _anything_ when they’ve not left off being together for a single day for two whole years. What we both need is a holiday.”

“My husband,” went on Mrs. Wilkins to Mrs. Arbuthnot, trying to throw some light on herself, “is a solicitor. He—” She cast about for something she could say elucidatory of Mellersh, and found: “He’s very handsome.”

“Well,” said Mrs. Arbuthnot kindly, “that must be a great pleasure to you.”

“Why?” asked Mrs. Wilkins.

“Because,” said Mrs. Arbuthnot, a little taken aback, for constant intercourse with the poor had accustomed her to have her pronouncements accepted without question, “because beauty—handsomeness—is a gift like any other, and if it is properly used—”

She trailed off into silence. Mrs. Wilkins’s great grey eyes were fixed on her, and it seemed suddenly to Mrs. Arbuthnot that perhaps she was becoming crystallised into a habit of exposition, and of exposition after the manner of nursemaids, through having an audience that couldn’t but agree, that would be afraid, if it wished, to interrupt, that didn’t know, that was, in fact, at her mercy.

But Mrs. Wilkins was not listening; for just then, absurd as it seemed, a picture had flashed across her brain, and there were two figures in it sitting together under a great trailing wistaria that stretched across the branches of a tree she didn’t know, and it was herself and Mrs. Arbuthnot—she saw them—she saw them. And behind them, bright in sunshine, were old grey walls—the mediaeval castle—she saw it—they were there . . .

She therefore stared at Mrs. Arbuthnot and did not hear a word she said. And Mrs. Arbuthnot stared too at Mrs. Wilkins, arrested by the expression on her face, which was swept by the excitement of what she saw, and was as luminous and tremulous under it as water in sunlight when it is ruffled by a gust of wind. At this moment, if she had been at a party, Mrs. Wilkins would have been looked at with interest.

They stared at each other; Mrs. Arbuthnot surprised, inquiringly, Mrs. Wilkins with the eyes of some one who has had a revelation. Of course. That was how it could be done. She herself, she by herself, couldn’t afford it, and wouldn’t be able, even if she could afford it, to go there all alone; but she and Mrs. Arbuthnot together . . .

She leaned across the table. “Why don’t we try and get it?” she whispered.

Mrs. Arbuthnot became even more wide-eyed. “Get it?” she repeated.

“Yes,” said Mrs. Wilkins, still as though she were afraid of being overheard. “Not just sit here and say How wonderful, and then go home to Hampstead without having put out a finger—go home just as usual and see about the dinner and the fish just as we’ve been doing for years and years and will go on doing for years and years. In fact,” said Mrs. Wilkins, flushing to the roots of her hair, for the sound of what she was saying, of what was coming pouring out, frightened her, and yet she couldn’t stop, “I see no end to it. There is no end to it. So that there ought to be a break, there ought to be intervals—in everybody’s interests. Why, it would really be being unselfish to go away and be happy for a little, because we would come back so much nicer. You see, after a bit everybody needs a holiday.”

“But—how do you mean, get it?” asked Mrs. Arbuthnot.

“Take it,” said Mrs. Wilkins.

“Take it?”

“Rent it. Hire it. Have it.”

“But—do you mean you and I?”

“Yes. Between us. Share. Then it would only cost half, and you look so—you look exactly as if you wanted it just as much as I do—as if you ought to have a rest—have something happy happen to you.”

“Why, but we don’t know each other.”

“But just think how well we would if we went away together for a month! And I’ve saved for a rainy day, and I expect so have you, and this _is_ the rainy day—look at it—”

“She is unbalanced,” thought Mrs. Arbuthnot; yet she felt strangely stirred.

“Think of getting away for a whole month—from everything—to heaven—”

“She shouldn’t say things like that,” thought Mrs. Arbuthnot. “The vicar—” Yet she felt strangely stirred. It would indeed be wonderful to have a rest, a cessation.

Habit, however, steadied her again; and years of intercourse with the poor made her say, with the slight though sympathetic superiority of the explainer, “But then, you see, heaven isn’t somewhere else. It is here and now. We are told so.”

She became very earnest, just as she did when trying patiently to help and enlighten the poor. “Heaven is within us,” she said in her gentle low voice. “We are told that on the very highest authority. And you know the lines about the kindred points, don’t you—”

“Oh yes, I know _them_,” interrupted Mrs. Wilkins impatiently.

“The kindred points of heaven and home,” continued Mrs. Arbuthnot, who was used to finishing her sentences. “Heaven is in our home.”

“It isn’t,” said Mrs. Wilkins, again surprisingly.

Mrs. Arbuthnot was taken aback. Then she said gently, “Oh, but it is. It is there if we choose, if we make it.”

“I do choose, and I do make it, and it isn’t,” said Mrs. Wilkins.

Then Mrs. Arbuthnot was silent, for she too sometimes had doubts about homes. She sat and looked uneasily at Mrs. Wilkins, feeling more and more the urgent need to getting her classified. If she could only classify Mrs. Wilkins, get her safely under her proper heading, she felt that she herself would regain her balance, which did seem very strangely to be slipping all to one side. For neither had she had a holiday for years, and the advertisement when she saw it had set her dreaming, and Mrs. Wilkins’s excitement about it was infectious, and she had the sensation, as she listened to her impetuous, odd talk and watched her lit-up face, that she was being stirred out of sleep.

Clearly Mrs. Wilkins was unbalanced, but Mrs. Arbuthnot had met the unbalanced before—indeed she was always meeting them—and they had no effect on her own stability at all; whereas this one was making her feel quite wobbly, quite as though to be off and away, away from her compass points of God, Husband, Home and Duty—she didn’t feel as if Mrs. Wilkins intended Mr. Wilkins to come too—and just for once be happy, would be both good and desirable. Which of course it wasn’t; which certainly of course it wasn’t. She, also, had a nest-egg, invested gradually in the Post Office Savings Bank, but to suppose that she would ever forget her duty to the extent of drawing it out and spending it on herself was surely absurd. Surely she couldn’t, she wouldn’t ever do such a thing? Surely she wouldn’t, she couldn’t ever forget her poor, forget misery and sickness as completely as that? No doubt a trip to Italy would be extraordinarily delightful, but there were many delightful things one would like to do, and what was strength given to one for except to help one not to do them?

Steadfast as the points of the compass to Mrs. Arbuthnot were the great four facts of life: God, Husband, Home, Duty. She had gone to sleep on these facts years ago, after a period of much misery, her head resting on them as on a pillow; and she had a great dread of being awakened out of so simple and untroublesome a condition. Therefore it was that she searched with earnestness for a heading under which to put Mrs. Wilkins, and in this way illumine and steady her own mind; and sitting there looking at her uneasily after her last remark, and feeling herself becoming more and more unbalanced and infected, she decided _pro tem_, as the vicar said at meetings, to put her under the heading Nerves. It was just possible that she ought to go straight into the category Hysteria, which was often only the antechamber to Lunacy, but Mrs. Arbuthnot had learned not to hurry people into their final categories, having on more than one occasion discovered with dismay that she had made a mistake; and how difficult it had been to get them out again, and how crushed she had been with the most terrible remorse.

Yes. Nerves. Probably she had no regular work for others, thought Mrs. Arbuthnot; no work that would take her outside herself. Evidently she was rudderless—blown about by gusts, by impulses. Nerves was almost certainly her category, or would be quite soon if no one helped her. Poor little thing, thought Mrs. Arbuthnot, her own balance returning hand in hand with her compassion, and unable, because of the table, to see the length of Mrs. Wilkins’s legs. All she saw was her small, eager, shy face, and her thin shoulders, and the look of childish longing in her eyes for something that she was sure was going to make her happy. No; such things didn’t make people happy, such fleeting things. Mrs. Arbuthnot had learned in her long life with Frederick—he was her husband, and she had married him at twenty and was now thirty-three—where alone true joys are to be found. They are to be found, she now knew, only in daily, in hourly, living for others; they are to be found only—hadn’t she over and over again taken her disappointments and discouragements there, and come away comforted?—at the feet of God.

Frederick had been the kind of husband whose wife betakes herself early to the feet of God. From him to them had been a short though painful step. It seemed short to her in retrospect, but it had really taken the whole of the first year of their marriage, and

every inch of the way had been a struggle, and every inch of it was stained, she felt at the time, with her heart's blood. All that was over now. She had long since found peace. And Frederick, from her passionately loved bridegroom, from her worshipped young husband, had become second only to God on her list of duties and forbearances. There he hung, the second in importance, a bloodless thing bled white by her prayers. For years she had been able to be happy only by forgetting happiness. She wanted to stay like that. She wanted to shut out everything that would remind her of beautiful things, that might set her off again longing, desiring....

"I'd like so much to be friends," she said earnestly. "Won't you come and see me, or let me come to you sometimes? Whenever you feel as if you wanted to talk. I'll give you my address"—she searched in her handbag—"and then you won't forget." And she found a card and held it out.

Mrs. Wilkins ignored the card.

"It's so funny," said Mrs. Wilkins, just as if she had not heard her, "but I _see_ us both—you and me—this April in the mediaeval castle."

Mrs. Arbuthnot relapsed into uneasiness. "Do you?" she said, making an effort to stay balanced under the visionary gaze of the shining grey eyes. "Do you?"

"Don't you ever see things in a kind of flash before they happen?" asked Mrs. Wilkins.

"Never," said Mrs. Arbuthnot.

She tried to smile; she tried to smile the sympathetic yet wise and tolerant smile with which she was accustomed to listen to the necessarily biassed and incomplete views of the poor. She didn't succeed. The smile trembled out.

"Of course," she said in a low voice, almost as if she were afraid the vicar and the Savings Bank were listening, "it would be most beautiful—most beautiful—"

"Even if it were wrong," said Mrs. Wilkins, "it would only be for a month."

"That—" began Mrs. Arbuthnot, quite clear as to the reprehensibleness of such a point of view; but Mrs. Wilkins stopped her before she could finish.

"Anyhow," said Mrs. Wilkins, stopping her, "I'm sure it's wrong to go on being good for too long, till one gets miserable. And I can see you've been good for years and years, because you look so unhappy"—Mrs. Arbuthnot opened her mouth to protest—"and I—I've done nothing but duties, things for other people, ever since I was a girl, and I don't believe anybody loves me a bit—a bit—the b-better—and I long—oh, I long—for something else—something else—"

Was she going to cry? Mrs. Arbuthnot became acutely uncomfortable and sympathetic. She hoped she wasn't going to cry. Not there. Not in that unfriendly room, with strangers coming and going.

But Mrs. Wilkins, after tugging agitatedly at a handkerchief that wouldn't come out of her pocket, did succeed at last in merely apparently blowing her nose with it, and then, blinking her eyes very quickly once or twice, looked at Mrs. Arbuthnot with a quivering air of half humble, half frightened apology, and smiled.

"Will you believe," she whispered, trying to steady her mouth, evidently dreadfully ashamed of herself, "that I've never spoken to any one before in my life like this? I can't think, I simply don't know, what has come over me."

"It's the advertisement," said Mrs. Arbuthnot, nodding gravely.

"Yes," said Mrs. Wilkins, dabbing furtively at her eyes, "and us both being so—"—she blew her nose again a little—"miserable."

Chapter 2

Of course Mrs. Arbuthnot was not miserable—how could she be, she asked herself, when God was taking care of her?—but she let that pass for the moment unrepudiated, because of her conviction that here was another fellow-creature in urgent need of her help; and not just boots and blankets and better sanitary arrangements this time, but the more delicate help of comprehension, of finding the exact right words.

The exact right words, she presently discovered, after trying various ones about living for others, and prayer, and the peace to be found in placing oneself unreservedly in God's hands—to meet all these words Mrs. Wilkins had other words, incoherent and yet, for the moment at least, till one had had more time, difficult to answer—the exact right words were a suggestion that it would do no harm to answer the advertisement. Non-committal. Mere inquiry. And what disturbed Mrs. Arbuthnot about this suggestion was that she did not make it solely to comfort Mrs. Wilkins; she made it because of her own strange longing for the mediaeval castle.

This was very disturbing. There she was, accustomed to direct, to lead, to advise, to support—except Frederick; she long since had learned to leave Frederick to God—being led herself, being influenced and thrown off her feet, by just an advertisement, by just an incoherent stranger. It was indeed disturbing. She failed to understand her sudden longing for what was, after all, self-indulgence, when for years no such desire had entered her heart.

"There's no harm in simply _asking_," she said in a low voice, as if the vicar and the Savings Bank and all her waiting and dependent poor were listening and condemning.

"It isn't as if it _committed_ us to anything," said Mrs. Wilkins, also in a low voice, but her voice shook.

They got up simultaneously—Mrs. Arbuthnot had a sensation of surprise that Mrs. Wilkins should be so tall—and went to a writing-table, and Mrs. Arbuthnot wrote to Z, Box 1000, _The Times_, for particulars. She asked for all particulars, but the only one they really wanted was the one about the rent. They both felt that it was Mrs. Arbuthnot who ought to write the letter and do the business part. Not only was she used to organising and being practical, but she also was older, and certainly calmer; and she herself had no doubt too that she was wiser. Neither had Mrs. Wilkins any doubt of this; the very way Mrs. Arbuthnot parted her hair suggested a great calm that could only proceed from wisdom.

But if she was wiser, older and calmer, Mrs. Arbuthnot's new friend nevertheless seemed to her to be the one who impelled. Incoherent, she yet impelled. She appeared to have, apart from her need of help, an upsetting kind of character. She had a curious infectiousness. She led one on. And the way her unsteady mind leaped at conclusions—wrong ones, of course; witness the one that she, Mrs. Arbuthnot, was miserable—the way she leaped at conclusions was disconcerting.

Whatever she was, however, and whatever her unsteadiness, Mrs. Arbuthnot found herself sharing her excitement and her longing; and when the letter had been posted in the letter-box in the hall and actually was beyond getting back again, both she and Mrs. Wilkins felt the same sense of guilt.

"It only shows," said Mrs. Wilkins in a whisper, as they turned away from the letter-box, "how immaculately good we've been all our lives. The very first time we do anything our husbands don't know about we feel guilty."

"I'm afraid I can't say I've been immaculately good," gently protested Mrs. Arbuthnot, a little uncomfortable at this fresh example of successful leaping at conclusions, for she had not said a word about her feeling of guilt.

"Oh, but I'm sure you have—I _see_ you being good—and that's why you're not happy."

"She shouldn't say things like that," thought Mrs. Arbuthnot. "I must try and help her not to."

Aloud she said gravely, "I don't know why you insist that I'm not happy. When you know me better I think you'll find that I am. And I'm sure you don't mean really that goodness, if one could attain it, makes one unhappy."

"Yes, I do," said Mrs. Wilkins. "Our sort of goodness does. We have attained it, and we are unhappy. There are miserable sorts of goodness and happy sorts—the sort we'll have at the mediaeval castle, for instance, is the happy sort."

"That is, supposing we go there," said Mrs. Arbuthnot restrainingly. She felt that Mrs. Wilkins needed holding on to. "After all, we've only written just to ask. Anybody may do that. I think it quite likely we shall find the conditions impossible, and even if they were not, probably by to-morrow we shall not want to go."

"I _see_ us there," was Mrs. Wilkins's answer to that.

All this was very unbalancing. Mrs. Arbuthnot, as she presently splashed through the dripping streets on her way to a meeting she was to speak at, was in an unusually disturbed condition of mind. She had, she hoped, shown herself very calm to Mrs. Wilkins, very practical and sober, concealing her own excitement. But she was really extraordinarily moved, and she felt happy, and she felt guilty, and she felt afraid, and she had all the feelings, though this she did not know, of a woman who has come away from a secret

meeting with her lover. That, indeed, was what she looked like when she arrived late on her platform; she, the open-browed, looked almost furtive as her eyes fell on the staring wooden faces waiting to hear her try and persuade them to contribute to the alleviation of the urgent needs of the Hampstead poor, each one convinced that they needed contributions themselves. She looked as though she were hiding something discreditable but delightful. Certainly her customary clear expression of candour was not there, and its place was taken by a kind of suppressed and frightened pleasedness, which would have led a more worldly-minded audience to the instant conviction of recent and probably impassioned lovemaking.

Beauty, beauty, beauty . . . the words kept ringing in her ears as she stood on the platform talking of sad things to the sparsely attended meeting. She had never been to Italy. Was that really what her nest-egg was to be spent on after all? Though she couldn't approve of the way Mrs. Wilkins was introducing the idea of predestination into her immediate future, just as if she had no choice, just as if to struggle, or even to reflect, were useless, it yet influenced her. Mrs. Wilkins's eyes had been the eyes of a seer. Some people were like that, Mrs. Arbuthnot knew; and if Mrs. Wilkins had actually seen her at the mediaeval castle it did seem probable that struggling would be a waste of time. Still, to spend her nest-egg on self-indulgence— The origin of this egg had been corrupt, but she had at least supposed its end was to be creditable. Was she to deflect it from its intended destination, which alone had appeared to justify her keeping it, and spend it on giving herself pleasure?

Mrs. Arbuthnot spoke on and on, so much practised in the kind of speech that she could have said it all in her sleep, and at the end of the meeting, her eyes dazzled by her secret visions, she hardly noticed that nobody was moved in any way whatever, least of all in the way of contributions.

But the vicar noticed. The vicar was disappointed. Usually his good friend and supporter Mrs. Arbuthnot succeeded better than this. And, what was even more unusual, she appeared, he observed, not even to mind.

"I can't imagine," he said to her as they parted, speaking irritably, for he was irritated both by the audience and by her, "what these people are coming to. _Nothing_ seems to move them."

"Perhaps they need a holiday," suggested Mrs. Arbuthnot; an unsatisfactory, a queer reply, the vicar thought.

"In February?" he called after her sarcastically.

"Oh no—not till April," said Mrs. Arbuthnot over her shoulder.

"Very odd," thought the vicar. "Very odd indeed." And he went home and was not perhaps quite christian to his wife.

That night in her prayers Mrs. Arbuthnot asked for guidance. She felt she ought really to ask, straight out and roundly, that the mediaeval castle should already have been taken by some one else and the whole thing thus be settled, but her courage failed her. Suppose her prayer were to be answered? No; she couldn't ask it; she couldn't risk it. And after all—she almost pointed this out to God—if she spent her present nest-egg on a holiday she could quite soon accumulate another. Frederick pressed money on her; and it would only mean, while she rolled up a second egg, that for a time her contributions to the parish charities would be less. And then it could be the next nest-egg whose original corruption would be purged away by the use to which it was finally put.

For Mrs. Arbuthnot, who had no money of her own, was obliged to live on the proceeds of Frederick's activities, and her very nest-egg was the fruit, posthumously ripened, of ancient sin. The way Frederick made his living was one of the standing distresses of her life. He wrote immensely popular memoirs, regularly, every year, of the mistresses of kings. There were in history numerous kings who had had mistresses, and there were still more numerous mistresses who had had kings; so that he had been able to publish a book of memoirs during each year of his married life, and even so there were great further piles of these ladies waiting to be dealt with. Mrs. Arbuthnot was helpless. Whether she liked it or not, she was obliged to live on the proceeds. He gave her a dreadful sofa once, after the success of his Du Barri memoir, with swollen cushions and soft, receptive lap, and it seemed to her a miserable thing that there, in her very home, should flaunt this re-incarnation of a dead old French sinner.

Simply good, convinced that morality is the basis of happiness, the fact that she and Frederick should draw their sustenance from guilt, however much purged by the passage of centuries, was one of the secret reasons of her sadness. The more the memoired lady had forgotten herself, the more his book about her was read and the more free-handed he was to his wife; and all that he gave her was spent, after adding slightly to her nest-egg—for she did hope and believe that some day people would cease to want to read of wickedness, and then Frederick would need supporting—on helping the poor. The parish flourished because, to take a handful at random, of the ill-behaviour of the ladies Du Barri, Montespan, Pompadour, Ninon de l'Enclos, and even of learned

Maintenon. The poor were the filter through which the money was passed, to come out, Mrs. Arbuthnot hoped, purified. She could do no more. She had tried in days gone by to think the situation out, to discover the exact right course for her to take, but had found it, as she had found Frederick, too difficult, and had left it, as she had left Frederick, to God. Nothing of this money was spent on her house or dress; those remained, except for the great soft sofa, austere. It was the poor who profited. Their very boots were stout with sins. But how difficult it had been. Mrs. Arbuthnot, groping for guidance, prayed about it to exhaustion. Ought she perhaps to refuse to touch the money, to avoid it as she would have avoided the sins which were its source? But then what about the parish's boots? She asked the vicar what he thought, and, through much delicate language, evasive and cautious, it did finally appear that he was for the boots.

At least she had persuaded Frederick, when first he began his terrible successful career—he only began it after their marriage; when she married him he had been a blameless official attached to the library of the British Museum—to publish the memoirs under another name, so that she was not publicly branded. Hampstead read the books with glee, and had no idea that their writer lived in its midst. Frederick was almost unknown, even by sight, in Hampstead. He never went to any of its gatherings. Whatever it was he did in the way of recreation was done in London, but he never spoke of what he did or whom he saw; he might have been perfectly friendless for any mention he ever made of friends to his wife. Only the vicar knew where the money for the parish came from, and he regarded it, he told Mrs. Arbuthnot, as a matter of honour not to mention it.

And at least her little house was not haunted by the loose-lived ladies, for Frederick did his work away from home. He had two rooms near the British Museum, which was the scene of his exhumations, and there he went every morning, and he came back long after his wife was asleep. Sometimes he did not come back at all. Sometimes she did not see him for several days together. Then he would suddenly appear at breakfast, having let himself in with his latchkey the night before, very jovial and good-natured and free-handed and glad if she would allow him to give her something—a well-fed man, contented with the world; a jolly, full-blooded, satisfied man. And she was always gentle, and anxious that his coffee should be as he liked it.

He seemed very happy. Life, she often thought, however much one tabulated was yet a mystery. There were always some people it was impossible to place. Frederick was one of them. He didn't seem to bear the remotest resemblance to the original Frederick. He didn't seem to have the least need of any of the things he used to say were so important and beautiful—love, home, complete communion of thoughts, complete immersion in each other's interests. After those early painful attempts to hold him up to the point from which they had hand in hand so splendidly started, attempts in which she herself had got terribly hurt and the Frederick she supposed she had married was mangled out of recognition, she hung him up finally by her bedside as the chief subject of her prayers, and left him, except for those, entirely to God. She had loved Frederick too deeply to be able now to do anything but pray for him. He had no idea that he never went out of the house without her blessing going with him too, hovering, like a little echo of finished love, round that once dear head. She didn't dare think of him as he used to be, as he had seemed to her to be in those marvellous first days of their love-making, of their marriage. Her child had died; she had nothing, nobody of her own to lavish herself on. The poor became her children, and God the object of her love. What could be happier than such a life, she sometimes asked herself; but her face, and particularly her eyes, continued sad.

"Perhaps when we're old . . . perhaps when we are both quite old . . ." she would think wistfully.

Chapter 3

The owner of the mediaeval castle was an Englishman, a Mr. Briggs, who was in London at the moment and wrote that it had beds enough for eight people, exclusive of servants, three sitting-rooms, battlements, dungeons, and electric light. The rent was £60 for the month, the servants' wages were extra, and he wanted references—he wanted assurances that the second half of his rent would be paid, the first half being paid in advance, and he wanted assurances of respectability from a solicitor, or a doctor, or a clergyman. He was very polite in his letter, explaining that his desire for references was what was usual and should be regarded as a mere formality.

Mrs. Arbuthnot and Mrs. Wilkins had not thought of references, and they had not dreamed a rent could be so high. In their minds had floated sums like three guineas a week; or less, seeing that the place was small and old.

Sixty pounds for a single month.

It staggered them.

Before Mrs. Arbuthnot's eyes rose up boots: endless vistas, all the stout boots that sixty pounds would buy; and besides the rent there would be the servants' wages, and the food, and the railway journeys out and home. While as for references, these did indeed seem a stumbling-block; it did seem impossible to give any without making their plan more public than they had intended.

They had both—even Mrs. Arbuthnot, lured for once away from perfect candour by the realisation of the great saving of trouble and criticism an imperfect explanation would produce—they had both thought it would be a good plan to give out, each to her own circle, their circles being luckily distinct, that each was going to stay with a friend who had a house in Italy. It would be true as far as it went—Mrs. Wilkins asserted that it would be quite true, but Mrs. Arbuthnot thought it wouldn't be quite—and it was the only way, Mrs. Wilkins said, to keep Mellersh even approximately quiet. To spend any of her money just on the mere getting to Italy would cause him indignation; what he would say if he knew she was renting part of a mediaeval castle on her own account Mrs. Wilkins preferred not to think. It would take him days to say it all; and this although it was her very own money, and not a penny of it had ever been his.

"But I expect," she said, "your husband is just the same. I expect all husbands are alike in the long run."

Mrs. Arbuthnot said nothing, because her reason for not wanting Frederick to know was the exactly opposite one—Frederick would be only too pleased for her to go, he would not mind it in the very least; indeed, he would hail such a manifestation of self-indulgence and worldliness with an amusement that would hurt, and urge her to have a good time and not to hurry home with a crushing detachment. Far better, she thought, to be missed by Mellersh than to be sped by Frederick. To be missed, to be needed, from whatever motive, was, she thought, better than the complete loneliness of not being missed or needed at all.

She therefore said nothing, and allowed Mrs. Wilkins to leap at her conclusions unchecked. But they did, both of them, for a whole day feel that the only thing to be done was to renounce the mediaeval castle; and it was in arriving at this bitter decision that they really realised how acute had been their longing for it.

Then Mrs. Arbuthnot, whose mind was trained in the finding of ways out of difficulties, found a way out of the reference difficulty; and simultaneously Mrs. Wilkins had a vision revealing to her how to reduce the rent.

Mrs. Arbuthnot's plan was simple, and completely successful. She took the whole of the rent in person to the owner, drawing it out of her Savings Bank—again she looked furtive and apologetic, as if the clerk must know the money was wanted for purposes of self-indulgence—and, going up with the six ten pound notes in her hand-bag to the address near the Brompton Oratory where the owner lived, presented them to him, waiving her right to pay only half. And when he saw her, and her parted hair and soft dark eyes and sober apparel, and heard her grave voice, he told her not to bother about writing round for those references.

"It'll be all right," he said, scribbling a receipt for the rent. "Do sit down, won't you? Nasty day, isn't it? You'll find the old castle has lots of sunshine, whatever else it hasn't got. Husband going?"

Mrs. Arbuthnot, unused to anything but candour, looked troubled at this question and began to murmur inarticulately, and the owner at once concluded that she was a widow—a war one, of course, for other widows were old—and that he had been a fool not to guess it.

"Oh, I'm sorry," he said, turning red right up to his fair hair. "I didn't mean—h'm, h'm, h'm—"

He ran his eye over the receipt he had written. "Yes, I think that's all right," he said, getting up and giving it to her. "Now," he added, taking the six notes she held out and smiling, for Mrs. Arbuthnot was agreeable to look at, "I'm richer, and you're happier. I've got money, and you've got San Salvatore. I wonder which is best."

"I think you know," said Mrs. Arbuthnot with her sweet smile.

He laughed and opened the door for her. It was a pity the interview was over. He would have liked to ask her to lunch with him. She made him think of his mother, of his nurse, of all things kind and comforting, besides having the attraction of not being his mother or his nurse.

"I hope you'll like the old place," he said, holding her hand a minute at the door. The very feel of her hand, even through its glove, was reassuring; it was the sort of hand, he thought, that children would like to hold in the dark. "In April, you know, it's simply a mass of flowers. And then there's the sea. You must wear white. You'll fit in very well. There are several portraits of you there."

"Portraits?"

“Madonnas, you know. There’s one on the stairs really exactly like you.”

Mrs. Arbuthnot smiled and said good-bye and thanked him. Without the least trouble and at once she had got him placed in his proper category: he was an artist and of an effervescent temperament.

She shook hands and left, and he wished she hadn’t. After she was gone he supposed that he ought to have asked for those references, if only because she would think him so unbusiness-like not to, but he could as soon have insisted on references from a saint in a nimbus as from that grave, sweet lady.

Rose Arbuthnot.

Her letter, making the appointment, lay on the table.

Pretty name.

That difficulty, then, was overcome. But there still remained the other one, the really annihilating effect of the expense on the nest-eggs, and especially on Mrs. Wilkins’s, which was in size, compared with Mrs. Arbuthnot’s, as the egg of the plover to that of the duck; and this in its turn was overcome by the vision vouchsafed to Mrs. Wilkins, revealing to her the steps to be taken for its overcoming. Having got San Salvatore—the beautiful, the religious name, fascinated them—they in their turn would advertise in the Agony Column of _The Times_, and would inquire after two more ladies, of similar desires to their own, to join them and share the expenses.

At once the strain of the nest-eggs would be reduced from half to a quarter. Mrs. Wilkins was prepared to fling her entire egg into the adventure, but she realised that if it were to cost even sixpence over her ninety pounds her position would be terrible. Imagine going to Mellersh and saying, “I owe.” It would be awful enough if some day circumstances forced her to say, “I have no nest-egg,” but at least she would be supported in such a case by the knowledge that the egg had been her own. She therefore, though prepared to fling her last penny into the adventure, was not prepared to fling into it a single farthing that was not demonstrably her own; and she felt that if her share of the rent was reduced to fifteen pounds only, she would have a safe margin for the other expenses. Also they might economise very much on food—gather olives off their own trees and eat them, for instance, and perhaps catch fish.

Of course, as they pointed out to each other, they could reduce the rent to an almost negligible sum by increasing the number of sharers; they could have six more ladies instead of two if they wanted to, seeing that there were eight beds. But supposing the eight beds were distributed in couples in four rooms, it would not be altogether what they wanted, to find themselves shut up at night with a stranger. Besides, they thought that perhaps having so many would not be quite so peaceful. After all, they were going to San Salvatore for peace and rest and joy, and six more ladies, especially if they got into one’s bedroom, might a little interfere with that. speech first However, there seemed to be only two ladies in England at that moment who had any wish to join them, for they had only two answers to their advertisement.

“Well, we only want two,” said Mrs. Wilkins, quickly recovering, for she had imagined a great rush.

“I think a choice would have been a good thing,” said Mrs. Arbuthnot.

“You mean because then we needn’t have had Lady Caroline Dester.”

“I didn’t say that,” gently protested Mrs. Arbuthnot.

“We needn’t have her,” said Mrs. Wilkins. “Just one more person would help us a great deal with the rent. We’re not obliged to have two.”

“But why should we not have her? She seems really quite what we want.”

“Yes—she does from her letter,” said Mrs. Wilkins doubtfully.

She felt she would be terribly shy of Lady Caroline. Incredible as it may seem, seeing how they get into everything, Mrs. Wilkins had never come across any members of the aristocracy.

They interviewed Lady Caroline, and they interviewed the other applicant, a Mrs. Fisher.

Lady Caroline came to the club in Shaftesbury Avenue, and appeared to be wholly taken up by one great longing, a longing to get away from everybody she had ever known. When she saw the club, and Mrs. Arbuthnot, and Mrs. Wilkins, she was sure that here was exactly what she wanted. She would be in Italy—a place she adored; she would not be in hotels—places she loathed; she would not be staying with friends—persons she disliked; and she would be in the company of strangers who would never mention a single person she knew, for the simple reason that they had not, could not have, and would not come across them. She asked a few questions about the fourth woman, and was satisfied with the answers. Mrs. Fisher, of Prince of Wales Terrace. A widow. She too would be unacquainted with any of her friends. Lady Caroline did not even know where Prince of Wales Terrace was.

“It’s in London,” said Mrs. Arbuthnot.

“Is it?” said Lady Caroline.

It all seemed most restful.

Mrs. Fisher was unable to come to the club because, she explained by letter, she could not walk without a stick; therefore Mrs. Arbuthnot and Mrs. Wilkins went to her.

“But if she can’t come to the club how can she go to Italy?” wondered Mrs. Wilkins, aloud.

“We shall hear that from her own lips,” said Mrs. Arbuthnot.

From Mrs. Fisher’s lips they merely heard, in reply to delicate questioning, that sitting in trains was not walking about; and they knew that already. Except for the stick, however, she appeared to be a most desirable fourth—quiet, educated, elderly. She was much older than they or Lady Caroline—Lady Caroline had informed them she was twenty-eight—but not so old as to have ceased to be active-minded. She was very respectable indeed, and still wore a complete suit of black though her husband had died, she told them, eleven years before. Her house was full of signed photographs of illustrious Victorian dead, all of whom she said she had known when she was little. Her father had been an eminent critic, and in his house she had seen practically everybody who was anybody in letters and art. Carlyle had scowled at her; Matthew Arnold had held her on his knee; Tennyson had sonorously rallied her on the length of her pig-tail. She animatedly showed them the photographs, hung everywhere on her walls, pointing out the signatures with her stick, and she neither gave any information about her own husband nor asked for any about the husbands of her visitors; which was the greatest comfort. Indeed, she seemed to think that they also were widows, for on inquiring who the fourth lady was to be, and being told it was a Lady Caroline Dester, she said, “Is she a widow too?” And on their explaining that she was not, because she had not yet been married, observed with abstracted amiability, “All in good time.”

But Mrs. Fisher’s very abstractedness—and she seemed to be absorbed chiefly in the interesting people she used to know and in their memorial photographs, and quite a good part of the interview was taken up by reminiscent anecdote of Carlyle, Meredith, Matthew Arnold, Tennyson, and a host of others—her very abstractedness was a recommendation. She only asked, she said, to be allowed to sit quiet in the sun and remember. That was all Mrs. Arbuthnot and Mrs. Wilkins asked of their sharers. It was their idea of a perfect sharer that she should sit quiet in the sun and remember, rousing herself on Saturday evenings sufficiently to pay her share. Mrs. Fisher was very fond, too, she said, of flowers, and once when she was spending a week-end with her father at Box Hill—

“Who lived at Box Hill?” interrupted Mrs. Wilkins, who hung on Mrs. Fisher’s reminiscences, intensely excited by meeting somebody who had actually been familiar with all the really and truly and undoubtedly great—actually seen them, heard them talking, touched them.

Mrs. Fisher looked at her over the top of her glasses in some surprise. Mrs. Wilkins, in her eagerness to tear the heart out quickly of Mrs. Fisher’s reminiscences, afraid that at any moment Mrs. Arbuthnot would take her away and she wouldn’t have heard half, had already interrupted several times with questions which appeared ignorant to Mrs. Fisher.

“Meredith of course,” said Mrs. Fisher rather shortly. “I remember a particular week-end”—she continued. “My father often took me, but I always remember this week-end particularly—”

“Did you know Keats?” eagerly interrupted Mrs. Wilkins.

Mrs. Fisher, after a pause, said with sub-acid reserve that she had been unacquainted with both Keats and Shakespeare.

“Oh of course—how ridiculous of me!” cried Mrs. Wilkins, flushing scarlet. “It’s because”—she floundered—“it’s because the immortals somehow still seem alive, don’t they—as if they were here, going to walk into the room in another minute—and one forgets they are dead. In fact one knows perfectly well that they’re not dead—not nearly so dead as you and I even now,” she assured Mrs. Fisher, who observed her over the top of her glasses.

“I thought I _saw_ Keats the other day,” Mrs. Wilkins incoherently proceeded, driven on by Mrs. Fisher’s look over the top of her glasses. “In Hampstead—crossing the road in front of that house—you know—the house where he lived—”

Mrs. Arbuthnot said they must be going.

Mrs. Fisher did nothing to prevent them.

“I _really_ thought I saw him,” protested Mrs. Wilkins, appealing for belief first to one and then to the other while waves of colour passed over her face, and totally unable to stop because of Mrs. Fisher’s glasses and the steady eyes looking at her over their tops. “I believe I _did_ see him—he was dressed in a—”

Even Mrs. Arbuthnot looked at her now, and in her gentlest voice said they would be late for lunch.

It was at this point that Mrs. Fisher asked for references. She had no wish to find herself shut up for four weeks with somebody who saw things. It is true that there were three sitting-rooms, besides the garden and the battlements at San Salvatore, so that there would be opportunities of withdrawal from Mrs. Wilkins; but it would be disagreeable to Mrs. Fisher, for instance, if Mrs. Wilkins were suddenly to assert that she saw Mr. Fisher. Mr. Fisher was dead; let him remain so. She had no wish to be told he was walking about the garden. The only reference she really wanted, for she was much too old and firmly seated in her place in the world for questionable associates to matter to her, was one with regard to Mrs. Wilkins’s health. Was her health quite normal? Was she an ordinary, everyday, sensible woman? Mrs. Fisher felt that if she were given even one address she would be able to find out what she needed. So she asked for references, and her visitors appeared to be so much taken aback—Mrs. Wilkins, indeed, was instantly sobered—that she added, “It is usual.”

Mrs. Wilkins found her speech first. “But,” she said, “aren’t we the ones who ought to ask for some from you?”

And this seemed to Mrs. Arbuthnot too the right attitude. Surely it was they who were taking Mrs. Fisher into their party, and not Mrs. Fisher who was taking them into it?

For answer Mrs. Fisher, leaning on her stick, went to the writing-table and in a firm hand wrote down three names and offered them to Mrs. Wilkins, and the names were so respectable, more, they were so momentous, they were so nearly august, that just to read them was enough. The President of the Royal Academy, the Archbishop of Canterbury, and the Governor of the Bank of England—who would dare disturb such personages in their meditations with inquiries as to whether a female friend of theirs was all she should be?

“They have known me since I was little,” said Mrs. Fisher—everybody seemed to have known Mrs. Fisher since or when she was little.

“I don’t think references are nice things at all between—between ordinary decent women,” burst out Mrs. Wilkins, made courageous by being, as she felt, at bay; for she very well knew that the only reference she could give without getting into trouble was Shoolbred, and she had little confidence in that, as it would be entirely based on Mellersh’s fish. “We’re not business people. We needn’t distrust each other—”

And Mrs. Arbuthnot said, with a dignity that yet was sweet, “I’m afraid references do bring an atmosphere into our holiday plan that isn’t quite what we want, and I don’t think we’ll take yours up or give you any ourselves. So that I suppose you won’t wish to join us.”

And she held out her hand in good-bye.

Then Mrs. Fisher, her gaze diverted to Mrs. Arbuthnot, who inspired trust and liking even in Tube officials, felt that she would be idiotic to lose the opportunity of being in Italy in the particular conditions offered, and that she and this calm-browed woman between them would certainly be able to curb the other one when she had her attacks. So she said, taking Mrs. Arbuthnot’s offered hand, “Very well. I waive references.”

She waived references.

The two as they walked to the station in Kensington High Street could not help thinking that this way of putting it was lofty. Even Mrs. Arbuthnot, spendthrift of excuses for lapses, thought Mrs. Fisher might have used other words; and Mrs. Wilkins, by the time she got to the station, and the walk and the struggle on the crowded pavement with other people's umbrellas had warmed her blood, actually suggested waiving Mrs. Fisher.

"If there is any waiving to be done, do let us be the ones who waive," she said eagerly.

But Mrs. Arbuthnot, as usual, held on to Mrs. Wilkins; and presently, having cooled down in the train, Mrs. Wilkins announced that at San Salvatore Mrs. Fisher would find her level. "I see her finding her level there," she said, her eyes very bright.

Whereupon Mrs. Arbuthnot, sitting with her quiet hands folded, turned over in her mind how best she could help Mrs. Wilkins not to see quite so much; or at least, if she must see, to see in silence.

Chapter 4

It had been arranged that Mrs. Arbuthnot and Mrs. Wilkins, travelling together, should arrive at San Salvatore on the evening of March 31st—the owner, who told them how to get there, appreciated their disinclination to begin their time in it on April 1st—and Lady Caroline and Mrs. Fisher, as yet unacquainted and therefore under no obligations to bore each other on the journey, for only towards the end would they find out by a process of sifting who they were, were to arrive on the morning of April 2nd. In this way everything would be got nicely ready for the two who seemed, in spite of the equality of the sharing, yet to have something about them of guests.

There were disagreeable incidents towards the end of March, when Mrs. Wilkins, her heart in her mouth and her face a mixture of guilt, terror and determination, told her husband that she had been invited to Italy, and he declined to believe it. Of course he declined to believe it. Nobody had ever invited his wife to Italy before. There was no precedent. He required proofs. The only proof was Mrs. Arbuthnot, and Mrs. Wilkins had produced her; but after what entreaties, what passionate persuading! Mrs. Arbuthnot had not imagined she would have to face Mr. Wilkins and say things to him that were short of the truth, and it brought home to her what she had for some time suspected, that she was slipping more and more away from God.

Indeed, the whole of March was filled with unpleasant, anxious moments. It was an uneasy month. Mrs. Arbuthnot's conscience, made super-sensitive by years of pampering, could not reconcile what she was doing with its own high standard of what was right. It gave her little peace. It nudged her at her prayers. It punctuated her entreaties for divine guidance with disconcerting questions, such as, "Are you not a hypocrite? Do you really mean that? Would you not, frankly, be disappointed if that prayer were granted?"

The prolonged wet, raw weather was on the side too of her conscience, producing far more sickness than usual among the poor. They had bronchitis; they had fevers; there was no end to the distress. And here she was going off, spending precious money on going off, simply and solely to be happy. One woman. One woman being happy, and these piteous multitudes . . .

She was unable to look the vicar in the face. He did not know, nobody knew, what she was going to do, and from the very beginning she was unable to look anybody in the face. She excused herself from making speeches appealing for money. How could she stand up and ask people for money when she herself was spending so much on her own selfish pleasure? Nor did it help her or quiet her that, having actually told Frederick, in her desire to make up for what she was squandering, that she would be grateful if he would let her have some money, he instantly gave her a cheque for £100. He asked no questions. She was scarlet. He looked at her a moment and then looked away. It was a relief to Frederick that she should take some money. She gave it all immediately to the organisation she worked with, and found herself more tangled in doubts than ever.

Mrs. Wilkins, on the contrary, had no doubts. She was quite certain that it was a most proper thing to have a holiday, and altogether right and beautiful to spend one's own hard-collected savings on being happy.

"Think how much nicer we shall be when we come back," she said to Mrs. Arbuthnot, encouraging that pale lady.

No, Mrs. Wilkins had no doubts, but she had fears; and March was for her too an anxious month, with the unconscious Mr. Wilkins coming back daily to his dinner and eating his fish in the silence of imagined security.

Also things happen so awkwardly. It really is astonishing, how awkwardly they happen. Mrs. Wilkins, who was very careful all this month to give Mellersh only the food he liked, buying it and hovering over its cooking with a zeal more than common, succeeded so well that Mellersh was pleased; definitely pleased; so much pleased that he began to think that he might, after all, have married the right wife instead of, as he had frequently suspected, the wrong one. The result was that on the third Sunday in the month—Mrs. Wilkins had made up her trembling mind that on the fourth Sunday, there being five in that March and it being on the fifth of them that she and Mrs. Arbuthnot were to start, she would tell Mellersh of her invitation—on the third Sunday, then, after a very well-cooked lunch in which the Yorkshire pudding had melted in his mouth and the apricot tart had been so perfect that he ate it all, Mellersh, smoking his cigar by the brightly burning fire the while hail gusts banged on the window, said: “I am thinking of taking you to Italy for Easter.” And paused for her astounded and grateful ecstasy.

None came. The silence in the room, except for the hail hitting the windows and the gay roar of the fire, was complete. Mrs. Wilkins could not speak. She was dumbfounded. The next Sunday was the day she had meant to break her news to him, and she had not yet even prepared the form of words in which she would break it.

Mr. Wilkins, who had not been abroad since before the war, and was noticing with increasing disgust, as week followed week of wind and rain, the peculiar persistent vileness of the weather, had slowly conceived a desire to get away from England for Easter. He was doing very well in his business. He could afford a trip. Switzerland was useless in April. There was a familiar sound about Easter in Italy. To Italy he would go; and as it would cause comment if he did not take his wife, take her he must—besides, she would be useful; a second person was always useful in a country whose language one did not speak for holding things, for waiting with the luggage.

He had expected an explosion of gratitude and excitement. The absence of it was incredible. She could not, he concluded, have heard. Probably she was absorbed in some foolish day-dream. It was regrettable how childish she remained.

He turned his head—their chairs were in front of the fire—and looked at her. She was staring straight into the fire, and it was no doubt the fire that made her face so red.

“I am thinking,” he repeated, raising his clear, cultivated voice and speaking with acerbity, for inattention at such a moment was deplorable, “of taking you to Italy for Easter. Did you not hear me?”

Yes, she had heard him, and she had been wondering at the extraordinary coincidence—really most extraordinary—she was just going to tell him how—how she had been invited—a friend had invited her—Easter, too—Easter was in April, wasn’t it?—her friend had a—had a house there.

In fact Mrs. Wilkins, driven by terror, guilt and surprise, had been more incoherent if possible than usual.

It was a dreadful afternoon. Mellersh, profoundly indignant, besides having his intended treat coming back on him like a blessing to roost, cross-examined her with the utmost severity. He demanded that she refuse the invitation. He demanded that, since she had so outrageously accepted it without consulting him, she should write and cancel her acceptance. Finding himself up against an unsuspected, shocking rock of obstinacy in her, he then declined to believe she had been invited to Italy at all. He declined to believe in this Mrs. Arbuthnot, of whom till that moment he had never heard; and it was only when the gentle creature was brought round—with such difficulty, with such a desire on her part to throw the whole thing up rather than tell Mr. Wilkins less than the truth—and herself endorsed his wife’s statements that he was able to give them credence. He could not but believe Mrs. Arbuthnot. She produced the precise effect on him that she did on Tube officials. She hardly needed to say anything. But that made no difference to her conscience, which knew and would not let her forget that she had given him an incomplete impression. “Do you,” asked her conscience, “see any real difference between an incomplete impression and a completely stated lie? God sees none.”

The remainder of March was a confused bad dream. Both Mrs. Arbuthnot and Mrs. Wilkins were shattered; try as they would not to, both felt extraordinarily guilty; and when on the morning of the 30th they did finally get off there was no exhilaration about the departure, no holiday feeling at all.

“We’ve been too good—_much_ too good,” Mrs. Wilkins kept on murmuring as they walked up and down the platform at Victoria, having arrived there an hour before they need have, “and that’s why we feel as though we’re doing wrong. We’re brow-beaten—we’re not any longer real human beings. Real human beings aren’t ever as good as we’ve been. Oh”—she clenched her thin hands—“to _think_ that we ought to be so happy now, here on the very station, actually starting, and we’re not, and it’s being spoilt for us just simply because we’ve spoilt _them!_ What have we done—what have we done, I should like to know,” she

inquired of Mrs. Arbuthnot indignantly, “except for once want to go away by ourselves and have a little rest from _them?_”

Mrs. Arbuthnot, patiently pacing, did not ask who she meant by _them_, because she knew. Mrs. Wilkins meant their husbands, persisting in her assumption that Frederick was as indignant as Mellersh over the departure of his wife, whereas Frederick did not even know his wife had gone.

Mrs. Arbuthnot, always silent about him, had said nothing of this to Mrs. Wilkins. Frederick went too deep into her heart for her to talk about him. He was having an extra bout of work finishing another of those dreadful books, and had been away practically continually the last few weeks, and was away when she left. Why should she tell him beforehand? Sure as she so miserably was that he would have no objection to anything she did, she merely wrote him a note and put it on the hall-table ready for him if and when he should come home. She said she was going for a month’s holiday as she needed a rest and she had not had one for so long, and that Gladys, the efficient parlourmaid, had orders to see to his comforts. She did not say where she was going; there was no reason why she should; he would not be interested, he would not care.

The day was wretched, blustering and wet; the crossing was atrocious, and they were very sick. But after having been very sick, just to arrive at Calais and not be sick was happiness, and it was there that the real splendour of what they were doing first began to warm their benumbed spirits. It got hold of Mrs. Wilkins first, and spread from her like a rose-coloured flame over her pale companion. Mellersh at Calais, where they restored themselves with soles because of Mrs. Wilkins’s desire to eat a sole Mellersh wasn’t having—Mellersh at Calais had already begun to dwindle and seem less important. None of the French porters knew him; not a single official at Calais cared a fig for Mellersh. In Paris there was no time to think of him because their train was late and they only just caught the Turin train at the Gare de Lyons; and by the afternoon of the next day when they got into Italy, England, Frederick, Mellersh, the vicar, the poor, Hampstead, the club, Shoolbred, everybody and everything, the whole inflamed sore dreariness, had faded to the dimness of a dream.

Chapter 5

It was cloudy in Italy, which surprised them. They had expected brilliant sunshine. But never mind: it was Italy, and the very clouds looked fat. Neither of them had ever been there before. Both gazed out of the windows with rapt faces. The hours flew as long as it was daylight, and after that there was the excitement of getting nearer, getting quite near, getting there. At Genoa it had begun to rain—Genoa! Imagine actually being at Genoa, seeing its name written up in the station just like any other name—at Nervi it was pouring, and when at last towards midnight, for again the train was late, they got to Mezzago, the rain was coming down in what seemed solid sheets. But it was Italy. Nothing it did could be bad. The very rain was different—straight rain, falling properly on to one’s umbrella; not that violently blowing English stuff that got in everywhere. And it did leave off; and when it did, behold the earth would be strewn with roses.

Mr. Briggs, San Salvatore’s owner, had said, “You get out at Mezzago, and then you drive.” But he had forgotten what he amply knew, that trains in Italy are sometimes late, and he had imagined his tenants arriving at Mezzago at eight o’clock and finding a string of flys to choose from.

The train was four hours late, and when Mrs. Arbuthnot and Mrs. Wilkins scrambled down the ladder-like high steps of their carriage into the black downpour, their skirts sweeping off great pools of sooty wet because their hands were full of suit-cases, if it had not been for the vigilance of Domenico, the gardener at San Salvatore, they would have found nothing for them to drive in. All ordinary flys had long since gone home. Domenico, foreseeing this, had sent his aunt’s fly, driven by her son his cousin; and his aunt and her fly lived in Castagneto, the village crouching at the feet of San Salvatore, and therefore, however late the train was, the fly would not dare come home without containing that which it had been sent to fetch.

Domenico’s cousin’s name was Beppo, and he presently emerged out of the dark where Mrs. Arbuthnot and Mrs. Wilkins stood, uncertain what to do next after the train had gone on, for they could see no porter and they thought from the feel of it that they were standing not so much on a platform as in the middle of the permanent way.

Beppo, who had been searching for them, emerged from the dark with a kind of pounce and talked Italian to them vociferously. Beppo was a most respectable young man, but he did not look as if he were, especially not in the dark, and he had a dripping hat slouched over one eye. They did not like the way he seized their suit-cases. He could not be, they thought, a porter. However, they presently from out of his streaming talk discerned the words San Salvatore, and after that they kept on saying them to him, for it was the only Italian they knew, as they hurried after him, unwilling to lose sight of their suit-cases, stumbling across rails and

through puddles out to where in the road a small, high fly stood.

Its hood was up, and its horse was in an attitude of thought. They climbed in, and the minute they were in—Mrs. Wilkins, indeed, could hardly be called in—the horse awoke with a start from its reverie and immediately began going home rapidly; without Beppo; without the suit-cases.

Beppo darted after him, making the night ring with his shouts, and caught the hanging reins just in time. He explained proudly, and as it seemed to him with perfect clearness, that the horse always did that, being a fine animal full of corn and blood, and cared for by him, Beppo, as if he were his own son, and the ladies must not be alarmed—he had noticed they were clutching each other; but clear, and loud, and profuse of words though he was, they only looked at him blankly.

He went on talking, however, while he piled the suit-cases up round them, sure that sooner or later they must understand him, especially as he was careful to talk very loud and illustrate everything he said with the simplest elucidatory gestures, but they both continued only to look at him. They both, he noticed sympathetically, had white faces, fatigued faces, and they both had big eyes, fatigued eyes. They were beautiful ladies, he thought, and their eyes, looking at him over the tops of the suit-cases watching his every movement—there were no trunks, only numbers of suit-cases—were like the eyes of the Mother of God. The only thing the ladies said, and they repeated it at regular intervals, even after they had started, gently prodding him as he sat on his box to call his attention to it, was, “San Salvatore?”

And each time he answered vociferously, encouragingly, “_Sì, sì_—San Salvatore.”

“We don’t _know_ of course if he’s taking us there,” said Mrs. Arbuthnot at last in a low voice, after they had been driving as it seemed to them a long while, and had got off the paving-stones of the sleep-shrouded town and were out on a winding road with what they could just see was a low wall on their left beyond which was a great black emptiness and the sound of the sea. On their right was something close and steep and high and black—rocks, they whispered to each other; huge rocks.

“No—we don’t _know_,” agreed Mrs. Wilkins, a slight coldness passing down her spine.

They felt very uncomfortable. It was so late. It was so dark. The road was so lonely. Suppose a wheel came off. Suppose they met Fascisti, or the opposite of Fascisti. How sorry they were now that they had not slept at Genoa and come on the next morning in daylight.

“But that would have been the first of April,” said Mrs. Wilkins, in a low voice.

“It is that now,” said Mrs. Arbuthnot beneath her breath.

“So it is,” murmured Mrs. Wilkins.

They were silent.

Beppo turned round on his box—a disquieting habit already noticed, for surely his horse ought to be carefully watched—and again addressed them with what he was convinced was lucidity—no _patois_, and the clearest explanatory movements.

How much they wished their mothers had made them learn Italian when they were little. If only now they could have said, “Please sit round the right way and look after the horse.” They did not even know what horse was in Italian. It was contemptible to be so ignorant.

In their anxiety, for the road twisted round great jutting rocks, and on their left was only the low wall to keep them out of the sea should anything happen, they too began to gesticulate, waving their hands at Beppo, pointing ahead. They wanted him to turn round again and face his horse, that was all. He thought they wanted him to drive faster; and there followed a terrifying ten minutes during which, as he supposed, he was gratifying them. He was proud of his horse, and it could go very fast. He rose in his seat, the whip cracked, the horse rushed forward, the rocks leaped towards them, the little fly swayed, the suit-cases heaved, Mrs. Arbuthnot and Mrs. Wilkins clung. In this way they continued, swaying, heaving, clattering, clinging, till at a point near Castagneto there was a rise in the road, and on reaching the foot of the rise the horse, who knew every inch of the way, stopped suddenly, throwing everything in the fly into a heap, and then proceeded up at the slowest of walks.

Beppo twisted himself round to receive their admiration, laughing with pride in his horse.

There was no answering laugh from the beautiful ladies. Their eyes, fixed on him, seemed bigger than ever, and their faces against the black of the night showed milky.

But here at least, once they were up the slope, were houses. The rocks left off, and there were houses; the low wall left off, and there were houses; the sea shrunk away, and the sound of it ceased, and the loneliness of the road was finished. No lights anywhere, of course, nobody to see them pass; and yet Beppo, when the houses began, after looking over his shoulder and shouting “Castagneto” at the ladies, once more stood up and cracked his whip and once more made his horse dash forward.

“We shall be there in a minute,” Mrs. Arbuthnot said to herself, holding on.

“We shall soon stop now,” Mrs. Wilkins said to herself, holding on. They said nothing aloud, because nothing would have been heard above the whip-cracking and the wheel-clattering and the boisterous inciting noises Beppo was making at his horse.

Anxiously they strained their eyes for any sight of the beginning of San Salvatore.

They had supposed and hoped that after a reasonable amount of village a mediaeval archway would loom upon them, and through it they would drive into a garden and draw up at an open, welcoming door, with light streaming from it and those servants standing in it who, according to the advertisement, remained.

Instead the fly suddenly stopped.

Peering out they could see they were still in the village street, with small dark houses each side; and Beppo, throwing the reins over the horse’s back as if completely confident this time that he would not go any farther, got down off his box. At the same moment, springing as it seemed out of nothing, a man and several half-grown boys appeared on each side of the fly and began dragging out the suit-cases.

“No, no—San Salvatore, San Salvatore”—exclaimed Mrs. Wilkins, trying to hold on to what suit-cases she could.

“_Sì, sì_—San Salvatore,” they all shouted, pulling.

“This _can’t_ be San Salvatore,” said Mrs. Wilkins, turning to Mrs. Arbuthnot, who sat quite still watching her suit-cases being taken from her with the same patience she applied to lesser evils. She knew she could do nothing if these men were wicked men determined to have her suit-cases.

“I don’t think it can be,” she admitted, and could not refrain from a moment’s wonder at the ways of God. Had she really been brought here, she and poor Mrs. Wilkins, after so much trouble in arranging it, so much difficulty and worry, along such devious paths of prevarication and deceit, only to be—

She checked her thoughts, and gently said to Mrs. Wilkins, while the ragged youths disappeared with the suit-cases into the night and the man with the lantern helped Beppo pull the rug off her, that they were both in God’s hands; and for the first time on hearing this, Mrs. Wilkins was afraid.

There was nothing for it but to get out. Useless to try to go on sitting in the fly repeating San Salvatore. Every time they said it, and their voices each time were fainter, Beppo and the other man merely echoed it in a series of loud shouts. If only they had learned Italian when they were little. If only they could have said, “We wish to be driven to the door.” But they did not even know what door was in Italian. Such ignorance was not only contemptible, it was, they now saw, definitely dangerous. Useless, however, to lament it now. Useless to put off whatever it was that was going to happen to them by trying to go on sitting in the fly. They therefore got out.

The two men opened their umbrellas for them and handed them to them. From this they received a faint encouragement, because they could not believe that if these men were wicked they would pause to open umbrellas. The man with the lantern then made signs to them to follow him, talking loud and quickly, and Beppo, they noticed, remained behind. Ought they to pay him? Not, they thought, if they were going to be robbed and perhaps murdered. Surely on such an occasion one did not pay. Besides, he had not after all brought them to San Salvatore. Where they had got to was evidently somewhere else. Also, he did not show the least wish to be paid; he let them go away into the night with no clamour at all. This, they could not help thinking, was a bad sign. He asked for nothing because presently he was to get so much.

They came to some steps. The road ended abruptly in a church and some descending steps. The man held the lantern low for them to see the steps.

“San Salvatore?” said Mrs. Wilkins once again, very faintly, before committing herself to the steps. It was useless to mention it now, of course, but she could not go down steps in complete silence. No mediaeval castle, she was sure, was ever built at the bottom of steps.

Again, however, came the echoing shout—“_Sì, sì_—San Salvatore.”

They descended gingerly, holding up their skirts just as if they would be wanting them another time and had not in all probability finished with skirts for ever.

The steps ended in a steeply sloping path with flat stone slabs down the middle. They slipped a good deal on these wet slabs, and the man with the lantern, talking loud and quickly, held them up. His way of holding them up was polite.

“Perhaps,” said Mrs. Wilkins in a low voice to Mrs. Arbuthnot, “It is all right after all.”

“We’re in God’s hands,” said Mrs. Arbuthnot again; and again Mrs. Wilkins was afraid.

They reached the bottom of the sloping path, and the light of the lantern flickered over an open space with houses round three sides. The sea was the fourth side, lazily washing backwards and forwards on pebbles.

“San Salvatore,” said the man pointing with his lantern to a black mass curved round the water like an arm flung about it.

They strained their eyes. They saw the black mass, and on the top of it a light.

“San Salvatore?” they both repeated incredulously, for where were the suit-cases, and why had they been forced to get out of the fly?

“_Sì, sì_—San Salvatore.”

They went along what seemed to be a quay, right on the edge of the water. There was not even a low wall here—nothing to prevent the man with the lantern tipping them in if he wanted to. He did not, however, tip them in. Perhaps it was all right after all, Mrs. Wilkins again suggested to Mrs. Arbuthnot on noticing this, who this time was herself beginning to think that it might be, and said no more about God’s hands.

The flicker of the lantern danced along, reflected in the wet pavement of the quay. Out to the left, in the darkness and evidently at the end of a jetty, was a red light. They came to an archway with a heavy iron gate. The man with the lantern pushed the gate open. This time they went up steps instead of down, and at the top of them was a little path that wound upwards among flowers. They could not see the flowers, but the whole place was evidently full of them.

It here dawned on Mrs. Wilkins that perhaps the reason why the fly had not driven them up to the door was that there was no road, only a footpath. That also would explain the disappearance of the suit-cases. She began to feel confident that they would find their suit-cases waiting for them when they got up to the top. San Salvatore was, it seemed, on the top of a hill, as a mediaeval castle should be. At a turn of the path they saw above them, much nearer now and shining more brightly, the light they had seen from the quay. She told Mrs. Arbuthnot of her dawning belief, and Mrs. Arbuthnot agreed that it was very likely a true one.

Once more, but this time in a tone of real hopefulness, Mrs. Wilkins said, pointing upwards at the black outline against the only slightly less black sky, “San Salvatore?” And once more, but this time comfortingly, encouragingly, came back the assurance, “_Sì, sì_—San Salvatore.”

They crossed a little bridge, over what was apparently a ravine, and then came a flat bit with long grass at the sides and more flowers. They felt the grass flicking wet against their stockings, and the invisible flowers were everywhere. Then up again through trees, along a zigzag path with the smell all the way of the flowers they could not see. The warm rain was bringing out all the sweetness. Higher and higher they went in this sweet darkness, and the red light on the jetty dropped farther and farther below them.

The path wound round to the other side of what appeared to be a little peninsula; the jetty and the red light disappeared; across the emptiness on their left were distant lights.

“Mezzago,” said the man, waving his lantern at the lights.

“_Sì, sì_,” they answered, for they had by now learned “_sì, sì_”. Upon which the man congratulated them in a great flow of polite words, not one of which they understood, on their magnificent Italian; for this was Domenico, the vigilant and accomplished gardener of San Salvatore, the prop and stay of the establishment, the resourceful, the gifted, the eloquent, the courteous, the intelligent Domenico. Only they did not know that yet; and he did in the dark, and even sometimes in the light, look, with his knife-sharp swarthy features and swift, panther movements, very like somebody wicked.

They passed along another flat bit of path, with a black shape like a high wall towering above them on their right, and then the path went up again under trellises, and trailing sprays of scented things caught at them and shook raindrops on them, and the light of the lantern flickered over lilies, and then came a flight of ancient steps worn with centuries, and then another iron gate, and then they were inside, though still climbing a twisting flight of stone steps with old walls on either side like the walls of dungeons, and with a vaulted roof.

At the top was a wrought-iron door, and through it shone a flood of electric light.

“_Ecco_,” said Domenico, lithely running up the last few steps ahead and pushing the door open.

And there they were, arrived; and it was San Salvatore; and their suit-cases were waiting for them; and they had not been murdered.

They looked at each other’s white faces and blinking eyes very solemnly.

It was a great, a wonderful moment. Here they were, in their mediaeval castle at last. Their feet touched its stones.

Mrs. Wilkins put her arm round Mrs. Arbuthnot’s neck and kissed her.

“The first thing to happen in this house,” she said softly, solemnly, “shall be a kiss.”

“Dear Lotty,” said Mrs. Arbuthnot.

“Dear Rose,” said Mrs. Wilkins, her eyes brimming with gladness.

Domenico was delighted. He liked to see beautiful ladies kiss. He made them a most appreciative speech of welcome, and they stood arm in arm, holding each other up, for they were very tired, blinking smilingly at him, and not understanding a word.

Chapter 6

When Mrs. Wilkins woke next morning she lay in bed a few minutes before getting up and opening the shutters. What would she see out of her window? A shining world, or a world of rain? But it would be beautiful; whatever it was would be beautiful.

She was in a little bedroom with bare white walls and a stone floor and sparse old furniture. The beds—there were two—were made of iron, enamelled black and painted with bunches of gay flowers. She lay putting off the great moment of going to the window as one puts off opening a precious letter, gloating over it. She had no idea what time it was; she had forgotten to wind up her watch ever since, centuries ago, she last went to bed in Hampstead. No sounds were to be heard in the house, so she supposed it was very early, yet she felt as if she had slept a long while—so completely rested, so perfectly content. She lay with her arms clasped round her head thinking how happy she was, her lips curved upwards in a delighted smile. In bed by herself: adorable condition. She had not been in a bed without Mellersh once now for five whole years; and the cool roominess of it, the freedom of one’s movements, the sense of recklessness, of audacity, in giving the blankets a pull if one wanted to, or twitching the pillows more comfortably! It was like the discovery of an entirely new joy.

Mrs. Wilkins longed to get up and open the shutters, but where she was was really so very delicious. She gave a sigh of contentment, and went on lying there looking round her, taking in everything in her room, her own little room, her very own to arrange just as she pleased for this one blessed month, her room bought with her own savings, the fruit of her careful denials, whose door she could bolt if she wanted to, and nobody had the right to come in. It was such a strange little room, so different from any she had known, and so sweet. It was like a cell. Except for the two beds, it suggested a happy austerity. “And the name of the chamber,” she thought, quoting and smiling round at it, “was Peace.”

Well, this was delicious, to lie there thinking how happy she was, but outside those shutters it was more delicious still. She jumped up, pulled on her slippers, for there was nothing on the stone floor but one small rug, ran to the window and threw open the shutters.

"_Oh!_" cried Mrs. Wilkins.

All the radiance of April in Italy lay gathered together at her feet. The sun poured in on her. The sea lay asleep in it, hardly stirring. Across the bay the lovely mountains, exquisitely different in colour, were asleep too in the light; and underneath her window, at the bottom of the flower-starred grass slope from which the wall of the castle rose up, was a great cypress, cutting through the delicate blues and violets and rose-colours of the mountains and the sea like a great black sword.

She stared. Such beauty; and she there to see it. Such beauty; and she alive to feel it. Her face was bathed in light. Lovely scents came up to the window and caressed her. A tiny breeze gently lifted her hair. Far out in the bay a cluster of almost motionless fishing boats hovered like a flock of white birds on the tranquil sea. How beautiful, how beautiful. Not to have died before this . . . to have been allowed to see, breathe, feel this. . . . She stared, her lips parted. Happy? Poor, ordinary, everyday word. But what could one say, how could one describe it? It was as though she could hardly stay inside herself, it was as though she were too small to hold so much of joy, it was as though she were washed through with light. And how astonishing to feel this sheer bliss, for here she was, not doing and not going to do a single unselfish thing, not going to do a thing she didn't want to do. According to everybody she had ever come across she ought at least to have twinges. She had not one twinge. Something was wrong somewhere. Wonderful that at home she should have been so good, so terribly good, and merely felt tormented. Twinges of every sort had there been her portion; aches, hurts, discouragements, and she the whole time being steadily unselfish. Now she had taken off all her goodness and left it behind her like a heap of rain-sodden clothes, and she only felt joy. She was naked of goodness, and was rejoicing in being naked. She was stripped, and exulting. And there, away in the dim mugginess of Hampstead, was Mellersh being angry.

She tried to visualise Mellersh, she tried to see him having breakfast and thinking bitter things about her; and lo, Mellersh himself began to shimmer, became rose-colour, became delicate violet, became an enchanting blue, became formless, became iridescent. Actually Mellersh, after quivering a minute, was lost in light.

"_Well_," thought Mrs. Wilkins, staring, as it were, after him. How extraordinary not to be able to visualise Mellersh; and she who used to know every feature, every expression of his by heart. She simply could not see him as he was. She could only see him resolved into beauty, melted into harmony with everything else. The familiar words of the General Thanksgiving came quite naturally into her mind, and she found herself blessing God for her creation, preservation, and all the blessings of this life, but above all for His inestimable Love; out loud; in a burst of acknowledgment. While Mellersh, at that moment angrily pulling on his boots before going out into the dripping streets, was indeed thinking bitter things about her.

She began to dress, choosing clean white clothes in honour of the summer's day, unpacking her suit-cases, tidying her adorable little room. She moved about with quick, purposeful steps, her long thin body held up straight, her small face, so much puckered at home with effort and fear, smoothed out. All she had been and done before this morning, all she had felt and worried about, was gone. Each of her worries behaved as the image of Mellersh had behaved, and dissolved into colour and light. And she noticed things she had not noticed for years—when she was doing her hair in front of the glass she noticed it, and thought, "Why, what pretty stuff." For years she had forgotten she had such a thing as hair, plaiting it in the evening and unplaiting it in the morning with the same hurry and indifference with which she laced and unlaced her shoes. Now she suddenly saw it, and she twisted it round her fingers before the glass, and was glad it was so pretty. Mellersh couldn't have seen it either, for he had never said a word about it. Well, when she got home she would draw his attention to it. "Mellersh," she would say, "look at my hair. Aren't you pleased you've got a wife with hair like curly honey?"

She laughed. She had never said anything like that to Mellersh yet, and the idea of it amused her. But why had she not? Oh yes—she used to be afraid of him. Funny to be afraid of anybody; and especially of one's husband, whom one saw in his more simplified moments, such as asleep, and not breathing properly through his nose.

When she was ready she opened her door to go across to see if Rose, who had been put the night before by a sleepy maidservant into a cell opposite, were awake. She would say good-morning to her, and then she would run down and stay with that cypress tree till breakfast was ready, and after breakfast she wouldn't so much as look out of a window till she had helped Rose get everything ready for Lady Caroline and Mrs. Fisher. There was much to be done that day, settling in, arranging the rooms; she mustn't leave

Rose to do it alone. They would make it all so lovely for the two to come, have such an entrancing vision ready for them of little cells bright with flowers. She remembered she had wanted Lady Caroline not to come; fancy wanting to shut some one out of heaven because she thought she would be shy of her! And as though it mattered if she were, and as though she would be anything so self-conscious as shy. Besides, what a reason. She could not accuse herself of goodness over that. And she remembered she had wanted not to have Mrs. Fisher either, because she had seemed lofty. How funny of her. So funny to worry about such little things, making them important.

The bedrooms and two of the sitting-rooms at San Salvatore were on the top floor, and opened into a roomy hall with a wide glass window at the north end. San Salvatore was rich in small gardens in different parts and on different levels. The garden this window looked down on was made on the highest part of the walls, and could only be reached through the corresponding spacious hall on the floor below. When Mrs. Wilkins came out of her room this window stood wide open, and beyond it in the sun was a Judas tree in full flower. There was no sign of anybody, no sound of voices or feet. Tubs of arum lilies stood about on the stone floor, and on a table flamed a huge bunch of fierce nasturtiums. Spacious, flowery, silent, with the wide window at the end opening into the garden, and the Judas tree absurdly beautiful in the sunshine, it seemed to Mrs. Wilkins, arrested on her way across to Mrs. Arbuthnot, too good to be true. Was she really going to live in this for a whole month? Up to now she had had to take what beauty she could as she went along, snatching at little bits of it when she came across it—a patch of daisies on a fine day in a Hampstead field, a flash of sunset between two chimney pots. She had never been in definitely, completely beautiful places. She had never been even in a venerable house; and such a thing as a profusion of flowers in her rooms was unattainable to her. Sometimes in the spring she had bought six tulips at Shoolbred's, unable to resist them, conscious that Mellersh if he knew what they had cost would think it inexcusable; but they had soon died, and then there were no more. As for the Judas tree, she hadn't an idea what it was, and gazed at it out there against the sky with the rapt expression of one who sees a heavenly vision.

Mrs. Arbuthnot, coming out of her room, found her there like that, standing in the middle of the hall staring.

"Now what does she think she sees now?" thought Mrs. Arbuthnot.

"We _are_ in God's hands," said Mrs. Wilkins, turning to her, speaking with extreme conviction.

"Oh!" said Mrs. Arbuthnot quickly, her face, which had been covered with smiles when she came out of her room, falling. "Why, what has happened?"

For Mrs. Arbuthnot had woken up with such a delightful feeling of security, of relief, and she did not want to find she had not after all escaped from the need of refuge. She had not even dreamed of Frederick. For the first time for years she had been spared the nightly dream that he was with her, that they were heart to heart, and its miserable awakening. She had slept like a baby, and had woken up confident; she had found there was nothing she wished to say in her morning prayer except Thank you. It was disconcerting to be told she was after all in God's hands.

"I hope nothing has happened?" she asked anxiously.

Mrs. Wilkins looked at her a moment, and laughed. "How funny," she said, kissing her.

"What is funny?" asked Mrs. Arbuthnot, her face clearing because Mrs. Wilkins laughed.

"We are. This is. Everything. It's all so wonderful. It's so funny and so adorable that we should be in it. I daresay when we finally reach heaven—the one they talk about so much—we shan't find it a bit more beautiful."

Mrs. Arbuthnot relaxed to smiling security again. "Isn't it divine?" she said.

"Were you ever, ever in your life so happy?" asked Mrs. Wilkins, catching her by the arm.

"No," said Mrs. Arbuthnot. Nor had she been; not ever; not even in her first love-days with Frederick. Because always pain had been close at hand in that other happiness, ready to torture with doubts, to torture even with the very excess of her love; while this was the simple happiness of complete harmony with her surroundings, the happiness that asks for nothing, that just accepts, just breathes, just is.

"Let's go and look at that tree close," said Mrs. Wilkins. "I don't believe it can only be a tree."

And arm in arm they went along the hall, and their husbands would not have known them their faces were so young with eagerness, and together they stood at the open window, and when their eyes, having feasted on the marvellous pink thing, wandered farther among the beauties of the garden, they saw sitting on the low wall at the east edge of it, gazing out over the bay, her feet in lilies, Lady Caroline.

They were astonished. They said nothing in their astonishment, but stood quite still, arm in arm, staring down at her.

She too had on a white frock, and her head was bare. They had had no idea that day in London, when her hat was down to her nose and her furs were up to her ears, that she was so pretty. They had merely thought her different from the other women in the club, and so had the other women themselves, and so had all the waitresses, eyeing her sideways and eyeing her again as they passed the corner where she sat talking; but they had had no idea she was so pretty. She was exceedingly pretty. Everything about her was very much that which it was. Her fair hair was very fair, her lovely grey eyes were very lovely and grey, her dark eyelashes were very dark, her white skin was very white, her red mouth was very red. She was extravagantly slender—the merest thread of a girl, though not without little curves beneath her thin frock where little curves should be. She was looking out across the bay, and was sharply defined against the background of empty blue. She was full in the sun. Her feet dangled among the leaves and flowers of the lilies just as if it did not matter that they should be bent or bruised.

“She ought to have a headache,” whispered Mrs. Arbuthnot at last, “sitting there in the sun like that.”

“She ought to have a hat,” whispered Mrs. Wilkins.

“She’s treading on lilies.”

“But they’re hers as much as ours.”

“Only one-fourth of them.”

Lady Caroline turned her head. She looked up at them a moment, surprised to see them so much younger than they had seemed that day at the club, and so much less unattractive. Indeed, they were really almost quite attractive, if any one could ever be really quite attractive in the wrong clothes. Her eyes, swiftly glancing over them, took in every inch of each of them in the half second before she smiled and waved her hand and called out Good-morning. There was nothing, she saw at once, to be hoped for in the way of interest from their clothes. She did not consciously think this, for she was having a violent reaction against beautiful clothes and the slavery they impose on one, her experience being that the instant one had got them they took one in hand and gave one no peace till they had been everywhere and been seen by everybody. You didn’t take your clothes to parties; they took you. It was quite a mistake to think that a woman, a really well-dressed woman, wore out her clothes; it was the clothes that wore out the woman—dragging her about at all hours of the day and night. No wonder men stayed young longer. Just new trousers couldn’t excite them. She couldn’t suppose that even the newest trousers ever behaved like that, taking the bit between their teeth. Her images were disorderly, but she thought as she chose, she used what images she liked. As she got off the wall and came towards the window, it seemed a restful thing to know she was going to spend an entire month with people in dresses made as she dimly remembered dresses used to be made five summers ago.

“I got here yesterday morning,” she said, looking up at them and smiling. She really was bewitching. She had everything, even a dimple.

“It’s a great pity,” said Mrs. Arbuthnot, smiling back, “because we were going to choose the nicest room for you.”

“Oh, but I’ve done that,” said Lady Caroline. “At least, I think it’s the nicest. It looks two ways—I adore a room that looks two ways, don’t you? Over the sea to the west, and over this Judas tree to the north.”

“And we had meant to make it pretty for you with flowers,” said Mrs. Wilkins.

“Oh, Domenico did that. I told him to directly I got here. He’s the gardener. He’s wonderful.”

“It’s a good thing, of course,” said Mrs. Arbuthnot a little hesitatingly, “to be independent, and to know exactly what one wants.”

“Yes, it saves trouble,” agreed Lady Caroline.

“But one shouldn’t be so independent,” said Mrs. Wilkins, “as to leave no opportunity for other people to exercise their benevolences on one.”

Lady Caroline, who had been looking at Mrs. Arbuthnot, now looked at Mrs. Wilkins. That day at that queer club she had had merely a blurred impression of Mrs. Wilkins, for it was the other one who did all the talking, and her impression had been of somebody so shy, so awkward that it was best to take no notice of her. She had not even been able to say good-bye properly, doing it in an agony, turning red, turning damp. Therefore she now looked at her in some surprise; and she was still more surprised when Mrs. Wilkins added, gazing at her with the most obvious sincere admiration, speaking indeed with a conviction that refused to remain unuttered, “I didn’t realise you were _so_ pretty.”

She stared at Mrs. Wilkins. She was not usually told this quite so immediately and roundly. Abundantly as she was used to it—impossible not to be after twenty-eight solid years—it surprised her to be told it with such bluntness, and by a woman.

“It’s very kind of you to think so,” she said.

“Why, you’re lovely,” said Mrs. Wilkins. “Quite, quite lovely.”

“I hope,” said Mrs. Arbuthnot pleasantly, “you make the most of it.”

Lady Caroline then stared at Mrs. Arbuthnot. “Oh yes,” she said. “I make the most of it. I’ve been doing that ever since I can remember.”

“Because,” said Mrs. Arbuthnot, smiling and raising a warning forefinger, “it won’t last.”

Then Lady Caroline began to be afraid these two were originals. If so, she would be bored. Nothing bored her so much as people who insisted on being original, who came and buttonholed her and kept her waiting while they were being original. And the one who admired her—it would be tiresome if she dogged her about in order to look at her. What she wanted of this holiday was complete escape from all she had had before, she wanted the rest of complete contrast. Being admired, being dogged, wasn’t contrast, it was repetition; and as for originals, to find herself shut up with two on the top of a precipitous hill in a mediaeval castle built for the express purpose of preventing easy goings out and in, would not, she was afraid, be especially restful. Perhaps she had better be a little less encouraging. They had seemed such timid creatures, even the dark one—she couldn’t remember their names—that day at the club, that she had felt it quite safe to be very friendly. Here they had come out of their shells; already; indeed, at once. There was no sign of timidity about either of them here. If they had got out of their shells so immediately, at the very first contact, unless she checked them they would soon begin to press upon her, and then good-bye to her dream of thirty restful, silent days, lying unmolested in the sun, getting her feathers smooth again, not being spoken to, not waited on, not grabbed at and monopolised, but just recovering from the fatigue, the deep and melancholy fatigue, of the too much.

Besides, there was Mrs. Fisher. She too must be checked. Lady Caroline had started two days earlier than had been arranged for two reasons: first, because she wished to arrive before the others in order to pick out the room or rooms she preferred, and second, because she judged it likely that otherwise she would have to travel with Mrs. Fisher. She did not want to travel with Mrs. Fisher. She did not want to arrive with Mrs. Fisher. She saw no reason whatever why for a single moment she should have to have anything at all to do with Mrs. Fisher.

But unfortunately Mrs. Fisher also was filled with a desire to get to San Salvatore first and pick out the room or rooms she preferred, and she and Lady Caroline had after all travelled together. As early as Calais they began to suspect it; in Paris they feared it; at Modane they knew it; at Mezzago they concealed it, driving out to Castagneto in two separate flys, the nose of the one almost touching the back of the other the whole way. But when the road suddenly left off at the church and the steps, further evasion was impossible; and faced by this abrupt and difficult finish to their journey there was nothing for it but to amalgamate.

Because of Mrs. Fisher’s stick Lady Caroline had to see about everything. Mrs. Fisher’s intentions, she explained from her fly when the situation had become plain to her, were active, but her stick prevented their being carried out. The two drivers told Lady Caroline boys would have to carry the luggage up to the castle, and she went in search of some, while Mrs. Fisher waited in the fly because of her stick. Mrs. Fisher could speak Italian, but only, she explained, the Italian of Dante, which Matthew Arnold used to read with her when she was a girl, and she thought this might be above the heads of boys. Therefore Lady Caroline, who spoke ordinary Italian very well, was obviously the one to go and do things.

“I am in your hands,” said Mrs. Fisher, sitting firmly in her fly. “You must please regard me as merely an old woman with a stick.”

And presently, down the steps and cobbles to the piazza, and along the quay, and up the zigzag path, Lady Caroline found herself as much obliged to walk slowly with Mrs. Fisher as if she were her own grandmother.

“It’s my stick,” Mrs. Fisher complacently remarked at intervals.

And when they rested at those bends of the zigzag path where seats were, and Lady Caroline, who would have liked to run on and get to the top quickly, was forced in common humanity to remain with Mrs. Fisher because of her stick, Mrs. Fisher told her how she had been on a zigzag path once with Tennyson.

“Isn’t his cricket wonderful?” said Lady Caroline absently.

“_The_ Tennyson,” said Mrs. Fisher, turning her head and observing her a moment over her spectacles.

“Isn’t he?” said Lady Caroline.

“I am speaking,” said Mrs. Fisher, “of Alfred.”

“Oh,” said Lady Caroline.

“And it was a path, too,” Mrs. Fisher went on severely, “curiously like this. No eucalyptus tree, of course, but otherwise curiously like this. And at one of the bends he turned and said to me—I see him now turning and saying to me—”

Yes, Mrs. Fisher would have to be checked. And so would these two up at the window. She had better begin at once. She was sorry she had got off the wall. All she need have done was to have waved her hand, and waited till they came down and out into the garden to her.

So she ignored Mrs. Arbuthnot’s remark and raised forefinger, and said with marked coldness—at least, she tried to make it sound marked—that she supposed they would be going to breakfast, and that she had had hers; but it was her fate that however coldly she sent forth her words they came out sounding quite warm and agreeable. That was because she had a sympathetic and delightful voice, due entirely to some special formation of her throat and the roof of her mouth, and having nothing whatever to do with what she was feeling. Nobody in consequence ever believed they were being snubbed. It was most tiresome. And if she stared icily it did not look icy at all, because her eyes, lovely to begin with, had the added loveliness of very long, soft, dark eyelashes. No icy stare could come out of eyes like that; it got caught and lost in the soft eyelashes, and the persons stared at merely thought they were being regarded with a flattering and exquisite attentiveness. And if ever she was out of humour or definitely cross—and who would not be sometimes in such a world?—she only looked so pathetic that people all rushed to comfort her, if possible by means of kissing. It was more than tiresome, it was maddening. Nature was determined that she should look and sound angelic. She could never be disagreeable or rude without being completely misunderstood.

“I had my breakfast in my room,” she said, trying her utmost to sound curt. “Perhaps I’ll see you later.”

And she nodded, and went back to where she had been sitting on the wall, with the lilies being nice and cool round her feet.

Chapter 7

Their eyes followed her admiringly. They had no idea they had been snubbed. It was a disappointment, of course, to find she had forestalled them and that they were not to have the happiness of preparing for her, of watching her face when she arrived and first saw everything, but there was still Mrs. Fisher. They would concentrate on Mrs. Fisher, and would watch her face instead; only, like everybody else, they would have preferred to watch Lady Caroline’s.

Perhaps, then, as Lady Caroline had talked of breakfast, they had better begin by going and having it, for there was too much to be done that day to spend any more time gazing at the scenery—servants to be interviewed, the house to be gone through and examined, and finally Mrs. Fisher’s room to be got ready and adorned.

They waved their hands gaily at Lady Caroline, who seemed absorbed in what she saw and took no notice, and turning away found the maidservant of the night before had come up silently behind them in cloth slippers with string soles.

She was Francesca, the elderly parlour-maid, who had been with the owner, he had said, for years, and whose presence made inventories unnecessary; and after wishing them good-morning and hoping they had slept well, she told them breakfast was ready in the dining-room on the floor below, and if they would follow her she would lead.

They did not understand a single word of the very many in which Francesca succeeded in clothing this simple information, but they followed her, for it at least was clear that they were to follow, and going down the stairs, and along the broad hall like the one above except for glass doors at the end instead of a window opening into the garden, they were shown into the dining-room; where, sitting at the head of the table having her breakfast, was Mrs. Fisher.

This time they exclaimed. Even Mrs. Arbuthnot exclaimed, though her exclamation was only “Oh.”

Mrs. Wilkins exclaimed at greater length. “Why, but it’s like having the bread taken out of one’s mouth!” exclaimed Mrs. Wilkins.

“How do you do,” said Mrs. Fisher. “I can’t get up because of my stick.” And she stretched out her hand across the table.

They advanced and shook it.

“We had no idea you were here,” said Mrs. Arbuthnot.

“Yes,” said Mrs. Fisher, resuming her breakfast. “Yes. I am here.” And with composure she removed the top of her egg.

“It’s a great disappointment,” said Mrs. Wilkins. “We had meant to give you _such_ a welcome.”

This was the one, Mrs. Fisher remembered, briefly glancing at her, who when she came to Prince of Wales Terrace said she had seen Keats. She must be careful with this one—curb her from the beginning.

She therefore ignored Mrs. Wilkins and said gravely, with a downward face of impenetrable calm bent on her egg, “Yes. I arrived yesterday with Lady Caroline.”

“It’s really dreadful,” said Mrs. Wilkins, exactly as if she had not been ignored. “There’s nobody left to get anything ready for now. I feel thwarted. I feel as if the bread had been taken out of my mouth just when I was going to be happy swallowing it.”

“Where will you sit?” asked Mrs. Fisher of Mrs. Arbuthnot—markedly of Mrs. Arbuthnot; the comparison with the bread seemed to her most unpleasant.

“Oh, thank you—” said Mrs. Arbuthnot, sitting down rather suddenly next to her.

There were only two places she could sit down in, the places laid on either side of Mrs. Fisher. She therefore sat down in one, and Mrs. Wilkins sat down opposite her in the other.

Mrs. Fisher was at the head of the table. Round her was grouped the coffee and the tea. Of course they were all sharing San Salvatore equally, but it was she herself and Lotty, Mrs. Arbuthnot mildly reflected, who had found it, who had had the work of getting it, who had chosen to admit Mrs. Fisher into it. Without them, she could not help thinking, Mrs. Fisher would not have been there. Morally Mrs. Fisher was a guest. There was no hostess in this party, but supposing there had been a hostess it would not have been Mrs. Fisher, nor Lady Caroline, it would have been either herself or Lotty. Mrs. Arbuthnot could not help feeling this as she sat down, and Mrs. Fisher, the hand which Ruskin had wrung suspended over the pots before her, inquired, “Tea or coffee?” She could not help feeling it even more definitely when Mrs. Fisher touched a small gong on the table beside her as though she had been used to that gong and that table ever since she was little, and, on Francesca’s appearing, bade her in the language of Dante bring more milk. There was a curious air about Mrs. Fisher, thought Mrs. Arbuthnot, of being in possession; and if she herself had not been so happy she would have perhaps minded.

Mrs. Wilkins noticed it too, but it only made her discursive brain think of cuckoos. She would no doubt immediately have begun to talk of cuckoos, incoherently, unrestrainably and deplorably, if she had been in the condition of nerves and shyness she was in last time she saw Mrs. Fisher. But happiness had done away with shyness—she was very serene; she could control her conversation; she did not have, horrified, to listen to herself saying things she had no idea of saying when she began; she was quite at her ease, and completely natural. The disappointment of not going to be able to prepare a welcome for Mrs. Fisher had evaporated at once, for it was impossible to go on being disappointed in heaven. Nor did she mind her behaving as hostess. What did it matter? You did not mind things in heaven. She and Mrs. Arbuthnot, therefore, sat down more willingly than they otherwise would have done, one on either side of Mrs. Fisher, and the sun, pouring through the two windows facing east across the bay, flooded the room, and there was an open door leading into the garden, and the garden was full of many lovely things, especially freesias.

The delicate and delicious fragrance of the freesias came in through the door and floated round Mrs. Wilkins’s enraptured nostrils. Freesias in London were quite beyond her. Occasionally she went into a shop and asked what they cost, so as just to have an

excuse for lifting up a bunch and smelling them, well knowing that it was something awful like a shilling for about three flowers. Here they were everywhere—bursting out of every corner and carpeting the rose beds. Imagine it—having freesias to pick in armsful if you wanted to, and with glorious sunshine flooding the room, and in your summer frock, and its being only the first of April!

“I suppose you realise, don’t you, that we’ve got to heaven?” she said, beaming at Mrs. Fisher with all the familiarity of a fellow-angel.

“They are considerably younger than I had supposed,” thought Mrs. Fisher, “and not nearly so plain.” And she mused a moment, while she took no notice of Mrs. Wilkins’s exuberance, on their instant and agitated refusal that day at Prince of Wales Terrace to have anything to do with the giving or the taking of references.

Nothing could affect her, of course; nothing that anybody did. She was far too solidly seated in respectability. At her back stood massively in a tremendous row those three great names she had offered, and they were not the only ones she could turn to for support and countenance. Even if these young women—she had no grounds for believing the one out in the garden to be really Lady Caroline Dester, she had merely been told she was—even if these young women should all turn out to be what Browning used to call—how well she remembered his amusing and delightful way of putting things—Fly-by-Nights, what could it possibly, or in any way matter to her? Let them fly by night if they wished. One was not sixty-five for nothing. In any case there would only be four weeks of it, at the end of which she would see no more of them. And in the meanwhile there were plenty of places where she could sit quietly away from them and remember. Also there was her own sitting-room, a charming room, all honey-coloured furniture and pictures, with windows to the sea towards Genoa, and a door opening on to the battlements. The house possessed two sitting-rooms, and she had explained to that pretty creature Lady Caroline—certainly a pretty creature, whatever else she was; Tennyson would have enjoyed taking her for blows on the downs—who had seemed inclined to appropriate the honey-coloured one, that she needed some little refuge entirely to herself because of her stick.

“Nobody wants to see an old woman hobbling about everywhere,” she had said. “I shall be quite content to spend much of my time by myself in here or sitting out on these convenient battlements.”

And she had a very nice bedroom, too; it looked two ways, across the bay to the morning sun—she liked the morning sun—and onto the garden. There were only two of these bedrooms with cross-views in the house, she and Lady Caroline had discovered, and they were by far the airiest. They each had two beds in them, and she and Lady Caroline had had the extra beds taken out at once and put into two of the other rooms. In this way there was much more space and comfort. Lady Caroline, indeed, had turned hers into a bed-sitting-room, with the sofa out of the bigger drawing-room and the writing-table and the most comfortable chair, but she herself had not had to do that because she had her own sitting-room, equipped with what was necessary. Lady Caroline had thought at first of taking the bigger sitting-room entirely for her own, because the dining-room on the floor below could quite well be used between meals to sit in by the two others, and was a very pleasant room with nice chairs, but she had not liked the bigger sitting-room’s shape—it was a round room in the tower, with deep slit windows pierced through the massive walls, and a domed and ribbed ceiling arranged to look like an open umbrella, and it seemed a little dark. Undoubtedly Lady Caroline had cast covetous glances at the honey-coloured room, and if she, Mrs. Fisher, had been less firm would have installed herself in it. Which would have been absurd.

“I hope,” said Mrs. Arbuthnot, smilingly making an attempt to convey to Mrs. Fisher that though she, Mrs. Fisher, might not be exactly a guest she certainly was not in the very least a hostess, “your room is comfortable.”

“Quite,” said Mrs. Fisher. “Will you have some more coffee?”

“No, thank you. Will you?”

“No, thank you. There were two beds in my bedroom, filling it up unnecessarily, and I had one taken out. It has made it much more convenient.”

“Oh _that’s_ why I’ve got two beds in my room!” exclaimed Mrs. Wilkins, illuminated; the second bed in her little cell had seemed an unnatural and inappropriate object from the moment she saw it.

“I gave no directions,” said Mrs. Fisher, addressing Mrs. Arbuthnot, “I merely asked Francesca to remove it.”

“I have two in my room as well,” said Mrs. Arbuthnot.

“Your second one must be Lady Caroline’s. She had hers removed too,” said Mrs. Fisher. “It seems foolish to have more beds in a room than there are occupiers.”

“But _we_ haven’t got any husbands here either,” said Mrs. Wilkins, “and I don’t see any use in extra beds in one’s room if one hasn’t got husbands to put in them. Can’t we have them taken away too?”

“Beds,” said Mrs. Fisher coldly, “cannot be removed from one room after another. They must remain somewhere.”

Mrs. Wilkins’s remarks seemed to Mrs. Fisher persistently unfortunate. Each time she opened her mouth she said something best left unsaid. Loose talk about husbands had never in Mrs. Fisher’s circle been encouraged. In the ’eighties, when she chiefly flourished, husbands were taken seriously, as the only real obstacles to sin. Beds too, if they had to be mentioned, were approached with caution; and a decent reserve prevented them and husbands ever being spoken of in the same breath.

She turned more markedly than ever to Mrs. Arbuthnot. “Do let me give you a little more coffee,” she said.

“No, thank you. But won’t you have some more?”

“No indeed. I never have more than two cups at breakfast. Would you like an orange?”

“No, thank you. Would you?”

“No, I don’t eat fruit at breakfast. It is an American fashion which I am too old now to adopt. Have you had all you want?”

“Quite. Have you?”

Mrs. Fisher paused before replying. Was this a habit, this trick of answering a simple question with the same question? If so it must be curbed, for no one could live for four weeks in any real comfort with somebody who had a habit.

She glanced at Mrs. Arbuthnot, and her parted hair and gentle brow reassured her. No; it was accident, not habit, that had produced those echoes. She could as soon imagine a dove having tiresome habits as Mrs. Arbuthnot. Considering her, she thought what a splendid wife she would have been for poor Carlyle. So much better than that horrid clever Jane. She would have soothed him.

“Then shall we go?” she suggested.

“Let me help you up,” said Mrs. Arbuthnot, all consideration.

“Oh, thank you—I can manage perfectly. It’s only sometimes that my stick prevents me—”

Mrs. Fisher got up quite easily; Mrs. Arbuthnot had hovered over her for nothing.

“_I’m_ going to have one of these gorgeous oranges,” said Mrs. Wilkins, staying where she was and reaching across to a black bowl piled with them. “Rose, how can you resist them. Look—have this one. Do have this beauty—” And she held out a big one.

“No, I’m going to see to my duties,” said Mrs. Arbuthnot, moving towards the door. “You’ll forgive me for leaving you, won’t you,” she added politely to Mrs. Fisher.

Mrs. Fisher moved towards the door too; quite easily; almost quickly; her stick did not hinder her at all. She had no intention of being left with Mrs. Wilkins.

“What time would you like to have lunch?” Mrs. Arbuthnot asked her, trying to keep her head as at least a non-guest, if not precisely a hostess, above water.

“Lunch,” said Mrs. Fisher, “is at half-past twelve.”

“You shall have it at half-past twelve then,” said Mrs. Arbuthnot. “I’ll tell the cook. It will be a great struggle,” she continued, smiling, “but I’ve brought a little dictionary—”

“The cook,” said Mrs. Fisher, “knows.”

“Oh?” said Mrs. Arbuthnot.

“Lady Caroline has already told her,” said Mrs. Fisher.

“Oh?” said Mrs. Arbuthnot again.

“Yes. Lady Caroline speaks the kind of Italian cooks understand. I am prevented going into the kitchen because of my stick. And even if I were able to go, I fear I shouldn’t be understood.”

“But—” began Mrs. Arbuthnot.

“But it’s _too_ wonderful,” Mrs. Wilkins finished for her from the table, delighted with these unexpected simplifications in her and Rose’s lives. “Why, we’ve got positively nothing to do here, either of us, except just be happy. You wouldn’t believe,” she said, turning her head and speaking straight to Mrs. Fisher, portions of orange in either hand, “how terribly good Rose and I have been for years without stopping, and how much now we need a perfect rest.”

And Mrs. Fisher, going without answering her out of the room, said to herself, “She must, she shall be curbed.”

Chapter 8

Presently, when Mrs. Wilkins and Mrs. Arbuthnot, unhampered by any duties, wandered out and down the worn stone steps and under the pergola into the lower garden, Mrs. Wilkins said to Mrs. Arbuthnot, who seemed pensive, “Don’t you see that if somebody else does the ordering it frees us?”

Mrs. Arbuthnot said she did see, but nevertheless she thought it rather silly to have everything taken out of their hands.

“I love things to be taken out of my hands,” said Mrs. Wilkins.

“But we found San Salvatore,” said Mrs. Arbuthnot, “and it is rather silly that Mrs. Fisher should behave as if it belonged only to her.”

“What is rather silly,” said Mrs. Wilkins with much serenity, “is to mind. I can’t see the least point in being in authority at the price of one’s liberty.”

Mrs. Arbuthnot said nothing to that for two reasons—first, because she was struck by the remarkable and growing calm of the hitherto incoherent and excited Lotty, and secondly because what she was looking at was so very beautiful.

All down the stone steps on either side were periwinkles in full flower, and she could now see what it was that had caught at her the night before and brushed, wet and scented, across her face. It was wistaria. _Wistaria and sunshine_ . . . she remembered the advertisement. Here indeed were both in profusion. The wistaria was tumbling over itself in its excess of life, its prodigality of flowering; and where the pergola ended the sun blazed on scarlet geraniums, bushes of them, and nasturtiums in great heaps, and marigolds so brilliant that they seemed to be burning, and red and pink snapdragons, all outdoing each other in bright, fierce colour. The ground behind these flaming things dropped away in terraces to the sea, each terrace a little orchard, where among the olives grew vines on trellises, and fig-trees, and peach-trees, and cherry-trees. The cherry-trees and peach-trees were in blossom—lovely showers of white and deep rose-colour among the trembling delicacy of the olives; the fig-leaves were just big enough to smell of figs, the vine-buds were only beginning to show. And beneath these trees were groups of blue and purple irises, and bushes of lavender, and grey, sharp cactuses, and the grass was thick with dandelions and daisies, and right down at the bottom was the sea. Colour seemed flung down anyhow, anywhere; every sort of colour, piled up in heaps, pouring along in rivers—the periwinkles looked exactly as if they were being poured down each side of the steps—and flowers that grow only in borders in England, proud flowers keeping themselves to themselves over there, such as the great blue irises and the lavender, were being jostled by small, shining common things like dandelions and daisies and the white bells of the wild onion, and only seemed the better and the more exuberant for it.

They stood looking at this crowd of loveliness, this happy jumble, in silence. No, it didn’t matter what Mrs. Fisher did; not here; not in such beauty. Mrs. Arbuthnot’s discomposure melted out of her. In the warmth and light of what she was looking at, of what to her was a manifestation, an entirely new side of God, how could one be discomposed? If only Frederick were with her, seeing it too, seeing as he would have seen it when first they were lovers, in the days when he saw what she saw and loved what she loved. . .

She sighed.

“You mustn’t sigh in heaven,” said Mrs. Wilkins. “One doesn’t.”

“I was thinking how one longs to share this with those one loves,” said Mrs. Arbuthnot.

“You mustn’t long in heaven,” said Mrs. Wilkins. “You’re supposed to be quite complete there. And it is heaven, isn’t it, Rose? See how everything has been let in together—the dandelions and the irises, the vulgar and the superior, me and Mrs. Fisher—all welcome, all mixed up anyhow, and all so visibly happy and enjoying ourselves.”

“Mrs. Fisher doesn’t seem happy—not visibly, anyhow,” said Mrs. Arbuthnot, smiling.

“She’ll begin soon, you’ll see.”

Mrs. Arbuthnot said she didn’t believe that after a certain age people began anything.

Mrs. Wilkins said she was sure no one, however old and tough, could resist the effects of perfect beauty. Before many days, perhaps only hours, they would see Mrs. Fisher bursting out into every kind of exuberance. “I’m quite sure,” said Mrs. Wilkins, “that we’ve got to heaven, and once Mrs. Fisher realises that that’s where she is, she’s bound to be different. You’ll see. She’ll leave off being ossified, and go all soft and able to stretch, and we shall get quite—why, I shouldn’t be surprised if we get quite fond of her.”

The idea of Mrs. Fisher bursting out into anything, she who seemed so particularly firmly fixed inside her buttons, made Mrs. Arbuthnot laugh. She condoned Lotty’s loose way of talking of heaven, because in such a place, on such a morning, condonation was in the very air. Besides, what an excuse there was.

And Lady Caroline, sitting where they had left her before breakfast on the wall, peeped over when she heard laughter, and saw them standing on the path below, and thought what a mercy it was they were laughing down there and had not come up and done it round her. She disliked jokes at all times, but in the morning she hated them; especially close up; especially crowding in her ears. She hoped the originals were on their way out for a walk, and not on their way back from one. They were laughing more and more. What could they possibly find to laugh at?

She looked down on the tops of their heads with a very serious face, for the thought of spending a month with laughers was a grave one, and they, as though they felt her eyes, turned suddenly and looked up.

The dreadful geniality of those women. . .

She shrank away from their smiles and wavings, but she could not shrink out of sight without falling into the lilies. She neither smiled nor waved back, and turning her eyes to the more distant mountains surveyed them carefully till the two, tired of waving, moved away along the path and turned the corner and disappeared.

This time they both did notice that they had been met with, at least, unresponsiveness.

“If we weren’t in heaven,” said Mrs. Wilkins serenely, “I should say we had been snubbed, but as nobody snubs anybody there of course we can’t have been.”

“Perhaps she is unhappy,” said Mrs. Arbuthnot.

“Whatever it is she is she’ll get over it here,” said Mrs. Wilkins with conviction.

“We must try and help her,” said Mrs. Arbuthnot.

“Oh, but nobody helps anybody in heaven. That’s finished with. You don’t try to be, or do. You simply _are_.”

Well, Mrs. Arbuthnot wouldn’t go into that—not here, not to-day. The vicar, she knew, would have called Lotty’s talk levity, if not profanity. How old he seemed from here; an old, old vicar.

They left the path, and clambered down the olive terraces, down and down, to where at the bottom the warm, sleepy sea heaved gently among the rocks. There a pine-tree grew close to the water, and they sat under it, and a few yards away was a fishing-boat lying motionless and green-bellied on the water. The ripples of the sea made little gurgling noises at their feet. They screwed up their eyes to be able to look into the blaze of light beyond the shade of their tree. The hot smell from the pine-needles and from the cushions of wild thyme that padded the spaces between the rocks, and sometimes a smell of pure honey from a clump of warm irises up behind them in the sun, puffed across their faces. Very soon Mrs. Wilkins took her shoes and stockings off, and let her feet

hang in the water. After watching her a minute Mrs. Arbuthnot did the same. Their happiness was then complete. Their husbands would not have known them. They left off talking. They ceased to mention heaven. They were just cups of acceptance.

Meanwhile Lady Caroline, on her wall, was considering her position. The garden on the top of the wall was a delicious garden, but its situation made it insecure and exposed to interruptions. At any moment the others might come and want to use it, because both the hall and the dining-room had doors opening straight into it. Perhaps, thought Lady Caroline, she could arrange that it should be solely hers. Mrs. Fisher had the battlements, delightful with flowers, and a watch-tower all to herself, besides having snatched the one really nice room in the house. There were plenty of places the originals could go to—she had herself seen at least two other little gardens, while the hill the castle stood on was itself a garden, with walks and seats. Why should not this one spot be kept exclusively for her? She liked it; she liked it best of all. It had the Judas tree and an umbrella pine, it had the freesias and the lilies, it had a tamarisk beginning to flush pink, it had the convenient low wall to sit on, it had from each of its three sides the most amazing views—to the east the bay and mountains, to the north the village across the tranquil clear green water of the little harbour and the hills dotted with white houses and orange groves, and to the west was the thin thread of land by which San Salvatore was tied to the mainland, and then the open sea and the coast line beyond Genoa reaching away into the blue dimness of France. Yes, she would say she wanted to have this entirely to herself. How obviously sensible if each of them had their own special place to sit in apart. It was essential to her comfort that she should be able to be apart, left alone, not talked to. The others ought to like it best too. Why herd? One had enough of that in England, with one's relations and friends—oh, the numbers of them!—pressing on one continually. Having successfully escaped them for four weeks why continue, and with persons having no earthly claim on one, to herd?

She lit a cigarette. She began to feel secure. Those two had gone for a walk. There was no sign of Mrs. Fisher. How very pleasant this was.

Somebody came out through the glass doors, just as she was drawing a deep breath of security. Surely it couldn't be Mrs. Fisher, wanting to sit with her? Mrs. Fisher had her battlements. She ought to stay on them, having snatched them. It would be too tiresome if she wouldn't, and wanted not only to have them and her sitting-room but to establish herself in this garden as well.

No; it wasn't Mrs. Fisher, it was the cook.

She frowned. Was she going to have to go on ordering the food? Surely one or other of those two waving women would do that now.

The cook, who had been waiting in increasing agitation in the kitchen, watching the clock getting nearer to lunch-time while she still was without knowledge of what lunch was to consist of, had gone at last to Mrs. Fisher, who had immediately waved her away. She then wandered about the house seeking a mistress, any mistress, who would tell her what to cook, and finding none; and at last, directed by Francesca, who always knew where everybody was, came out to Lady Caroline.

Domenico had provided this cook. She was Costanza, the sister of that one of his cousins who kept a restaurant down on the piazza. She helped her brother in his cooking when she had no other job, and knew every sort of fat, mysterious Italian dish such as the workmen of Castagneto, who crowded the restaurant at midday, and the inhabitants of Mezzago when they came over on Sundays, loved to eat. She was a fleshless spinster of fifty, grey-haired, nimble, rich of speech, and thought Lady Caroline more beautiful than anyone she had ever seen; and so did Domenico; and so did the boy Giuseppe who helped Domenico and was, besides, his nephew; and so did the girl Angela who helped Francesca and was, besides, Domenico's niece; and so did Francesca herself. Domenico and Francesca, the only two who had seen them, thought the two ladies who arrived last very beautiful, but compared to the fair young lady who arrived first they were as candles to the electric light that had lately been installed, and as the tin tubs in the bedrooms to the wonderful new bathroom their master had had arranged on his last visit.

Lady Caroline scowled at the cook. The scowl, as usual, was transformed on the way into what appeared to be an intent and beautiful gravity, and Costanza threw up her hands and took the saints aloud to witness that here was the very picture of the Mother of God.

Lady Caroline asked her crossly what she wanted, and Costanza's head went on one side with delight at the sheer music of her voice. She said, after waiting a moment in case the music was going to continue, for she didn't wish to miss any of it, that she wanted orders; she had been to the Signorina's mother, but in vain.

"She is not my mother," repudiated Lady Caroline angrily; and her anger sounded like the regretful wail of a melodious orphan.

Costanza poured forth pity. She too, she explained, had no mother—

Lady Caroline interrupted with the curt information that her mother was alive and in London.

Costanza praised God and the saints that the young lady did not yet know what it was like to be without a mother. Quickly enough did misfortunes overtake one; no doubt the young lady already had a husband.

“No,” said Lady Caroline icily. Worse than jokes in the morning did she hate the idea of husbands. And everybody was always trying to press them on her—all her relations, all her friends, all the evening papers. After all, she could only marry one, anyhow; but you would think from the way everybody talked, and especially those persons who wanted to be husbands, that she could marry at least a dozen.

Her soft, pathetic “No” made Costanza, who was standing close to her, well with sympathy.

“Poor little one,” said Costanza, moved actually to pat her encouragingly on the shoulder, “take hope. There is still time.”

“For lunch,” said Lady Caroline freezingly, marvelling as she spoke that she should be patted, she who had taken so much trouble to come to a place, remote and hidden, where she could be sure that among other things of a like oppressive nature pattings also were not, “we will have—”

Costanza became business-like. She interrupted with suggestions, and her suggestions were all admirable and all expensive.

Lady Caroline did not know they were expensive, and fell in with them at once. They sounded very nice. Every sort of young vegetables and fruits came into them, and much butter and a great deal of cream and incredible numbers of eggs. Costanza said enthusiastically at the end, as a tribute to this acquiescence, that of the many ladies and gentlemen she had worked for on temporary jobs such as this she preferred the English ladies and gentlemen. She more than preferred them—they roused devotion in her. For they knew what to order; they did not skimp; they refrained from grinding down the faces of the poor.

From this Lady Caroline concluded that she had been extravagant, and promptly countermanded the cream.

Costanza’s face fell, for she had a cousin who had a cow, and the cream was to have come from them both.

“And perhaps we had better not have chickens,” said Lady Caroline.

Costanza’s face fell more, for her brother at the restaurant kept chickens in his back-yard, and many of them were ready for killing.

“Also do not order strawberries till I have consulted with the other ladies,” said Lady Caroline, remembering that it was only the first of April, and that perhaps people who lived in Hampstead might be poor; indeed, must be poor, or why live in Hampstead? “It is not I who am mistress here.”

“Is it the old one?” asked Costanza, her face very long.

“No,” said Lady Caroline.

“Which of the other two ladies is it?”

“Neither,” said Lady Caroline.

Then Costanza’s smiles returned, for the young lady was having fun with her and making jokes. She told her so, in her friendly Italian way, and was genuinely delighted.

“I never make jokes,” said Lady Caroline briefly. “You had better go, or lunch will certainly not be ready by half-past twelve.”

And these curt words came out sounding so sweet that Costanza felt as if kind compliments were being paid her, and forgot her disappointment about the cream and the chickens, and went away all gratitude and smiles.

“This,” thought Lady Caroline, “will never do. I haven’t come here to housekeep, and I won’t.”

She called Costanza back. Costanza came running. The sound of her name in that voice enchanted her.

“I have ordered the lunch for to-day,” said Lady Caroline, with the serious angel face that was hers when she was annoyed, “and I have also ordered the dinner, but from now on you will go to one of the other ladies for orders. I give no more.”

The idea that she would go on giving orders was too absurd. She never gave orders at home. Nobody there dreamed of asking her to do anything. That such a very tiresome activity should be thrust upon her here, simply because she happened to be able to talk Italian, was ridiculous. Let the originals give orders if Mrs. Fisher refused to. Mrs. Fisher, of course, was the one Nature intended for such a purpose. She had the very air of a competent housekeeper. Her clothes were the clothes of a housekeeper, and so was the way she did her hair.

Having delivered herself of her ultimatum with an acerbity that turned sweet on the way, and accompanied it by a peremptory gesture of dismissal that had the grace and loving-kindness of a benediction, it was annoying that Costanza should only stand still with her head on one side gazing at her in obvious delight.

“Oh, _go_ away!” exclaimed Lady Caroline in English, suddenly exasperated.

There had been a fly in her bedroom that morning which had stuck just as Costanza was sticking; only one, but it might have been a myriad it was so tiresome from daylight on. It was determined to settle on her face, and she was determined it should not. Its persistence was uncanny. It woke her, and would not let her go to sleep again. She hit at it, and it eluded her without fuss or effort and with an almost visible blandness, and she had only hit herself. It came back again instantly, and with a loud buzz alighted on her cheek. She hit at it again and hurt herself, while it skimmed gracefully away. She lost her temper, and sat up in bed and waited, watching to hit at it and kill it. She kept on hitting at it at last with fury and with all her strength, as if it were a real enemy deliberately trying to madden her; and it elegantly skimmed in and out of her blows, not even angry, to be back again the next instant. It succeeded every time in getting on to her face, and was quite indifferent how often it was driven away. That was why she had dressed and come out so early. Francesca had already been told to put a net over her bed, for she was not going to allow herself to be annoyed twice like that. People were exactly like flies. She wished there were nets for keeping them off too. She hit at them with words and frowns, and like the fly they slipped between her blows and were untouched. Worse than the fly, they seemed unaware that she had even tried to hit them. The fly at least did for a moment go away. With human beings the only way to get rid of them was to go away herself. That was what, so tired, she had done this April; and having got here, having got close up to the details of life at San Salvatore, it appeared that here, too, she was not to be let alone.

Viewed from London there had seemed to be no details. San Salvatore from there seemed to be an empty, a delicious blank. Yet, after only twenty-four hours of it, she was discovering that it was not a blank at all, and that she was having to ward off as actively as ever. Already she had been much stuck to. Mrs. Fisher had stuck nearly the whole of the day before, and this morning there had been no peace, not ten minutes uninterruptedly alone.

Costanza of course had finally to go because she had to cook, but hardly had she gone before Domenico came. He came to water and tie up. That was natural, since he was the gardener, but he watered and tied up all the things that were nearest to her; he hovered closer and closer; he watered to excess; he tied plants that were as straight and steady as arrows. Well, at least he was a man, and therefore not quite so annoying, and his smiling good-morning was received with an answering smile; upon which Domenico forgot his family, his wife, his mother, his grown-up children and all his duties, and only wanted to kiss the young lady’s feet.

He could not do that, unfortunately, but he could talk while he worked, and talk he did; voluminously; pouring out every kind of information, illustrating what he said with gestures so lively that he had to put down the watering-pot, and thus delay the end of the watering.

Lady Caroline bore it for a time but presently was unable to bear it, and as he would not go, and she could not tell him to, seeing that he was engaged in his proper work, once again it was she who had to.

She got off the wall and moved to the other side of the garden, where in a wooden shed were some comfortable low cane chairs. All she wanted was to turn one of these round with its back to Domenico and its front to the sea towards Genoa. Such a little thing to want. One would have thought she might have been allowed to do that unmolested. But he, who watched her every movement, when he saw her approaching the chairs darted after her and seized one and asked to be told where to put it.

Would she never get away from being waited on, being made comfortable, being asked where she wanted things put, having to say thank you? She was short with Domenico, who instantly concluded the sun had given her a headache, and ran in and fetched her a sunshade and a cushion and a footstool, and was skilful, and was wonderful, and was one of Nature’s gentlemen.

She shut her eyes in a heavy resignation. She could not be unkind to Domenico. She could not get up and walk indoors as she would have done if it had been one of the others. Domenico was intelligent and very competent. She had at once discovered that it was he who really ran the house, who really did everything. And his manners were definitely delightful, and he undoubtedly was a charming person. It was only that she did so much long to be let alone. If only, only she could be left quite quiet for this one month, she felt that she might perhaps make something of herself after all.

She kept her eyes shut, because then he would think she wanted to sleep and would go away.

Domenico's romantic Italian soul melted within him at the sight, for having her eyes shut was extraordinarily becoming to her. He stood entranced, quite still, and she thought he had stolen away, so she opened them again.

No; there he was, staring at her. Even he. There was no getting away from being stared at.

"I have a headache," she said, shutting them again.

"It is the sun," said Domenico, "and sitting on the wall without a hat."

"I wish to sleep."

"_Sì signorina_," he said sympathetically; and went softly away.

She opened her eyes with a sigh of relief. The gentle closing of the glass doors showed her that he had not only gone quite away but had shut her out in the garden so that she should be undisturbed. Now perhaps she would be alone till lunch-time.

It was very curious, and no one in the world could have been more surprised than she herself, but she wanted to think. She had never wanted to do that before. Everything else that it is possible to do without too much inconvenience she had either wanted to do or had done at one period or another of her life, but not before had she wanted to think. She had come to San Salvatore with the single intention of lying comatose for four weeks in the sun, somewhere where her parents and friends were not, lapped in forgetfulness, stirring herself only to be fed, and she had not been there more than a few hours when this strange new desire took hold of her.

There had been wonderful stars the evening before, and she had gone out into the top garden after dinner, leaving Mrs. Fisher alone over her nuts and wine, and, sitting on the wall at the place where the lilies crowded their ghost heads, she had looked out into the gulf of the night, and it had suddenly seemed as if her life had been a noise all about nothing.

She had been intensely surprised. She knew stars and darkness did produce unusual emotions because, in others, she had seen them being produced, but they had not before done it in herself. A noise all about nothing. Could she be quite well? She had wondered. For a long while past she had been aware that her life was a noise, but it had seemed to be very much about something; a noise, indeed, about so much that she felt she must get out of earshot for a little or she would be completely, and perhaps permanently, deafened. But suppose it was only a noise about nothing?

She had not had a question like that in her mind before. It had made her feel lonely. She wanted to be alone, but not lonely. That was very different; that was something that ached and hurt dreadfully right inside one. It was what one dreaded most. It was what made one go to so many parties; and lately even the parties had seemed once or twice not to be a perfectly certain protection. Was it possible that loneliness had nothing to do with circumstances, but only with the way one met them? Perhaps, she had thought, she had better go to bed. She couldn't be very well.

She went to bed; and in the morning, after she had escaped the fly and had her breakfast and got out again into the garden, there was this same feeling again, and in broad daylight. Once more she had that really rather disgusting suspicion that her life till now had not only been loud but empty. Well, if that were so, and if her first twenty-eight years—the best ones—had gone just in meaningless noise, she had better stop a moment and look round her; pause, as they said in tiresome novels, and consider. She hadn't got many sets of twenty-eight years. One more would see her growing very like Mrs. Fisher. Two more— She averted her eyes.

Her mother would have been concerned if she had known. Her mother doted. Her father would have been concerned too, for he also doted. Everybody doted. And when, melodiously obstinate, she had insisted on going off to entomb herself in Italy for a whole month with queer people she had got out of an advertisement, refusing even to take her maid, the only explanation her friends could imagine was that poor Scrap—such was her name among them—had overdone it and was feeling a little nervy.

Her mother had been distressed at her departure. It was such an odd thing to do, such a sign of disappointment. She encouraged the general idea of the verge of a nervous breakdown. If she could have seen her adored Scrap, more delightful to look upon than any other mother's daughter had ever yet been, the object of her utmost pride, the source of all her fondest hopes, sitting staring at the empty noonday Mediterranean considering her three possible sets of twenty-eight years, she would have been miserable. To go away alone was bad; to think was worse. No good could come out of the thinking of a beautiful young woman. Complications could come out of it in profusion, but no good. The thinking of the beautiful was bound to result in hesitations, in reluctances, in unhappiness all round. And here, if she could have seen her, sat her Scrap thinking quite hard. And such things. Such old things. Things nobody ever began to think till they were at least forty.

Chapter 9

That one of the two sitting-rooms which Mrs. Fisher had taken for her own was a room of charm and character. She surveyed it with satisfaction on going into it after breakfast, and was glad it was hers. It had a tiled floor, and walls the colour of pale honey, and inlaid furniture the colour of amber, and mellow books, many in ivory or lemon-coloured covers. There was a big window overlooking the sea towards Genoa, and a glass door through which she could proceed out on to the battlements and walk along past the quaint and attractive watch-tower, in itself a room with chairs and a writing table, to where on the other side of the tower the battlements ended in a marble seat, and one could see the western bay and the point round which began the Gulf of Spezia. Her south view, between these two stretches of sea, was another hill, higher than San Salvatore, the last of the little peninsula, with the bland turrets of a smaller and uninhabited castle on the top, on which the setting sun still shone when everything else was sunk in shadow. Yes, she was very comfortably established here; and receptacles—Mrs. Fisher did not examine their nature closely, but they seemed to be small stone troughs, or perhaps little sarcophagi—ringed round the battlements with flowers.

These battlements, she thought, considering them, would have been a perfect place for her to pace up and down gently in moments when she least felt the need of her stick, or to sit in on the marble seat, having first put a cushion on it, if there had not unfortunately been a second glass door opening on to them, destroying their complete privacy, spoiling her feeling that the place was only for her. The second door belonged to the round drawing-room, which both she and Lady Caroline had rejected as too dark. That room would probably be sat in by the women from Hampstead, and she was afraid they would not confine themselves to sitting in it, but would come out through the glass door and invade her battlements. This would ruin the battlements. It would ruin them as far as she was concerned if they were to be overrun; or even if, not actually overrun, they were liable to be raked by the eyes of persons inside the room. No one could be perfectly at ease if they were being watched and knew it. What she wanted, what she surely had a right to, was privacy. She had no wish to intrude on the others; why then should they intrude on her? And she could always relax her privacy if, when she became better acquainted with her companions, she should think it worth while, but she doubted whether any of the three would so develop as to make her think it worth while.

Hardly anything was really worth while, reflected Mrs. Fisher, except the past. It was astonishing, it was simply amazing, the superiority of the past to the present. Those friends of hers in London, solid persons of her own age, knew the same past that she knew, could talk about it with her, could compare it as she did with the tinkling present, and in remembering great men forget for a moment the trivial and barren young people who still, in spite of the war, seemed to litter the world in such numbers. She had not come away from these friends, these conversable ripe friends, in order to spend her time in Italy chatting with three persons of another generation and defective experience; she had come away merely to avoid the treacheries of a London April. It was true what she had told the two who came to Prince of Wales Terrace, that all she wished to do at San Salvatore was to sit by herself in the sun and remember. They knew this, for she had told them. It had been plainly expressed and clearly understood. Therefore she had a right to expect them to stay inside the round drawing-room and not to emerge interruptingly on to her battlements.

But would they? The doubt spoilt her morning. It was only towards lunch-time that she saw a way to be quite safe, and ringing for Francesca, bade her, in slow and majestic Italian, shut the shutters of the glass door of the round drawing-room, and then, going with her into the room, which had become darker than ever in consequence, but also, Mrs. Fisher observed to Francesca, who was being voluble, would because of this very darkness remain agreeably cool, and after all there were the numerous slit-windows in the walls to let in light and it was nothing to do with her if they did not let it in, she directed the placing of a cabinet of curios across the door on its inside.

This would discourage egress.

Then she rang for Domenico, and caused him to move one of the flower-filled sarcophagi across the door on its outside.

This would discourage ingress.

“No one,” said Domenico, hesitating, “will be able to use the door.”

“No one,” said Mrs. Fisher firmly, “will wish to.”

She then retired to her sitting-room, and from a chair placed where she could look straight on to them, gazed at her battlements, secured to her now completely, with calm pleasure.

Being here, she reflected placidly, was much cheaper than being in an hotel and, if she could keep off the others, immeasurably more agreeable. She was paying for her rooms—extremely pleasant rooms, now that she was arranged in them—£3 a week, which came to about eight shillings a day, battlements, watch-tower and all. Where else abroad could she live as well for so little, and have as many baths as she liked, for eight shillings a day? Of course she did not yet know what her food would cost, but she would insist on carefulness over that, though she would also insist on its being carefulness combined with excellence. The two were perfectly compatible if the caterer took pains. The servants’ wages, she had ascertained, were negligible, owing to the advantageous exchange, so that there was only the food to cause her anxiety. If she saw signs of extravagance she would propose that they each hand over a reasonable sum every week to Lady Caroline which should cover the bills, any of it that was not used to be returned, and if it were exceeded the loss to be borne by the caterer.

Mrs. Fisher was well off and had the desire for comforts proper to her age, but she disliked expenses. So well off was she that, had she so chosen, she could have lived in an opulent part of London and driven from it and to it in a Rolls-Royce. She had no such wish. It needed more vitality than went with true comfort to deal with a house in an opulent spot and a Rolls-Royce. Worries attended such possessions, worries of every kind, crowned by bills. In the sober gloom of Prince of Wales Terrace she could obscurely enjoy inexpensive yet real comfort, without being snatched at by predatory men-servants or collectors for charities, and a taxi stand was at the end of the road. Her annual outlay was small. The house was inherited. Death had furnished it for her. She trod in the dining-room on the Turkey carpet of her fathers; she regulated her day by the excellent black marble clock on the mantelpiece which she remembered from childhood; her walls were entirely covered by the photographs her illustrious deceased friends had given either herself or her father, with their own handwriting across the lower parts of their bodies, and the windows, shrouded by the maroon curtains of all her life, were decorated besides with the selfsame aquariums to which she owed her first lessons in sealore, and in which still swam slowly the goldfishes of her youth.

Were they the same goldfish? She did not know. Perhaps, like carp, they outlived everybody. Perhaps, on the other hand, behind the deep-sea vegetation provided for them at the bottom, they had from time to time as the years went by withdrawn and replaced themselves. Were they or were they not, she sometimes wondered, contemplating them between the courses of her solitary meals, the same goldfish that had that day been there when Carlyle—how well she remembered it—angrily strode up to them in the middle of some argument with her father that had grown heated, and striking the glass smartly with his fist had put them to flight, shouting as they fled, “Och, ye deaf deevils! Och, ye lucky deaf deevils! Ye can’t hear anything of the blasted, blethering, doddering, glaikit fool-stuff yer maister talks, can ye?” Or words to that effect.

Dear, great-souled Carlyle. Such natural gushings forth; such true freshness; such real grandeur. Rugged, if you will—yes, undoubtedly sometimes rugged, and startling in a drawing-room, but magnificent. Who was there now to put beside him? Who was there to mention in the same breath? Her father, than whom no one had had more _flair_, said: “Thomas is immortal.” And here was this generation, this generation of puniness, raising its little voice in doubts, or, still worse, not giving itself the trouble to raise it at all, not—it was incredible, but it had been thus reported to her—even reading him. Mrs. Fisher did not read him either, but that was different. She had read him; she had certainly read him. Of course she had read him. There was Teufelsdröck—she quite well remembered a tailor called Teufelsdröck. So like Carlyle to call him that. Yes, she must have read him, though naturally details escaped her.

The gong sounded. Lost in reminiscence Mrs. Fisher had forgotten time, and hastened to her bedroom to wash her hands and smoothe her hair. She did not wish to be late and set a bad example, and perhaps find her seat at the head of the table taken. One could put no trust in the manners of the younger generation; especially not in those of that Mrs. Wilkins.

She was, however, the first to arrive in the dining-room. Francesca in a white apron stood ready with an enormous dish of smoking hot, glistening maccaroni, but nobody was there to eat it.

Mrs. Fisher sat down, looking stern. Lax, lax.

“Serve me,” she said to Francesca, who showed a disposition to wait for the others.

Francesca served her. Of the party she liked Mrs. Fisher least, in fact she did not like her at all. She was the only one of the four ladies who had not yet smiled. True she was old, true she was unbeautiful, true she therefore had no reason to smile, but kind ladies smiled, reason or no. They smiled, not because they were happy but because they wished to make happy. This one of the four ladies could not then, Francesca decided, be kind; so she handed her the maccaroni, being unable to hide any of her feelings, morosely.

It was very well cooked, but Mrs. Fisher had never cared for maccaroni, especially not this long, worm-shaped variety. She found it difficult to eat—slippery, wriggling off her fork, making her look, she felt, undignified when, having got it as she supposed into her mouth, ends of it yet hung out. Always, too, when she ate it she was reminded of Mr. Fisher. He had during their married life behaved very much like maccaroni. He had slipped, he had wriggled, he had made her feel undignified, and when at last she had got him safe, as she thought, there had invariably been little bits of him that still, as it were, hung out.

Francesca from the sideboard watched Mrs. Fisher’s way with maccaroni gloomily, and her gloom deepened when she saw her at last take her knife to it and chop it small.

Mrs. Fisher really did not know how else to get hold of the stuff. She was aware that knives in this connection were improper, but one did finally lose patience. Maccaroni was never allowed to appear on her table in London. Apart from its tiresomeness she did not even like it, and she would tell Lady Caroline not to order it again. Years of practice, reflected Mrs. Fisher, chopping it up, years of actual living in Italy, would be necessary to learn the exact trick. Browning managed maccaroni wonderfully. She remembered watching him one day when he came to lunch with her father, and a dish of it had been ordered as a compliment to his connection with Italy. Fascinating, the way it went in. No chasing round the plate, no slidings off the fork, no subsequent protrusions of loose ends—just one dig, one whisk, one thrust, one gulp, and lo, yet another poet had been nourished.

“Shall I go and seek the young lady?” asked Francesca, unable any longer to look on a good maccaroni being cut with a knife.

Mrs. Fisher came out of her reminiscent reflections with difficulty. “She knows lunch is at half-past twelve,” she said. “They all know.”

“She may be asleep,” said Francesca. “The other ladies are further away, but this one is not far away.”

“Beat the gong again then,” said Mrs. Fisher.

What manners, she thought; what, what manners. It was not an hotel, and considerations were due. She must say she was surprised at Mrs. Arbuthnot, who had not looked like somebody unpunctual. Lady Caroline, too—she had seemed amiable and courteous, whatever else she might be. From the other one, of course, she expected nothing.

Francesca fetched the gong, and took it out into the garden and advanced, beating it as she advanced, close up to Lady Caroline, who, still stretched in her low chair, waited till she had done, and then turned her head and in the sweetest tones poured forth what appeared to be music but was really invective.

Francesca did not recognise the liquid flow as invective; how was she to, when it came out sounding like that? And with her face all smiles, for she could not but smile when she looked at this young lady, she told her the maccaroni was getting cold.

“When I do not come to meals it is because I do not wish to come to meals,” said the irritated Scrap, “and you will not in future disturb me.”

“Is she ill?” asked Francesca, sympathetic but unable to stop smiling. Never, never had she seen hair so beautiful. Like pure flax; like the hair of northern babes. On such a little head only blessing could rest, on such a little head the nimbus of the holiest saints could fitly be placed.

Scrap shut her eyes and refused to answer. In this she was injudicious, for its effect was to convince Francesca, who hurried away full of concern to tell Mrs. Fisher, that she was indisposed. And Mrs. Fisher, being prevented, she explained, from going out to Lady Caroline herself because of her stick, sent the two others instead, who had come in at that moment heated and breathless and full of excuses, while she herself proceeded to the next course, which was a very well-made omelette, bursting most agreeably at both its ends with young green peas.

“Serve me,” she directed Francesca, who again showed a disposition to wait for the others.

“_Oh_, why won’t they leave me alone?—oh, why _won’t_ they leave me alone?” Scrap asked herself when she heard more scrunchings on the little pebbles which took the place of grass, and therefore knew some one else was approaching.

She kept her eyes tight shut this time. Why should she go in to lunch if she didn’t want to? This wasn’t a private house; she was in no way tangled up in duties towards a tiresome hostess. For all practical purposes San Salvatore was an hotel, and she ought to be let alone to eat or not to eat exactly as if she really had been in an hotel.

But the unfortunate Scrap could not just sit still and close her eyes without rousing that desire to stroke and pet in her beholders with which she was only too familiar. Even the cook had patted her. And now a gentle hand—how well she knew and how much she dreaded gentle hands—was placed on her forehead.

“I’m afraid you’re not well,” said a voice that was not Mrs. Fisher’s, and therefore must belong to one of the originals.

“I have a headache,” murmured Scrap. Perhaps it was best to say that; perhaps it was the shortest cut to peace.

“I’m so sorry,” said Mrs. Arbuthnot softly, for it was her hand being gentle.

“And I,” said Scrap to herself, “who thought if I came here I would escape mothers.”

“Don’t you think some tea would do you good?” asked Mrs. Arbuthnot tenderly.

Tea? The idea was abhorrent to Scrap. In this heat to be drinking tea in the middle of the day. . .

“No,” she murmured.

“I expect what would really be best for her,” said another voice, “is to be left quiet.”

How sensible, thought Scrap; and raised the eye-lashes of one eye just enough to peep through and see who was speaking.

It was the freckled original. The dark one, then, was the one with the hand. The freckled one rose in her esteem.

“But I can’t bear to think of you with a headache and nothing being done for it,” said Mrs. Arbuthnot. “Would a cup of strong black coffee—?”

Scrap said no more. She waited, motionless and dumb, till Mrs. Arbuthnot should remove her hand. After all, she couldn’t stand there all day, and when she went away she would have to take her hand with her.

“I do think,” said the freckled one, “that she wants nothing except quiet.”

And perhaps the freckled one pulled the one with the hand by the sleeve, for the hold on Scrap’s forehead relaxed, and after a minute’s silence, during which no doubt she was being contemplated—she was always being contemplated—the footsteps began to scrunch the pebbles again, and grew fainter, and were gone.

“Lady Caroline has a headache,” said Mrs. Arbuthnot, re-entering the dining-room and sitting down in her place next to Mrs. Fisher. “I can’t persuade her to have even a little tea, or some black coffee. Do you know what aspirin is in Italian?”

“The proper remedy for headaches,” said Mrs. Fisher firmly, “is castor oil.”

“But she hasn’t got a headache,” said Mrs. Wilkins.

“Carlyle,” said Mrs. Fisher, who had finished her omelette and had leisure, while she waited for the next course, to talk, “suffered at one period terribly from headaches, and he constantly took castor oil as a remedy. He took it, I should say, almost to excess, and called it, I remember, in his interesting way the oil of sorrow. My father said it coloured for a time his whole attitude to life, his whole philosophy. But that was because he took too much. What Lady Caroline wants is one dose, and one only. It is a mistake to keep on taking castor oil.”

“Do you know the Italian for it?” asked Mrs. Arbuthnot.

“Ah, that I’m afraid I don’t. However, she would know. You can ask her.”

“But she hasn’t got a headache,” repeated Mrs. Wilkins, who was struggling with the maccaroni. “She only wants to be let alone.”

They both looked at her. The word shovel crossed Mrs. Fisher’s mind in connection with Mrs. Wilkins’s actions at that moment.

“Then why should she say she has?” asked Mrs. Arbuthnot.

“Because she is still trying to be polite. Soon she won’t try, when the place has got more into her—she’ll really be it. Without trying. Naturally.”

“Lotty, you see,” explained Mrs. Arbuthnot, smiling to Mrs. Fisher, who sat waiting with a stony patience for her next course, delayed because Mrs. Wilkins would go on trying to eat the maccaroni, which must be less worth eating than ever now that it was cold; “Lotty, you see, has a theory about this place—”

But Mrs. Fisher had no wish to hear any theory of Mrs. Wilkins’s.

“I am sure I don’t know,” she interrupted, looking severely at Mrs. Wilkins, “why you should assume Lady Caroline is not telling the truth.”

“I don’t assume—I know,” said Mrs. Wilkins.

“And pray how do you know?” asked Mrs. Fisher icily, for Mrs. Wilkins was actually helping herself to more maccaroni, offered her officiously and unnecessarily a second time by Francesca.

“When I was out there just now I saw inside her.”

Well, Mrs. Fisher wasn’t going to say anything to that; she wasn’t going to trouble to reply to downright idiocy. Instead she sharply rapped the little table-gong by her side, though there was Francesca standing at the sideboard, and said, for she would wait no longer for her next course, “Serve me.”

And Francesca—it must have been wilful—offered her the maccaroni again.

Chapter 10

There was no way of getting into or out of the top garden at San Salvatore except through the two glass doors, unfortunately side by side, of the dining-room and the hall. A person in the garden who wished to escape unseen could not, for the person to be escaped from would be met on the way. It was a small, oblong garden, and concealment was impossible. What trees there were—the Judas tree, the tamarisk, the umbrella-pine—grew close to the low parapets. Rose bushes gave no real cover; one step to right or left of them, and the person wishing to be private was discovered. Only the north-west corner was a little place jutting out from the great wall, a kind of excrescence or loop, no doubt used in the old distrustful days for observation, where it was possible to sit really unseen, because between it and the house was a thick clump of daphne.

Scrap, after glancing round to see that no one was looking, got up and carried her chair into this place, stealing away as carefully on tiptoe as those steal whose purpose is sin. There was another excrescence on the walls just like it at the north-east corner, but this, though the view from it was almost more beautiful, for from it you could see the bay and the lovely mountains behind Mezzago, was exposed. No bushes grew near it, nor had it any shade. The north-west loop then was where she would sit, and she settled into it, and nestling her head in her cushion and putting her feet comfortably on the parapet, from whence they appeared to the villagers on the piazza below as two white doves, thought that now indeed she would be safe.

Mrs. Fisher found her there, guided by the smell of her cigarette. The incautious Scrap had not thought of that. Mrs. Fisher did not smoke herself, and all the more distinctly could she smell the smoke of others. The virile smell met her directly she went out into the garden from the dining-room after lunch in order to have her coffee. She had bidden Francesca set the coffee in the shade of the house just outside the glass door, and when Mrs. Wilkins, seeing a table being carried there, reminded her, very officiously and tactlessly Mrs. Fisher considered, that Lady Caroline wanted to be alone, she retorted—and with what propriety—that the garden was for everybody.

Into it accordingly she went, and was immediately aware that Lady Caroline was smoking. She said to herself, “These modern young women,” and proceeded to find her; her stick, now that lunch was over, being no longer the hindrance to action that it was before her meal had been securely, as Browning once said—surely it was Browning? Yes, she remembered how much diverted

she had been—roped in.

Nobody diverted her now, reflected Mrs. Fisher, making straight for the clump of daphne; the world had grown very dull, and had entirely lost its sense of humour. Probably they still had their jokes, these people—in fact she knew they did, for _Punch_ still went on; but how differently it went on, and what jokes. Thackeray, in his inimitable way, would have made mincemeat of this generation. Of how much it needed the tonic properties of that astringent pen it was of course unaware. It no longer even held him—at least, so she had been informed—in any particular esteem. Well, she could not give it eyes to see and ears to hear and a heart to understand, but she could and would give it, represented and united in the form of Lady Caroline, a good dose of honest medicine.

“I hear you are not well,” she said, standing in the narrow entrance of the loop and looking down with the inflexible face of one who is determined to do good at the motionless and apparently sleeping Scrap.

Mrs. Fisher had a deep voice, very like a man’s, for she had been overtaken by that strange masculinity that sometimes pursues a woman during the last laps of her life.

Scrap tried to pretend that she was asleep, but if she had been her cigarette would not have been held in her fingers but would have been lying on the ground.

She forgot this. Mrs. Fisher did not, and coming inside the loop, sat down on a narrow stone seat built out of the wall. For a little she could sit on it; for a little, till the chill began to penetrate.

She contemplated the figure before her. Undoubtedly a pretty creature, and one that would have had a success at Farringford. Strange how easily even the greatest men were moved by exteriors. She had seen with her own eyes Tennyson turn away from everybody—turn, positively, his back on a crowd of eminent people assembled to do him honour, and withdraw to the window with a young person nobody had ever heard of, who had been brought there by accident and whose one and only merit—if it be a merit, that which is conferred by chance—was beauty. Beauty! All over before you can turn round. An affair, one might almost say, of minutes. Well, while it lasted it did seem able to do what it liked with men. Even husbands were not immune. There had been passages in the life of Mr. Fisher . . .

“I expect the journey has upset you,” she said in her deep voice. “What you want is a good dose of some simple medicine. I shall ask Domenico if there is such a thing in the village as castor oil.”

Scrap opened her eyes and looked straight at Mrs. Fisher.

“Ah,” said Mrs. Fisher, “I knew you were not asleep. If you had been you would have let your cigarette fall to the ground.”

Scrap threw the cigarette over the parapet.

“Waste,” said Mrs. Fisher. “I don’t like smoking for women, but I still less like waste.”

“What _does_ one do with people like this?” Scrap asked herself, her eyes fixed on Mrs. Fisher in what felt to her an indignant stare but appeared to Mrs. Fisher as really charming docility.

“Now you’ll take my advice,” said Mrs. Fisher, touched, “and not neglect what may very well turn into an illness. We are in Italy, you know, and one has to be careful. You ought, to begin with, to go to bed.”

“I never go to bed,” snapped Scrap; and it sounded as moving, as forlorn, as that line spoken years and years ago by an actress playing the part of Poor Jo in dramatised version of Bleak House—“I’m always moving on,” said Poor Jo in this play, urged to do so by a policeman; and Mrs. Fisher, then a girl, had laid her head on the red velvet parapet of the front row of the dress circle and wept aloud.

It was wonderful, Scrap’s voice. It had given her, in the ten years since she came out, all the triumphs that intelligence and wit can have, because it made whatever she said seem memorable. She ought, with a throat formation like that, to have been a singer, but in every kind of music Scrap was dumb except this one music of the speaking voice; and what a fascination, what a spell lay in that. Such was the loveliness of her face and the beauty of her colouring that there was not a man into whose eyes at the sight of her there did not leap a flame of intensest interest; but, when he heard her voice, the flame in that man’s eyes was caught and fixed. It was the same with every man, educated and uneducated, old, young, desirable themselves or undesirable, men of her own world and bus-conductors, generals and Tommies—during the war she had had a perplexing time—bishops equally with vergers—round

about her confirmation startling occurrences had taken place—wholesome and unwholesome, rich and penniless, brilliant or idiotic; and it made no difference at all what they were, or how long and securely married: into the eyes of every one of them, when they saw her, leapt this flame, and when they heard her it stayed there.

Scrap had had enough of this look. It only led to difficulties. At first it had delighted her. She had been excited, triumphant. To be apparently incapable of doing or saying the wrong thing, to be applauded, listened to, petted, adored wherever she went, and when she came home to find nothing there either but the most indulgent proud fondness—why, how extremely pleasant. And so easy, too. No preparation necessary for this achievement, no hard work, nothing to learn. She need take no trouble. She had only to appear, and presently say something.

But gradually experiences gathered round her. After all, she had to take trouble, she had to make efforts, because, she discovered with astonishment and rage, she had to defend herself. That look, that leaping look, meant that she was going to be grabbed at. Some of those who had it were more humble than others, especially if they were young, but they all, according to their several ability, grabbed; and she who had entered the world so jauntily, with her head in the air and the completest confidence in anybody whose hair was grey, began to distrust, and then to dislike, and soon to shrink away from, and presently to be indignant. Sometimes it was just as if she didn't belong to herself, wasn't her own at all, but was regarded as a universal thing, a sort of beauty-of-all-work. Really men . . . And she found herself involved in queer, vague quarrels, being curiously hated. Really women . . . And when the war came, and she flung herself into it along with everybody else, it finished her. Really generals . . .

The war finished Scrap. It killed the one man she felt safe with, whom she would have married, and it finally disgusted her with love. Since then she had been embittered. She was struggling as angrily in the sweet stuff of life as a wasp got caught in honey. Just as desperately did she try to unstick her wings. It gave her no pleasure to outdo other women; she didn't want their tiresome men. What could one do with men when one had got them? None of them would talk to her of anything but the things of love, and how foolish and fatiguing that became after a bit. It was as though a healthy person with a normal hunger was given nothing whatever to eat but sugar. Love, love . . . the very word made her want to slap somebody. "_Why_ should I love you? _Why_ should I?" she would ask amazed sometimes when somebody was trying—somebody was always trying—to propose to her. But she never got a real answer, only further incoherence.

A deep cynicism took hold of the unhappy Scrap. Her inside grew hoary with disillusionment, while her gracious and charming outside continued to make the world more beautiful. What had the future in it for her? She would not be able, after such a preparation, to take hold of it. She was fit for nothing; she had wasted all this time being beautiful. Presently she wouldn't be beautiful, and what then? Scrap didn't know what then, it appalled her to wonder even. Tired as she was of being conspicuous she was at least used to that, she had never known anything else; and to become inconspicuous, to fade, to grow shabby and dim, would probably be most painful. And once she began, what years and years of it there would be! Imagine, thought Scrap, having most of one's life at the wrong end. Imagine being old for two or three times as long as being young. Stupid, stupid. Everything was stupid. There wasn't a thing she wanted to do. There were thousands of things she didn't want to do. Avoidance, silence, invisibility, if possible unconsciousness—these negations were all she asked for at the moment; and here, even here, she was not allowed a minute's peace, and this absurd woman must come pretending, merely because she wanted to exercise power and make her go to bed and make her—hideous—drink castor oil, that she thought she was ill.

"I'm sure," said Mrs. Fisher, who felt the cold of the stone beginning to come through and knew she could not sit much longer, "you'll do what is reasonable. Your mother would wish—have you a mother?"

A faint wonder came into Scrap's eyes. Have you a mother? If ever anybody had a mother it was Scrap. It had not occurred to her that there could be people who had never heard of her mother. She was one of the major marchionesses—there being, as no one knew better than Scrap, marchionesses and marchionesses—and had held high positions at Court. Her father, too, in his day had been most prominent. His day was a little over, poor dear, because in the war he had made some important mistakes, and besides he was now grown old; still, there he was, an excessively well-known person. How restful, how extraordinarily restful to have found some one who had never heard of any of her lot, or at least had not yet connected her with them.

She began to like Mrs. Fisher. Perhaps the originals didn't know anything about her either. When she first wrote to them and signed her name, that great name of Dester which twisted in and out of English history like a bloody thread, for its bearers constantly killed, she had taken it for granted that they would know who she was; and at the interview in Shaftesbury Avenue she was sure they did know, because they hadn't asked, as they otherwise would have, for references.

Scrap began to cheer up. If nobody at San Salvatore had ever heard of her, if for a whole month she could shed herself, get right away from everything connected with herself, be allowed really to forget the clinging and the clogging and all the noise, why, perhaps she might make something of herself after all. She might really think; really clear up her mind; really come to some conclusion.

“What I want to do here,” she said, leaning forward in her chair and clasping her hands round her knees and looking up at Mrs. Fisher, whose seat was higher than hers, almost with animation, so much pleased was she that Mrs. Fisher knew nothing about her, “is to come to a conclusion. That’s all. It isn’t much to want, is it? Just that.”

She gazed at Mrs. Fisher, and thought that almost any conclusion would do; the great thing was to get hold of something, catch something tight, cease to drift.

Mrs. Fisher’s little eyes surveyed her. “I should say,” she said, “that what a young woman like you wants is a husband and children.”

“Well, that’s one of the things I’m going to consider,” said Scrap amiably. “But I don’t think it would be a conclusion.”

“And meanwhile,” said Mrs. Fisher, getting up, for the cold of the stone was now through, “I shouldn’t trouble my head if I were you with considerings and conclusions. Women’s heads weren’t made for thinking, I assure you. I should go to bed and get well.”

“I am well,” said Scrap.

“Then why did you send a message that you were ill?”

“I didn’t.”

“Then I’ve had all the trouble of coming out here for nothing.”

“But wouldn’t you prefer coming out and finding me well than coming out and finding me ill?” asked Scrap, smiling.

Even Mrs. Fisher was caught by the smile.

“Well, you’re a pretty creature,” she said forgivingly. “It’s a pity you weren’t born fifty years ago. My friends would have liked looking at you.”

“I’m very glad I wasn’t,” said Scrap. “I dislike being looked at.”

“Absurd,” said Mrs. Fisher, growing stern again. “That’s what you are made for, young women like you. For what else, pray? And I assure you that if my friends had looked at you, you would have been looked at by some very great people.”

“I dislike very great people,” said Scrap, frowning. There had been an incident quite recently—really potentates. . .

“What _I_ dislike,” said Mrs. Fisher, now as cold as the stone she had got up from, “is the pose of the modern young woman. It seems to me pitiful, positively pitiful, in its silliness.”

And, her stick crunching the pebbles, she walked away.

“That’s all right,” Scrap said to herself, dropping back into her comfortable position with her head in the cushion and her feet on the parapet; if only people would go away she didn’t in the least mind why they went.

“Don’t you think darling Scrap is growing a little, just a little, peculiar?” her mother had asked her father a short time before that latest peculiarity of the flight to San Salvatore, uncomfortably struck by the very odd things Scrap said and the way she had taken to slinking out of reach whenever she could and avoiding everybody except—such a sign of age—quite young men, almost boys.

“Eh? What? Peculiar? Well, let her be peculiar if she likes. A woman with her looks can be any damned thing she pleases,” was the infatuated answer.

“I do let her,” said her mother meekly; and indeed if she did not, what difference would it make?

Mrs. Fisher was sorry she had bothered about Lady Caroline. She went along the hall towards her private sitting-room, and her stick as she went struck the stone floor with a vigour in harmony with her feelings. Sheer silliness, these poses. She had no patience with them. Unable to be or do anything of themselves, the young of the present generation tried to achieve a reputation for

cleverness by decrying all that was obviously great and obviously good and by praising everything, however obviously bad, that was different. Apes, thought Mrs. Fisher, roused. Apes. Apes. And in her sitting-room she found more apes, or what seemed to her in her present mood more, for there was Mrs. Arbuthnot placidly drinking coffee, while at the writing-table, the writing-table she already looked upon as sacred, using her pen, her own pen brought for her hand alone from Prince of Wales Terrace, sat Mrs. Wilkins writing; at the table; in her room; with her pen.

“Isn’t this a delightful place?” said Mrs. Arbuthnot cordially. “We have just discovered it.”

“I’m writing to Mellersh,” said Mrs. Wilkins, turning her head and also cordially—as though, Mrs. Fisher thought, she cared a straw who she was writing to and anyhow knew who the person she called Mellersh was. “He’ll want to know,” said Mrs. Wilkins, optimism induced by her surroundings, “that I’ve got here safely.”

Chapter 11

The sweet smells that were everywhere in San Salvatore were alone enough to produce concord. They came into the sitting-room from the flowers on the battlements, and met the ones from the flowers inside the room, and almost, thought Mrs. Wilkins, could be seen greeting each other with a holy kiss. Who could be angry in the middle of such gentlenesses? Who could be acquisitive, selfish, in the old rasped London way, in the presence of this bounteous beauty?

Yet Mrs. Fisher seemed to be all three of these things.

There was so much beauty, so much more than enough for every one, that it did appear to be a vain activity to try and make a corner in it.

Yet Mrs. Fisher was trying to make a corner in it, and had railed off a portion for her exclusive use.

Well, she would get over that presently; she would get over it inevitably, Mrs. Wilkins was sure, after a day or two in the extraordinary atmosphere of peace in that place.

Meanwhile she obviously hadn’t even begun to get over it. She stood looking at her and Rose with an expression that appeared to be one of anger. Anger. Fancy. Silly old nerve-racked London feelings, thought Mrs. Wilkins, whose eyes saw the room full of kisses, and everybody in it being kissed, Mrs. Fisher as copiously as she herself and Rose.

“You don’t like us being in here,” said Mrs. Wilkins, getting up and at once, after her manner, fixing on the truth. “Why?”

“I should have thought,” said Mrs. Fisher leaning on her stick, “you could have seen that it is my room.”

“You mean because of the photographs,” said Mrs. Wilkins.

Mrs. Arbuthnot, who was a little red and surprised, got up too.

“And the notepaper,” said Mrs. Fisher. “Notepaper with my London address on it. That pen—”

She pointed. It was still in Mrs. Wilkins’s hand.

“Is yours. I’m very sorry,” said Mrs. Wilkins, laying it on the table. And she added smiling, that it had just been writing some very amiable things.

“But why,” asked Mrs. Arbuthnot, who found herself unable to acquiesce in Mrs. Fisher’s arrangements without at least a gentle struggle, “ought we not to be here? It’s a sitting-room.”

“There is another one,” said Mrs. Fisher. “You and your friend cannot sit in two rooms at once, and if I have no wish to disturb you in yours I am unable to see why you should wish to disturb me in mine.”

“But why—” began Mrs. Arbuthnot again.

“It’s quite natural,” Mrs. Wilkins interrupted, for Rose was looking stubborn; and turning to Mrs. Fisher she said that although sharing things with friends was pleasant she could understand that Mrs. Fisher, still steeped in the Prince of Wales Terrace attitude to life, did not yet want to, but that she would get rid of that after a bit and feel quite different. “Soon you’ll want us to share,” said Mrs. Wilkins reassuringly. “Why, you may even get so far as _asking_ me to use your pen if you knew I hadn’t got one.”

Mrs. Fisher was moved almost beyond control by this speech. To have a ramshackle young woman from Hampstead patting her on the back as it were, in breezy certitude that quite soon she would improve, stirred her more deeply than anything had stirred her since her first discovery that Mr. Fisher was not what he seemed. Mrs. Wilkins must certainly be curbed. But how? There was a curious imperviousness about her. At that moment, for instance, she was smiling as pleasantly and with as unclouded a face as if she were saying nothing in the least impertinent. Would she know she was being curbed? If she didn't know, if she were too tough to feel it, then what? Nothing, except avoidance; except, precisely, one's own private sitting-room.

"I'm an old woman," said Mrs. Fisher, "and I need a room to myself. I cannot get about, because of my stick. As I cannot get about I have to sit. Why should I not sit quietly and undisturbed, as I told you in London I intended to? If people are to come in and out all day long, chattering and leaving doors open, you will have broken the agreement, which was that I was to be quiet."

"But we haven't the least wish—" began Mrs. Arbuthnot, who was again cut short by Mrs. Wilkins.

"We're only too glad," said Mrs. Wilkins, "for you to have this room if it makes you happy. We didn't know about it, that's all. We wouldn't have come in if we had—not till you invited us, anyhow. I expect," she finished looking down cheerfully at Mrs. Fisher, "you soon will." And picking up her letter she took Mrs. Arbuthnot's hand and drew her towards the door.

Mrs. Arbuthnot did not want to go. She, the mildest of women, was filled with a curious and surely unchristian desire to stay and fight. Not, of course, really, nor even with any definitely aggressive words. No; she only wanted to reason with Mrs. Fisher, and to reason patiently. But she did feel that something ought to be said, and that she ought not to allow herself to be rated and turned out as if she were a schoolgirl caught in ill behaviour by Authority.

Mrs. Wilkins, however, drew her firmly to and through the door, and once again Rose wondered at Lotty, at her balance, her sweet and equable temper—she who in England had been such a thing of gusts. From the moment they got into Italy it was Lotty who seemed the elder. She certainly was very happy; blissful, in fact. Did happiness so completely protect one? Did it make one so untouchable, so wise? Rose was happy herself, but not anything like _so_ happy. Evidently not, for not only did she want to fight Mrs. Fisher but she wanted something else, something more than this lovely place, something to complete it; she wanted Frederick. For the first time in her life she was surrounded by perfect beauty, and her one thought was to show it to him, to share it with him. She wanted Frederick. She yearned for Frederick. Ah, if only, only Frederick . . .

"Poor old thing," said Mrs. Wilkins, shutting the door gently on Mrs. Fisher and her triumph. "Fancy on a day like this."

"She's a very rude old thing," said Mrs. Arbuthnot.

"She'll get over that. I'm sorry we chose just her room to go and sit in."

"It's much the nicest," said Mrs. Arbuthnot. "And it isn't hers."

"Oh but there are lots of other places, and she's such a poor old thing. Let her have the room. Whatever does it matter?"

And Mrs. Wilkins said she was going down to the village to find out where the post-office was and post her letter to Mellersh, and would Rose go too.

"I've been thinking about Mellersh," said Mrs. Wilkins as they walked, one behind the other, down the narrow zigzag path up which they had climbed in the rain the night before.

She went first. Mrs. Arbuthnot, quite naturally now, followed. In England it had been the other way about—Lotty, timid, hesitating, except when she burst out so awkwardly, getting behind the calm and reasonable Rose whenever she could.

"I've been thinking about Mellersh," repeated Mrs. Wilkins over her shoulder, as Rose seemed not to have heard.

"Have you?" said Rose, a faint distaste in her voice, for her experiences with Mellersh had not been of a kind to make her enjoy remembering him. She had deceived Mellersh; therefore she didn't like him. She was unconscious that this was the reason of her dislike, and thought it was that there didn't seem to be much, if any, of the grace of God about him. And yet how wrong to feel that, she rebuked herself, and how presumptuous. No doubt Lotty's husband was far, far nearer to God than she herself was ever likely to be. Still, she didn't like him.

"I've been a mean dog," said Mrs. Wilkins.

“A what?” asked Mrs. Arbuthnot, incredulous of her hearing.

“All this coming away and leaving him in that dreary place while I rollick in heaven. He had planned to take me to Italy for Easter himself. Did I tell you?”

“No,” said Mrs. Arbuthnot; and indeed she had discouraged talk about husbands. Whenever Lotty had begun to blurt out things she had swiftly changed the conversation. One husband led to another, in conversation as well as in life, she felt, and she could not, she would not, talk of Frederick. Beyond the bare fact that he was there, he had not been mentioned. Mellersh had had to be mentioned, because of his obstructiveness, but she had carefully kept him from overflowing outside the limits of necessity.

“Well, he did,” said Mrs. Wilkins. “He had never done such a thing in his life before, and I was horrified. Fancy—just as I had planned to come to it myself.”

She paused on the path and looked up at Rose.

“Yes,” said Rose, trying to think of something else to talk about.

“Now you see why I say I’ve been a mean dog. _He_ had planned a holiday in Italy with me, and _I_ had planned a holiday in Italy leaving him at home. I think,” she went on, her eyes fixed on Rose’s face, “Mellersh has every reason to be both angry and hurt.”

Mrs. Arbuthnot was astonished. The extraordinary quickness with which, hour by hour, under her very eyes, Lotty became more selfless, disconcerted her. She was turning into something surprisingly like a saint. Here she was now being affectionate about Mellersh—Mellersh, who only that morning, while they hung their feet into the sea, had seemed a mere iridescence, Lotty had told her, a thing of gauze. That was only that morning; and by the time they had had lunch Lotty had developed so far as to have got him solid enough again to write to, and to write to at length. And now, a few minutes later, she was announcing that he had every reason to be angry with her and hurt, and that she herself had been—the language was unusual, but it did express real penitence—a mean dog.

Rose stared at her astonished. If she went on like this, soon a nimbus might be expected round her head, was there already, if one didn’t know it was the sun through the tree-trunks catching her sandy hair.

A great desire to love and be friends, to love everybody, to be friends with everybody, seemed to be invading Lotty—a desire for sheer goodness. Rose’s own experience was that goodness, the state of being good, was only reached with difficulty and pain. It took a long time to get to it; in fact one never did get to it, or, if for a flashing instant one did, it was only for a flashing instant. Desperate perseverance was needed to struggle along its path, and all the way was dotted with doubts. Lotty simply flew along. She had certainly, thought Rose, not got rid of her impetuousness. It had merely taken another direction. She was now impetuously becoming a saint. Could one really attain goodness so violently? Wouldn’t there be an equally violent reaction?

“I shouldn’t,” said Rose with caution, looking down into Lotty’s bright eyes—the path was steep, so that Lotty was well below her—“I shouldn’t be sure of that too quickly.”

“But I am sure of it, and I’ve written and told him so.”

Rose stared. “Why, but only this morning—” she began.

“It’s all in this,” interrupted Lotty, tapping the envelope and looking pleased.

“What—everything?”

“You mean about the advertisement and my savings being spent? Oh no—not yet. But I’ll tell him all that when he comes.”

“When he comes?” repeated Rose.

“I’ve invited him to come and stay with us.”

Rose could only go on staring.

“It’s the least I could do. Besides—look at this.” Lotty waved her hand. “Disgusting not to share it. I was a mean dog to go off and leave him, but no dog I’ve ever heard of was ever as mean as I’d be if I didn’t try and persuade Mellersh to come out and enjoy this too. It’s barest decency that he should have some of the fun out of my nest-egg. After all, he has housed me and fed me for years.

One shouldn't be churlish."

"But—do you think he'll come?"

"Oh, I _hope_ so," said Lotty with the utmost earnestness; and added, "Poor lamb."

At that Rose felt she would like to sit down. Mellersh a poor lamb? That same Mellersh who a few hours before was mere shimmer? There was a seat at the bend of the path, and Rose went to it and sat down. She wished to get her breath, gain time. If she had time she might perhaps be able to catch up the leaping Lotty, and perhaps be able to stop her before she committed herself to what she probably presently would be sorry for. Mellersh at San Salvatore? Mellersh, from whom Lotty had taken such pains so recently to escape?

"I _see_ him here," said Lotty, as if in answer to her thoughts.

Rose looked at her with real concern: for every time Lotty said in that convinced voice, "I _see_," what she saw came true. Then it was to be supposed that Mr. Wilkins too would presently come true.

"I wish," said Rose anxiously, "I understood you."

"Don't try," said Lotty, smiling.

"But I must, because I love you."

"Dear Rose," said Lotty, swiftly bending down and kissing her.

"You're so quick," said Rose. "I can't follow your developments. I can't keep touch. It was what happened with Freder—"

She broke off and looked frightened.

"The whole idea of our coming here," she went on again, as Lotty didn't seem to have noticed, "was to get away, wasn't it? Well, we've got away. And now, after only a single day of it, you want to write to the very people—"

She stopped.

"The very people we were getting away from," finished Lotty. "It's quite true. It seems idiotically illogical. But I'm so happy, I'm so well, I feel so fearfully wholesome. This place—why, it makes me feel _flooded_ with love."

And she stared down at Rose in a kind of radiant surprise.

Rose was silent a moment. Then she said, "And do you think it will have the same effect on Mr. Wilkins?"

Lotty laughed. "I don't know," she said. "But even if it doesn't, there's enough love about to flood fifty Mr. Wilkinses, as you call him. The great thing is to have lots of love _about_. I don't see," she went on, "at least I don't see here, though I did at home, that it matters who loves as long as somebody does. I was a stingy beast at home, and used to measure and count. I had a queer obsession about justice. As though justice mattered. As though justice can really be distinguished from vengeance. It's only love that's any good. At home I wouldn't love Mellersh unless he loved me back, exactly as much, absolute fairness. Did you ever. And as he didn't, neither did I, and the _aridity_ of that house! The _aridity_ . . ."

Rose said nothing. She was bewildered by Lotty. One odd effect of San Salvatore on her rapidly developing friend was her sudden free use of robust words. She had not used them in Hampstead. Beast and dog were more robust than Hampstead cared about. In words, too, Lotty had come unchained.

But how she wished, oh how Rose wished, that she too could write to her husband and say "Come." The Wilkins _ménage_, however pompous Mellersh might be, and he had seemed to Rose pompous, was on a healthier, more natural footing than hers. Lotty could write to Mellersh and would get an answer. She couldn't write to Frederick, for only too well did she know he wouldn't answer. At least, he might answer—a hurried scribble, showing how much bored he was at doing it, with perfunctory thanks for her letter. But that would be worse than no answer at all; for his handwriting, her name on an envelope addressed by him, stabbed her heart. Too acutely did it bring back the letters of their beginnings together, the letters from him so desolate with separation, so aching with love and longing. To see apparently one of these very same letters arrive, and open it and find:

Dear Rose—Thanks for letter. Glad you're having a good time. Don't hurry back. Say if you want any money. Everything going splendidly here.—Yours, Frederick.

—no, it couldn't be borne.

"I don't think I'll come down to the village with you to-day," she said, looking up at Lotty with eyes suddenly gone dim. "I think I want to think."

"All right," said Lotty, at once starting off briskly down the path. "But don't think too long," she called back over her shoulder. "Write and invite him at once."

"Invite whom?" asked Rose, startled.

"Your husband."

Chapter 12

At the evening meal, which was the first time the whole four sat round the dining-room table together, Scrap appeared.

She appeared quite punctually, and in one of those wrappers or tea-gowns which are sometimes described as ravishing. This one really was ravishing. It certainly ravished Mrs. Wilkins, who could not take her eyes off the enchanting figure opposite. It was a shell-pink garment, and clung to the adorable Scrap as though it, too, loved her.

"What a beautiful dress!" exclaimed Mrs. Wilkins eagerly.

"What—this old rag?" said Scrap, glancing down at it as if to see which one she had got on. "I've had it a hundred years." And she concentrated on her soup.

"You must be very cold in it," said Mrs. Fisher, thin-lipped; for it showed a great deal of Scrap—the whole of her arms, for instance, and even where it covered her up it was so thin that you still saw her.

"Who—me?" said Scrap, looking up a moment. "Oh, no."

And she continued her soup.

"You mustn't catch a chill, you know," said Mrs. Arbuthnot, feeling that such loveliness must at all costs be preserved unharmed. "There's a great difference here when the sun goes down."

"I'm quite warm," said Scrap, industriously eating her soup.

"You look as if you had nothing at all on underneath," said Mrs. Fisher.

"I haven't. At least, hardly anything," said Scrap, finishing her soup.

"How very imprudent," said Mrs. Fisher, "and how highly improper."

Whereupon Scrap stared at her.

Mrs. Fisher had arrived at dinner feeling friendly towards Lady Caroline. She at least had not intruded into her room and sat at her table and written with her pen. She did, Mrs. Fisher had supposed, know how to behave. Now it appeared that she did not know, for was this behaving, to come dressed—no, undressed—like that to a meal? Such behaviour was not only exceedingly improper but also most inconsiderate, for the indelicate creature would certainly catch a chill, and then infect the entire party. Mrs. Fisher had a great objection to other people's chills. They were always the fruit of folly; and then they were handed on to her, who had done nothing at all to deserve them.

"Bird-brained," thought Mrs. Fisher, sternly contemplating Lady Caroline. "Not an idea in her head except vanity."

"But there are no men here," said Mrs. Wilkins, "so how can it be improper? Have you noticed," she inquired of Mrs. Fisher, who endeavoured to pretend she did not hear, "how difficult it is to be improper without men?"

Mrs. Fisher neither answered her nor looked at her; but Scrap looked at her, and did that with her mouth which in any other mouth would have been a faint grin. Seen from without, across the bowl of nasturtiums, it was the most beautiful of brief and dimpled smiles.

She had a very alive sort of face, that one, thought Scrap, observing Mrs. Wilkins with a dawn of interest. It was rather like a field of corn swept by lights and shadows. Both she and the dark one, Scrap noticed, had changed their clothes, but only in order to put on silk jumpers. The same amount of trouble would have been enough to dress them properly, reflected Scrap. Naturally they looked like nothing on earth in the jumpers. It didn't matter what Mrs. Fisher wore; indeed, the only thing for her, short of plumes and ermine, was what she did wear. But these others were quite young still, and quite attractive. They really definitely had faces. How different life would be for them if they made the most of themselves instead of the least. And yet—Scrap was suddenly bored, and turned away her thoughts and absently ate toast. What did it matter? If you did make the best of yourself, you only collected people round you who ended by wanting to grab.

"I've had the most wonderful day," began Mrs. Wilkins, her eyes shining.

Scrap lowered hers. "Oh," she thought, "she's going to gush."

"As though anybody were interested in her day," thought Mrs. Fisher, lowering hers also.

In fact, whenever Mrs. Wilkins spoke Mrs. Fisher deliberately cast down her eyes. Thus would she mark her disapproval. Besides, it seemed the only safe thing to do with her eyes, for no one could tell what the uncurbed creature would say next. That which she had just said, for instance, about men—addressed too, to her—what could she mean? Better not conjecture, thought Mrs. Fisher; and her eyes, though cast down, yet saw Lady Caroline stretch out her hand to the Chianti flask and fill her glass again.

Again. She had done it once already, and the fish was only just going out of the room. Mrs. Fisher could see that the other respectable member of the party, Mrs. Arbuthnot, was noticing it too. Mrs. Arbuthnot was, she hoped and believed, respectable and well-meaning. It is true she also had invaded her sitting-room, but no doubt she had been dragged there by the other one, and Mrs. Fisher had little if anything against Mrs. Arbuthnot, and observed with approval that she only drank water. That was as it should be. So, indeed, to give her her dues, did the freckled one; and very right at their age. She herself drank wine, but with what moderation: one meal, one glass. And she was sixty-five, and might properly, and even beneficially, have had at least two.

"That," she said to Lady Caroline, cutting right across what Mrs. Wilkins was telling them about her wonderful day and indicating the wine-glass, "is very bad for you."

Lady Caroline, however, could not have heard, for she continued to sip, her elbow on the table, and listen to what Mrs. Wilkins was saying.

And what was it she was saying? She had invited somebody to come and stay? A man?

Mrs. Fisher could not credit her ears. Yet it evidently was a man, for she spoke of the person as he.

Suddenly and for the first time—but then this was most important—Mrs. Fisher addressed Mrs. Wilkins directly. She was sixty-five, and cared very little what sorts of women she happened to be with for a month, but if the women were to be mixed with men it was a different proposition altogether. She was not going to be made a cat's-paw of. She had not come out there to sanction by her presence what used in her day to be called fast behaviour. Nothing had been said at the interview in London about men; if there had been she would have declined, of course, to come.

"What is his name?" asked Mrs. Fisher, abruptly interposing.

Mrs. Wilkins turned to her with a slight surprise. "Wilkins," she said.

"Wilkins?"

"Yes."

"Your name?"

"And his."

"A relation?"

“Not blood.”

“A connection?”

“A husband.”

Mrs. Fisher once more cast down her eyes. She could not talk to Mrs. Wilkins. There was something about the things she said. . . “A husband.” Suggesting one of many. Always that unseemly twist to everything. Why could she not say “My husband”? Besides, Mrs. Fisher had, she herself knew not for what reason, taken both the Hampstead young women for widows. War ones. There had been an absence of mention of husbands at the interview which would not, she considered, be natural if such persons did after all exist. And if a husband was not a relation, who was? “Not blood.” What a way to talk. Why, a husband was the first of all relations. How well she remembered Ruskin—no, it was not Ruskin, it was the Bible that said a man should leave his father and mother and cleave only to his wife; showing that she became by marriage an even more than blood relation. And if the husband’s father and mother were to be nothing to him compared to his wife, how much less than nothing ought the wife’s father and mother be to her compared to her husband. She herself had been unable to leave her father and mother in order to cleave to Mr. Fisher because they were no longer, when she married, alive, but she certainly would have left them if they had been there to leave. Not blood, indeed. Silly talk.

The dinner was very good. Succulence succeeded succulence. Costanza had determined to do as she chose in the matter of cream and eggs the first week, and see what happened at the end of it when the bills had to be paid. Her experience of the English was that they were quiet about bills. They were shy of words. They believed readily. Besides, who was the mistress here? In the absence of a definite one, it occurred to Costanza that she might as well be the mistress herself. So she did as she chose about the dinner, and it was very good.

The four, however, were so much preoccupied by their own conversation that they ate it without noticing how good it was. Even Mrs. Fisher, she who in such matters was manly, did not notice. The entire excellent cooking was to her as though it were not; which shows how much she must have been stirred.

She was stirred. It was that Mrs. Wilkins. She was enough to stir anybody. And she was undoubtedly encouraged by Lady Caroline, who, in her turn, was no doubt influenced by the Chianti.

Mrs. Fisher was very glad there were no men present, for they certainly would have been foolish about Lady Caroline. She was precisely the sort of young woman to unbalance them; especially, Mrs. Fisher recognised, at that moment. Perhaps it was the Chianti momentarily intensifying her personality, but she was undeniably most attractive; and there were few things Mrs. Fisher disliked more than having to look on while sensible, intelligent men, who the moment before were talking seriously and interestingly about real matters, became merely foolish and simpering—she had seen them actually simpering—just because in walked a bit of bird-brained beauty. Even Mr. Gladstone, that great wise statesman, whose hand had once rested for an unforgettable moment solemnly on her head, would have, she felt, on perceiving Lady Caroline left off talking sense and horribly embarked on badinage.

“You see,” Mrs. Wilkins said—a silly trick that, with which she mostly began her sentences; Mrs. Fisher each time wished to say, “Pardon me—I do not see, I hear”—but why trouble?—“You see,” said Mrs. Wilkins, leaning across towards Lady Caroline, “we arranged, didn’t we, in London that if any of us wanted to we could each invite one guest. So now I’m doing it.”

“I don’t remember that,” said Mrs. Fisher, her eyes on her plate.

“Oh yes, we did—didn’t we, Rose?”

“Yes—I remember,” said Lady Caroline. “Only it seemed so incredible that one could ever want to. One’s whole idea was to get away from one’s friends.”

“And one’s husbands.”

Again that unseemly plural. But how altogether unseemly, thought Mrs. Fisher. Such implications. Mrs. Arbuthnot clearly thought so too, for she had turned red.

“And family affection,” said Lady Caroline—or was it the Chianti speaking? Surely it was the Chianti.

“And the want of family affection,” said Mrs. Wilkins—what a light she was throwing on her home life and real character.

“That wouldn’t be so bad,” said Lady Caroline. “I’d stay with that. It would give one room.”

“Oh no, no—it’s dreadful,” cried Mrs. Wilkins. “It’s as if one had no clothes on.”

“But I like that,” said Lady Caroline.

“Really—” said Mrs. Fisher.

“It’s a divine feeling, getting rid of things,” said Lady Caroline, who was talking altogether to Mrs. Wilkins and paid no attention to the other two.

“Oh, but in a bitter wind to have nothing on and know there never will be anything on and you going to get colder and colder till at last you die of it—that’s what it was like, living with somebody who didn’t love one.”

These confidences, thought Mrs. Fisher . . . and no excuse whatever for Mrs. Wilkins, who was making them entirely on plain water. Mrs. Arbuthnot, judging from her face, quite shared Mrs. Fisher’s disapproval; she was fidgeting.

“But didn’t he?” asked Lady Caroline—every bit as shamelessly unreticent as Mrs. Wilkins.

“Mellersh? He showed no signs of it.”

“Delicious,” murmured Lady Caroline.

“Really—” said Mrs. Fisher.

“I didn’t think it was at all delicious. I was miserable. And now, since I’ve been here, I simply stare at myself being miserable. As miserable as that. And about Mellersh.”

“You mean he wasn’t worth it.”

“Really—” said Mrs. Fisher.

“No, I don’t. I mean I’ve suddenly got well.”

Lady Caroline, slowly twisting the stem of her glass in her fingers, scrutinised the lit-up face opposite.

“And now I’m well I find I can’t sit here and gloat all to myself. I can’t be happy, shutting him out. I must share. I understand exactly what the Blessed Damozel felt like.”

“What was the Blessed Damozel?” asked Scrap.

“Really—” said Mrs. Fisher; and with such emphasis this time that Lady Caroline turned to her.

“Ought I to know?” she asked. “I don’t know any natural history. It sounds like a bird.”

“It is a poem,” said Mrs. Fisher with extraordinary frost.

“Oh,” said Scrap.

“I’ll lend it to you,” said Mrs. Wilkins, over whose face laughter rippled.

“No,” said Scrap.

“And its author,” said Mrs. Fisher icily, “though not perhaps quite what one would have wished him to be, was frequently at my father’s table.”

“What a bore for you,” said Scrap. “That’s what mother’s always doing—inviting authors. I hate authors. I wouldn’t mind them so much if they didn’t write books. Go on about Mellersh,” she said, turning to Mrs. Wilkins.

“Really—” said Mrs. Fisher.

“All those empty beds,” said Mrs. Wilkins.

“What empty beds?” asked Scrap.

“The ones in this house. Why, of course they each ought to have somebody happy inside them. Eight beds, and only four people. It’s dreadful, dreadful to be so greedy and keep everything just for oneself. I want Rose to ask her husband out too. You and Mrs. Fisher haven’t got husbands, but why not give some friend a glorious time?”

Rose bit her lip. She turned red, she turned pale. If only Lotty would keep quiet, she thought. It was all very well to have suddenly become a saint and want to love everybody, but need she be so tactless? Rose felt that all her poor sore places were being danced on. If only Lotty would keep quiet . . .

And Mrs. Fisher, with even greater frostiness than that with which she had received Lady Caroline’s ignorance of the Blessed Damozel, said, “There is only one unoccupied bedroom in this house.”

“Only one?” echoed Mrs. Wilkins, astonished. “Then who are in all the others?”

“We are,” said Mrs. Fisher.

“But we’re not in all the bedrooms. There must be at least six. That leaves two over, and the owner told us there were eight beds—didn’t he Rose?”

“There are six bedrooms,” said Mrs. Fisher; for both she and Lady Caroline had thoroughly searched the house on arriving, in order to see which part of it they would be most comfortable in, and they both knew that there were six bedrooms, two of which were very small, and in one of these small ones Francesca slept in the company of a chair and a chest of drawers, and the other, similarly furnished, was empty.

Mrs. Wilkins and Mrs. Arbuthnot had hardly looked at the house, having spent most of their time out-of-doors gaping at the scenery, and had, in the agitated inattentiveness of their minds when first they began negotiating for San Salvatore, got into their heads that the eight beds of which the owner spoke were the same as eight bedrooms; which they were not. There were indeed eight beds, but four of them were in Mrs. Wilkins’s and Mrs. Arbuthnot’s rooms.

“There are six bedrooms,” repeated Mrs. Fisher. “We have four, Francesca has the fifth, and the sixth is empty.”

“So that,” said Scrap, “however kind we feel we would be if we could, we can’t. Isn’t it fortunate?”

“But then there’s only room for one?” said Mrs. Wilkins, looking round at the three faces.

“Yes—and you’ve got him,” said Scrap.

Mrs. Wilkins was taken aback. This question of the beds was unexpected. In inviting Mellersh she had intended to put him in one of the four spare-rooms that she imagined were there. When there were plenty of rooms and enough servants there was no reason why they should, as they did in their small, two-servanted house at home, share the same one. Love, even universal love, the kind of love with which she felt herself flooded, should not be tried. Much patience and self-effacement were needed for successful married sleep. Placidity; a steady faith; these too were needed. She was sure she would be much fonder of Mellersh, and he not mind her nearly so much, if they were not shut up together at night, if in the morning they could meet with the cheery affection of friends between whom lies no shadow of differences about the window or the washing arrangements, or of absurd little choked-down resentments at something that had seemed to one of them unfair. Her happiness, she felt, and her ability to be friends with everybody, was the result of her sudden new freedom and its peace. Would there be that sense of freedom, that peace, after a night shut up with Mellersh? Would she be able in the morning to be full towards him, as she was at that moment full, of nothing at all but loving-kindness? After all, she hadn’t been very long in heaven. Suppose she hadn’t been in it long enough for her to have become fixed in blandness? And only that morning what an extraordinary joy it had been to find herself alone when she woke, and able to pull the bed-clothes any way she liked!

Francesca had to nudge her. She was so much absorbed that she did not notice the pudding.

“If,” thought Mrs. Wilkins, distractedly helping herself, “I share my room with Mellersh I risk losing all I now feel about him. If on the other hand I put him in the one spare-room, I prevent Mrs. Fisher and Lady Caroline from giving somebody a treat. True they don’t seem to want to at present, but at any moment in this place one or the other of them may be seized with a desire to make somebody happy, and then they wouldn’t be able to because of Mellersh.”

“What a problem,” she said aloud, her eyebrows puckered.

“What is?” asked Scrap.

“Where to put Mellersh.”

Scrap stared. “Why, isn’t one room enough for him?” she asked.

“Oh yes, quite. But then there won’t be any room left at all—any room for somebody you may want to invite.”

“I shan’t want to,” said Scrap.

“Or _you_,” said Mrs. Wilkins to Mrs. Fisher. “Rose, of course, doesn’t count. I’m sure she would like sharing her room with her husband. It’s written all over her.”

“Really—” said Mrs. Fisher.

“Really what?” asked Mrs. Wilkins, turning hopefully to her, for she thought the word this time was the preliminary to a helpful suggestion.

It was not. It stood by itself. It was, as before, mere frost.

Challenged, however, Mrs. Fisher did fasten it on to a sentence. “Really am I to understand,” she asked, “that you propose to reserve the one spare-room for the exclusive use of your own family?”

“He isn’t my own family,” said Mrs. Wilkins. “He’s my husband. You see—”

“I see nothing,” Mrs. Fisher could not this time refrain from interrupting—for what an intolerable trick. “At the most I hear, and that reluctantly.”

But Mrs. Wilkins, as impervious to rebuke as Mrs. Fisher had feared, immediately repeated the tiresome formula and launched out into a long and excessively indelicate speech about the best place for the person she called Mellersh to sleep in.

Mellersh—Mrs. Fisher, remembering the Thomases and Johns and Alfreds and Roberts of her day, plain names that yet had all become glorious, thought it sheer affectation to be christened Mellersh—was, it seemed, Mrs. Wilkins’s husband, and therefore his place was clearly indicated. Why this talk? She herself, as if foreseeing his arrival, had had a second bed put in Mrs. Wilkins’s room. There were certain things in life which were never talked about but only done. Most things connected with husbands were not talked about; and to have a whole dinner-table taken up with a discussion as to where one of them should sleep was an affront to the decencies. How and where husbands slept should be known only to their wives. Sometimes it was not known to them, and then the marriage had less happy moments; but these moments were not talked about either; the decencies continued to be preserved. At least, it was so in her day. To have to hear whether Mr. Wilkins should or should not sleep with Mrs. Wilkins, and the reasons why he should and the reasons why he shouldn’t, was both uninteresting and indelicate.

She might have succeeded in imposing propriety and changing the conversation if it had not been for Lady Caroline. Lady Caroline encouraged Mrs. Wilkins, and threw herself into the discussion with every bit as much unreserve as Mrs. Wilkins herself. No doubt she was impelled on this occasion by Chianti, but whatever the reason there it was. And, characteristically, Lady Caroline was all for Mr. Wilkins being given the solitary spare-room. She took that for granted. Any other arrangement would be impossible, she said; her expression was, “Barbarous.” Had she never read her Bible, Mrs. Fisher was tempted to inquire—_And they two shall be one flesh?_ Clearly also, then, one room. But Mrs. Fisher did not inquire. She did not care even to allude to such texts to some one unmarried.

However, there was one way she could force Mr. Wilkins into his proper place and save the situation: she could say she herself intended to invite a friend. It was her right. They had all said so. Apart from propriety, it was monstrous that Mrs. Wilkins should want to monopolise the one spare-room, when in her own room was everything necessary for her husband. Perhaps she really would invite somebody—not invite, but suggest coming. There was Kate Lumley, for instance. Kate could perfectly afford to come and pay her share; and she was of her own period and knew, and had known, most of the people she herself knew and had known. Kate, of course, had only been on the fringe; she used to be asked only to the big parties, not to the small ones, and she still was only on the fringe. There were some people who never got off the fringe, and Kate was one. Often, however, such people were more permanently agreeable to be with than the others, in that they remained grateful.

Yes; she might really consider Kate. The poor soul had never married, but then everybody could not expect to marry, and she was quite comfortably off—not too comfortably, but just comfortably enough to pay her own expenses if she came and yet be grateful. Yes; Kate was the solution. If she came, at one stroke, Mrs. Fisher saw, would the Wilkinses be regularised and Mrs. Wilkins be prevented from having more than her share of the rooms. Also, Mrs. Fisher would save herself from isolation; spiritual isolation. She desired physical isolation between meals, but she disliked that isolation which is of the spirit. Such isolation would, she feared, certainly be hers with these three alien-minded young women. Even Mrs. Arbuthnot was, owing to her friendship with Mrs. Wilkins, necessarily alien-minded. In Kate she would have a support. Kate, without intruding on her sitting-room, for Kate was tractable, would be there at meals to support her.

Mrs. Fisher said nothing at the moment; but presently in the drawing-room, when they were gathered round the wood fire—she had discovered there was no fireplace in her own sitting-room, and therefore she would after all be forced, so long as the evenings remained cool, to spend them in the other room—presently, while Francesca was handing coffee round and Lady Caroline was poisoning the air with smoke, Mrs. Wilkins, looking relieved and pleased, said: “Well, if nobody really wants that room, and wouldn’t use it anyhow, I shall be very glad if Mellersh may have it.”

“Of course he must have it,” said Lady Caroline.

Then Mrs. Fisher spoke.

“I have a friend,” she said in her deep voice; and sudden silence fell upon the others.

“Kate Lumley,” said Mrs. Fisher.

Nobody spoke.

“Perhaps,” continued Mrs. Fisher, addressing Lady Caroline, “you know her?”

No, Lady Caroline did not know Kate Lumley; and Mrs. Fisher, without asking the others if they did, for she was sure they knew no one, proceeded. “I wish to invite her to join me,” said Mrs. Fisher.

Complete silence.

Then Scrap said, turning to Mrs. Wilkins, “That settles Mellersh, then.”

“It settles the question of Mr. Wilkins,” said Mrs. Fisher, “although I am unable to understand that there should ever have been a question, in the only way that is right.”

“I’m afraid you’re in for it, then,” said Lady Caroline, again to Mrs. Wilkins. “Unless,” she added, “he can’t come.”

But Mrs. Wilkins, her brow perturbed—for suppose after all she were not yet quite stable in heaven?—could only say, a little uneasily, “I _see_ him here.”

Chapter 13

The uneventful days—only outwardly uneventful—slipped by in floods of sunshine, and the servants, watching the four ladies, came to the conclusion there was very little life in them.

To the servants San Salvatore seemed asleep. No one came to tea, nor did the ladies go anywhere to tea. Other tenants in other springs had been far more active. There had been stir and enterprise; the boat had been used; excursions had been made; Beppo’s fly was ordered; people from Mezzago came over and spent the day; the house rang with voices; even sometimes champagne had been drunk. Life was varied, life was interesting. But this? What was this? The servants were not even scolded. They were left completely to themselves. They yawned.

Perplexing, too, was the entire absence of gentlemen. How could gentlemen keep away from so much beauty? For, added up, and even after the subtraction of the old one, the three younger ladies produced a formidable total of that which gentlemen usually sought.

Also the evident desire of each lady to spend long hours separated from the other ladies puzzled the servants. The result was a deathly stillness in the house, except at meal-times. It might have been as empty as it had been all the winter, for any sounds of life

there were. The old lady sat in her room, alone; the dark-eyed lady wandered off alone, loitering, so Domenico told them, who sometimes came across her in the course of his duties, incomprehensibly among the rocks; the very beautiful fair lady lay in her low chair in the top garden, alone; the less, but still beautiful fair lady went up the hills and stayed up them for hours, alone; and every day the sun blazed slowly round the house, and disappeared at evening into the sea, and nothing at all had happened.

The servants yawned.

Yet the four visitors, while their bodies sat—that was Mrs. Fisher's—or lay—that was Lady Caroline's—or loitered—that was Mrs. Arbuthnot's—or went in solitude up into the hills—that was Mrs. Wilkins's—were anything but torpid really. Their minds were unusually busy. Even at night their minds were busy, and the dreams they had were clear, thin, quick things, entirely different from the heavy dreams of home. There was that in the atmosphere of San Salvatore which produced active-mindedness in all except the natives. They, as before, whatever the beauty around them, whatever the prodigal seasons did, remained immune from thoughts other than those they were accustomed to. All their lives they had seen, year by year, the amazing recurrent spectacle of April in the gardens, and custom had made it invisible to them. They were as blind to it, as unconscious of it, as Domenico's dog asleep in the sun.

The visitors could not be blind to it—it was too arresting after London in a particularly wet and gloomy March. Suddenly to be transported to that place where the air was so still that it held its breath, where the light was so golden that the most ordinary things were transfigured—to be transported into that delicate warmth, that caressing fragrance, and to have the old grey castle as the setting, and, in the distance, the serene clear hills of Perugini's backgrounds, was an astonishing contrast. Even Lady Caroline, used all her life to beauty, who had been everywhere and seen everything, felt the surprise of it. It was, that year, a particularly wonderful spring, and of all the months at San Salvatore April, if the weather was fine, was best. May scorched and withered; March was restless, and could be hard and cold in its brightness; but April came along softly like a blessing, and if it were a fine April it was so beautiful that it was impossible not to feel different, not to feel stirred and touched.

Mrs. Wilkins, we have seen, responded to it instantly. She, so to speak, at once flung off all her garments and dived straight into glory, unhesitatingly, with a cry of rapture.

Mrs. Arbuthnot was stirred and touched, but differently. She had odd sensations—presently to be described.

Mrs. Fisher, being old, was of a closer, more impermeable texture, and offered more resistance; but she too had odd sensations, also in their place to be described.

Lady Caroline, already amply acquainted with beautiful houses and climates, to whom they could not come quite with the same surprise, yet was very nearly as quick to react as Mrs. Wilkins. The place had an almost instantaneous influence on her as well, and of one part of this influence she was aware: it had made her, beginning on the very first evening, want to think, and acted on her curiously like a conscience. What this conscience seemed to press upon her notice with an insistence that startled her—Lady Caroline hesitated to accept the word, but it would keep on coming into her head—was that she was tawdry.

Tawdry. She. Fancy.

She must think that out.

The morning after the first dinner together, she woke up in a condition of regret that she should have been so talkative to Mrs. Wilkins the night before. What had made her be, she wondered. Now, of course, Mrs. Wilkins would want to grab, she would want to be inseparable; and the thought of a grabbing and an inseparableness that should last four weeks made Scrap's spirit swoon within her. No doubt the encouraged Mrs. Wilkins would be lurking in the top garden waiting to waylay her when she went out, and would hail her with morning cheerfulness. How much she hated being hailed with morning cheerfulness—or indeed, hailed at all. She oughtn't to have encouraged Mrs. Wilkins the night before. Fatal to encourage. It was bad enough not to encourage, for just sitting there and saying nothing seemed usually to involve her, but actively to encourage was suicidal. What on earth had made her? Now she would have to waste all the precious time, the precious, lovely time for thinking in, for getting square with herself, in shaking Mrs. Wilkins off.

With great caution and on the tips of her toes, balancing herself carefully lest the pebbles should scrunch, she stole out when she was dressed to her corner; but the garden was empty. No shaking off was necessary. Neither Mrs. Wilkins nor anybody else was to be seen. She had it entirely to herself. Except for Domenico, who presently came and hovered, watering his plants, again especially

all the plants that were nearest her, no one came out at all; and when, after a long while of following up thoughts which seemed to escape her just as she had got them, and dropping off exhausted to sleep in the intervals of this chase, she felt hungry and looked at her watch and saw that it was past three, she realised that nobody had even bothered to call her in to lunch. So that, Scrap could not but remark, if any one was shaken off it was she herself.

Well, but how delightful, and how very new. Now she would really be able to think, uninterruptedly. Delicious to be forgotten.

Still, she was hungry; and Mrs. Wilkins, after that excessive friendliness the night before, might at least have told her lunch was ready. And she had really been excessively friendly—so nice about Mellersh's sleeping arrangements, wanting him to have the spare-room and all. She wasn't usually interested in arrangements, in fact she wasn't ever interested in them; so that Scrap considered she might be said almost to have gone out of her way to be agreeable to Mrs. Wilkins. And, in return, Mrs. Wilkins didn't even bother whether or not she had any lunch.

Fortunately, though she was hungry, she didn't mind missing a meal. Life was full of meals. They took up an enormous proportion of one's time; and Mrs. Fisher was, she was afraid, one of those persons who at meals linger. Twice now had she dined with Mrs. Fisher, and each time she had been difficult at the end to dislodge, lingering on slowly cracking innumerable nuts and slowly drinking a glass of wine that seemed as if it would never be finished. Probably it would be a good thing to make a habit of missing lunch, and as it was quite easy to have tea brought out to her, and as she breakfasted in her room, only once a day would she have to sit at the dining-room table and endure the nuts.

Scrap burrowed her head comfortably in the cushions, and with her feet crossed on the low parapet gave herself up to more thought. She said to herself, as she had said at intervals throughout the morning: Now I'm going to think. But, never having thought out anything in her life, it was difficult. Extraordinary how one's attention wouldn't stay fixed; extraordinary how one's mind slipped sideways. Settling herself down to a review of her past as a preliminary to the consideration of her future, and hunting in it to begin with for any justification of that distressing word tawdry, the next thing she knew was that she wasn't thinking about this at all, but had somehow switched on to Mr. Wilkins.

Well, Mr. Wilkins was quite easy to think about, though not pleasant. She viewed his approach with misgivings. For not only was it a profound and unexpected bore to have a man added to the party, and a man, too, of the kind she was sure Mr. Wilkins must be, but she was afraid—and her fear was the result of a drearily unvarying experience—that he might wish to hang about her.

This possibility had evidently not yet occurred to Mrs. Wilkins, and it was not one to which she could very well draw her attention; not, that is, without being too fatuous to live. She tried to hope that Mr. Wilkins would be a wonderful exception to the dreadful rule. If only he were, she would be so much obliged to him that she believed she might really quite like him.

But—she had misgivings. Suppose he hung about her so that she was driven from her lovely top garden; suppose the light in Mrs. Wilkins's funny, flickering face was blown out. Scrap felt she would particularly dislike this to happen to Mrs. Wilkins's face, yet she had never in her life met any wives, not any at all, who had been able to understand that she didn't in the least want their husbands. Often she had met wives who didn't want their husbands either, but that made them none the less indignant if they thought somebody else did, and none the less sure, when they saw them hanging round Scrap, that she was trying to get them. Trying to get them! The bare thought, the bare recollection of these situations, filled her with a boredom so extreme that it instantly sent her to sleep again.

When she woke up she went on with Mr. Wilkins.

Now if, thought Scrap, Mr. Wilkins were not an exception and behaved in the usual way, would Mrs. Wilkins understand, or would it just simply spoil her holiday? She seemed quick, but would she be quick about just this? She seemed to understand and see inside one, but would she understand and see inside one when it came to Mr. Wilkins?

The experienced Scrap was full of doubts. She shifted her feet on the parapet; she jerked a cushion straight. Perhaps she had better try and explain to Mrs. Wilkins, during the days still remaining before the arrival—explain in a general way, rather vague and talking at large—her attitude towards such things. She might also expound to her her peculiar dislike of people's husbands, and her profound craving to be, at least for this one month, let alone.

But Scrap had her doubts about this too. Such talk meant a certain familiarity, meant embarking on a friendship with Mrs. Wilkins; and if, after having embarked on it and faced the peril it contained of too much Mrs. Wilkins, Mr. Wilkins should turn out to be

artful—and people did get very artful when they were set on anything—and manage after all to slip through into the top garden, Mrs. Wilkins might easily believe she had been taken in, and that she, Scrap, was deceitful. Deceitful! And about Mr. Wilkins. Wives were really pathetic.

At half-past four she heard sounds of saucers on the other side of the daphne bushes. Was tea being sent out to her?

No; the sounds came no closer, they stopped near the house. Tea was to be in the garden, in her garden. Scrap considered she might at least have been asked if she minded being disturbed. They all knew she sat there.

Perhaps some one would bring hers to her in her corner.

No; nobody brought anything.

Well, she was too hungry not to go and have it with the others to-day, but she would give Francesca strict orders for the future.

She got up, and walked with that slow grace which was another of her outrageous number of attractions towards the sounds of tea. She was conscious not only of being very hungry but of wanting to talk to Mrs. Wilkins again. Mrs. Wilkins had not grabbed, she had left her quite free all day in spite of the _rapprochement_ the night before. Of course she was an original, and put on a silk jumper for dinner, but she hadn't grabbed. This was a great thing. Scrap went towards the tea-table quite looking forward to Mrs. Wilkins; and when she came in sight of it she saw only Mrs. Fisher and Mrs. Arbuthnot.

Mrs. Fisher was pouring out the tea, and Mrs. Arbuthnot was offering Mrs. Fisher macaroons. Every time Mrs. Fisher offered Mrs. Arbuthnot anything—her cup, or milk, or sugar—Mrs. Arbuthnot offered her macaroons—pressed them on her with an odd assiduousness, almost with obstinacy. Was it a game? Scrap wondered, sitting down and seizing a macaroon.

"Where is Mrs. Wilkins?" asked Scrap.

They did not know. At least, Mrs. Arbuthnot, on Scrap's inquiry, did not know; Mrs. Fisher's face, at the name, became elaborately uninterested.

It appeared that Mrs. Wilkins had not been seen since breakfast. Mrs. Arbuthnot thought she had probably gone for a picnic. Scrap missed her. She ate the enormous macaroons, the best and biggest she had ever come across, in silence. Tea without Mrs. Wilkins was dull; and Mrs. Arbuthnot had that fatal flavour of motherliness about her, of wanting to pet one, to make one very comfortable, coaxing one to eat—coaxing her, who was already so frankly, so even excessively, eating—that seemed to have dogged Scrap's steps through life. Couldn't people leave one alone? She was perfectly able to eat what she wanted unincited. She tried to quench Mrs. Arbuthnot's zeal by being short with her. Useless. The shortness was not apparent. It remained, as all Scrap's evil feelings remained, covered up by the impenetrable veil of her loveliness.

Mrs. Fisher sat monumentally, and took no notice of either of them. She had had a curious day, and was a little worried. She had been quite alone, for none of the three had come to lunch, and none of them had taken the trouble to let her know they were not coming; and Mrs. Arbuthnot, drifting casually into tea, had behaved oddly till Lady Caroline joined them and distracted her attention.

Mrs. Fisher was prepared not to dislike Mrs. Arbuthnot, whose parted hair and mild expression seemed very decent and womanly, but she certainly had habits that were difficult to like. Her habit of instantly echoing any offer made her of food or drink, of throwing the offer back on one, as it were, was not somehow what one expected of her. "Will you have some more tea?" was surely a question to which the answer was simply yes or no; but Mrs. Arbuthnot persisted in the trick she had exhibited the day before at breakfast, of adding to her yes or no the words, "Will _you?_" She had done it again that morning at breakfast and here she was doing it at tea—the two meals at which Mrs. Fisher presided and poured out. Why did she do it? Mrs. Fisher failed to understand.

But this was not what was worrying her; this was merely by the way. What was worrying her was that she had been quite unable that day to settle to anything, and had done nothing but wander restlessly from her sitting-room to her battlements and back again. It had been a wasted day, and how much she disliked waste. She had tried to read, and she had tried to write to Kate Lumley; but no—a few words read, a few lines written, and up she got again and went out on to the battlements and stared at the sea.

It did not matter that the letter to Kate Lumley should not be written. There was time enough for that. Let the others suppose her coming was definitely fixed. All the better. So would Mr. Wilkins be kept out of the spare-room and put where he belonged. Kate would keep. She could be held in reserve. Kate in reserve was just as potent as Kate in actuality, and there were points about Kate in reserve which might be missing from Kate in actuality. For instance, if Mrs. Fisher were going to be restless, she would rather

Kate were not there to see. There was a want of dignity about restlessness, about trotting backwards and forwards. But it did matter that she could not read a sentence of any of her great dead friends' writings; no, not even of Browning's, who had been so much in Italy, nor of Ruskin's, whose _Stones of Venice_ she had brought with her to re-read so nearly on the very spot; nor even a sentence of a really interesting book like the one she had found in her sitting-room about the home life of the German Emperor, poor man—written in the nineties, when he had not yet begun to be more sinned against than sinning, which was, she was firmly convinced, what was the matter with him now, and full of exciting things about his birth and his right arm and _accoucheurs_—without having to put it down and go and stare at the sea.

Reading was very important; the proper exercise and development of one's mind was a paramount duty. How could one read if one were constantly trotting in and out? Curious, this restlessness. Was she going to be ill? No, she felt well; indeed, unusually well, and she went in and out quite quickly—trotted, in fact—and without her stick. Very odd that she shouldn't be able to sit still, she thought, frowning across the tops of some purple hyacinths at the Gulf of Spezia glittering beyond a headland; very odd that she, who walked so slowly, with such dependence on her stick, should suddenly trot.

It would be interesting to talk to some one about it, she felt. Not to Kate—to a stranger. Kate would only look at her and suggest a cup of tea. Kate always suggested cups of tea. Besides, Kate had a flat face. That Mrs. Wilkins, now—annoying as she was, loose-tongued as she was, impertinent, objectionable, would probably understand, and perhaps know what was making her be like this. But she could say nothing to Mrs. Wilkins. She was the last person to whom one would admit sensations. Dignity alone forbade it. Confide in Mrs. Wilkins? Never.

And Mrs. Arbuthnot, while she wistfully mothered the obstructive Scrap at tea, felt too that she had had a curious day. Like Mrs. Fisher's, it had been active, but, unlike Mrs. Fisher's, only active in mind. Her body had been quite still; her mind had not been still at all, it had been excessively active. For years she had taken care to have no time to think. Her scheduled life in the parish had prevented memories and desires from intruding on her. That day they had crowded. She went back to tea feeling dejected, and that she should feel dejected in such a place with everything about her to make her rejoice, only dejected her the more. But how could she rejoice alone? How could anybody rejoice and enjoy and appreciate, really appreciate, alone? Except Lotty. Lotty seemed able to. She had gone off down the hill directly after breakfast, alone yet obviously rejoicing, for she had not suggested that Rose should go too, and she was singing as she went.

Rose had spent the day by herself, sitting with her hands clasping her knees, staring straight in front of her. What she was staring at were the grey swords of the agaves, and, on their tall stalks, the pale irises that grew in the remote place she had found, while beyond them, between the grey leaves and the blue flowers, she saw the sea. The place she had found was a hidden corner where the sun-baked stones were padded with thyme, and nobody was likely to come. It was out of sight and sound of the house; it was off any path; it was near the end of the promontory. She sat so quiet that presently lizards darted over her feet, and some tiny birds like finches, frightened away at first, came back again and flitted among the bushes round her just as if she hadn't been there. How beautiful it was. And what was the good of it with no one there, no one who loved being with one, who belonged to one, to whom one could say, "Look." And wouldn't one say, "Look—_dearest?_" Yes, one would say _dearest_ and the sweet word, just to say it to somebody who loved one, would make one happy.

She sat quite still, staring straight in front of her. Strange that in this place she did not want to pray. She who had prayed so constantly at home didn't seem able to do it here at all. The first morning she had merely thrown up a brief thank you to heaven on getting out of bed, and had gone straight to the window to see what everything looked like—thrown up the thank you as carelessly as a ball, and thought no more about it. That morning, remembering this and ashamed, she had knelt down with determination; but perhaps determination was bad for prayers, for she had been unable to think of a thing to say. And as for her bedtime prayers, on neither of the nights had she said a single one. She had forgotten them. She had been so much absorbed in other thoughts that she had forgotten them; and, once in bed, she was asleep and whirling along among bright, thin swift dreams before she had so much time as to stretch herself out.

What had come over her? Why had she let go the anchor of prayer? And she had difficulty, too, in remembering her poor, in remembering even that there were such things as poor. Holidays, of course, were good, and were recognised by everybody as good, but ought they so completely to blot out, to make such havoc of, the realities? Perhaps it was healthy to forget her poor; with all the greater gusto would she go back to them. But it couldn't be healthy to forget her prayers, and still less could it be healthy not to mind.

Rose did not mind. She knew she did not mind. And, even worse, she knew she did not mind not minding. In this place she was indifferent to both the things that had filled her life and made it seem as if it were happy for years. Well, if only she could rejoice in her wonderful new surroundings, have that much at least to set against the indifference, the letting go—but she could not. She had no work; she did not pray; she was left empty.

Lotty had spoilt her day that day, as she had spoilt her day the day before—Lotty, with her invitation to her husband, with her suggestion that she too should invite hers. Having flung Frederick into her mind again the day before, Lotty had left her; for the whole afternoon she had left her alone with her thoughts. Since then they had been all of Frederick. Where at Hampstead he came to her only in her dreams, here he left her dreams free and was with her during the day instead. And again that morning, as she was struggling not to think of him, Lotty had asked her, just before disappearing singing down the path, if she had written yet and invited him, and again he was flung into her mind and she wasn't able to get him out.

How could she invite him? It had gone on so long, their estrangement, such years; she would hardly know what words to use; and besides, he would not come. Why should he come? He didn't care about being with her. What could they talk about? Between them was the barrier of his work and her religion. She could not—how could she, believing as she did in purity, in responsibility for the effect of one's actions on others—bear his work, bear living by it; and he, she knew, had at first resented and then been merely bored by her religion. He had let her slip away; he had given her up; he no longer minded; he accepted her religion indifferently, as a settled fact. Both it and she—Rose's mind, becoming more luminous in the clear light of April at San Salvatore, suddenly saw the truth—bored him.

Naturally when she saw this, when that morning it flashed upon her for the first time, she did not like it; she liked it so little that for a space the whole beauty of Italy was blotted out. What was to be done about it? She could not give up believing in good and not liking evil, and it must be evil to live entirely on the proceeds of adulteries, however dead and distinguished they were. Besides, if she did, if she sacrificed her whole past, her bringing up, her work for the last ten years, would she bore him less? Rose felt right down at her very roots that if you have once thoroughly bored somebody it is next to impossible to unbore him. Once a bore always a bore—certainly, she thought, to the person originally bored.

Then, thought she, looking out to sea through eyes grown misty, better cling to her religion. It was better—she hardly noticed the reprehensibleness of her thought—than nothing. But oh, she wanted to cling to something tangible, to love something living, something that one could hold against one's heart, that one could see and touch and do things for. If her poor baby hadn't died . . . babies didn't get bored with one, it took them a long while to grow up and find one out. And perhaps one's baby never did find one out; perhaps one would always be to it, however old and bearded it grew, somebody special, somebody different from every one else, and if for no other reason, precious in that one could never be repeated.

Sitting with dim eyes looking out to sea she felt an extraordinary yearning to hold something of her very own tight to her bosom. Rose was slender, and as reserved in figure as in character, yet she felt a queer sensation of—how could she describe it?—bosom. There was something about San Salvatore that made her feel all bosom. She wanted to gather to her bosom, to comfort and protect, soothing the dear head that should lie on it with softest strokings and murmurs of love. Frederick, Frederick's child—come to her, pillowed on her, because they were unhappy, because they had been hurt. . . They would need her then, if they had been hurt; they would let themselves be loved then, if they were unhappy.

Well, the child was gone, would never come now; but perhaps Frederick—some day—when he was old and tired . . .

Such were Mrs. Arbuthnot's reflections and emotions that first day at San Salvatore by herself. She went back to tea dejected as she had not been for years. San Salvatore had taken her carefully built-up semblance of happiness away from her, and given her nothing in exchange. Yes—it had given her yearnings in exchange, this ache and longing, this queer feeling of bosom; but that was worse than nothing. And she who had learned balance, who never at home was irritated but always able to be kind, could not, even in her dejection, that afternoon endure Mrs. Fisher's assumption of the position as hostess at tea.

One would have supposed that such a little thing would not have touched her, but it did. Was her nature changing? Was she to be not only thrown back on long-stifled yearnings after Frederick, but also turned into somebody who wanted to fight over little things? After tea, when both Mrs. Fisher and Lady Caroline had disappeared again—it was quite evident that nobody wanted her—she was more dejected than ever, overwhelmed by the discrepancy between the splendour outside her, the warm, teeming beauty and self-sufficiency of nature, and the blank emptiness of her heart.

Then came Lotty, back to dinner, incredibly more freckled, exuding the sunshine she had been collecting all day, talking, laughing, being tactless, being unwise, being without reticence; and Lady Caroline, so quiet at tea, woke up to animation, and Mrs. Fisher was not so noticeable, and Rose was beginning to revive a little, for Lotty's spirits were contagious as she described the delights of her day, a day which might easily to any one else have had nothing in it but a very long and very hot walk and sandwiches, when she suddenly said catching Rose's eye, "Letter gone?"

Rose flushed. This tactlessness . . .

"What letter?" asked Scrap, interested. Both her elbows were on the table and her chin was supported in her hands, for the nut-stage had been reached, and there was nothing for it but to wait in as comfortable as position as possible till Mrs. Fisher had finished cracking.

"Asking her husband here," said Lotty.

Mrs. Fisher looked up. Another husband? Was there to be no end to them? Nor was this one, then, a widow either; but her husband was no doubt a decent, respectable man, following a decent, respectable calling. She had little hope of Mr. Wilkins; so little, that she had refrained from inquiring what he did.

"Has it?" persisted Lotty, as Rose said nothing.

"No," said Rose.

"Oh, well—to-morrow then," said Lotty.

Rose wanted to say No again to this. Lotty would have in her place, and would, besides, have expounded all her reasons. But she could not turn herself inside out like that and invite any and everybody to come and look. How was it that Lotty, who saw so many things, didn't see stuck on her heart, and seeing keep quiet about it, the sore place that was Frederick?

"Who is your husband?" asked Mrs. Fisher, carefully adjusting another nut between the crackers.

"Who should he be," said Rose quickly, roused at once by Mrs. Fisher to irritation, "except _Mr._ Arbuthnot?"

"I mean, of course, what is Mr. Arbuthnot?"

And Rose, gone painfully red at this, said after a tiny pause, "My husband."

Naturally, Mrs. Fisher was incensed. She couldn't have believed it of this one, with her decent hair and gentle voice, that she too should be impertinent.

Chapter 14

That first week the wistaria began to fade, and the flowers of the Judas-tree and peach-trees fell off and carpeted the ground with rose-colour. Then all the freesias disappeared, and the irises grew scarce. And then, while these were clearing themselves away, the double banksia roses came out, and the big summer roses suddenly flaunted gorgeously on the walls and trellises. Fortune's Yellow was one of them; a very beautiful rose. Presently the tamarisk and the daphnes were at their best, and the lilies at their tallest. By the end of the week the fig-trees were giving shade, the plum-blossom was out among the olives, the modest weigelias appeared in their fresh pink clothes, and on the rocks sprawled masses of thick-leaved, star-shaped flowers, some vivid purple and some a clear, pale lemon.

By the end of the week, too, Mr. Wilkins arrived; even as his wife had foreseen he would, so he did. And there were signs almost of eagerness about his acceptance of her suggestion, for he had not waited to write a letter in answer to hers, but had telegraphed.

That, surely, was eager. It showed, Scrap thought, a definite wish for reunion; and watching his wife's happy face, and aware of her desire that Mellersh should enjoy his holiday, she told herself that he would be a very unusual fool should he waste his time bothering about anybody else. "If he isn't nice to her," Scrap thought, "he shall be taken to the battlements and tipped over." For, by the end of the week, she and Mrs. Wilkins had become Caroline and Lotty to each other, and were friends.

Mrs. Wilkins had always been friends, but Scrap had struggled not to be. She had tried hard to be cautious, but how difficult was caution with Mrs. Wilkins! Free herself from every vestige of it, she was so entirely unreserved, so completely expansive, that soon

Scrap, almost before she knew what she was doing, was being unreserved too. And nobody could be more unreserved than Scrap, once she let herself go.

The only difficulty about Lotty was that she was nearly always somewhere else. You couldn't catch her; you couldn't pin her down to come and talk. Scrap's fears that she would grab seemed grotesque in retrospect. Why, there was no grab in her. At dinner and after dinner were the only times one really saw her. All day long she was invisible, and would come back in the late afternoon looking a perfect sight, her hair full of bits of moss, and her freckles worse than ever. Perhaps she was making the most of her time before Mellersh arrived to do all the things she wanted to do, and meant to devote herself afterwards to going about with him, tidy and in her best clothes.

Scrap watched her, interested in spite of herself, because it seemed so extraordinary to be as happy as all that on so little. San Salvatore was beautiful, and the weather was divine; but scenery and weather had never been enough for Scrap, and how could they be enough for somebody who would have to leave them quite soon and go back to life in Hampstead? Also, there was the imminence of Mellersh, of that Mellersh from whom Lotty had so lately run. It was all very well to feel one ought to

PREFACE.

I. SHAKESPEARE'S KING JOHN was printed for the first time in the Folio of 1623. The poet adopted most of the characters, the general plot, and occasional lines, or fragments of lines, from an earlier play, in two parts, published in 1591, with the following

title-page:

The | Troublesome Raigne | of _Iohn_ King of _England_, with the dis-|_couerie of King_ Richard Cordelions | Base sonne (vulgarly named, The Ba-|stard Fawconbridge): _also the_ | death of King _Iohn_ at _Swinstead_ | _Abbey._ | _As it was (sundry times) publikely acted by the_ | _Queenes Maiesties Players, in the ho-_|_nourable Citie of London._ | Imprinted at London for _Sampson Clarke_, | _and are to be solde at his shop, on the backe-_|side of the _Royall Exchange_. | 1591. |

This play was reprinted for a different bookseller in 1611, with the words 'W. Sh.' added to the title; and a third edition in 1622, again issued by a different bookseller, has 'W. Shakespeare.'

There can be little doubt that the booksellers attributed the play to Shakespeare in the hope that so popular a name might help the sale, for although the earlier play is by no means devoid of merit, the evidence of its style conclusively proves that Shakespeare had no part in the authorship. We have therefore not reprinted it, but contented ourselves with indicating the passages borrowed verbally from it.

2. Of RICHARD II. four editions in Quarto were published before the appearance of the first Folio:

Q■. The | Tragedie of King Ri-|chard the se-|cond. | _As it hath beene publikely acted_ | _by the right Honourable the_ | _Lorde Chamberlaine his Ser'uants._ | LONDON | Printed by Valentine Simmes for Andrew Wise, and | are to be sold at his shop in Paules church yard at | the signe of the Angel. | 1597. |

Q■. The | Tragedie of King Ri-|chard the second. | As it hath beene publikely acted by the Right Ho-|nourable the Lord Chamberlaine his | seruants. | _By William Shake-speare._ | LONDON | Printed by Valentine Simmes for Andrew Wise, and | are to be sold at his shop in Paules churchyard at | the signe of the Angel. | 1598. |

Q■. The | Tragedie of King | Richard the second. | As it hath been publikely acted by the Right | Honourable the Lord Chamberlaine | his seruantes. | By _William Shake-speare_. | LONDON, | Printed by W. W. for _Mathew Law_, and are to be | sold at his shop in Paules Church-yard, at | the signe of the Foxe. | 1608. |

The same edition was also issued in the same year with the following title-page:

The | Tragedie of King | Richard the Second: | With new additions of the Parlia-|ment Sceane, and the deposing | of King Richard, | As it hath been lately acted by the Kinges | Maiesties seruantes, at the Globe. | By _William Shake-speare_. | At London, | Printed by W. W. for _Mathew Law_, and are to | be sold at his shop in Paules Church-yard, | at the signe of the Foxe. | 1608. |

Q■. The | Tragedie of King | Richard the Se-|cond: | _With new additions of the Parliament Sceane_, | _and the deposing of King_ | _Richard._ | As it hath been lately acted by the Kinges | Maiesties seruants, at the Globe. | _By_ WILLIAM SHAKE-SPEARE. | At LONDON, | Printed for _Mathew Law_, and are to be sold | at his shop in Paules Church-yard, at the | signe of the Foxe. | 1615. |

Each of these Quartos was printed from its immediate predecessor. The third however contains an important addition, found in all the extant copies of Q■, amounting to 165 lines, viz. IV. 1. 154-318. This is what is meant by 'the new additions of the Parliament scene' mentioned in the title-pages of some copies of Q■ and in that of Q■. These 'new additions' are found also in the first and following Folios and in Q■. The play, as given in the first Folio, was no doubt printed from a copy of Q■, corrected with some care and prepared for stage representation. Several passages have been left out with a view of shortening the performance. In the 'new additions of the Parliament Scene' it would appear that the defective text of the Quarto had been corrected from the author's MS. For this part therefore the first Folio is our highest authority: for all the rest of the play the first Quarto affords the best text.

The fifth Quarto (Q■) was printed from the second Folio (F■), but its readings sometimes agree with one or other of the earlier Quartos, and in a few cases are entirely independent of previous editions. Its title-page is as follows:

The | Life and | Death of King | Richard the | Second. | With new Additions of the | _Parliament Scene_, and the | Deposing of King _Richard_. | As it hath beene acted by the Kings Majesties | Servants, at the _Globe_. | By _William Shakespeare_. | London, Printed by Iohn Norton. | 1634. |

* * * * *

3. THE FIRST PART OF KING HENRY THE FOURTH appeared in six successive Quarto editions before the publication of the first Folio. The title-pages of the first five of these editions are given in full below. The version in the first Folio seems to have been

printed from a partially corrected copy of the fifth Quarto. In many places the readings coincide with those of the earlier Quartos, which were probably consulted by the corrector. The title of the play in the Folio is, 'The First Part of Henry the Fourth, with the Life and Death of Henry Sirnamed Hotspurre.' As there is no copy of the fourth Quarto in the Capell collection, our collation has been made from the copy in the Bodleian, and verified by that in the Devonshire Library. The deficiencies of Capell's copy of the third Quarto have been supplied by a collation of the Bodleian copy of that edition.

Q■. The | History of | Henrie the | Fovrth; | With the battell at Shrewsburie, | _betweene the King and Lord_ | Henry Percy, surnamed | Henrie Hotspur of | the North. | _With the humorous conceits of Sir_ | Iohn Falstalffe. | AT LONDON, | Printed by _P. S._ for _Andrew Wise_, dwelling | in Paules Churchyard, at the signe of | the Angell. 1598. |

Q■. The | History of | Henrie the | Fovrth; | With the battell at Shrewsburie, | _betweene the King and Lord_ Henry | Percy, _surnamed_ Henry Hot-|spur of the North. | _With the humorous conceits of Sir_ | Iohn Falstalffe. | Newly corrected by _W. Shakespeare_. | AT LONDON, | Printed by _S. S._ for _Andrew Wise_, dwelling | in Paules Churchyard, at the signe of | the Angell. 1599. |

Q■. The | History of | Henrie the fourth, | With the battell at Shrewsburie, | _betweene the King, and Lord_ | Henry Percy, surnamed Henry Hot-|_spur of the North._ | _With the humorous conceits of Sir_ | Iohn Falstaffe. | Newly corrected by _W. Shakespeare_. | London | Printed by Valentine Simmes, for _Mathew Law_, and | are to be solde at his shop in Paules Churchyard, | at the signe of the Fox. | 1604. |

Q■. The | History of | Henry the fourth, | With the battell at Shrewseburie, | _betweene the King, and Lord_ | Henry Percy, surnamed Henry | _Hotspur of the North._ | _With the humorous conceites of Sir_ | Iohn Falstalffe. | _Newly corrected by W. Shake-speare._ | London, | Printed for _Mathew Law_, and are to be sold at | his shop in Paules Church-yard, neere vnto S. | Augustines gate, at the signe of | the Foxe. 1608. |

Q■. The | History of | Henrie the fourth, | With the Battell at Shrewseburie, betweene | the King, and Lord Henrie Percy, sur-| named _Henrie Hotspur_ of the North. | With the humorous conceites of Sir | _Iohn Falstaffe_. | Newly corrected by _W. Shakespeare._ | LONDON, | Printed by W. W. for _Mathew Law_, and are to be sold | at his shop in Paules Church-yard, neere vnto S. | _Augustines_ Gate, at the signe of the Foxe. | 1613. |

Subsequent editions in Quarto were printed in 1622 (Q■) by T. P. for Mathew Law, in 1632 (Q■) by John Norton for William Sheares, and in 1639 (Q■) by John Norton for Hugh Perry. In all these the title-page is substantially the same. Each Quarto appears to have been printed from its predecessor.

The 'Dering MS.' quoted in our foot-notes was discovered in the muniment room at Surrenden by the Rev. Lambert B. Larking in 1844, and published in the following year for the Shakespeare Society under the editorship of Mr Halliwell. It contains a large portion of the First Part of Henry IV. and some scenes of the Second Part. Mr Halliwell believes it to have been written in the early part of the 17th century, certainly earlier than 1640, for the purpose of private theatrical performance. Some additions and corrections were made by the hand of 'Sir Edward Deryng, the first baronet, who died in 1644.' (_Introduction_, p. xii. ed. 1845.)

We are of opinion that this MS. was copied from the fifth Quarto of the First Part, and from a complete Quarto of the Second Part. The writer seems to have been both illiterate and careless. His punctuation is singularly bad, and his spelling peculiar to himself. We have noticed such various readings as seemed in any way remarkable.

* * * * *

4. THE SECOND PART OF KING HENRY THE FOURTH was first published in Quarto in 1600 with the following title-page:

THE | Second part of Henrie | the fourth, continuing to his death, | _and coronation of Henrie_ | the fift. | With the humours of sir Iohn Fal-| _staffe, and swaggering_ | Pistoll. | _As it hath been sundrie times publikely_ | acted by the right honourable, the Lord | Chamberlaine his seruants. | _Written by William Shakespeare._ | LONDON | Printed by V. S. for Andrew Wise, and | William Aspley. | 1600. |

In some copies of the Quarto the first scene of Act III. is left out altogether. The omission seems to have been discovered after part of the edition had been struck off and rectified by the insertion of two new leaves. In order to make this insertion, the type was taken to pieces in part of the preceding and subsequent leaves, so that there are two different impressions for the latter part of Act II. and the beginning of Act III. Sc. 2. Where this difference occurs we have used the symbols Q■, and Q■; where the two are identical we

use only Q.

The version in the first Folio was probably printed from a transcript of the original MS. It contains passages of considerable length which are not found in the Quarto. Some of these are among the finest in the play, and are too closely connected with the context to allow of the supposition that they were later additions inserted by the author after the publication of the Quarto. In the MS. from which that edition was printed, these passages had been most likely omitted, or erased, in order to shorten the play for the stage. The Folio in other places affords occasional readings which seem preferable to those of the Quarto, but for the most part the Quarto is to be regarded as having the higher critical value.

* * * * *

5. KING HENRY THE FIFTH appears in its present form for the first time in the Folio of 1623. An imperfect edition in quarto was printed surreptitiously in 1600, with the following title:

(Q■). The | Cronicle | History of Henry the fift, | With his battell fought at _Agin Court_ in | France. Togither with _Auntient_ | _Pistoll._ | _As it hath bene sundry times playd by the Right honorable_ | _the Lord Chamberlaine his seruants._ | LONDON Printed by _Thomas Creede_, for Tho. Milling-|ton, and Iohn Busby. And are to be | sold at his house in Carter Lane, next | the Powle head. 1600. |

The text of this edition is given literatim at the end of the present volume, with the readings of two reprints which appeared in 1602 and 1608 respectively. The title-pages of these are as follows:

(Q■). The | Chronicle | History of Henry the fift, | With his battell fought at _Agin Court_ | in _France_. Together with _Auntient_ | _Pistoll._ | _As it hath bene sundry times playd by the Right honorable_ | _the Lord Chamberlaine his seruants._ | LONDON | Printed by Thomas Creede, for Thomas | Pauier, and are to be sold at his shop in Cornhill, | at the signe of the Cat and Parrets neare | the Exchange. 1602. |

Q■. The | Chronicle History | of Henry the fift, with his | battell fought at _Agin Court_ in | France. Together with _an-_|_cient Pistoll._ | _As it hath bene sundry times playd by the Right Honou-_|_rable the Lord Chamberlaine his_ | _Seruants._ | Printed for T. P. 1608. |

The text of these Quarto editions is so imperfect and varies so much from the more authentic text of the Folio, that it was impossible to give the variations in our foot-notes. We are inclined to agree with Mr Collier and others in the supposition that the Quarto text was 'hastily made up from notes taken at the theatre during the performance, subsequently patched together.' The references to these Quartos are inclosed in brackets in accordance with the rule mentioned in the Preface to Vol. I. p. xxi.

It is scarcely necessary to add that 'The famous Victories of Henry the Fift,' published in 1617, has nothing to do with Shakespeare's play.

* * * * *

We have the pleasure of adding several new names to the list of our benefactors. Miss Thackeray, of Windsor, has been so kind as to lend us a copy of Nares's Glossary which belonged to her late father, the Provost of King's College, Cambridge, and is copiously annotated in his hand.

Mr Henry Wilbraham has obtained for us the loan of some valuable MS. notes on Shakespeare, compiled by the late Mr Roger Wilbraham, F.R.S., formerly Fellow of Trinity College, and now in the possession of Mr George Fortescue Wilbraham of Delamere House, Cheshire.

Dr C. M. Ingleby and Mr G. R. French have sent us valuable communications, the former with reference to difficulties in the text, the latter with reference to points of history and genealogy.

We are also indebted for various acts of kindness and courtesy to the Marquis Camden, the Rev. T. S. Woollaston, the Rev. Lambert B. Larking, the Rev. Archibald Clerke of Kilmallie, Mr Stirling of Keir, Mr Pryme, Mr W. B. Donne, Mr P. S. Worsley, Professor Goldwin Smith, the Rev. H. O. Coxe, Librarian of the Bodleian, Mr C. Wright, and the late Mr George Daniell.

THE LIFE AND DEATH

OF

KING JOHN.

DRAMATIS PERSONÆ[A].

KING JOHN. PRINCE HENRY, son to the king. ARTHUR, Duke of Bretagne, nephew to the king. The Earl of PEMBROKE. The Earl of ESSEX. The Earl of SALISBURY. The Lord BIGOT. HUBERT DE BURGH. ROBERT FAULCONBRIDGE, son to Sir Robert Faulconbridge. PHILIP the BASTARD, his half-brother. JAMES GURNEY, servant to Lady Faulconbridge. PETER of Pomfret, a

prophet.

PHILIP, King of France. LEWIS, the Dauphin. Lymoges, Duke of AUSTRIA. CARDINAL PANDULPH, the Pope's legate. MELUN, a French lord. CHATILLON, ambassador from France to King John.

QUEEN ELINOR, mother to King John. CONSTANCE, mother to Arthur. BLANCH of Spain, niece to King John. LADY FAULCONBRIDGE.

Lords, Citizens of Angiers, Sheriff, Heralds, Officers, Soldiers, Messengers, and other Attendants.

SCENE: _Partly in England, and partly in France_[B].

[A] First given by Rowe. See note (I).

[B] SCENE ...] See note (II).

THE LIFE AND DEATH

OF

KING JOHN.

ACT I.

SCENE I. KING JOHN'S _palace_.

Enter KING JOHN, QUEEN ELINOR, PEMBROKE, ESSEX, SALISBURY, _and others, with_ CHATILLON.[1]

K. John. Now, say, Chatillon, what would France with us?

Chat. Thus, after greeting, speaks the King of France In my behaviour to the majesty, The borrowed majesty, of England here.[2]

Eli. A strange beginning: 'borrowed majesty!'[2] 5

K. John. Silence, good mother; hear the embassy.

Chat. Philip of France, in right and true behalf Of thy deceased brother Geffrey's son,[3] Arthur Plantagenet, lays most lawful claim[4] To this fair island and the territories, 10 To Ireland, Poictiers, Anjou, Touraine, Maine,[5] Desiring thee to lay aside the sword Which sways usurpingly these several titles, And put the same into young Arthur's hand, Thy nephew and right royal sovereign. 15

K. John. What follows if we disallow of this?

Chat. The proud control of fierce and bloody war, To enforce these rights so forcibly withheld.

K. John. Here have we war for war and blood for blood, Controlment for controlment: so answer France.[6] 20

Chat. Then take my king's defiance from my mouth, The farthest limit of my embassy.

K. John. Bear mine to him, and so depart in peace: Be thou as lightning in the eyes of France; For ere thou canst report I will be there,[7] 25 The thunder of my cannon shall be heard: So hence! Be thou the trumpet of our wrath And sullen presage of your own decay.[8] An honourable conduct let him have: Pembroke, look to't. Farewell, Chatillon.[9] 30

[_Exeunt Chatillon and Pembroke._

Eli. What now, my son! have I not ever said How that ambitious Constance would not cease Till she had kindled France and all the world, Upon the right and party of her son? This might have been prevented and made whole 35 With very easy arguments of love, Which now the manage of two kingdoms must[10] With fearful bloody issue arbitrate.

K. John. Our strong possession and our right for us.

Eli. Your strong possession much more than your right, 40 Or else it must go wrong with you and me: So much my conscience whispers in your ear, Which none but heaven and you and I shall hear.

Enter a Sheriff.[11]

Essex. My liege, here is the strangest controversy Come from the country to be judged by you, 45 That e'er I heard: shall I produce the men?

K. John. Let them approach. Our abbeys and our priories shall pay This expedition's charge.

Enter ROBERT FAULCONBRIDGE, _and_ PHILIP _his bastard brother_.[12]

What men are you?

Bast. Your faithful subject I, a gentleman[13] 50 Born in Northamptonshire and eldest son, As I suppose, to Robert Faulconbridge,[14] A soldier, by the honour-giving hand Of Cœur-de-lion knighted in the field.[15]

K. John. What art thou?[16] 55

Rob. The son and heir to that same Faulconbridge.

K. John. Is that the elder, and art thou the heir? You came not of one mother then, it seems.

Bast. Most certain of one mother, mighty king; That is well known; and, as I think, one father: 60 But for the certain knowledge of that truth I put you o'er to heaven and to my mother: Of that I doubt, as all men's children may.

Eli. Out on thee, rude man! thou dost shame thy mother And wound her honour with this diffidence. 65

Bast. I, madam? no, I have no reason for it; That is my brother's plea and none of mine; The which if he can prove, a' pops me out[17] At least from fair five hundred pound a year: Heaven guard my mother's honour and my land! 70

K. John. A good blunt fellow. Why, being younger born, Doth he lay claim to thine inheritance?

Bast. I know not why, except to get the land. But once he slander'd me with bastardy: But whether I be as true begot or no,[18] 75 That still I lay upon my mother's head; But that I am as well begot, my liege,-- Fair fall the bones that took the pains for me!-- Compare our faces and be judge yourself.[19] If old Sir Robert did beget us both 80 And were our father and this son like him,[20] O old Sir Robert, father, on my knee I give heaven thanks I was not like to thee!

K. John. Why, what a madcap hath heaven lent us here![21]

Eli. He hath a trick of Cœur-de-lion's face;[22] 85 The accent of his tongue affecteth him. Do you not read some tokens of my son In the large composition of this man?

K. John. Mine eye hath well examined his parts And finds them perfect Richard. Sirrah, speak, 90 What doth move you to claim your brother's land?

Bast. Because he hath a half-face, like my father.[23] With half that face would he have all my land:[23][24] A half-faced groat five hundred pound a year![23]

Rob. My gracious liege, when that my father lived, 95 Your brother did employ my father much,--

Bast. Well, sir, by this you cannot get my land: Your tale must be how he employ'd my mother.

Rob. And once dispatch'd him in an embassy To Germany, there with the emperor 100 To treat of high affairs touching that time. The advantage of his absence took the king And in the mean time sojourn'd at my father's; Where how he did prevail I shame to speak, But truth is truth: large lengths of seas and shores[25] 105 Between my father and my mother lay, As I have heard my father speak himself, When this same lusty gentleman was got. Upon his death-bed he by will bequeath'd His lands to me, and took it on his death[26] 110 That this my mother's son was none of his; And if he were, he came into the world[27] Full fourteen weeks before the course of time. Then, good my liege, let me have what is mine, My father's land, as was my father's will. 115

K. John. Sirrah, your brother is legitimate; Your father's wife did after wedlock bear him, And if she did play false, the fault was hers; Which fault lies on the hazards of all husbands[28] That marry wives. Tell me, how if my brother, 120 Who, as you say, took pains to get this son, Had of your father claim'd this son for his? In sooth, good friend, your father might have kept This calf bred from his cow from all the world; In sooth he might; then, if he were my brother's, 125 My brother might not claim him; nor your

father, Being none of his, refuse him: this concludes; My mother's son did get your father's heir; Your father's heir must have your father's land.

Rob. Shall then my father's will be of no force 130 To dispossess that child which is not his?

Bast. Of no more force to dispossess me, sir, Than was his will to get me, as I think.

Eli. Whether hadst thou rather be a Faulconbridge[29] And like thy brother, to enjoy thy land, 135 Or the reputed son of Cœur-de-lion, Lord of thy presence and no land beside?[30]

Bast. Madam, an if my brother had my shape,[31] And I had his, sir Robert's his, like him;[32] And if my legs were two such riding-rods,[33] 140 My arms such eel-skins stuff'd, my face so thin That in mine ear I durst not stick a rose Lest men should say 'Look, where three-farthings goes!' And, to his shape, were heir to all this land,[34] Would I might never stir from off this place, 145 I would give it every foot to have this face;[35] I would not be sir Nob in any case.[36]

Eli. I like thee well: wilt thou forsake thy fortune, Bequeath thy land to him and follow me? I am a soldier and now bound to France. 150

Bast. Brother, take you my land, I'll take my chance. Your face hath got five hundred pound a year, Yet sell your face for five pence and 'tis dear. Madam, I'll follow you unto the death.

Eli. Nay, I would have you go before me thither. 155

Bast. Our country manners give our betters way.

K. John. What is thy name?

Bast. Philip, my liege, so is my name begun; Philip, good old sir Robert's wife's eldest son.

K. John. From henceforth bear his name whose form thou bear'st:[37] 160 Kneel thou down Philip, but rise more great,[38] Arise sir Richard and Plantagenet.

Bast. Brother by the mother's side, give me your hand: My father gave me honour, yours gave land. Now blessed be the hour, by night or day, 165 When I was got, sir Robert was away!

Eli. The very spirit of Plantagenet! I am thy grandam, Richard; call me so.[39]

Bast. Madam, by chance but not by truth; what though?[40] Something about, a little from the right, 170 In at the window, or else o'er the hatch: Who dares not stir by day must walk by night, And have is have, however men do catch: Near or far off, well won is still well shot, And I am I, howe'er I was begot. 175

K. John. Go, Faulconbridge: now hast thou thy desire; A landless knight makes thee a landed squire. Come, madam, and come, Richard, we must speed For France, for France, for it is more than need.

Bast. Brother, adieu: good fortune come to thee! 180 For thou wast got i' the way of honesty.[41]

[_Exeunt all but Bastard._[42]

A foot of honour better than I was; But many a many foot of land the worse.[43] Well, now can I make any Joan a lady. 'Good den, sir Richard!'--'God-a-mercy, fellow!'-- 185 And if his name be George, I'll call him Peter; For new-made honour doth forget men's names: 'Tis too respective and too sociable[44] For your conversion. Now your traveller,[45] He and his toothpick at my worship's mess, 190 And when my knightly stomach is sufficed, Why then I suck my teeth and catechize My picked man of countries: 'My dear sir,'[46] Thus, leaning on mine elbow, I begin, 'I shall beseech you'--that is question now;[47] 195 And then comes answer like an Absey book:[48] 'O sir,' says answer, 'at your best command; At your employment; at your service, sir:' 'No, sir,' says question, 'I, sweet sir, at yours:' And so, ere answer knows what question would, 200 Saving in dialogue of compliment,[49] And talking of the Alps and Apennines, The Pyrenean and the river Po,[50] It draws toward supper in conclusion so.[51] But this is worshipful society 205 And fits the mounting spirit like myself,[52] For he is but a bastard to the time That doth not smack of observation;[53] And so am I, whether I smack or no;[53][54] And not alone in habit and device, 210 Exterior form, outward accoutrement, But from the inward motion to deliver Sweet, sweet, sweet poison for the age's tooth: Which, though I will not practise to deceive,[55] Yet, to avoid deceit, I mean to learn; 215 For it shall strew the footsteps of my rising. But who comes in such haste in riding-robes? What

woman-post is this? hath she no husband That will take pains to blow a horn before her?

Enter LADY FAULCONBRIDGE _and_ JAMES GURNEY.

O me! it is my mother. How now, good lady![56] 220 What brings you here to court so hastily?

Lady F. Where is that slave, thy brother? where is he,[57] That holds in chase mine honour up and down?

Bast. My brother Robert? old sir Robert's son? Colbrand the giant, that same mighty man? 225 Is it sir Robert's son that you seek so?

Lady F. Sir Robert's son! Ay, thou unreverend boy, Sir Robert's son: why scorn'st thou at sir Robert?[58] He is sir Robert's son, and so art thou.

Bast. James Gurney, wilt thou give us leave awhile?[59] 230

Gur. Good leave, good Philip.

Bast. Philip! sparrow: James,[60] There's toys abroad: anon I'll tell thee more. [_Exit Gurney._[61] Madam, I was not old sir Robert's son: Sir Robert might have eat his part in me Upon Good-Friday and ne'er broke his fast: 235 Sir Robert could do well: marry, to confess,[62] Could he get me? Sir Robert could not do it:[63] We know his handiwork: therefore, good mother, To whom am I beholding for these limbs?[64] Sir Robert never holp to make this leg.[65] 240

Lady F. Hast thou conspired with thy brother too,[66] That for thine own gain shouldst defend mine honour? What means this scorn, thou most untoward knave?

Bast. Knight, knight, good mother, Basilisco-like.[67] What! I am dubb'd! I have it on my shoulder.[68] 245 But, mother, I am not sir Robert's son; I have disclaim'd sir Robert and my land; Legitimation, name and all is gone: Then, good my mother, let me know my father; Some proper man, I hope: who was it, mother? 250

Lady F. Hast thou denied thyself a Faulconbridge?

Bast. As faithfully as I deny the devil.

Lady F. King Richard Cœur-de-lion was thy father: By long and vehement suit I was seduced To make room for him in my husband's bed: 255 Heaven lay not my transgression to my charge![69] Thou art the issue of my dear offence,[70] Which was so strongly urged past my defence.

Bast. Now, by this light, were I to get again, Madam, I would not wish a better father. 260 Some sins do bear their privilege on earth, And so doth yours; your fault was not your folly:[71] Needs must you lay your heart at his dispose. Subjected tribute to commanding love, Against whose fury and unmatched force 265 The aweless lion could not wage the fight, Nor keep his princely heart from Richard's hand.[72] He that perforce robs lions of their hearts May easily win a woman's. Ay, my mother,[73] With all my heart I thank thee for my father! 270 Who lives and dares but say thou didst not well When I was got, I'll send his soul to hell. Come, lady, I will show thee to my kin;[74] And they shall say, when Richard me begot, If thou hadst said him nay, it had been sin: 275 Who says it was, he lies; I say 'twas not. [_Exeunt._

ACT II.

SCENE I. _France. Before Angiers._

Enter AUSTRIA _and forces, drums, etc. on one side: on the other_ KING PHILIP _of France and his Power_; LEWIS, ARTHUR, CONSTANCE _and attendants._[75]

Lew. Before Angiers well met, brave Austria.[76] Arthur, that great forerunner of thy blood, Richard, that robb'd the lion of his heart And fought the holy wars in Palestine, By this brave duke came early to his grave: 5 And for amends to his posterity, At our importance hither is he come, To spread his colours, boy, in thy behalf, And to rebuke the usurpation Of thy unnatural uncle, English John: 10 Embrace him, love him, give him welcome hither.

Arth. God shall forgive you Cœur-de-lion's death The rather that you give his offspring life, Shadowing their right under your wings of war:[77] I give you welcome with a powerless hand, 15 But with a heart full of unstained love:[78] Welcome before the gates of Angiers, duke.

Lew. A noble boy! Who would not do thee right?

Aust. Upon thy cheek lay I this zealous kiss, As seal to this indenture of my love, 20 That to my home I will no more return, Till Angiers and the right thou hast in France, Together with that pale, that white-faced shore, Whose foot spurns back the ocean's roaring tides And coops from other lands her islanders, 25 Even till that England, hedged in with the main, That water-walled bulwark, still secure And confident from foreign purposes, Even till that utmost corner of the west[79] Salute thee for her king: till then, fair boy, 30 Will I not think of home, but follow arms.

Const. O, take his mother's thanks, a widow's thanks, Till your strong hand shall help to give him strength To make a more requital to your love!

Aust. The peace of heaven is theirs that lift their swords[80] 35 In such a just and charitable war.

K. Phi. Well then, to work: our cannon shall be bent[81] Against the brows of this resisting town. Call for our chiefest men of discipline, To cull the plots of best advantages: 40 We'll lay before this town our royal bones, Wade to the market-place in Frenchmen's blood, But we will make it subject to this boy.

Const. Stay for an answer to your embassy, Lest unadvised you stain your swords with blood: 45 My Lord Chatillon may from England bring That right in peace which here we urge in war, And then we shall repent each drop of blood That hot rash haste so indirectly shed.[82]

Enter CHATILLON.

K. Phi. A wonder, lady! lo, upon thy wish, 50 Our messenger Chatillon is arrived! What England says, say briefly, gentle lord; We coldly pause for thee; Chatillon, speak.

Chat. Then turn your forces from this paltry siege And stir them up against a mightier task. 55 England, impatient of your just demands, Hath put himself in arms: the adverse winds, Whose leisure I have stay'd, have given him time To land his legions all as soon as I; His marches are expedient to this town, 60 His forces strong, his soldiers confident. With him along is come the mother-queen, An Ate, stirring him to blood and strife;[83] With her her niece, the Lady Blanch of Spain; With them a bastard of the king's deceased;[84] 65 And all the unsettled humours of the land, Rash, inconsiderate, fiery voluntaries, With ladies' faces and fierce dragons' spleens, Have sold their fortunes at their native homes, Bearing their birthrights proudly on their backs,[85] 70 To make a hazard of new fortunes here: In brief, a braver choice of dauntless spirits Than now the English bottoms have waft o'er Did never float upon the swelling tide, To do offence and scath in Christendom. [_Drum beats._[86] 75 The interruption of their churlish drums Cuts off more circumstance: they are at hand,[87] To parley or to fight; therefore prepare.[87]

K. Phi. How much unlook'd for is this expedition!

Aust. By how much unexpected, by so much 80 We must awake endeavour for defence; For courage mounteth with occasion: Let them be welcome then; we are prepared.

Enter KING JOHN, ELINOR, BLANCH, _the_ Bastard, Lords, _and Forces_.[88]

K. John. Peace be to France, if France in peace permit[89] Our just and lineal entrance to our own; 85 If not, bleed France, and peace ascend to heaven, Whiles we, God's wrathful agent, do correct[90] Their proud contempt that beats His peace to heaven.[91]

K. Phi. Peace be to England, if that war return From France to England, there to live in peace. 90 England we love; and for that England's sake With burden of our armour here we sweat. This toil of ours should be a work of thine; But thou from loving England art so far, That thou hast under-wrought his lawful king,[92] 95 Cut off the sequence of posterity, Out-faced infant state and done a rape Upon the maiden virtue of the crown. Look here upon thy brother Geffrey's face; These eyes, these brows, were moulded out of his: 100 This little abstract doth contain that large Which died in Geffrey, and the hand of time Shall draw this brief into as huge a volume.[93] That Geffrey was thy elder brother born, And this his son; England was Geffrey's right 105 And this is Geffrey's: in the name of God[94] How comes it then that thou art call'd a king, When living blood doth in these temples beat, Which owe the crown that thou o'ermasterest?

K. John. From whom hast thou this great commission, France, 110 To draw my answer from thy articles?[95]

K. Phi. From that supernal judge, that stirs good thoughts In any breast of strong authority,[96] To look into the blots and stains of right:[97] That judge hath made me guardian to this boy: 115 Under whose warrant I impeach thy wrong And by whose help I mean to chastise it.

K. John. Alack, thou dost usurp authority.[98]

K. Phi. Excuse; it is to beat usurping down.[98][99]

Eli. Who is it thou dost call usurper, France?[98][100] 120

Const. Let me make answer; thy usurping son.[98]

Eli. Out, insolent! thy bastard shall be king,[98] That thou mayst be a queen, and check the world![98]

Const. My bed was ever to thy son as true[98] As thine was to thy husband; and this boy[98] 125 Liker in feature to his father Geffrey[98] Than thou and John in manners; being as like[98][101] As rain to water, or devil to his dam.[98] My boy a bastard! By my soul, I think[98] His father never was so true begot:[98] 130 It cannot be, an if thou wert his mother.[98][102]

Eli. There's a good mother, boy, that blots thy father.[98]

Const. There's a good grandam, boy, that would blot thee.[98][103]

Aust. Peace![98]

Bast. Hear the crier.[98]

Aust. What the devil art thou?[98]

Bast. One that will play the devil, sir, with you,[98] 135 An a' may catch your hide and you alone:[98][104] You are the hare of whom the proverb goes,[98] Whose valour plucks dead lions by the beard:[98] I'll smoke your skin-coat, an I catch you right;[98][105] Sirrah, look to't; i' faith, I will, i' faith.[98] 140

Blanch. O, well did he become that lion's robe[98] That did disrobe the lion of that robe![98]

Bast. It lies as sightly on the back of him[98] As great Alcides' shows upon an ass:[98][106] But, ass, I'll take that burthen from your back,[98] 145 Or lay on that shall make your shoulders crack.[98]

Aust. What cracker is this same that deafs our ears[98] With this abundance of superfluous breath?[98]

K. Phi. Lewis, determine what we shall do straight.[98][107]

Lew. Women and fools, break off your conference.[98][108] 150 King John, this is the very sum of all; England and Ireland, Anjou, Touraine, Maine,[109] In right of Arthur do I claim of thee:[110] Wilt thou resign them and lay down thy arms?

K. John. My life as soon: I do defy thee, France. 155 Arthur of Bretagne, yield thee to my hand;[111] And out of my dear love I'll give thee more Than e'er the coward hand of France can win: Submit thee, boy.[112]

Eli. Come to thy grandam, child.[112]

Const. Do, child, go to it grandam, child;[112][113][114] 160 Give grandam kingdom, and it grandam will[112][114] Give it a plum, a cherry, and a fig:[112] There's a good grandam.[112]

Arth. Good my mother, peace![112] I would that I were low laid in my grave:[112] I am not worth this coil that's made for me.[112] 165

Eli. His mother shames him so, poor boy, he weeps.[112]

Const. Now shame upon you, whether she does or no![112][115] His grandam's wrongs, and not his mother's shames,[112][116] Draws those heaven-moving pearls from his poor eyes,[112][117] Which heaven shall take in nature of a fee;[112] 170 Ay, with these crystal beads heaven shall be bribed[112][118] To do him justice and revenge on you.[112]

Eli. Thou monstrous slanderer of heaven and earth![112]

Const. Thou monstrous injurer of heaven and earth![112] Call not me slanderer; thou and thine usurp[112][119] 175 The dominations, royalties and rights[112][120] Of this oppressed boy: this is thy eld'st son's son,[112][121] Infortunate in nothing but in thee:[112] Thy sins are visited in this poor child;[112][122] The canon of the law is laid on him,[112] 180 Being but the second generation[112] Removed from thy sin-conceiving womb.[112]

K. John. Bedlam, have done.[112][123]

Const. I have but this to say,[112] That he is not only plagued for her sin,[112] But God hath made her sin and her the plague[112] 185 On this removed issue, plagued for her[112] And with her plague; her sin his injury,[112][124] Her injury the beadle to her sin,[112][125] All punish'd in the person of this child,[112] And all for her; a plague upon her![112][126] 190

Eli. Thou unadvised scold, I can produce[112] A will that bars the title of thy son.[112]

Const. Ay, who doubts that? a will! a wicked will;[112] A woman's will; a canker'd grandam's will![112]

K. Phi. Peace, lady! pause, or be more temperate:[112] 195 It ill beseems this presence to cry aim[112][127] To these ill-tuned repetitions.[112] Some trumpet summon hither to the walls These men of Angiers: let us hear them speak Whose title they admit, Arthur's or John's. 200

Trumpet sounds. Enter certain Citizens _upon the walls_.[128]

First Cit. Who is it that hath warn'd us to the walls?

K. Phi. 'Tis France, for England.

K. John. England, for itself. You men of Angiers, and my loving subjects,--

K. Phi. You loving men of Angiers, Arthur's subjects, Our trumpet call'd you to this gentle parle,-- 205

K. John. For our advantage; therefore hear us first.[129] These flags of France, that are advanced here Before the eye and prospect of your town, Have hither march'd to your endamagement: The cannons have their bowels full of wrath, 210 And ready mounted are they to spit forth Their iron indignation 'gainst your walls: All preparation for a bloody siege[130] And merciless proceeding by these French[131] Confronts your city's eyes, your winking gates;[132] 215 And but for our approach those sleeping stones, That as a waist doth girdle you about,[133] By the compulsion of their ordinance[134] By this time from their fixed beds of lime Had been dishabited, and wide havoc made 220 For bloody power to rush upon your peace. But on the sight of us your lawful king, Who painfully with much expedient march Have brought a countercheck before your gates, To save unscratch'd your city's threatened cheeks,[135] 225 Behold, the French amazed vouchsafe a parle; And now, instead of bullets wrapp'd in fire,[136] To make a shaking fever in your walls, They shoot but calm words folded up in smoke, To make a faithless error in your ears: 230 Which trust accordingly kind citizens, And let us in, your king, whose labour'd spirits,[137] Forwearied in this action of swift speed,[138] Crave harbourage within your city walls.[139]

K. Phi. When I have said, make answer to us both. 235 Lo, in this right hand, whose protection Is most divinely vow'd upon the right Of him it holds, stands young Plantagenet, Son to the elder brother of this man, And king o'er him and all that he enjoys: 240 For this down-trodden equity, we tread In warlike march these greens before your town, Being no further enemy to you Than the constraint of hospitable zeal In the relief of this oppressed child 245 Religiously provokes. Be pleased then To pay that duty which you truly owe To him that owes it, namely this young prince:[140] And then our arms, like to a muzzled bear, Save in aspect, hath all offence seal'd up;[141] 250 Our cannons' malice vainly shall be spent Against the invulnerable clouds of heaven;[142] And with a blessed and unvex'd retire, With unhack'd swords and helmets all unbruised. We will bear home that lusty blood again 255 Which here we came to spout against your town, And leave your children, wives and you in peace. But if you fondly pass our proffer'd offer,[143] 'Tis not the roundure of your old-faced walls[144] Can hide you from our messengers of war, 260 Though all these English and their discipline Were harbour'd in their rude circumference.[145] Then tell us, shall your city call us lord, In that behalf which we have challenged it?[146] Or shall we give the signal to our rage 265 And stalk in blood to our possession?

First Cit. In brief, we are the king of England's subjects: For him, and in his right, we hold this town.[147]

K. John. Acknowledge then the king, and let me in.

First Cit. That can we not; but he that proves the king, 270 To him will we prove loyal: till that time Have we ramm'd up our gates against the world.

K. John. Doth not the crown of England prove the king? And if not that, I bring you witnesses, Twice fifteen thousand hearts of England's breed,-- 275

Bast. Bastards, and else.[148]

K. John. To verify our title with their lives.

K. Phi. As many and as well-born bloods as those,--

Bast. Some bastards too.[148]

K. Phi. Stand in his face to contradict his claim.

First Cit. Till you compound whose right is worthiest, We for the worthiest hold the right from both.

K. John. Then God forgive the sin of all those souls[149] That to their everlasting residence, Before the dew of evening fall, shall fleet, In dreadful trial of our kingdom's king!

K. Phi. Amen, amen! Mount, chevaliers! to arms!

Bast. Saint George, that swinged the dragon, and e'er since[150] Sits on his horse back at mine hostess' door,[150][151] Teach us some fence! [_To Aust._] Sirrah, were I at home,[152] At your den, sirrah, with your lioness, I would set an ox-head to your lion's hide,[153] And make a monster of you.

Aust. Peace! no more.

Bast. O, tremble, for you hear the lion roar.

K. John. Up higher to the plain; where we'll set forth In best appointment all our regiments.

Bast. Speed then, to take advantage of the field.[154]

K. Phi. It shall be so; and at the other hill[155] Command the rest to stand. God and our right! [_Exeunt._

Here after excursions, enter the Herald of France, _with trumpets, to the gates_.[156]

F. Her. You men of Angiers, open wide your gates,[157] And let young Arthur, Duke of Bretagne, in,[158] Who by the hand of France this day hath made Much work for tears in many an English mother, Whose sons lie scattered on the bleeding ground:[159] Many a widow's husband grovelling lies,[160] Coldly embracing the discoloured earth;[161] And victory, with little loss, doth play[162] Upon the dancing banners of the French, Who are at hand, triumphantly display'd,[163] To enter conquerors and to proclaim Arthur of Bretagne England's king and yours.[158]

Enter English Herald, _with trumpet_.[164]

E. Her. Rejoice, you men of Angiers, ring your bells; King John, your king and England's, doth approach, Commander of this hot malicious day: Their armours, that march'd hence so silver-bright, Hither return all gilt with Frenchmen's blood;[165] There stuck no plume in any English crest That is removed by a staff of France;[166] Our colours do return in those same hands That did display them when we first march'd forth; And, like a jolly troop of huntsmen, come Our lusty English, all with purpled hands, Dyed in the dying slaughter of their foes:[167] Open your gates and give the victors way.

First Cit. Heralds, from off our towers we might behold,[168] From first to last, the onset and retire Of both your armies; whose equality By our best eyes cannot be censured: Blood hath bought blood and blows have answer'd blows; Strength match'd with strength, and power confronted power: Both are alike; and both alike we like. One must prove greatest: while they weigh so even, We hold our town for neither, yet for both.

Re-enter the two KINGS, _with their powers, severally_.[169]

K. John. France, hast thou yet more blood to cast away?[170] Say, shall the current of our right run on?[171] Whose passage, vex'd with thy impediment, Shall leave his native channel, and o'erswell With course disturb'd even thy confining shores, Unless thou let his silver water keep[172] A peaceful progress to the ocean.

K. Phi. England, thou hast not saved one drop of blood, In this hot trial, more than we of France; Rather, lost more. And by this hand I swear, That sways the earth this climate overlooks, Before we will lay down our just-borne arms,[173] We'll put thee down, 'gainst whom these arms we bear, Or add a royal number to the dead, Gracing the scroll that tells of this war's loss With slaughter coupled to the name of kings.

Bast. Ha, majesty! how high thy glory towers, When the rich blood of kings is set on fire! O, now doth Death line his dead chaps with steel; The swords of soldiers are his teeth, his fangs; And now he feasts, mousing the flesh of men,[174] In undetermined differences of kings. Why stand these royal fronts amazed thus? Cry, 'havoc!' kings; back to the stained field, You equal potents, fiery kindled spirits![175] Then let confusion of one part confirm The other's peace; till then, blows, blood, and death!

K. John. Whose party do the townsmen yet admit?

K. Phi. Speak, citizens, for England; who's your king?[176]

First Cit. The king of England, when we know the king.

K. Phi. Know him in us, that here hold up his right.

K. John. In us, that are our own great deputy, 365 And bear possession of our person here,[177] Lord of our presence, Angiers, and of you.[178]

First Cit. A greater power than we denies all this;[179] And till it be undoubted, we do lock Our former scruple in our strong-barr'd gates; 370 King'd of our fears, until our fears, resolved,[180][181] Be by some certain king purged and deposed.[181]

Bast. By heaven, these scroyles of Angiers flout you, kings,[182] And stand securely on their battlements, As in a theatre, whence they gape and point 375 At your industrious scenes and acts of death.[183] Your royal presences be ruled by me:[184] Do like the mutines of Jerusalem,[185] Be friends awhile and both conjointly bend[186] Your sharpest deeds of malice on this town: 380 By east and west let France and England mount Their battering cannon charged to the mouths, Till their soul-fearing clamours have brawl'd down The flinty ribs of this contemptuous city: I'ld play incessantly upon these jades, 385 Even till unfenced desolation Leave them as naked as the vulgar air. That done, dissever your united strengths, And part your mingled colours once again; Turn face to face and bloody point to point; 390 Then, in a moment, Fortune shall cull forth Out of one side her happy minion, To whom in favour she shall give the day, And kiss him with a glorious victory. How like you this wild counsel, mighty states? 395 Smacks it not something of the policy?[187]

K. John. Now, by the sky that hangs above our heads, I like it well. France, shall we knit our powers And lay this Angiers even with the ground; Then after fight who shall be king of it? 400

Bast. An if them hast the mettle of a king,[188] Being wrong'd as we are by this peevish town, Turn thou the mouth of thy artillery, As we will ours, against these saucy walls; And when that we have dash'd them to the ground, 405 Why then defy each other, and pell-mell Make work upon ourselves, for heaven or hell.

K. Phi. Let it be so. Say, where will you assault?

K. John. We from the west will send destruction Into this city's bosom. 410

Aust. I from the north.

K. Phi. Our thunder from the south[189] Shall rain their drift of bullets on this town.

Bast. O prudent discipline! From north to south:[190] Austria and France shoot in each other's mouth:[190] I'll stir them to it. Come, away, away![190] 415

First Cit. Hear us, great kings: vouchsafe awhile to stay, And I shall show you peace and fair-faced league; Win you this city without stroke or wound; Rescue those breathing lives to die in beds, That here come sacrifices for the field: 420 Persever not, but hear me, mighty kings.

K. John. Speak on with favour; we are bent to hear.[191]

First Cit. That daughter there of Spain, the Lady Blanch, Is niece to England: look upon the years[192] Of Lewis the Dauphin and that lovely maid:[193] 425 If lusty love should go in quest of beauty, Where should he find it fairer than in Blanch? If zealous love should go in search of virtue,[194] Where should he find it purer than in Blanch? If love ambitious sought a match of birth, 430 Whose veins bound richer blood than Lady Blanch? Such as she is, in beauty, virtue, birth, Is the young Dauphin every way complete:[193] If not complete of, say he is not she;[195] And she again wants nothing, to name want, 435 If want it be not that she is not he:[196] He is the half part of a blessed man, Left to be finished by such as she;[197] And she a fair divided excellence,[198] Whose fulness of perfection lies in him. 440 O, two such silver currents, when they join, Do glorify the banks that bound them in; And two such shores to two such streams made one, Two such controlling bounds shall you be, kings, To these two princes, if you marry them. 445 This union shall do more than battery can To our fast-closed gates; for at this match, With swifter spleen than powder can enforce,[199] The mouth of passage shall we fling wide ope. And give you entrance: but without this match, 450 The

sea enraged is not half so deaf, Lions more confident, mountains and rocks[200] More free from motion, no, not Death himself[200] In mortal fury half so peremptory, As we to keep this city.

Bast. Here's a stay[201] 455 That shakes the rotten carcass of old Death Out of his rags! Here's a large mouth, indeed, That spits forth death and mountains, rocks and seas, Talks as familiarly of roaring lions As maids of thirteen do of puppy-dogs! 460 What cannoneer begot this lusty blood?[202] He speaks plain cannon fire, and smoke and bounce;[203] He gives the bastinado with his tongue: Our ears are cudgell'd; not a word of his But buffets better than a fist of France: 465 Zounds! I was never so bethump'd with words Since I first call'd my brother's father dad.[204]

Eli. Son, list to this conjunction, make this match;[205][206] Give with our niece a dowry large enough:[206] For by this knot thou shalt so surely tie[206] 470 Thy now unsured assurance to the crown,[206][207] That yon green boy shall have no sun to ripe[206] The bloom that promiseth a mighty fruit.[206] I see a yielding in the looks of France;[206] Mark, how they whisper: urge them while their souls[206] 475 Are capable of this ambition,[206] Lest zeal, now melted by the windy breath[206][208] Of soft petitions, pity and remorse,[206] Cool and congeal again to what it was.[206]

First Cit. Why answer not the double majesties 480 This friendly treaty of our threaten'd town?

K. Phi. Speak England first, that hath been forward first[209] To speak unto this city: what say you?

K. John. If that the Dauphin there, thy princely son,[193] Can in this book of beauty read 'I love,' 485 Her dowry shall weigh equal with a queen:[210] For Anjou, and fair Touraine, Maine, Poictiers,[211] And all that we upon this side the sea, Except this city now by us besieged, Find liable to our crown and dignity, 490 Shall gild her bridal bed and make her rich In titles, honours and promotions, As she in beauty, education, blood,[212] Holds hand with any princess of the world.[213]

K. Phi. What say'st thou, boy? look in the lady's face. 495

Lew. I do, my lord; and in her eye I find[214] A wonder, or a wondrous miracle, The shadow of myself form'd in her eye;[215] Which, being but the shadow of your son,[215] Becomes a sun and makes your son a shadow:[215][216] 500 I do protest I never loved myself Till now infixed I beheld myself[217] Drawn in the flattering table of her eye.[218]

[_Whispers with Blanch._

Bast. Drawn in the flattering table of her eye![219] Hang'd in the frowning-wrinkle of her brow! 505 And quarter'd in her heart! he doth espy Himself love's traitor: this is pity now, That, hang'd and drawn and quarter'd, there should be In such a love so vile a lout as he.

Blanch. My uncle's will in this respect is mine:[220] 510 If he see aught in you that makes him like, That any thing he sees, which moves his liking, I can with ease translate it to my will;[221] Or if you will, to speak more properly, I will enforce it easily to my love.[222] 515 Further I will not flatter you, my lord, That all I see in you is worthy love, Than this; that nothing do I see in you, Though churlish thoughts themselves should be your judge, That I can find should merit any hate. 520

K. John. What say these young ones? What say you, my niece?

Blanch. That she is bound in honour still to do What you in wisdom still vouchsafe to say.[223]

K. John. Speak then, prince Dauphin; can you love this lady?

Lew. Nay, ask me if I can refrain from love; 525 For I do love her most unfeignedly.

K. John. Then do I give Volquessen, Touraine, Maine, Poictiers, and Anjou, these five provinces,[224] With her to thee; and this addition more, Full thirty thousand marks of English coin. 530 Philip of France, if thou be pleased withal, Command thy son and daughter to join hands.

K. Phi. It likes us well; young princes, close your hands.[225]

Aust. And your lips too; for I am well assured[226] That I did so when I was first assured.[226] 535

K. Phi. Now, citizens of Angiers, ope your gates,[227] Let in that amity which you have made; For at Saint Mary's chapel presently The rites of marriage shall be solemnized. Is not the Lady Constance in this troop? 540 I know she is not, for this match made up[228] Her presence would have interrupted much: Where is she and her son? tell me, who knows.[229]

Lew. She is sad and passionate at your highness' tent.[230]

K. Phil. And, by my faith, this league that we have made 545 Will give her sadness very little cure. Brother of England, how may we content This widow lady? In her right we came;[231] Which we, God knows, have turn'd another way, To our own vantage.

K. John. We will heal up all; 550 For we'll create young Arthur Duke of Bretagne[232] And Earl of Richmond; and this rich fair town We make him lord of. Call the Lady Constance;[233] Some speedy messenger bid her repair To our solemnity: I trust we shall, 555 If not fill up the measure of her will, Yet in some measure satisfy her so That we shall stop her exclamation. Go we, as well as haste will suffer us, To this unlook'd for, unprepared pomp. 560

[_Exeunt all but the Bastard._[234]

Bast. Mad world! mad kings! mad composition![235] John, to stop Arthur's title in the whole, Hath willingly departed with a part, And France, whose armour conscience buckled on, Whom zeal and charity brought to the field 565 As God's own soldier, rounded in the ear With that same purpose-changer, that sly devil, That broker, that still breaks the pate of faith, That daily break-vow, he that wins of all, Of kings, of beggars, old men, young men, maids, 570 Who, having no external thing to lose[236] But the word 'maid,' cheats the poor maid of that,[237] That smooth-faced gentleman, tickling Commodity, Commodity, the bias of the world, The world, who of itself is peised well,[238] 575 Made to run even upon even ground, Till this advantage, this vile-drawing bias,[239] This sway of motion, this Commodity, Makes it take head from all indifferency, From all direction, purpose, course, intent: 580 And this same bias, this Commodity, This bawd, this broker, this all-changing word,[240] Clapp'd on the outward eye of fickle France, Hath drawn him from his own determined aid,[241] From a resolved and honourable war, 585 To a most base and vile-concluded peace.[242] And why rail I on this Commodity?[243] But for because he hath not woo'd me yet: Not that I have the power to clutch my hand,[244] When his fair angels would salute my palm; 590 But for my hand, as unattempted yet,[245] Like a poor beggar, raileth on the rich. Well, whiles I am a beggar, I will rail[246] And say there is no sin but to be rich; And being rich, my virtue then shall be 595 To say there is no vice but beggary. Since kings break faith upon commodity, Gain, be my lord, for I will worship thee.[247] [_Exit._

FOOTNOTES:

[75] ACT II. SCENE I. Rowe (ed. 2). Scæna Secunda. Ff.

France ...] Capell. Enter before Angiers, Philip King of France, Lewis, Daulphin, Austria, Constance, Arthur Ff.

[76] Lew.] King Philip. Theobald conj.

[247] _Gain, be_] Theobald. _Gaine be_ Ff (_Gain_ F■ F■).

ACT III.

SCENE I. _The French_ KING'S _Pavilion_.[248]

Enter CONSTANCE, ARTHUR, _and_ SALISBURY.

Const. Gone to be married! gone to swear a peace! False blood to false blood join'd! gone to be friends! Shall Lewis have Blanch, and Blanch those provinces? It is not so; thou hast misspoke, misheard; Be well advised, tell o'er thy tale again: 5 It cannot be; thou dost but say 'tis so: I trust I may not trust thee; for thy word[249] Is but the vain breath of a common man: Believe me, I do not believe thee, man;[250] I have a king's oath to the contrary. 10 Thou shalt be punish'd for thus frighting me, For I am sick and capable of fears, Oppress'd with wrongs and therefore full of fears. A widow, husbandless, subject to fears, A woman, naturally born to fears; 15 And though thou now confess thou didst but jest,[251] With my vex'd spirits I cannot take a truce,[251][252] But they will quake and tremble all this day. What dost thou mean by shaking of thy head? Why dost thou look so sadly on my son? 20 What means that hand upon that breast of thine? Why holds thine eye that lamentable rheum, Like a proud river peering o'er his

bounds? Be these sad signs confirmers of thy words?[253] Then speak again; not all thy former tale, 25 But this one word, whether thy tale be true.

Sal. As true as I believe you think them false[254] That give you cause to prove my saying true.

Const. O, if thou teach me to believe this sorrow, Teach thou this sorrow how to make me die, 30 And let belief and life encounter so As doth the fury of two desperate men Which in the very meeting fall and die. Lewis marry Blanch! O boy, then where art thou?[255] France friend with England, what becomes of me?[256] 35 Fellow, be gone: I cannot brook thy sight: This news hath made thee a most ugly man.[257]

Sal. What other harm have I, good lady, done,[257] But spoke the harm that is by others done?[257]

Const. Which harm within itself so heinous is[257] 40 As it makes harmful all that speak of it.[257]

Arth. I do beseech you, madam, be content.[258]

Const. If thou, that bid'st me be content, wert grim, Ugly and slanderous to thy mother's womb, Full of unpleasing blots and sightless stains,[259] 45 Lame, foolish, crooked, swart, prodigious, Patch'd with foul moles and eye-offending marks, I would not care, I then would be content, For then I should not love thee, no, nor thou Become thy great birth nor deserve a crown. 50 But thou art fair, and at thy birth, dear boy, Nature and Fortune join'd to make thee great: Of Nature's gifts thou mayst with lilies boast And with the half-blown rose. But Fortune, O, She is corrupted, changed and won from thee; 55 She adulterates hourly with thine uncle John,[260] And with her golden hand hath pluck'd on France To tread down fair respect of sovereignty. And made his majesty the bawd to theirs. France is a bawd to Fortune and King John,[261] 60 That strumpet Fortune, that usurping John! Tell me, thou fellow, is not France forsworn? Envenom him with words, or get thee gone And leave those woes alone which I alone[262] Am bound to under-bear.

Sal. Pardon me, madam, 65 I may not go without you to the kings.

Const. Thou mayst, thou shalt; I will not go with thee: I will instruct my sorrows to be proud;[263] For grief is proud and makes his owner stoop.[264] To me and to the state of my great grief 70 Let kings assemble; for my grief's so great That no supporter but the huge firm earth[265] Can hold it up: here I and sorrows sit;[266] Here is my throne, bid kings come bow to it.

[_Seats herself on the ground._[267]

Enter KING JOHN, KING PHILIP, LEWIS, BLANCH, ELINOR, _the_ BASTARD, AUSTRIA, _and_ Attendants.

K. Phi. 'Tis true, fair daughter; and this blessed day Ever in France shall be kept festival:[268] 75 To solemnize this day the glorious sun Stays in his course and plays the alchemist, Turning with splendour of his precious eye The meagre cloddy earth to glittering gold: 80 The yearly course that brings this day about Shall never see it but a holiday.[269]

Const. A wicked day, and not a holy day! [_Rising._[270] What hath this day deserved? what hath it done, That it in golden letters should be set 85 Among the high tides in the calendar? Nay, rather turn this day out of the week, This day of shame, oppression, perjury. Or, if it must stand still, let wives with child Pray that their burthens may not fall this day, 90 Lest that their hopes prodigiously be cross'd: But on this day let seamen fear no wreck;[271] No bargains break that are not this day made: This day, all things begun come to ill end, Yea, faith itself to hollow falsehood change![272] 95

K. Phi. By heaven, lady, you shall have no cause To curse the fair proceedings of this day: Have I not pawn'd to you my majesty?

Const. You have beguiled me with a counterfeit Resembling majesty, which, being touch'd and tried,[273] 100 Proves valueless: you are forsworn, forsworn; You came in arms to spill mine enemies' blood,[274] But now in arms you strengthen it with yours: The grappling vigour and rough frown of war Is cold in amity and painted peace,[275] 105 And our oppression hath made up this league.[276] Arm, arm, you heavens, against these perjured kings![277] A widow cries; be husband to me, heavens![278] Let not the hours of this ungodly day Wear out the day in peace; but, ere sunset,[279] 110 Set armed discord 'twixt these perjured kings! Hear me, O, hear me!

Aust. Lady Constance, peace!

Const. War! war! no peace! peace is to me a war. O Lymoges! O Austria! thou dost shame That bloody spoil: thou slave, thou wretch, thou coward! 115 Thou little valiant, great in villany! Thou ever strong upon the stronger side! Thou Fortune's champion that

dost never fight But when her humorous ladyship is by To teach thee safety! thou art perjured too, 120 And soothest up greatness. What a fool art thou. A ramping fool, to brag and stamp and swear[280] Upon my party! Thou cold-blooded slave, Hast thou not spoke like thunder on my side, Been sworn my soldier, bidding me depend 125 Upon thy stars, thy fortune and thy strength, And dost thou now fall over to my foes? Thou wear a lion's hide! doff it for shame, And hang a calf's-skin on those recreant limbs.[281]

Aust. O, that a man should speak those words to me![282] 130

Bast. And hang a calf's-skin on those recreant limbs.[283]

Aust. Thou darest not say so, villain, for thy life.

Bast. And hang a calf's-skin on those recreant limbs.[283][284]

K. John. We like not this; thou dost forget thyself.

Enter PANDULPH.[285]

K. Phi. Here comes the holy legate of the pope. 135

Pand. Hail, you anointed deputies of heaven! To thee, King John, my holy errand is. I Pandulph, of fair Milan cardinal, And from Pope Innocent the legate here, Do in his name religiously demand 140 Why thou against the church, our holy mother, So wilfully dost spurn; and force perforce Keep Stephen Langton, chosen archbishop[286] Of Canterbury, from that holy see?[287] This, in our foresaid holy father's name, 145 Pope Innocent, I do demand of thee.

K. John. What earthy name to interrogatories[288] Can task the free breath of a sacred king?[289] Thou canst not, cardinal, devise a name So slight, unworthy and ridiculous, 150 To charge me to an answer, as the pope.[290] Tell him this tale; and from the mouth of England Add thus much more, that no Italian priest Shall tithe or toll in our dominions; But as we, under heaven, are supreme head,[291] 155 So under Him that great supremacy,[292] Where we do reign, we will alone uphold, Without the assistance of a mortal hand: So tell the pope, all reverence set apart To him and his usurp'd authority. 160

K. Phi. Brother of England, you blaspheme in this.

K. John. Though you and all the kings of Christendom Are led so grossly by this meddling priest, Dreading the curse that money may buy out; And by the merit of vile gold, dross, dust, 165 Purchase corrupted pardon of a man, Who in that sale sells pardon from himself, Though you and all the rest so grossly led This juggling witchcraft with revenue cherish, Yet I alone, alone do me oppose 170 Against the pope and count his friends my foes.

Pand. Then, by the lawful power that I have, Thou shalt stand cursed and excommunicate: And blessed shall he be that doth revolt From his allegiance to an heretic; 175 And meritorious shall that hand be call'd, Canonized and worshipp'd as a saint,[293] That takes away by any secret course Thy hateful life.

Const. O, lawful let it be That I have room with Rome to curse awhile![294] 180 Good father cardinal, cry thou amen To my keen curses; for without my wrong There is no tongue hath power to curse him right.

Pand. There's law and warrant, lady, for my curse.

Const. And for mine too: when law can do no right,[295] 185 Let it be lawful that law bar no wrong: Law cannot give my child his kingdom here, For he that holds his kingdom holds the law; Therefore, since law itself is perfect wrong, How can the law forbid my tongue to curse? 190

Pand. Philip of France, on peril of a curse, Let go the hand of that arch-heretic; And raise the power of France upon his head, Unless he do submit himself to Rome.

Eli. Look'st thou pale, France? do not let go thy hand. 195

Const. Look to that, devil; lest that France repent,[296] And by disjoining hands, hell lose a soul.

Aust. King Philip, listen to the cardinal.

Bast. And hang a calf's-skin on his recreant limbs.[297]

Aust. Well, ruffian, I must pocket up these wrongs, 200 Because--

Bast. Your breeches best may carry them.

K. John. Philip, what say'st thou to the cardinal?

Const. What should he say, but as the cardinal?

Lew. Bethink you, father; for the difference Is purchase of a heavy curse from Rome, 205 Or the light loss of England for a friend: Forego the easier.

Blanch. That's the curse of Rome.[298]

Const. O Lewis, stand fast! the devil tempts thee here[299] In likeness of a new untrimmed bride.[300]

Blanch. The Lady Constance speaks not from her faith,[301] 210 But from her need.[301]

Const. O, if thou grant my need,[301] Which only lives but by the death of faith,[301] That need must needs infer this principle,[301] That faith would live again by death of need.[301] O then, tread down my need, and faith mounts up;[301] 215 Keep my need up, and faith is trodden down![301]

K. John. The king is moved, and answers not to this.[301][302]

Const. O, be removed from him, and answer well![301]

Aust. Do so, King Philip; hang no more in doubt.[301]

Bast. Hang nothing but a calf's-skin, most sweet lout.[301] 220

K. Phi. I am perplex'd, and know not what to say.

Pand. What canst thou say but will perplex thee more, If thou stand excommunicate and cursed?

K. Phi. Good reverend father, make my person yours, And tell me how you would bestow yourself. 225 This royal hand and mine are newly knit, And the conjunction of our inward souls Married in league, coupled and link'd together With all religious strength of sacred vows; The latest breath that save the sound of words 230 Was deep-sworn faith, peace, amity, true love Between our kingdoms and our royal selves, And even before this truce, but new before,[303] No longer than we well could wash our hands To clap this royal bargain up of peace, 235 Heaven knows, they were besmear'd and overstain'd With slaughter's pencil, where revenge did paint The fearful difference of incensed kings: And shall these hands, so lately purged of blood, So newly join'd in love, so strong in both, 240 Unyoke this seizure and this kind regreet? Play fast and loose with faith? so jest with heaven, Make such unconstant children of ourselves, As now again to snatch our palm from palm, Unswear faith sworn, and on the marriage-bed 245 Of smiling peace to march a bloody host, And make a riot on the gentle brow Of true sincerity? O, holy sir, My reverend father, let it not be so! Out of your grace, devise, ordain, impose 250 Some gentle order; and then we shall be blest[304] To do your pleasure and continue friends.

Pand. All form is formless, order orderless. Save what is opposite to England's love. Therefore to arms! be champion of our church, 255 Or let the church, our mother, breathe her curse, A mother's curse, on her revolting son. France, thou mayst hold a serpent by the tongue, A chafed lion by the mortal paw,[305] A fasting tiger safer by the tooth, 260 Than keep in peace that hand which thou dost hold.

K. Phi. I may disjoin my hand, but not my faith.

Pand. So makest thou faith an enemy to faith; And like a civil war set'st oath to oath, Thy tongue against thy tongue. O, let thy vow 265 First made to heaven, first be to heaven perform'd, That is, to be the champion of our church. What since thou sworest is sworn against thyself And may not be performed by thyself, For that which thou hast sworn to do amiss 270 Is not amiss when it is truly done,[306] And being not done, where doing tends to ill, The truth is then most done not doing it: The better act of purposes mistook Is to mistake again; though indirect,[307] 275 Yet indirection thereby grows direct, And falsehood falsehood cures, as fire cools fire Within the scorched veins of one new-burn'd. It is religion that doth make vows kept; But thou hast sworn against religion, 280 By what thou swear'st against the thing thou swear'st,[308] And makest an oath the surety for thy truth[309] Against an oath: the truth thou art unsure[309][310][311] To swear, swears only not to be forsworn;[311][312] Else what a mockery should it be to

swear! 285 But thou dost swear only to be forsworn; And most forsworn, to keep what thou dost swear. Therefore thy later vows against thy first[313] Is in thyself rebellion to thyself; And better conquest never canst thou make 290 Than arm thy constant and thy nobler parts Against these giddy loose suggestions:[314] Upon which better part our prayers come in, If thou vouchsafe them. But if not, then know The peril of our curses light on thee[315] 295 So heavy as thou shalt not shake them off, But in despair die under their black weight.

Aust. Rebellion, flat rebellion!

Bast. Will't not be? Will not a calf's-skin stop that mouth of thine?

Lew. Father, to arms![316]

Blanch. Upon thy wedding-day? 300 Against the blood that thou hast married? What, shall our feast be kept with slaughtered men?[317] Shall braying trumpets and loud churlish drums, Clamours of hell, be measures to our pomp? O husband, hear me! ay, alack, how new[318] 305 Is husband in my mouth! even for that name, Which till this time my tongue did ne'er pronounce, Upon my knee I beg, go not to arms Against mine uncle.

Const. O, upon my knee,[319] Made hard with kneeling, I do pray to thee,[319] 310 Thou virtuous Dauphin, alter not the doom[319] Forethought by heaven![319]

Blanch. Now shall I see thy love: what motive may Be stronger with thee than the name of wife?

Const. That which upholdeth him that thee upholds, 315 His honour: O, thine honour, Lewis, thine honour!

Lew. I muse your majesty doth seem so cold, When such profound respects do pull you on.

Pand. I will denounce a curse upon his head.

K. Phi. Thou shalt not need. England, I will fall from thee.[320] 320

Const. O fair return of banish'd majesty!

Eli. O foul revolt of French inconstancy!

K. John. France, thou shalt rue this hour within this hour.

Bast. Old Time the clock-setter, that bald sexton Time, Is it as he will? well then, France shall rue. 325

Blanch. The sun's o'ercast with blood: fair day, adieu! Which is the side that I must go withal? I am with both: each army hath a hand; And in their rage, I having hold of both, They whirl asunder and dismember me. 330 Husband, I cannot pray that thou mayst win; Uncle, I needs must pray that thou mayst lose; Father, I may not wish the fortune thine; Grandam, I will not wish thy wishes thrive: Whoever wins, on that side shall I lose; 335 Assured loss before the match be play'd.

Lew. Lady, with me, with me thy fortune lies.[321]

Blanch. There where my fortune lives, there my life dies.

K. John. Cousin, go draw our puissance together.

[_Exit Bastard._[322]

France, I am burn'd up with inflaming wrath; 340 A rage whose heat hath this condition, That nothing can allay, nothing but blood,[323] The blood, and dearest-valued blood, of France.[324]

K. Phi. Thy rage shall burn thee up, and thou shalt turn To ashes, ere our blood shall quench that fire: 345 Look to thyself, thou art in jeopardy.

K. John. No more than he that threats. To arms let's hie! [_Exeunt._

SCENE II. _The same. Plains near Angiers._[325]

Alarums, excursions. Enter the BASTARD, _with_ AUSTRIA'S _head_.

Bast. Now, by my life, this day grows wondrous hot; Some airy devil hovers in the sky,[326] And pours down mischief. Austria's head lie there, While Philip breathes.

Enter KING JOHN, ARTHUR, _and_ HUBERT.[327]

K. John. Hubert, keep this boy. Philip, make up:[328] 5 My mother is assailed in our tent, And ta'en, I fear.

Bast. My lord, I rescued her; Her highness is in safety, fear you not: But on, my liege; for very little pains Will bring this labour to an happy end. [_Exeunt._[329] 10

SCENE III. _The same._[330]

Alarums, excursions, retreat. Enter KING JOHN, ELINOR, ARTHUR, _the_ BASTARD, HUBERT, _and_ Lords.

K. John. [_To Elinor_] So shall it be; your grace shall stay behind[331] So strongly guarded. [_To Arthur_] Cousin, look not sad:[332] Thy grandam loves thee; and thy uncle will As dear be to thee as thy father was.

Arth. O, this will make my mother die with grief! 5

K. John. [_To the Bastard_] Cousin, away for England! haste before:[333] And, ere our coming, see thou shake the bags Of hoarding abbots; imprisoned angels[334] Set at liberty: the fat ribs of peace[334][335] Must by the hungry now be fed upon:[336] 10 Use our commission in his utmost force.[337]

Bast. Bell, book, and candle shall not drive me back, When gold and silver becks me to come on.[338] I leave your highness. Grandam, I will pray, If ever I remember to be holy, 15 For your fair safety; so, I kiss your hand.

Eli. Farewell, gentle cousin.

K. John. Coz, farewell. [_Exit Bastard._[339]

Eli. Come hither, little kinsman; hark, a word.[340]

K. John. Come hither, Hubert. O my gentle Hubert,[341] We owe thee much! within this wall of flesh 20 There is a soul counts thee her creditor, And with advantage means to pay thy love: And, my good friend, thy voluntary oath Lives in this bosom, dearly cherished. Give me thy hand. I had a thing to say, 25 But I will fit it with some better time.[342] By heaven, Hubert, I am almost ashamed[343] To say what good respect I have of thee.

Hub. I am much bounden to your majesty.

K. John. Good friend, thou hast no cause to say so yet,[344] 30 But thou shalt have; and creep time ne'er so slow, Yet it shall come for me to do thee good. I had a thing to say, but let it go: The sun is in the heaven, and the proud day, Attended with the pleasures of the world, 35 Is all too wanton and too full of gawds[345] To give me audience: if the midnight bell Did, with his iron tongue and brazen mouth,[346] Sound on into the drowsy race of night;[346][347] If this same were a churchyard where we stand, 40 And thou possessed with a thousand wrongs, Or if that surly spirit, melancholy, Had baked thy blood and made it heavy-thick,[348] Which else runs tickling up and down the veins,[349] Making that idiot, laughter, keep men's eyes[350] 45 And strain their cheeks to idle merriment, A passion hateful to my purposes, Or if that thou couldst see me without eyes, Hear me without thine ears, and make reply Without a tongue, using conceit alone, 50 Without eyes, ears and harmful sound of words; Then, in despite of brooded watchful day,[351] I would into thy bosom pour my thoughts: But, ah, I will not! yet I love thee well; And, by my troth, I think thou lovest me well. 55

Hub. So well, that what you bid me undertake, Though that my death were adjunct to my act, By heaven, I would do it.[352]

K. John. Do not I know thou wouldst? Good Hubert, Hubert, Hubert, throw thine eye On yon young boy: I'll tell thee what, my friend, 60 He is a very serpent in my way; And wheresoe'er this foot of mine doth tread, He lies before me: dost thou understand me? Thou art his keeper.

Hub. And I'll keep him so, That he shall not offend your majesty.[353]

K. John. Death.[65] 65

Hub. My lord?[354]

K. John. A grave.

Hub. He shall not live.

K. John. Enough. I could be merry now. Hubert, I love thee; Well, I'll not say what I intend for thee: Remember. Madam, fare you well:[355] I'll send those powers o'er to your majesty.

Eli. My blessing go with thee!

K. John. For England, cousin, go:[356] Hubert shall be your man, attend on you[357] With all true duty. On toward Calais, ho! [_Exeunt._

SCENE IV. _The same. The_ FRENCH KING'S _tent_.

Enter KING PHILIP, LEWIS, PANDULPH, _and_ Attendants.[358]

K. Phi. So, by a roaring tempest on the flood, A whole armado of convicted sail[359] Is scattered and disjoin'd from fellowship.[360]

Pand. Courage and comfort! all shall yet go well.

K. Phi. What can go well, when we have run so ill? 5 Are we not beaten? Is not Angiers lost? Arthur ta'en prisoner? divers dear friends slain? And bloody England into England gone, O'erbearing interruption, spite of France?

Lew. What he hath won, that hath he fortified: 10 So hot a speed with such advice disposed, Such temperate order in so fierce a cause,[361] Doth want example: who hath read or heard Of any kindred action like to this?

K. Phi. Well could I bear that England had this praise, 15 So we could find some pattern of our shame.

Enter CONSTANCE.

Look, who comes here! a grave unto a soul;[362] Holding the eternal spirit, against her will,[363] In the vile prison of afflicted breath.[364] I prithee, lady, go away with me. 20

Const. Lo, now! now see the issue of your peace.

K. Phi. Patience, good lady! comfort, gentle Constance!

Const. No, I defy all counsel, all redress, But that which ends all counsel, true redress,[365] Death, death; O amiable lovely death![365] 25 Thou odoriferous stench! sound rottenness![366] Arise forth from the couch of lasting night,[367] Thou hate and terror to prosperity, And I will kiss thy detestable bones[368] And put my eyeballs in thy vaulty brows 30 And ring these fingers with thy household worms And stop this gap of breath with fulsome dust And be a carrion monster like thyself: Come, grin on me, and I will think thou smilest, And buss thee as thy wife. Misery's love,[369] 35 O, come to me!

K. Phil. O fair affliction, peace!

Const. No, no, I will not, having breath to cry: O, that my tongue were in the thunder's mouth! Then with a passion would I shake the world;[370] And rouse from sleep that fell anatomy 40 Which cannot hear a lady's feeble voice,[371] Which scorns a modern invocation.[371][372]

Pand. Lady, you utter madness, and not sorrow.

Const. Thou art not holy to belie me so;[373] I am not mad: this hair I tear is mine; 45 My name is Constance; I was Geffrey's wife; Young Arthur is my son, and he is lost: I am not mad: I would to heaven I were! For then, 'tis like I should forget myself: O, if I could, what grief should I forget! 50 Preach some philosophy to make me mad,[374] And thou shalt be canonized, cardinal;[374][375] For being not mad but sensible of grief,[374] My reasonable part produces reason[374] How I may be deliver'd of these woes,[374] 55 And teaches me to kill or hang myself:[374] If I were mad, I should forget my son,[374] Or madly think a babe of clouts were he:[374] I am not mad; too well, too well I feel The different plague of each calamity. 60

K. Phi. Bind up those tresses. O, what love I note[376] In the fair multitude of those her hairs![376] Where but by chance a silver drop hath fallen,[376] Even to that drop ten thousand wiry friends[376][377] Do glue themselves in sociable grief,[376] 65 Like true, inseparable, faithful loves,[376][378] Sticking together in calamity.[376]

Const. To England, if you will.[376]

K. Phi. Bind up your hairs.[376]

Const. Yes, that I will; and wherefore will I do it?[376] I tore them from their bonds and cried aloud[376] 70 'O that these hands could so redeem my son,[376] As they have given these hairs their liberty!'[376] But now I envy at their liberty,[376] And will again commit them to their bonds,[376] Because my poor child is a prisoner.[376] 75 And, father cardinal, I have heard you say[379] That we shall see and know our friends in heaven: If that be true, I shall see my boy again;[380] For since the birth of Cain, the first male child, To him that did but yesterday suspire, 80 There was not such a gracious creature born. But now will canker-sorrow eat my bud And chase the native beauty from his cheek And he will look as hollow as a ghost, As dim and meagre as an ague's fit, 85 And so he'll die; and, rising so again, When I shall meet him in the court of heaven I shall not know him: therefore never, never Must I behold my pretty Arthur more.

Pand. You hold too heinous a respect of grief. 90

Const. He talks to me that never had a son.

K. Phi. You are as fond of grief as of your child.

Const. Grief fills the room up of my absent child, Lies in his bed, walks up and down with me, Puts on his pretty looks, repeats his words, 95 Remembers me of all his gracious parts, Stuffs out his vacant garments with his form; Then, have I reason to be fond of grief?[381] Fare you well: had you such a loss as I,[382] I could give better comfort than you do. 100 I will not keep this form upon my head,[383] When there is such disorder in my wit. O Lord! my boy, my Arthur, my fair son! My life, my joy, my food, my all the world! My widow-comfort, and my sorrows' cure! [_Exit._[384] 105

K. Phi. I fear some outrage, and I'll follow her. [_Exit._

Lew. There's nothing in this world can make me joy:[385] Life is as tedious as a twice-told tale Vexing the dull ear of a drowsy man; And bitter shame hath spoil'd the sweet world's taste.[386] 110 That it yields nought but shame and bitterness.[387]

Pand. Before the curing of a strong disease, Even in the instant of repair and health, The fit is strongest; evils that take leave,[388] On their departure most of all show evil:[388] 115 What have you lost by losing of this day?

Lew. All days of glory, joy and happiness.

Pand. If you had won it, certainly you had. No, no; when Fortune means to men most good, She looks upon them with a threatening eye. 120 'Tis strange to think how much King John hath lost In this which he accounts so clearly won: Are not you grieved that Arthur is his prisoner?

Lew. As heartily as he is glad he hath him.

Pand. Your mind is all as youthful as your blood. 125 Now hear me speak with a prophetic spirit; For even the breath of what I mean to speak Shall blow each dust, each straw, each little rub, Out of the path which shall directly lead Thy foot to England's throne; and therefore mark. 130 John hath seized Arthur; and it cannot be That, whiles warm life plays in that infant's veins,[389] The misplaced John should entertain an hour,[390] One minute, nay, one quiet breath of rest.[391] A sceptre snatch'd with an unruly hand 135 Must be as boisterously maintain'd as gain'd; And he that stands upon a slippery place Makes nice of no vile hold to stay him up: That John may stand, then Arthur needs must fall;[392] So be it, for it cannot be but so. 140

Lew. But what shall I gain by young Arthur's fall?

Pand. You, in the right of Lady Blanch your wife, May then make all the claim that Arthur did.

Lew. And lose it, life and all, as Arthur did.

Pand. How green you are and fresh in this old world! 145 John lays you plots; the times conspire with you;[393] For he that steeps his safety in true blood Shall find but bloody safety and untrue. This act so evilly born shall cool the hearts[394] Of all his

people and freeze up their zeal, 150 That none so small advantage shall step forth[395] To check his reign, but they will cherish it;[396] No natural exhalation in the sky, No scope of nature, no distemper'd day,[397] No common wind, no customed event, 155 But they will pluck away his natural cause[398] And call them meteors, prodigies and signs, Abortives, presages and tongues of heaven,[399] Plainly denouncing vengeance upon John.

Lew. May be he will not touch young Arthur's life, 160 But hold himself safe in his prisonment.

Pand. O, sir, when he shall hear of your approach, If that young Arthur be not gone already, Even at that news he dies; and then the hearts[400] Of all his people shall revolt from him 165 And kiss the lips of unacquainted change And pick strong matter of revolt and wrath Out of the bloody fingers' ends of John. Methinks I see this hurly all on foot: And, O, what better matter breeds for you[401] 170 Than I have named! The bastard Faulconbridge Is now in England, ransacking the church, Offending charity: if but a dozen French[402] Were there in arms, they would be as a call To train ten thousand English to their side, 175 Or as a little snow, tumbled about,[403] Anon becomes a mountain. O noble Dauphin,[404] Go with me to the king: 'tis wonderful What may be wrought out of their discontent,[405] Now that their souls are topful of offence.[405] 180 For England go: I will whet on the king.

Lew. Strong reasons make strong actions: let us go:[406] If you say ay, the king will not say no. [_Exeunt._

FOOTNOTES:

[248] ACT III. SCENE I.] Pope (ed. 2). Actus Secundus. Ff. ACT II. SCENE I. Rowe. SCENE VII. Pope (ed. 1).

The French....] Theobald.

[406] _reasons make_] Capell. _reasons makes_ Ff. _reason makes_ Rowe.

strong actions] F■ F■ F■. _strange actions_ F■.

ACT IV.

SCENE I. _A room in a castle._

Enter HUBERT _and_ Executioners.[407]

Hub. Heat me these irons hot; and look thou stand[408] Within the arras: when I strike my foot Upon the bosom of the ground, rush forth, And bind the boy which you shall find with me Fast to the chair: be heedful: hence, and watch. 5

First Exec. I hope your warrant will bear out the deed.[409]

Hub. Uncleanly scruples! fear not you: look to't.[410]

[_Exeunt Executioners._

Young lad, come forth; I have to say with you.

Enter ARTHUR.

Arth. Good morrow, Hubert.

Hub. Good morrow, little prince.[411]

Arth. As little prince, having so great a title 10 To be more prince, as may be. You are sad.

Hub. Indeed, I have been merrier.

Arth. Mercy on me! Methinks no body should be sad but I: Yet, I remember, when I was in France,[412] Young gentlemen would be as sad as night, 15 Only for wantonness. By my Christendom. So I were out of prison and kept sheep, I should be as merry as the day is long;[413] And so I would be here, but that I doubt My uncle practises more harm to me: 20 He is afraid of me and I of him: Is it my fault that I was Geffrey's son? No, indeed, is't not; and I would to heaven[414] I were your son, so you would love me, Hubert.

Hub. [_Aside_] If I talk to him, with his innocent prate[415] 25 He will awake my mercy which lies dead: Therefore I will be sudden and dispatch.

Arth. Are you sick, Hubert? you look pale to-day: In sooth, I would you were a little sick, That I might sit all night and watch with you: 30 I warrant I love you more than you do me.[416]

Hub. [_Aside_] His words do take possession of my bosom.[417] Read here, young Arthur. [_Showing a paper._ [_Aside_] How now, foolish rheum![418][419] Turning dispiteous torture out of door![419][420] I must be brief, lest resolution drop 35 Out at mine eyes in tender womanish tears. Can you not read it? is it not fair writ?[421]

Arth. Too fairly, Hubert, for so foul effect:[422] Must you with hot irons burn out both mine eyes?[423]

Hub. Young boy, I must.

Arth. And will you?

Hub. And I will.

Arth. Have you the heart? When your head did but ache, I knit my handkercher about your brows,[424] The best I had, a princess wrought it me, And I did never ask it you again; And with my hand at midnight held your head, And like the watchful minutes to the hour, Still and anon cheer'd up the heavy time, Saying, 'What lack you?' and 'Where lies your grief?' Or 'What good love may I perform for you?' Many a poor man's son would have lien still[425] And ne'er have spoke a loving word to you; But you at your sick service had a prince.[426] Nay, you may think my love was crafty love And call it cunning: do, an if you will:[427] If heaven be pleased that you must use me ill, Why then you must. Will you put out mine eyes? These eyes that never did nor never shall[428] So much as frown on you.[429]

Hub. I have sworn to do it; And with hot irons must I burn them out.

Arth. Ah, none but in this iron age would do it![430] The iron of itself, though heat red-hot,[430] Approaching near these eyes, would drink my tears[430] And quench his fiery indignation[430][431] Even in the matter of mine innocence;[430][432] Nay, after that, consume away in rust,[430] But for containing fire to harm mine eye.[430] Are you more stubborn-hard than hammer'd iron?[430][433] An if an angel should have come to me[434] And told me Hubert should put out mine eyes, I would not have believed him,--no tongue but Hubert's.[435]

Hub. Come forth. [_Stamps._

Re-enter Executioners, _with a cord, irons, &c._[436]

Do as I bid you do.

Arth. O, save me, Hubert, save me! my eyes are out Even with the fierce looks of these bloody men.

Hub. Give me the iron, I say, and bind him here.[437]

Arth. Alas, what need you be so boisterous-rough?[438] I will not struggle, I will stand stone-still.[439] For heaven sake, Hubert, let me not be bound![440] Nay, hear me, Hubert, drive these men away, And I will sit as quiet as a lamb; I will not stir, nor wince, nor speak a word,[441] Nor look upon the iron angerly:[442] Thrust but these men away, and I'll forgive you, Whatever torment you do put me to.

Hub. Go, stand within; let me alone with him.

First Exec. I am best pleased to be from such a deed.[409]

[_Exeunt Executioners._[443]

Arth. Alas, I then have chid away my friend! He hath a stern look, but a gentle heart: Let him come back, that his compassion may Give life to yours.

Hub. Come, boy, prepare yourself.

Arth. Is there no remedy?

Hub. None, but to lose your eyes.

Arth. O heaven, that there were but a mote in yours,[444] A grain, a dust, a gnat, a wandering hair, Any annoyance in that precious sense! Then feeling what small things are boisterous there, Your vile intent must needs seem horrible.

Hub. Is this your promise? go to, hold your tongue.

Arth. Hubert, the utterance of a brace of tongues[445] Must needs want pleading for a pair of eyes:[445] Let me not hold my tongue, let me not, Hubert; Or, Hubert, if you will, cut out my tongue, So I may keep mine eyes: O, spare mine eyes, Though to no use but still to look on you! Lo, by my troth, the instrument is cold And would not harm me.

Hub. I can heat it, boy.

Arth. No, in good sooth; the fire is dead with grief, Being create for comfort, to be used In undeserved extremes: see else yourself; There is no malice in this burning coal;[446] The breath of heaven hath blown his spirit out[447] 110 And strew'd repentant ashes on his head.[447]

Hub. But with my breath I can revive it, boy.

Arth. An if you do, you will but make it blush[448][449] And glow with shame of your proceedings, Hubert:[448] Nay, it perchance will sparkle in your eyes;[448] 115 And like a dog that is compell'd to fight,[448] Snatch at his master that doth tarre him on.[448][450] All things that you should use to do me wrong Deny their office: only you do lack That mercy which fierce fire and iron extends,[451] 120 Creatures of note for mercy-lacking uses.[452]

Hub. Well, see to live; I will not touch thine eye[453] For all the treasure that thine uncle owes:[454] Yet am I sworn and I did purpose, boy, With this same very iron to burn them out. 125

Arth. O, now you look like Hubert! all this while You were disguised.[455]

Hub. Peace; no more. Adieu. Your uncle must not know but you are dead; I'll fill these dogged spies with false reports: And, pretty child, sleep doubtless and secure, 130 That Hubert, for the wealth of all the world, Will not offend thee.

Arth. O heaven! I thank you, Hubert.

Hub. Silence; no more: go closely in with me: Much danger do I undergo for thee. [_Exeunt._

SCENE II. KING JOHN'S _palace_.

Enter KING JOHN, PEMBROKE, SALISBURY, _and other_ Lords.[456]

K. John. Here once again we sit, once again crown'd,[457] And looked upon, I hope, with cheerful eyes.

Pem. This 'once again,' but that your highness pleased, Was once superfluous: you were crown'd before, And that high royalty was ne'er pluck'd off, 5 The faiths of men ne'er stained with revolt; Fresh expectation troubled not the land With any long'd-for change or better state.

Sal. Therefore, to be possess'd with double pomp, To guard a title that was rich before, 10 To gild refined gold, to paint the lily, To throw a perfume on the violet, To smooth the ice, or add another hue Unto the rainbow, or with taper-light To seek the beauteous eye of heaven to garnish, 15 Is wasteful and ridiculous excess.

Pem. But that your royal pleasure must be done, This act is as an ancient tale new told, And in the last repeating troublesome, Being urged at a time unseasonable. 20

Sal. In this the antique and well noted face Of plain old form is much disfigured; And, like a shifted wind unto a sail, It makes the course of thoughts to fetch about, Startles and frights consideration, 25 Makes sound opinion sick and truth suspected,[458] For putting on so new a fashion'd robe.

Pem. When workmen strive to do better than well,[459] They do confound their skill in covetousness;[460] And oftentimes excusing of a fault 30 Doth make the fault the worse by the excuse, As patches set upon a little breach Discredit more in hiding of the fault[461] Than did the fault before it was so patch'd.[461]

Sal. To this effect, before you were new crown'd, 35 We breathed our counsel: but it pleased your highness To overbear it, and we are all well pleased,[462] Since all and every part of what we would Doth make a stand at what your highness will.[463]

K. John. Some reasons of this double coronation 40 I have possess'd you with and think them strong; And more, more strong, then lesser is my fear,[464] I shall indue you with: meantime but ask What you would have reform'd that is not well, And well shall you perceive how willingly 45 I will both hear and grant you your requests.

Pem. Then I, as one that am the tongue of these To sound the purposes of all their hearts, Both for myself and them, but, chief of all, Your safety, for the which myself and them[465] 50 Bend their best studies, heartily request The enfranchisement of Arthur; whose restraint Doth move the murmuring lips of discontent To break into this dangerous argument,--[466] If what in rest you have in right you hold,[467] 55 Why then your fears, which, as they say, attend[468] The steps of wrong, should move you to mew

up[468] Your tender kinsman and to choke his days With barbarous ignorance and deny his youth The rich advantage of good exercise? 60 That the time's enemies may not have this To grace occasions, let it be our suit That you have bid us ask his liberty;[469] Which for our goods we do no further ask[470] Than whereupon our weal, on you depending,[471] 65 Counts it your weal he have his liberty.[472]

Enter HUBERT.

K. John. Let it be so: I do commit his youth To your direction. Hubert, what news with you?

[_Taking him apart._[473]

Pem. This is the man should do the bloody deed; He show'd his warrant to a friend of mine: 70 The image of a wicked heinous fault Lives in his eye; that close aspect of his Does show the mood of a much troubled breast;[474] And I do fearfully believe 'tis done, What we so fear'd he had a charge to do. 75

Sal. The colour of the king doth come and go Between his purpose and his conscience, Like heralds 'twixt two dreadful battles set:[475] His passion is so ripe, it needs must break.

Pem. And when it breaks, I fear will issue thence 80 The foul corruption of a sweet child's death.

K. John. We cannot hold mortality's strong hand:[476] Good lords, although my will to give is living, The suit which you demand is gone and dead: He tells us Arthur is deceased to-night. 85

Sal. Indeed we fear'd his sickness was past cure.

Pem. Indeed we heard how near his death he was Before the child himself felt he was sick: This must be answer'd either here or hence.

K. John. Why do you bend such solemn brows on me? 90 Think you I bear the shears of destiny? Have I commandment on the pulse of life?

Sal. It is apparent foul play; and 'tis shame[477] That greatness should so grossly offer it: So thrive it in your game! and so, farewell. 95

Pem. Stay yet, Lord Salisbury; I'll go with thee, And find the inheritance of this poor child, His little kingdom of a forced grave. That blood which owed the breadth of all this isle,[478] Three foot of it doth hold: bad world the while! 100 This must not be thus borne: this will break out To all our sorrows, and ere long I doubt. [_Exeunt Lords._[479]

K. John. They burn in indignation. I repent:[480][481] There is no sure foundation set on blood,[481] No certain life achieved by others' death.[481] 105

Enter a Messenger.[482]

A fearful eye thou hast: where is that blood That I have seen inhabit in those cheeks? So foul a sky clears not without a storm: Pour down thy weather: how goes all in France?

Mess. From France to England. Never such a power[483] 110 For any foreign preparation Was levied in the body of a land. The copy of your speed is learn'd by them; For when you should be told they do prepare, The tidings comes that they are all arrived.[484] 115

K. John. O, where hath our intelligence been drunk? Where hath it slept? Where is my mother's care,[485] That such an army could be drawn in France, And she not hear of it?

Mess. My liege, her ear Is stopp'd with dust; the first of April died 120 Your noble mother: and, as I hear, my lord, The Lady Constance in a frenzy died Three days before: but this from rumour's tongue I idly heard; if true or false I know not.

K. John. Withhold thy speed, dreadful occasion! 125 O, make a league with me, till I have pleased My discontented peers! What! mother dead![486] How wildly then walks my estate in France! Under whose conduct came those powers of France[487] That thou for truth givest out are landed here? 130

Mess. Under the Dauphin.[488]

K. John. Thou hast made me giddy With these ill tidings.

Enter the BASTARD _and_ PETER _of Pomfret_.[489]

Now, what says the world To your proceedings? do not seek to stuff My head with more ill news, for it is full.

Bast. But if you be afeard to hear the worst,[490] 135 Then let the worst unheard fall on your head.

K. John. Bear with me, cousin; for I was amazed Under the tide: but now I breathe again Aloft the flood, and can give audience To any tongue, speak it of what it will. 140

Bast. How I have sped among the clergy-men,[491] The sums I have collected shall express. But as I travell'd hither through the land, I find the people strangely fantasied; Possess'd with rumours, full of idle dreams, 145 Not knowing what they fear, but full of fear: And here's a prophet, that I brought with me From forth the streets of Pomfret, whom I found With many hundreds treading on his heels; To whom he sung, in rude harsh-sounding rhymes, 150 That, ere the next Ascension-day at noon, Your highness should deliver up your crown.

K. John. Thou idle dreamer, wherefore didst thou so?

Peter. Foreknowing that the truth will fall out so.

K. John. Hubert, away with him; imprison him; 155 And on that day at noon, whereon he says I shall yield up my crown, let him be hang'd. Deliver him to safety; and return, For I must use thee. [_Exit Hubert with Peter._[492]

O my gentle cousin, Hear'st thou the news abroad, who are arrived? 160

Bast. The French, my lord; men's mouths are full of it: Besides, I met Lord Bigot and Lord Salisbury, With eyes as red as new-enkindled fire, And others more, going to seek the grave Of Arthur, whom they say is kill'd to-night[493][494] 165 On your suggestion.[494]

K. John. Gentle kinsman, go, And thrust thyself into their companies:[495] I have a way to win their loves again; Bring them before me.

Bast. I will seek them out.

K. John. Nay, but make haste; the better foot before. 170 O, let me have no subject enemies,[496] When adverse foreigners affright my towns With dreadful pomp of stout invasion! Be Mercury, set feathers to thy heels, And fly like thought from them to me again. 175

Bast. The spirit of the time shall teach me speed. [_Exit._

K. John. Spoke like a sprightful noble gentleman. Go after him; for he perhaps shall need Some messenger betwixt me and the peers; And be thou he.

Mess. With all my heart, my liege. [_Exit._[497] 180

K. John. My mother dead!

Re-enter HUBERT.[498]

Hub. My lord, they say five moons were seen to-night;[499] Four fixed, and the fifth did whirl about The other four in wondrous motion.

K. John. Five moons!

Hub. Old men and beldams in the streets 185 Do prophesy upon it dangerously: Young Arthur's death is common in their mouths: And when they talk of him, they shake their heads And whisper one another in the ear; And he that speaks doth gripe the hearer's wrist, 190 Whilst he that hears makes fearful action, With wrinkled brows, with nods, with rolling eyes. I saw a smith stand with his hammer, thus, The whilst his iron did on the anvil cool, With open mouth swallowing a tailor's news; 195 Who, with his

shears and measure in his hand, Standing on slippers, which his nimble haste Had falsely thrust upon contrary feet, Told of a many thousand warlike French[500] That were embattailed and rank'd in Kent: 200 Another lean unwash'd artificer Cuts off his tale and talks of Arthur's death.

K. John. Why seek'st thou to possess me with these fears? Why urgest thou so oft young Arthur's death? Thy hand hath murder'd him: I had a mighty cause[501] 205 To wish him dead, but thou hadst none to kill him.

Hub. No had, my lord! why, did you not provoke me?[502]

K. John. It is the curse of kings to be attended By slaves that take their humours for a warrant To break within the bloody house of life,[503] 210 And on the winking of authority To understand a law, to know the meaning Of dangerous majesty, when perchance it frowns More upon humour than advised respect.

Hub. Here is your hand and seal for what I did. 215

K. John. O, when the last account 'twixt heaven and earth Is to be made, then shall this hand and seal Witness against us to damnation! How oft the sight of means to do ill deeds Make deeds ill done! Hadst not thou been by,[504] 220 A fellow by the hand of nature mark'd, Quoted and sign'd to do a deed of shame, This murder had not come into my mind: But taking note of thy abhorr'd aspect, Finding thee fit for bloody villany, 225 Apt, liable to be employ'd in danger, I faintly broke with thee of Arthur's death; And thou, to be endeared to a king, Made it no conscience to destroy a prince.[505]

Hub. My lord,-- 230

K. John. Hadst thou but shook thy head or made a pause When I spake darkly what I purposed, Or turn'd an eye of doubt upon my face, As bid me tell my tale in express words,[506] Deep shame had struck me dumb, made me break off, 235 And those thy fears might have wrought fears in me: But thou didst understand me by my signs And didst in signs again parley with sin;[507] Yea, without stop, didst let thy heart consent, And consequently thy rude hand to act 240 The deed, which both our tongues held vile to name. Out of my sight, and never see me more! My nobles leave me; and my state is braved, Even at my gates, with ranks of foreign powers: Nay, in the body of this fleshly land,[508] 245 This kingdom, this confine of blood and breath, Hostility and civil tumult reigns[509] Between my conscience and my cousin's death.

Hub. Arm you against your other enemies, I'll make a peace between your soul and you. 250 Young Arthur is alive: this hand of mine Is yet a maiden and an innocent hand, Not painted with the crimson spots of blood. Within this bosom never enter'd yet The dreadful motion of a murderous thought;[510] 255 And you have slander'd nature in my form, Which, howsoever rude exteriorly, Is yet the cover of a fairer mind Than to be butcher of an innocent child.[511]

K. John. Doth Arthur live? O, haste thee to the peers, 260 Throw this report on their incensed rage, And make them tame to their obedience! Forgive the comment that my passion made Upon thy feature; for my rage was blind, And foul imaginary eyes of blood[512] 265 Presented thee more hideous than thou art. O, answer not, but to my closet bring The angry lords with all expedient haste. I conjure thee but slowly; run more fast. [_Exeunt._

SCENE III. _Before the castle._

Enter ARTHUR, _on the walls_.[513]

Arth. The wall is high, and yet will I leap down: Good ground, be pitiful and hurt me not! There's few or none do know me: if they did, This ship-boy's semblance hath disguised me quite. I am afraid; and yet I'll venture it. 5 If I get down, and do not break my limbs, I'll find a thousand shifts to get away: As good to die and go, as die and stay. [_Leaps down._[514] O me! my uncle's spirit is in these stones: Heaven take my soul, and England keep my bones! [_Dies._ 10

Enter PEMBROKE, SALISBURY, _and_ BIGOT.

Sal. Lords, I will meet him at Saint Edmundsbury:[515] It is our safety, and we must embrace This gentle offer of the perilous time.

Pem. Who brought that letter from the cardinal?

Sal. The Count Melun, a noble lord of France;[516] 15 Whose private with me of the Dauphin's love[517] Is much more general than these lines import.

Big. To-morrow morning let us meet him then.

Sal. Or rather then set forward; for 'twill be Two long days' journey, lords, or ere we meet.[518] 20

Enter the BASTARD.

Bast. Once more to-day well met, distemper'd lords! The king by me requests your presence straight.

Sal. The king hath dispossess'd himself of us: We will not line his thin bestained cloak[519] With our pure honours, nor attend the foot 25 That leaves the print of blood where'er it walks. Return and tell him so: we know the worst.

Bast. Whate'er you think, good words, I think, were best.

Sal. Our griefs, and not our manners, reason now.

Bast. But there is little reason in your grief; 30 Therefore 'twere reason you had manners now.

Pem. Sir, sir, impatience hath his privilege.[520]

Bast. 'Tis true, to hurt his master, no man else.[520][521]

Sal. This is the prison. What is he lies here?

[_Seeing Arthur._[522]

Pem. O death, made proud with pure and princely beauty! 35 The earth had not a hole to hide this deed.

Sal. Murder, as hating what himself hath done, Doth lay it open to urge on revenge.

Big. Or, when he doom'd this beauty to a grave,[523] Found it too precious-princely for a grave.[524] 40

Sal. Sir Richard, what think you? have you beheld,[525] Or have you read or heard? or could you think? Or do you almost think, although you see, That you do see? could thought, without this object,[526] Form such another? This is the very top,[527] 45 The height, the crest, or crest unto the crest, Of murder's arms: this is the bloodiest shame, The wildest savagery, the vilest stroke, That ever wall-eyed wrath or staring rage Presented to the tears of soft remorse. 50

Pem. All murders past do stand excused in this: And this, so sole and so unmatchable, Shall give a holiness, a purity, To the yet unbegotten sin of times;[528] And prove a deadly bloodshed but a jest, 55 Exampled by this heinous spectacle.

Bast. It is a damned and a bloody work; The graceless action of a heavy hand, If that it be the work of any-hand.

Sal. If that it be the work of any hand![529] 60 We had a kind of light what would ensue: It is the shameful work of Hubert's hand; The practice and the purpose of the king: From whose obedience I forbid my soul, Kneeling before this ruin of sweet life, 65 And breathing to his breathless excellence[530] The incense of a vow, a holy vow, Never to taste the pleasures of the world, Never to be infected with delight, Nor conversant with ease and idleness, 70 Till I have set a glory to this hand,[531] By giving it the worship of revenge.

Pem. } Our souls religiously confirm thy words. _Big._ }

Enter HUBERT.

Hub. Lords, I am hot with haste in seeking you:[532] Arthur doth live; the king hath sent for you. 75

Sal. O, he is bold and blushes not at death. Avaunt, thou hateful villain, get thee gone!

Hub. I am no villain.

Sal. Must I rob the law? [_Drawing his sword._[533]

Bast. Your sword is bright, sir; put it up again.

Sal. Not till I sheathe it in a murderer's skin.

Hub. Stand back, Lord Salisbury, stand back, I say; By heaven, I think my sword's as sharp as yours: I would not have you, lord, forget yourself, Nor tempt the danger of my true defence; Lest I, by marking of your rage, forget[534] Your worth, your greatness and nobility.

Big. Out, dunghill! darest thou brave a nobleman?

Hub. Not for my life: but yet I dare defend My innocent life against an emperor.

Sal. Thou art a murderer.

Hub. Do not prove me so;[535] Yet I am none: whose tongue soe'er speaks false, Not truly speaks; who speaks not truly, lies.

Pem. Cut him to pieces.

Bast. Keep the peace, I say.

Sal. Stand by, or I shall gall you, Faulconbridge.

Bast. Thou wert better gall the devil, Salisbury: If thou but frown on me, or stir thy foot, Or teach thy hasty spleen to do me shame, I'll strike thee dead. Put up thy sword betime;[536] Or I'll so maul you and your toasting-iron, That you shall think the devil is come from hell.

Big. What wilt thou do, renowned Faulconbridge?[537] Second a villain and a murderer?

Hub. Lord Bigot, I am none.

Big. Who kill'd this prince?

Hub. 'Tis not an hour since I left him well: I honour'd him, I loved him, and will weep My date of life out for his sweet life's loss.

Sal. Trust not those cunning waters of his eyes, For villany is not without such rheum;[538] And he, long traded in it, makes it seem Like rivers of remorse and innocency.[539] Away with me, all you whose souls abhor The uncleanly savours of a slaughter-house;[540] For I am stifled with this smell of sin.[541]

Big. Away toward Bury, to the Dauphin there!

Pem. There tell the king he may inquire us out.

[_Exeunt Lords._

Bast. Here's a good world! Knew you of this fair work?[542] Beyond the infinite and boundless reach[543] Of mercy, if thou didst this deed of death,[543] Art thou damn'd, Hubert.[543]

Hub. Do but hear me, sir.

Bast. Ha! I'll tell thee what; Thou'rt damn'd as black--nay, nothing is so black;[544] Thou art more deep damn'd than Prince Lucifer: There is not yet so ugly a fiend of hell As thou shalt be, if thou didst kill this child.

Hub. Upon my soul--[545]

Bast. If thou didst but consent To this most cruel act, do but despair; And if thou want'st a cord, the smallest thread That ever spider twisted from her womb Will serve to strangle thee; a rush will be a beam[546] To hang thee on; or wouldst thou drown thyself,[547] Put but a little water in a spoon, And it shall be as all the ocean, Enough to stifle such a villain up. I do suspect thee very grievously.

Hub. If I in act, consent, or sin of thought, Be guilty of the stealing that sweet breath Which was embounded in this beauteous clay, Let hell want pains enough to torture me. I left him well.

Bast. Go, bear him in thine arms.[548] I am amazed, methinks, and lose my way 140 Among the thorns and dangers of this world. How easy dost thou take all England up![549] From forth this morsel of dead royalty,[549] The life, the right and truth of all this realm Is fled to heaven; and England now is left 145 To tug and scamble and to part by the teeth[550] The unowed interest of proud-swelling state.[551] Now for the bare-pick'd bone of majesty Doth dogged war bristle his angry crest And snarleth in the gentle eyes of peace: 150 Now powers from home and discontents at home Meet in one line; and vast confusion waits, As doth a raven on a sick-fallen beast,[552] The imminent decay of wrested pomp.[553] Now happy he whose cloak and cincture can[554] 155 Hold out this tempest. Bear away that child And follow me with speed: I'll to the king: A thousand businesses are brief in hand,[555] And heaven itself doth frown upon the land. [_Exeunt._[556]

ACT V.

SCENE I. KING JOHN'S _palace_.

Enter KING JOHN, PANDULPH, _and_ Attendants.[557]

K. John. Thus have I yielded up into your hand The circle of my glory. [_Giving the crown._[558]

Pand. Take again From this my hand, as holding of the pope[559] Your sovereign greatness and authority.

K. John. Now keep your holy word: go meet the French, 5 And from his holiness use all your power To stop their marches 'fore we are inflamed.[560] Our discontented counties do revolt; Our people quarrel with obedience, Swearing allegiance and the love of soul[561] 10 To stranger blood, to foreign royalty. This inundation of mistemper'd humour[562] Rests by you only to be qualified: Then pause not; for the present time's so sick, That present medicine must be minister'd, 15 Or overthrow incurable ensues.[563]

Pand. It was my breath that blew this tempest up. Upon your stubborn usage of the pope; But since you are a gentle convertite, My tongue shall hush again this storm of war 20 And make fair weather in your blustering land. On this Ascension-day, remember well, Upon your oath of service to the pope, Go I to make the French lay down their arms. [_Exit._

K. John. Is this Ascension-day? Did not the prophet 25 Say that before Ascension-day at noon My crown I should give off? Even so I have: I did suppose it should be on constraint; But, heaven be thank'd, it is but voluntary.

Enter the BASTARD.

Bast. All Kent hath yielded; nothing there holds out 30 But Dover Castle: London hath received, Like a kind host, the Dauphin and his powers: Your nobles will not hear you, but are gone To offer service to your enemy, And wild amazement hurries up and down[564] 35 The little number of your doubtful friends.[565]

K. John. Would not my lords return to me again, After they heard young Arthur was alive?

Bast. They found him dead and cast into the streets. An empty casket, where the jewel of life[566] 40 By some damn'd hand was robb'd and ta'en away.

K. John. That villain Hubert told me he did live.

Bast. So, on my soul, he did, for aught he knew. But wherefore do you droop? why look you sad? Be great in act, as you have been in thought; 45 Let not the world see fear and sad distrust[567] Govern the motion of a kingly eye: Be stirring as the time; be fire with fire;[568] Threaten the threatener and outface the brow Of bragging horror: so shall inferior eyes, 50 That borrow their behaviours from the great, Grow great by your example and put on The dauntless spirit of resolution. Away, and glister like the god of war, When he intendeth to become the field: 55 Show boldness and aspiring confidence. What, shall they seek the lion in his den, And fright him there? and make him tremble there? O, let it not be said: forage, and run[569] To meet displeasure farther from the doors, 60 And grapple with him ere he comes so nigh.

K. John. The legate of the pope hath been with me, And I have made a happy peace with him; And he hath promised to dismiss the powers Led by the Dauphin.

Bast. O inglorious league! 65 Shall we, upon the footing of our land, Send fair-play orders and make compromise,[570] Insinuation, parley and base truce To arms invasive? shall a beardless boy, A cocker'd silken wanton, brave our fields, 70 And flesh his spirit in a warlike soil, Mocking the air with colours idly spread,[571] And find no check? Let us, my liege, to arms: Perchance the cardinal cannot make your peace;[572] Or if he do, let it at least be said 75 They saw we had a purpose of defence.

K. John. Have thou the ordering of this present time.

Bast. Away, then, with good courage! yet, I know, Our party may well meet a prouder foe. [_Exeunt._

SCENE II. _The_ DAUPHIN'S _Camp at St Edmundsbury_.

Enter, in arms, LEWIS, SALISBURY, MELUN, PEMBROKE, BIGOT, _and_ Soldiers.[573]

Lew. My Lord Melun, let this be copied out, And keep it safe for our remembrance: Return the precedent to these lords again; That, having our fair order written down, Both they and we, perusing o'er these notes, 5 May know wherefore we took the sacrament And keep our faiths firm and inviolable.

Sal. Upon our sides it never shall be broken. And, noble Dauphin, albeit we swear A voluntary zeal and an unurged faith[574] 10 To your proceedings; yet believe me, prince, I am not glad that such a sore of time Should seek a plaster by contemn'd revolt,[575] And heal the inveterate canker of one wound By making many. O, it grieves my soul, 15 That I must draw this metal from my side To be a widow-maker! O, and there Where honourable rescue and defence Cries out upon the name of Salisbury![576] But such is the infection of the time, 20 That, for the health and physic of our right, We cannot deal but with the very hand Of stern injustice and confused wrong. And is't not pity, O my grieved friends, That we, the sons and children of this isle, 25 Were born to see so sad an hour as this;[577] Wherein we step after a stranger march[578] Upon her gentle bosom, and fill up Her enemies' ranks,--I must withdraw and weep Upon the spot of this enforced cause,--[579] 30 To grace the gentry of a land remote, And follow unacquainted colours here? What, here? O nation, that thou couldst remove! That Neptune's arms, who clippeth thee about, Would bear thee from the knowledge of thyself,[580] 35 And grapple thee unto a pagan shore;[581] Where these two Christian armies might combine The blood of malice in a vein of league,[582] And not to spend it so unneighbourly![583]

Lew. A noble temper dost thou show in this; 40 And great affections wrestling in thy bosom[584] Doth make an earthquake of nobility.[585] O, what a noble combat hast thou fought[586] Between compulsion and a brave respect![587] Let me wipe off this honourable dew, 45 That silverly doth progress on thy cheeks: My heart hath melted at a lady's tears, Being an ordinary inundation; But this effusion of such manly drops, This shower, blown up by tempest of the soul, 50 Startles mine eyes, and makes me more amazed Than had I seen the vaulty top of heaven Figured quite o'er with burning meteors. Lift up thy brow, renowned Salisbury, And with a great heart heave away this storm: 55 Commend these waters to those baby eyes[588] That never saw the giant world enraged; Nor met with fortune other than at feasts, Full of warm blood, of mirth, of gossiping.[589] Come, come; for thou shalt thrust thy hand as deep 60 Into the purse of rich prosperity As Lewis himself: so, nobles, shall you all, That knit your sinews to the strength of mine. And even there, methinks, an angel spake:

Enter PANDULPH.[590]

Look, where the holy legate comes apace, 65 To give us warrant from the hand of heaven, And on our actions set the name of right With holy breath.

Pand. Hail, noble prince of France![591] The next is this, King John hath reconciled Himself to Rome; his spirit is come in, 70 That so stood out against the holy church, The great metropolis and see of Rome: Therefore thy threatening colours now wind up; And tame the savage spirit of wild war, That, like a lion foster'd up at hand, 75 It may lie gently at the foot of peace, And be no further harmful than in show.

Lew. Your grace shall pardon me, I will not back: I am too high-born to be propertied, To be a secondary at control, 80 Or useful serving-man and instrument, To any sovereign state throughout the world. Your breath first kindled the dead coal of wars[592] Between this chastised kingdom and myself, And brought in matter that should feed this fire; 85 And now 'tis far too huge to be blown out With that same weak wind which enkindled it. You taught me how to know the face of right, Acquainted me with interest to this land,[593] Yea, thrust this enterprise into my heart; 90 And come ye now to tell me John hath made His peace with Rome? What is that peace to me? I, by the honour of my marriage-bed, After young Arthur, claim this land for mine; And, now it is half-conquer'd, must I back 95 Because that John hath made his peace with Rome? Am I Rome's slave? What penny hath Rome borne, What men provided, what munition sent, To underprop this action? Is't not I That undergo this charge? who else but I, 100 And such as to my claim are liable, Sweat in this business and maintain this war? Have I not heard these islanders shout out 'Vive le roi!' as I have bank'd their towns? Have I not here the best cards for the game, 105 To win this easy match play'd for a crown? And shall I now give o'er the yielded set? No, no, on my soul, it never shall be said.[594]

Pand. You look but on the outside of this work.

Lew. Outside or inside, I will not return 110 Till my attempt so much be glorified As to my ample hope was promised Before I drew this gallant head of war, And cull'd these fiery spirits from the world, To outlook conquest and to win renown 115 Even in the jaws of danger and of death. [_Trumpet sounds._[595] What lusty trumpet thus doth summon us?

Enter the BASTARD, _attended_.[596]

Bast. According to the fair play of the world,[597] Let me have audience; I am sent to speak:[598] My holy lord of Milan, from the king[598] 120 I come, to learn how you have dealt for him;[598] And, as you answer, I do know the scope And warrant limited unto my tongue.

Pand. The Dauphin is too wilful-opposite,[599] And will not temporize with my entreaties;[600] 125 He flatly says he'll not lay down his arms.

Bast. By all the blood that ever fury breathed, The youth says well. Now hear our English king; For thus his royalty doth speak in me. He is prepared, and reason too he should:[601] 130 This apish and unmannerly approach, This harness'd masque and unadvised revel, This unhair'd sauciness and boyish troops,[602] The king doth smile at; and is well prepared To whip this dwarfish war, these pigmy arms,[603] 135 From out the circle of his territories. That hand which had the strength, even at your door, To cudgel you and make you take the hatch, To dive like buckets in concealed wells, To crouch in litter of your stable planks, 140 To lie like pawns lock'd up in chests and trunks, To hug with swine, to seek sweet safety out[604] In vaults and prisons, and to thrill and shake Even at the crying of your nation's crow,[605] Thinking his voice an armed Englishman;[606] 145 Shall that victorious hand be feebled here, That in your chambers gave you chastisement? No: know the gallant monarch is in arms And like an eagle o'er his aery towers,[607] To souse annoyance that comes near his nest. 150 And you degenerate, you ingrate revolts,[608] You bloody Neroes, ripping up the womb Of your dear mother England, blush for shame; For your own ladies and pale-visaged maids Like Amazons come tripping after drums, 155 Their thimbles into armed gauntlets change,[609] Their needles to lances, and their gentle hearts[610] To fierce and bloody inclination.

Lew. There end thy brave, and turn thy face in peace; We grant thou canst outscold us: fare thee well;[611] 160 We hold our time too precious to be spent With such a brabbler.[612]

Pand. Give me leave to speak.

Bast. No, I will speak.

Lew. We will attend to neither. Strike up the drums; and let the tongue of war Plead for our interest and our being here. 165

Bast. Indeed, your drums, being beaten, will cry out; And so shall you, being beaten: do but start An echo with the clamour of thy drum, And even at hand a drum is ready braced That shall reverberate all as loud as thine;[613] 170 Sound but another, and another shall As loud as thine rattle the welkin's ear And mock the deep-mouth'd thunder: for at hand, Not trusting to this halting legate here, Whom he hath used rather for sport than need, 175 Is warlike John; and in his forehead sits A bare-ribb'd death, whose office is this day[614] To feast upon whole thousands of the French.

Lew. Strike up our drums, to find this danger out.

Bast. And thou shalt find it, Dauphin, do not doubt. 180

[_Exeunt._

SCENE III. _The field of battle._

Alarums. Enter KING JOHN _and_ HUBERT.[615]

K. John. How goes the day with us? O, tell me, Hubert.

Hub. Badly, I fear. How fares your majesty?

K. John. This fever, that hath troubled me so long, Lies heavy on me; O, my heart is sick!

Enter a Messenger.

Mess. My lord, your valiant kinsman, Faulconbridge, 5 Desires your majesty to leave the field And send him word by me which way you go.

K. John. Tell him, toward Swinstead, to the abbey there.[616]

Mess. Be of good comfort; for the great supply That was expected by the Dauphin here, 10 Are wreck'd three nights ago on Goodwin Sands.[617] This news was brought to Richard but even now: The French fight coldly, and retire themselves.

K. John. Ay me! this tyrant fever burns me up,[618] And will not let me welcome this good news. 15 Set on toward Swinstead: to my litter straight;[616] Weakness possesseth me, and I am faint. [_Exeunt._

SCENE IV. _Another part of the field._[619]

Enter SALISBURY, PEMBROKE, _and_ BIGOT.

Sal. I did not think the king so stored with friends.

Pem. Up once again; put spirit in the French:[620] If they miscarry, we miscarry too.[620]

Sal. That misbegotten devil, Faulconbridge, In spite of spite, alone upholds the day. 5

Pem. They say King John sore sick hath left the field.

Enter MELUN, _wounded_.

Mel. Lead me to the revolts of England here.

Sal. When we were happy we had other names.

Pem. It is the Count Melun.

Sal. Wounded to death.

Mel. Fly, noble English, you are bought and sold; 10 Unthread the rude eye of rebellion[621] And welcome home again discarded faith. Seek out King John and fall before his feet; For if the French be lords of this loud day,[622] He means to recompense the pains you take 15 By cutting off your heads: thus hath he sworn And I with him, and many moe with me,[623] Upon the altar at Saint Edmundsbury;[624] Even on that altar where we swore to you Dear amity and everlasting love. 20

Sal. May this be possible? may this be true?

Mel. Have I not hideous death within my view, Retaining but a quantity of life, Which bleeds away, even as a form of wax Resolveth from his figure 'gainst the fire?[625] 25 What in the world should make me now deceive, Since I must lose the use of all deceit?[626] Why should I then be false, since it is true That I must die here and live hence by truth? I say again, if Lewis do win the day,[627] 30 He is forsworn, if e'er those eyes of yours Behold another day break in the east: But even this night, whose black contagious breath Already smokes about the burning crest[628] Of the old, feeble and day-wearied sun, 35 Even this ill night, your breathing shall expire, Paying the fine of rated treachery[629] Even with a treacherous fine of all your lives, If Lewis by your assistance win the day. Commend me to one Hubert with your king: 40 The love of him, and this respect besides, For that my grandsire was an Englishman,[630] Awakes my conscience to confess all this. In lieu whereof, I pray you, bear me hence From forth the noise and rumour of the field, 45 Where I may think the remnant of my thoughts In peace, and part this body and my soul With contemplation and devout desires.

Sal. We do believe thee: and beshrew my soul But I do love the favour and the form 50 Of this most fair occasion, by the which We will untread the steps of damned flight, And like a bated and retired flood,[631] Leaving our rankness and irregular course,[632] Stoop low within those bounds we have o'erlook'd[633] 55 And calmly run on in obedience Even to our ocean, to our great King John. My arm shall give thee help to bear thee hence; For I do see the cruel pangs of death[634] Right in thine eye. Away, my friends! New flight;[635] 60 And happy newness, that intends old right.[636]

[_Exeunt, leading off Melun._

SCENE V. _The French camp._[637]

Enter LEWIS _and his train_.

Lew. The sun of heaven methought was loath to set, But stay'd, and made the western welkin blush, When English measure backward their own ground[638] In faint retire. O, bravely came we off, When with a volley of our needless shot, 5 After such bloody toil, we bid good night; And wound our tattering colours clearly up,[639] Last in the field, and almost lords of it!

Enter a Messenger.

Mess. Where is my prince, the Dauphin?[640]

Lew. Here: what news?

Mess. The Count Melun is slain; the English lords 10 By his persuasion are again fall'n off,[641] And your supply, which you have wish'd so long,[642] Are cast away and sunk on Goodwin Sands.

Lew. Ah, foul shrewd news! beshrew thy very heart! I did not think to be so sad to-night[643] 15 As this hath made me. Who was he that said King John did fly an hour or two before The stumbling night did part our weary powers?

Mess. Whoever spoke it, it is true, my lord.

Lew. Well; keep good quarter and good care to-night: 20 The day shall not be up so soon as I, To try the fair adventure of to-morrow. [_Exeunt._

SCENE VI. _An open place in the neighbourhood of Swinstead Abbey._[644]

Enter the BASTARD _and_ HUBERT, _severally_.

Hub. Who's there? speak, ho! speak quickly, or I shoot.

Bast. A friend. What art thou?

Hub. Of the part of England.

Bast. Whither dost thou go?[645][646]

Hub. What's that to thee? why may not I demand[646][647] Of thine affairs, as well as thou of mine?[646][647] 5

Bast. Hubert, I think?[646][647]

Hub. Thou hast a perfect thought: I will upon all hazards well believe Thou art my friend, that know'st my tongue so well. Who art thou?

Bast. Who thou wilt: and if thou please,[648] Thou mayst befriend me so much as to think 10 I come one way of the Plantagenets.

Hub. Unkind remembrance! thou and eyeless night[649] Have done me shame: brave soldier, pardon me, That any accent breaking from thy tongue Should 'scape the true acquaintance of mine ear. 15

Bast. Come, come; sans compliment, what news abroad?

Hub. Why, here walk I in the black brow of night, To find you out.

Bast. Brief, then; and what's the news?

Hub. O, my sweet sir, news fitting to the night, Black, fearful, comfortless and horrible. 20

Bast. Show me the very wound of this ill news: I am no woman, I'll not swoon at it.[650]

Hub. The king, I fear, is poison'd by a monk: I left him almost speechless; and broke out To acquaint you with this evil, that you might 25 The better arm you to the sudden time, Than if you had at leisure known of this.[651]

Bast. How did he take it? who did taste to him?

Hub. A monk, I tell you; a resolved villain, Whose bowels suddenly burst out: the king 30 Yet speaks and peradventure may recover.

Bast. Who didst thou leave to tend his majesty?[652]

Hub. Why, know you not? the lords are all come back,[653] And brought Prince Henry in their company; At whose request the king hath pardon'd them, 35 And they are all about his majesty.

Bast. Withhold thine indignation, mighty heaven, And tempt us not to bear above our power! I'll tell thee, Hubert, half my power this night,[654] Passing these flats, are taken by the tide; 40 These Lincoln Washes have devoured them; Myself, well mounted, hardly have escaped.[655] Away before: conduct me to the king; I doubt he will be dead or ere I come.[656] [_Exeunt._

SCENE VII. _The orchard in Swinstead Abbey._[657]

Enter Prince HENRY, SALISBURY, _and_ BIGOT.

P. Hen. It is too late: the life of all his blood Is touch'd corruptibly, and his pure brain,[658] Which some suppose the soul's frail dwelling-house, Doth by the idle comments that it makes Foretell the ending of mortality. 5

Enter PEMBROKE.

Pem. His highness yet doth speak, and holds belief That, being brought into the open air, It would allay the burning quality Of that fell poison which assaileth him.

P. Hen. Let him be brought into the orchard here.[659] 10 Doth he still rage? [_Exit Bigot._

Pem. He is more patient Than when you left him; even now he sung.

P. Hen. O vanity of sickness! fierce extremes In their continuance will not feel themselves.[660] Death, having prey'd upon the outward parts,[661] 15 Leaves them invisible, and his siege is now[662] Against the mind, the which he pricks and wounds[663] With many legions of strange fantasies, Which, in their throng and press to that last hold, Confound themselves. 'Tis strange that death should sing. 20 I am the cygnet to this pale faint swan,[664] Who chants a doleful hymn to his own death, And from the organ-pipe of frailty sings His soul and body to their lasting rest.[665]

Sal. Be of good comfort, prince; for you are born 25 To set a form upon that indigest Which he hath left so shapeless and so rude.

Enter Attendants, _and_ BIGOT, _carrying_ KING JOHN _in a chair_.[666]

K. John. Ay, marry, now my soul hath elbow-room; It would not ou Translator: François Guizot

ROMÉO ET JULIETTE

TRAGÉDIE

NOTICE SUR ROMÉO ET JULIETTE

Deux grandes familles de Vérone, les Montecchi et les Capelletti (les _Montaigu_ et les _Capulet_), vivaient depuis longtemps dans une inimitié qui avait souvent donné lieu, dans les rues, à des combats sanglants. Alberto della Scala, second capitaine perpétuel de Vérone, avait inutilement travaillé à les réconcilier; mais du moins était-il parvenu à les contenir de telle sorte que lorsqu'ils se rencontraient, dit l'historien de Vérone, Girolamo della Corte, «les plus jeunes cédaient le pas aux plus âgés, ils se saluaient et se rendaient le salut.»

En 1303, sous Bartolommeo della Scala, élu capitaine perpétuel après la mort de son père Alberto, Antonio Cappelletto, chef de sa faction, donna, dans le carnaval, une grande fête, à laquelle il invita une partie de la noblesse de Vérone. Roméo Montecchio, âgé de vingt à vingt et un ans, et l'un des plus beaux et des plus aimables jeunes gens de la ville; s'y rendit masqué avec quelques-uns de ses amis. Au bout de quelque temps, ayant ôté son masque, il s'assit dans un coin d'où il pouvait voir et être vu. On s'étonna beaucoup de la hardiesse avec laquelle il venait ainsi au milieu de ses ennemis. Cependant, comme il était jeune et de manières agréables, ceux-ci, dit l'historien, «n'y firent pas autant d'attention qu'ils en auraient fait peut-être s'il eût été plus âgé.» Ses yeux et ceux de Juliette Cappelletto se rencontrèrent bientôt, et, frappés également d'admiration, ils ne cessèrent plus de se regarder. La fête s'étant terminée par une danse appelée chez nous, dit Girolamo, «la danse du chapeau» (_dal cappello_), une dame vint prendre Roméo, qui, se trouvant ainsi introduit dans la danse, après avoir fait quelques tours avec sa danseuse, la quitta pour aller prendre Juliette, qui dansait avec un autre. Aussitôt qu'elle l'eût senti lui toucher la main, elle lui dit: «Bénie soit votre venue!» Et lui, lui serrant la main, répondit: «Quelles bénédictions en recevez-vous, madame?» Et elle reprit en souriant: «Ne vous étonnez pas, seigneur, si je bénis votre venue; M. Mercutio était là depuis longtemps à me glacer, et par votre politesse vous êtes venu me réchauffer.» (Ce jeune homme, qui s'appelait Mercutio, dit le louche, et que l'agrément de son esprit faisait aimer de tout le monde,

avait toujours eu les mains plus froides que la glace.) A ces mots, Roméo répondit: «Je suis grandement heureux de vous rendre service en quoi que ce soit.» Comme la danse finissait, Juliette ne put dire que ces mots: «Hélas! je suis plus à vous qu'à moi-même.»

Roméo s'étant rendu plusieurs fois dans une petite rue, sur laquelle donnaient les fenêtres de Juliette, un soir elle le reconnut à «son éternuement ou à quelque autre signe,» et elle ouvrit la fenêtre. Ils se saluèrent «très-poliment (_cortesissimamente_),» et, après s'être longtemps entretenus de leurs amours, ils convinrent qu'il fallait qu'ils se mariassent, quoi qu'il en pût arriver; et que cela devait se faire par l'entremise du frère Lonardo, franciscain, «théologien, grand philosophe, distillateur admirable, savant dans l'art de la magie,» et confesseur de presque toute la ville. Roméo l'alla trouver, et le frère, songeant au crédit qu'il acquerrait, non-seulement auprès du capitaine perpétuel, mais dans toute la ville, s'il parvenait à réconcilier les deux familles, se prêta aux désirs des deux jeunes gens. A l'époque de la Quadragésime, où la confession était d'obligation, Juliette se rendit avec sa mère dans l'église de Saint-François, dans la citadelle, et étant entrée la première dans le confessionnal, de l'autre côté duquel se trouvait Roméo, également venu à l'église avec son père, ils reçurent la bénédiction nuptiale par la fenêtre du confessionnal, que le frère avait eu soin d'ouvrir; puis, par les soins d'une très adroite vieille de la maison de Juliette, ils passèrent la nuit ensemble dans son jardin.

Cependant, après les fêtes de Pâques, une troupe nombreuse de Capelletti rencontra, à peu de distance des portes de Vérone, quelques Montecchi, et les attaqua, animée par Tébaldo, cousin germain de Juliette, qui, voyant que Roméo faisait tous ses efforts pour arrêter le combat, s'attacha à lui, et, le forçant à se défendre, en reçut un coup d'épée dans la gorge, dont il tomba mort sur-le-champ. Roméo fut banni, et, peu de temps après, Juliette, près de se voir contrainte d'en épouser un autre, eut recours au frère Lonardo, qui lui donna à avaler une poudre au moyen de laquelle elle devait passer pour morte, et être portée dans la sépulture de sa famille, qui se trouvait placée dans l'église du couvent de Lonardo. Celui-ci devait venir l'en retirer et la faire passer ensuite, déguisée, à Mantoue, où était Roméo, qu'il se chargeait d'instruire de tout.

Les choses se passèrent comme l'avait annoncé Lonardo; mais Roméo ayant appris indirectement la mort de Juliette avant d'avoir reçu la lettre du religieux, partit sur-le-champ pour Vérone avec un seul domestique, et, muni d'un poison violent, se rendit au tombeau, qu'il ouvrit, baigna de larmes le corps de Juliette, avala le poison et mourut. Juliette, réveillée l'instant d'après, voyant Roméo mort et ayant appris du religieux, qui venait d'arriver, ce qui s'était passé, fut saisie d'une douleur si forte que, «sans pouvoir dire une parole, elle demeura morte sur le sein de son Roméo[1].»

[Note 1: Voyez _Istorie di Verona del sig. Girolamo della Corte_, etc., t. Ier, p. 589 et suiv. Édit. de 1594.]

Cette histoire est racontée comme véritable par Girolamo della Corte; il assure avoir vu plusieurs fois le tombeau de Juliette et de Roméo, qui, s'élevant un peu au-dessus de terre et placé près d'un puits, servait alors de lavoir à la maison des orphelins de Saint-François, que l'on bâtissait en cet endroit. Il rapporte en même temps que le cavalier Gerardo Boldiero, son oncle, qui l'avait mené à ce tombeau, lui avait montré dans un coin du mur, près du couvent des Capucins, l'endroit d'où il avait entendu dire qu'un grand nombre d'années auparavant on avait retiré les restes de Juliette et de Roméo, ainsi que de plusieurs autres. Le capitaine Bréval, dans ses voyages, dit également avoir vu à Vérone, en 1762, un vieux bâtiment qui était alors une maison d'orphelins, et qui, selon son guide, avait renfermé le tombeau de Roméo et de Juliette; mais il n'existait plus.

Ce n'est probablement pas sur le récit de Girolamo della Corte que Shakspeare a composé sa tragédie; elle fut d'abord représentée, à ce qu'il paraît, en 1595, chez lord Hundsdon, lord chambellan de la reine Élisabeth, et imprimée pour la première fois en 1597. Or, l'ouvrage de Girolamo della Corte, qui devait avoir vingt-deux livres, se trouve interrompu au milieu du vingtième livre et à l'année 1560 par la maladie de l'auteur. On voit de plus, dans la préface de l'éditeur, que cette maladie fut longue et amena la mort de l'historien, que la nécessité de revoir le travail auquel Girolamo n'avait pu mettre lui-même la dernière main prit un temps considérable, et enfin que les procès, tant «civils que criminels,» dont fut tourmenté l'éditeur, ne lui permirent pas de mener à fin son entreprise aussi promptement qu'il l'aurait désiré; en sorte que l'ouvrage de Girolamo ne put être publié que longtemps après sa mort: l'édition de 1594 est donc, selon toute apparence, la première, et ne pouvait guère, en 1595, être déjà venue à la connaissance de Shakspeare.

Mais l'histoire de Roméo et de Juliette, sans doute très-populaire à Vérone, avait déjà fait le sujet d'une nouvelle, composée par Luigi da Porto, et publiée à Venise en 1535, six ans après la mort de l'auteur, sous le titre de la _Giulietta_. Cette nouvelle, réimprimée, traduite, imitée dans plusieurs langues, fournit à Arthur Brooke le sujet d'un poëme anglais, publié en 1562[2], et où Shakspeare a certainement puisé le sujet de sa tragédie. L'imitation est complète. Juliette, dans le poëme de Brooke ainsi que

dans la nouvelle de Luigi da Porto, se tue avec le poignard de Roméo, au lieu de mourir de douleur comme dans l'histoire de Girolamo della Corte; mais ce qu'il y a de singulier, c'est que le poëme d'Arthur Brooke, et Shakspeare qui l'a suivi, fassent mourir Roméo comme dans l'histoire, avant le réveil de Juliette, tandis que, dans la nouvelle de Luigi da Porto, il ne meurt qu'après l'avoir vue se réveiller et avoir eu avec elle une scène de douleur et d'adieux. On a reproché à Shakspeare de ne s'être pas conformé à cette circonstance qui lui fournissait une situation très-pathétique, et on en a conclu qu'il ne connaissait pas la nouvelle italienne, bien que traduite en anglais. Cependant quelques circonstances donnent lieu de croire que Shakspeare connaissait cette traduction. Quant à ses motifs pour préférer le récit du poëte à celui du romancier, il peut en avoir eu plusieurs: d'abord, pour s'être écarté en un point si important de la nouvelle de Luigi da Porto, qu'il a suivie scrupuleusement sur presque tous les autres, peut-être Arthur Brooke, l'auteur même du poëme, avait-il eu quelques renseignements sur l'histoire véritable, telle que l'avait racontée Girolamo della Corte, contemporain de Shakspeare; il aura pu les lui communiquer, et l'exactitude de Shakspeare à se rapprocher, autant qu'il le pouvait, de l'histoire ou des récits reçus comme tels, ne lui aura pas permis d'hésiter dans le choix. D'ailleurs, et c'est probablement ici la vraie raison du poëte, Shakspeare ne fait presque jamais précéder une résolution forte par de longs discours: «Les discours, dit Macbeth, jettent un souffle trop froid sur l'action.» Quelques angoisses que la réflexion ajoute à la douleur, elle porte l'esprit sur un trop grand nombre d'objets pour ne pas le distraire de l'idée unique qui conduit aux actions désespérées. Après avoir reçu les adieux de Roméo, après avoir pleuré sa mort avec lui, il eût pu arriver que Juliette la pleurât toute sa vie au lieu de se tuer à l'instant. Garrick a refait cette scène du tombeau d'après la supposition adoptée par la nouvelle de Luigi da Porto; la scène est touchante, mais, comme cela était peut-être inévitable dans une situation pareille, impossible à rendre par des paroles; les sentiments en sont trop et trop peu agités, le désespoir trop et trop peu violent. Il y a dans le laconisme de la Juliette et du Roméo de Shakspeare, à ces derniers moments, bien plus de passion et de vérité.

[Note 2: Sous le titre de: _l'Histoire tragique de Roméo et Juliette, contenant un exemple rare de vraie fidélité, avec les subtiles inventions et pratiques d'un vieux moine, et leur fâcheuse issue._ Ce poëme a été réimprimé à la suite de _Roméo et Juliette_, dans les grandes éditions de Shakspeare, entre autres dans celle de Malone.]

Ce laconisme est d'autant plus remarquable que, dans tout le cours de la pièce, Shakspeare s'est livré sans contrainte à cette abondance de réflexions et de paroles qui est l'un des caractères de son génie. Nulle part le contraste n'est plus frappant entre le fond des sentiments que peint le poëte et la forme sous laquelle il les exprime. Shakspeare excelle à voir les sentiments humains tels qu'ils se présentent, tels qu'ils sont réellement dans la nature, sans préméditation, sans travail de l'homme sur lui-même, naïfs et impétueux, mêlés de bien et de mal, d'instincts vulgaires et d'élans sublimes, comme l'est l'âme humaine dans son état primitif et spontané. Quoi de plus vrai que l'amour de Roméo et de Juliette, cet amour si jeune, si vif, si irréfléchi, plein à la fois de passion physique et de tendresse morale, abandonné sans mesure et pourtant sans grossièreté, parce que les délicatesses du coeur s'unissent partout à l'emportement des sens! Il n'y a rien là de subtil, ni de factice, ni de spirituellement arrangé par le poëte; ce n'est ni l'amour pur des imaginations pieusement exaltées, ni l'amour licencieux des vies blasées et perverties; c'est l'amour lui-même, l'amour tout entier, involontaire, souverain, sans contrainte et sans corruption, tel qu'il éclate à l'entrée de la jeunesse, dans le coeur de l'homme, à la fois simple et divers, comme Dieu l'a fait. _Roméo et Juliette_ est vraiment la tragédie de l'amour, comme _Othello_ celle de la jalousie, et _Macbeth_ celle de l'ambition. Chacun des grands drames de Shakspeare est dédié à l'un des grands sentiments de l'humanité; et le sentiment qui remplit le drame est bien réellement celui qui remplit et possède l'âme humaine quand elle s'y livre; Shakspeare n'y retranche, n'y ajoute et n'y change rien; il le représente simplement, hardiment, dans son énergique et complète vérité.

Passez maintenant du fond à la forme et du sentiment même au langage que lui prête le poëte; quel contraste! Autant le sentiment est vrai et profondément connu et compris, autant l'expression en est souvent factice, chargée de développements et d'ornements où se complaît l'esprit du poëte, mais qui ne se placent point naturellement dans la bouche du personnage. _Roméo et Juliette_ est peut-être même, entre les grandes pièces de Shakspeare, celle où ce défaut abonde le plus. On dirait que Shakspeare a voulu imiter ce luxe de paroles, cette facilité verbeuse qui, dans la littérature comme dans la vie, caractérisent en général les peuples du midi; il avait certainement lu, du moins dans les traductions, quelques poëtes italiens; et les innombrables subtilités dont le langage de tous les personnages de _Roméo et Juliette_ est, pour ainsi dire, tissu, les continuelles comparaisons avec le soleil, les fleurs et les étoiles, quoique souvent brillantes et gracieuses, sont évidemment une imitation du style des sonnets et une dette payée à la couleur locale. C'est peut-être parce que les sonnets italiens sont presque toujours sur le ton plaintif que la recherche et l'exagération de langage se font particulièrement sentir dans les plaintes des deux amants; l'expression de leur court bonheur est, surtout dans la bouche de Juliette, d'une simplicité ravissante; et quand ils arrivent au terme extrême de leur destinée, quand le poëte entre dans la dernière scène de cette douloureuse tragédie, alors il renonce à toutes ses velléités d'imitation, à toutes ses réflexions spirituellement savantes; ses personnages, à qui, dit Johnson, «il a toujours laissé un _concetti_ dans leur misère,» n'en

retrouvent plus dès que la misère a frappé ses grands coups; l'imagination cesse de se jouer; la passion elle-même ne se montre plus qu'en s'unissant à des sentiments solides, graves, presque sévères; et cette amante si avide des joies de l'amour, Juliette, menacée dans sa fidélité conjugale, ne songe plus qu'à remplir ses devoirs et à conserver sans tache l'épouse de son cher Roméo. Admirable trait de sens moral et de bon sens dans le génie adonné à peindre la passion!

Du reste, Shakspeare se trompait lorsqu'en prodiguant les réflexions, les images et les paroles, il croyait imiter l'Italie et ses poëtes. Il n'imitait pas du moins les maîtres de la poésie italienne, ses pareils, les seuls qui méritassent ses regards. Entre eux et lui, la différence est immense et singulière: c'est par l'intelligence des sentiments naturels que Shakspeare excelle; il les peint aussi vrais et aussi simples, au fond, qu'il leur prête d'affectation et quelquefois de bizarrerie dans le langage; c'est au contraire dans les sentiments mêmes que les grands poëtes italiens du XIVe siècle, Pétrarque surtout, introduisent souvent autant de recherche et de subtilité que d'élévation et de grâce; ils altèrent et transforment, selon leurs croyances, religieuses et morales, ou même selon leurs goûts littéraires, ces instincts et ces passions du coeur humain auxquels Shakspeare laisse leur physionomie et leur liberté natives. Quoi de moins semblable que l'amour de Pétrarque pour Laure et celui de Juliette pour Roméo? En revanche, l'expression, dans Pétrarque, est presque toujours aussi naturelle que le sentiment est raffiné; et tandis que Shakspeare présente, sous une forme étrange et affectée, des émotions parfaitement simples et vraies, Pétrarque prête à des émotions mystiques, ou du moins singulières et très-contenues, tout le charme d'une forme simple et pure.

Je veux citer un seul exemple de cette différence entre les deux poëtes, mais un exemple bien frappant, car c'est sur la même situation, le même sentiment, presque sur la même image que, dans cette occasion, ils se sont exercés l'un et l'autre.

Laure est morte. Pétrarque veut peindre, à son entrée dans le sommeil de la mort, celle qu'il a peinte, si souvent et avec tant de passion charmante, dans l'éclat de la vie et de la jeunesse:

Non come fiamma che per forza è spenta, Ma che per se medesma si consume, Sen' andò in pace l'anima contenta, A guisa d'un soave e chiaro lume, Cui nutrimento a poco a poco manca, Tenendo al fin il suo usato costume. Pallida nò, ma più che neve bianca Che senza vento in un bel colle fiocchi, Parea posar come persona stanca. Quasi un dolce dormir ne' suoi begli occhi, Sendo lo spirto già da lei diviso, Era quel che morir chiaman gli schiocchi. Morte bella parea nel suo bel viso[3].

[Note 3: _Rime di Petrarca, Trionfo della morte_, c. I.]

«Comme un flambeau qui n'est pas éteint violemment, mais qui se consume de lui-même, son âme sereine s'en alla en paix, semblable à une lumière claire et douce à qui l'aliment manque peu à peu, et qui garde jusqu'à la fin son apparence accoutumée. Elle n'était point pâle, mais, plus blanche que la neige qui tombe à flocons, sans un souffle de vent, sur une gracieuse colline, elle semblait se reposer, comme une personne fatiguée. L'esprit s'étant déjà séparé d'elle, ses beaux yeux semblaient dormir doucement de ce sommeil que les insensés appellent la mort, et la mort paraissait belle sur son beau visage.»

Juliette aussi est morte. Roméo la contemple dans son tombeau, et lui aussi il la trouve toujours belle:

... O, my love, my wife! Death, that has suck'd the honey of thy breath, Has had no power yet upon thy beauty; Thou art not conquer'd; beauty's ensign yet Is crimson in thy lips and in thy cheeks; And death's pale flag is not advanced there!

«O mon amour, ma femme! la mort, qui a sucé le miel de ton haleine, n'a point eu encore de pouvoir sur ta beauté; tu n'es pas sa conquête; la couleur de la beauté, l'incarnat brille encore sur tes lèvres et sur tes joues, et la mort n'a pas planté ici son pâle drapeau!»

Je n'ai garde d'insister sur la comparaison. Qui ne sent combien la forme est plus simple et plus belle dans Pétrarque? C'est la poésie suave et brillante du Midi à côté de l'imagination forte, rude et heurtée du Nord.

L'amour de Roméo pour Rosalinde est une invention de Luigi da Porto, conservée dans le poëme d'Arthur Brooke. Cette invention jette si peu d'intérêt sur les premiers actes de la pièce, que Shakspeare ne l'a probablement adoptée que pour faire mieux ressortir ce caractère de soudaineté propre aux passions du climat. Le personnage de Mercutio lui a été indiqué par ces vers du poëme anglais:

A courtier that eche where was highly had in price, For he was courteous of his speech, and pleasant of devise. Even as a lyon would among the lambs be bold, Such was among the bashful maydes Mercutio to behold.

«Un courtisan que, quelque part qu'il se trouvât, chacun tenait en très-haute estime, car il était courtois dans ses discours et devisait plaisamment; autant un lion serait hardi au milieu des agneaux, autant Mercutio le paraissait au milieu des jeunes filles timides.»

Tel était sans doute le bel air du temps de Shakspeare, et c'est comme le type de l'homme aimable et amusant qu'il a peint Mercutio. Cependant, si la hardiesse lui a manqué pour attaquer, comme Molière, les ridicules de la cour, il laisse assez souvent entrevoir que le ton lui en était à charge. Le rôle de Mercutio paraît avoir coûté à son goût et à la justesse de son esprit. Dryden rapporte, comme une tradition de son temps, que Shakspeare disait «qu'il avait été obligé de tuer Mercutio au troisième acte, de peur que Mercutio ne le tuât.» Cependant Mercutio a conservé en Angleterre de zélés partisans; Johnson entre autres, à cette occasion, traite assez durement Dryden pour quelques paroles irrévérentes sur cet aimable Mercutio, dont les «saillies, dit-il, ne sont peut-être pas toujours à sa portée.» L'éloignement de Shakspeare pour le genre d'esprit qu'il a prodigué dans _Roméo_ est, du reste, suffisamment prouvé par l'injonction du frère Laurence à Roméo, lorsque celui-ci commence à lui expliquer ses affaires en style de sonnet: «Mon fils, lui dit-il, parle simplement.» Le frère Laurence est l'homme sage de la pièce, et ses discours sont en général aussi simples que de son temps il était permis à un philosophe de l'être.

Le rôle de la nourrice de Juliette offre également peu de ces subtilités que Shakspeare paraît, dans cet ouvrage, avoir réservées aux gens de la haute classe, et quelquefois aux valets qui les imitent. Ce caractère de la nourrice est indiqué dans le poëme d'Arthur Brooke, où il est loin cependant d'avoir la même vérité grossière que dans la pièce de Shakspeare.

Partout où ils échappent aux concetti, les vers de _Roméo et Juliette_ sont peut-être les plus gracieux et les plus brillants qui soient sortis de la plume de Shakspeare; ils sont en grande partie rimés, autre hommage rendu aux habitudes italiennes.

Roméo et Juliette fut jouée pour la première fois, en 1596, par _les serviteurs de lord Hundsdon_, les grands seigneurs ayant joui jusqu'au règne de Jacques Ier d'une liberté illimitée quant à la protection qu'ils accordaient aux acteurs. Un acte du Parlement y apporta alors quelque restriction.

ROMÉO ET JULIETTE

PERSONNAGES

ESCALUS, prince de Vérone. PARIS, jeune seigneur, parent du prince. MONTAIGU, CAPULET, chefs des deux maisons ennemies. UN VIEILLARD, oncle de Capulet. ROMÉO, fils de Montaigu. MERCUTIO, parent du prince et ami de Roméo. BENVOLIO, neveu de Montaigu et ami de Roméo. TYBALT, neveu de la signora Capulet. FRERE LAURENCE, franciscain. FRERE JEAN, religieux du même ordre. BALTHASAR, domestique de Roméo. SAMSON, GREGOIRE, domestique de Capulet. ABRAHAM, domestique de Montaigu. UN APOTHICAIRE. TROIS MUSICIENS. UN VALET. UN PAGE de Pâris. PIERRE. UN OFFICIER. CHOEUR. LA SIGNORA MONTAIGU, femme de Montaigu. LA SIGNORA CAPULET, femme de Capulet. JULIETTE, fille de Capulet. LA NOURRICE de Juliette.

CITOYENS DE VÉRONE, PLUSIEURS HOMMES ET FEMMES DES DEUX FAMILLES, MASQUES, GARDES, GENS DU GUET ET SERVITEURS.

La scène est pendant presque toute la pièce à Vérone.

Au cinquième acte elle est une fois à Mantoue.

PROLOGUE

Dans la belle Vérone, où nous plaçons notre scène, l'antique haine de deux maisons égales en dignité vient d'éclater par de nouveaux troubles, où le sang des citoyens a souillé les mains des citoyens. De la race funeste de ces deux ennemis a pris naissance, sous des étoiles funestes, un couple d'amants infortunés dont les malheurs et la ruine déplorable enseveliront avec eux les luttes de leurs parents. L'épisode terrible de cet amour marqué de mort, l'obstination de leurs parents dans des fureurs dont la mort de leurs enfants peut seule terminer le cours, vont pendant ces deux heures occuper notre scène. Si vous nous prêtez la faveur d'une oreille attentive, nous travaillerons par nos efforts à perfectionner ce qui pourrait manquer ici.

ACTE PREMIER

SCÈNE I

Une place publique.

Entrent SAMSON et GRÉGOIRE, _armés d'épées et de boucliers._

SAMSON.--Tiens, Grégoire, sur ma parole, on ne nous fera plus avaler de pilules[4].

[Note 4: SAMSON. _Gregory, o'my word, we'll not carry coals._ GREGORY. _No, for then we should be colliers._ SAMSON. _I mean, an we be in choler we'll draw._ GREGORY. _Ay, while you live, draw your neck out, o'the collar._

Carry coals (porter du charbon) était, du temps de Shakspeare, une expression proverbiale en anglais pour dire _supporter des injures_. Samson, jouant sur les deux sens de cette expression, répond: _Non, car nous serions des charbonniers._ Il a fallu changer cette réplique de Samson pour qu'elle se rapportât à l'expression _avaler des pilules_, la seule qui, en français puisse rendre _carry coals_. On a été de même obligé à quelques légères altérations dans les deux répliques suivantes, dont la plaisanterie porte sur la consonance des mots _choler_ (colère) et _collar_ (collier, collier de fer). La même liberté, et de plus grandes encore seront souvent indispensables dans le cours de cette pièce, pour donner un sens quelconque à cette suite de jeux de mots, de calembours, de quolibets, dont se compose, durant les deux premiers actes, la conversation de presque tous les personnages, et aussi pour éviter ou adoucir quelques plaisanteries trop grossières. C'est un travail ingrat autant que rebutant de chercher dans la partie burlesque de notre langue de quoi travestir convenablement des bouffonneries où l'esprit ne peut découvrir d'autre mérite que celui qu'elles empruntent de ce grotesque attirail, et où l'on est à chaque instant tenté de demander pardon au lecteur de la peine qu'on prend pour lui transmettre ces puérilités: mais c'est Shakspeare qu'il s'agit de faire connaître, ou du moins le goût de ce temps d'où est sorti Shakspeare.]

GRÉGOIRE.--Non, car elles pourraient bien nous donner la colique.

SAMSON.--Je veux dire que, si on nous fâche, il faudra être francs du collier.

GRÉGOIRE.--Franc pour toute ta vie du collier du bourreau, n'est-ce pas?

SAMSON.--Je suis prompt à taper quand je me mets en train.

GRÉGOIRE.--Mais tu n'es pas prompt à te mettre en train de taper.

SAMSON.--La vue d'un de ces chiens de Montaigu me remue tout le corps.

GRÉGOIRE.--On se remue pour courir; quand on est brave, on tient ferme: c'est pour cela que, lorsqu'on te remue, tu te sauves.

SAMSON.--Un chien de cette maison me remuera de telle sorte que je tiendrai ferme: je prendrai le côté du mur avec tout homme ou femme des Montaigu.

GRÉGOIRE.--C'est ce qui prouve que tu n'es qu'un faible esclave, car ce sont les plus faibles qu'on met au pied du mur[5].

[Note 5: _The weakest goes to the wall_ (le plus faible va contre le mur). Il a fallu changer un peu le sens de la phrase pour qu'elle se prêtât à la suite de la plaisanterie. Samson répond que les femmes étant _the weaker vessels_ (les vases les moins solides), expression empruntée à l'Écriture, sont toujours (_thrust to the wall_) jetées contre le mur, au coin du mur.]

SAMSON.--Oui, c'est vrai; et voilà pourquoi les femmes étant des vaisseaux plus fragiles, on les met toujours au pied du mur. Je prendrai le côté du mur sur les serviteurs de la maison de Montaigu; et pour les filles, je les mettrai au pied du mur.

GRÉGOIRE.--La querelle est entre nos maîtres et nous, leurs hommes.

SAMSON.--Cela m'est égal, je veux me montrer tyran. Quand je me serai battu avec les hommes, je serai cruel envers les filles: je leur couperai la tête.

GRÉGOIRE.--La tête des filles?

SAMSON.--Oui, la tête des filles, ou bien....[6]: arrange cela comme tu voudras.

[Note 6: _Or their maidenheads; take it in what sense thou wilt._--GREG. _They must take it in sense that feel it._--SAMS. _Me they shall feel, while I am able to stand._ Le jeu de mots roule sur les têtes des filles (_the heads of the maids_) ou leur virginité (_maidenhead_); il est impossible à rendre en français.]

GRÉGOIRE.--C'est à celles qui le sentiront à s'en arranger.

SAMSON.--Elles me sentiront tant que le courage me tiendra; et on sait que je suis un gaillard bien en chair.

GRÉGOIRE.--Oui, tu n'es pas poisson: si tu l'étais, tu serais un hareng de deux liards. Allons, tire ta flamberge; en voilà deux de la maison des Montaigu.

(Entrent Abraham et Balthasar.)

SAMSON.--Voilà mon épée hors du fourreau. Cherche-leur querelle, je t'épaulerai.

GRÉGOIRE.--Comment, en tournant les épaules et en te sauvant?

SAMSON.--Ne crains rien de mon courage.

GRÉGOIRE.--Moi, craindre ton courage! non, vraiment.

SAMSON.--Mettons la loi de notre côté; laissons-les commencer.

GRÉGOIRE.--Je vais froncer le sourcil en passant devant eux; qu'ils le prennent comme ils voudront.

SAMSON.--C'est-à-dire comme ils l'oseront. Moi, je vais leur mordre mon pouce[7]; s'ils le supportent, ils sont déshonorés.

[Note 7: Mordre son pouce était, du temps de Shakspeare, une des insultes les plus en usage pour commencer une querelle.]

ABRAHAM.--Est-ce à notre intention, monsieur, que vous mordez votre pouce?

SAMSON.--Je mords mon pouce, monsieur.

ABRAHAM.--Est-ce à notre intention, monsieur, que vous mordez votre pouce?

SAMSON.--Aurons-nous la loi de notre côté si je réponds oui?

GRÉGOIRE.--Non pas.

SAMSON.--Non, monsieur, ce n'est pas à votre intention que je mords mon pouce; mais je mords mon pouce, monsieur.

GRÉGOIRE.--Cherchez-vous querelle, monsieur?

ABRAHAM.--Querelle, monsieur? Non monsieur.

SAMSON.--Si vous cherchez querelle, monsieur, je suis bon pour vous; je sers un aussi bon maître que vous.

ABRAHAM.--Pas un meilleur.

SAMSON.--Soit, monsieur.

GRÉGOIRE.--Dis meilleur. (_A part, à Samson_.) J'aperçois un des parents de mon maître[8].

[Note 8: Il faut que cette phrase de Grégoire se rapporte à Tybalt, qu'il aperçoit apparemment de loin, car Benvolio est parent des Montaigu.]

(On voit de loin entrer Benvolio.)

SAMSON.--Oui, meilleur, monsieur.

ABRAHAM.--Vous mentez.

SAMSON.--Tirez, si vous êtes des hommes.--Grégoire, n'oublie pas ce coup qui fait tant de bruit.

(Ils se battent.)

BENVOLIO, _accourant l'épée nue pour les séparer_.--Séparez-vous, imbéciles. Remettez vos épées; vous ne savez ce que vous faites. (_Il abaisse leurs épées_)

(Entre Tybalt.)

TYBALT.--Quoi! tu tires l'épée contre cette lâche canaille! Tourne-toi, Benvolio; regarde ta mort en face.

BENVOLIO.--Je ne veux que rétablir la paix ici. Remets ton épée, ou sers-t'en pour m'aider à séparer ces hommes.

TYBALT.--Quoi! l'épée est tirée et tu parles de paix! Je hais ce mot comme je hais l'enfer, tous les Montaigu et toi. Défends-toi, lâche.

(Ils se battent.)

(Entrent des partisans des deux maisons qui se joignent à la mêlée. Entrent ensuite des citoyens avec de gros bâtons.)

PREMIER CITOYEN.--Prenez vos bâtons, vos piques, vos pertuisanes. Frappons, faisons-les tomber à terre: à bas les Capulet! à bas les Montaigu!

Entrent le vieux Capulet, en robe de chambre, et la signora Capulet.

CAPULET.--Quel est ce bruit? Holà! Donnez-moi mon épée de combat.

LA SIGNORA CAPULET.--Votre béquille, votre béquille! Que voulez-vous faire d'une épée?

CAPULET.--Mon épée! vous dis-je, j'aperçois le vieux Montaigu: il fait briller sa lame en l'air pour me braver.

(Entrent Montaigu et la signora Montaigu.)

MONTAIGU.--C'est toi, traître de Capulet!--Ne me retenez pas, laissez-moi aller.

LA SIGNORA MONTAIGU.--Je ne vous laisserai pas faire un pas pour chercher un ennemi.

(Entrent le prince et sa suite.)

LE PRINCE.--Sujets rebelles, ennemis de la paix, profanateurs de ce fer souillé du sang de vos voisins...--Ne m'écouteront-ils donc pas?--Holà! comment! Hommes ou bêtes que vous êtes, qui ne savez éteindre les flammes de votre rage pernicieuse que dans des flots de sang tirés de vos propres veines; sous peine de la torture, jetez à terre de vos mains sanglantes ces armes forgées par la colère[9], et écoutez la sentence de votre prince irrité.--Déjà par votre fait, vieux Capulet, et vous Montaigu, trois querelles intestines ont, sur une parole en l'air, troublé trois fois la tranquillité de nos rues, et fait quitter aux anciens de Vérone les graves ornements qui leur conviennent, pour manier de vieilles pertuisanes dans de vieilles mains rongées par la paix, afin de réprimer les violences de la haine qui vous ronge. Si jamais vous troublez encore nos rues, vous payerez de votre vie la violation de la paix. Pour cette fois, que tous se retirent, excepté vous, Capulet, qui me suivrez; et vous, Montaigu, rendez-vous cette après-midi à l'antique manoir de Villafranca[10], où nous tenons notre cour publique de justice, pour y apprendre nos intentions ultérieures sur ce qui vient de se passer. Encore une fois, sous peine de mort, que tous se retirent.

[Note 9: _Mis-tempered weapons_, ce qui signifie à la fois armes d'une mauvaise trempe et armes forgées dans une mauvaise intention, forgées à mal.]

[Note 10: _Villafranca_, que Shakspeare appelle _Free town_, était, selon la nouvelle originale, une propriété des Capulet.]

(Sortent le prince, sa suite, Capulet, la signora Capulet, Tybalt, les citoyens et les domestiques.)

LA SIGNORA MONTAIGU.--Qui donc a de nouveau ranimé cette ancienne querelle? Répondez, mon neveu; y étiez-vous lorsqu'elle a commencé?

BENVOLIO.--Les domestiques de votre ennemi et les vôtres étaient déjà ici à se battre chaudement quand je suis arrivé: j'ai tiré l'épée pour les séparer. En ce moment est survenu, l'épée à la main, le bouillant Tybalt, qui, tout en me jetant des défis aux oreilles, s'est mis à faire le moulinet au-dessus de sa tête, et à pourfendre les vents, qui, n'en recevant pas le moindre mal, ont sifflé de mépris. Pendant que nous faisions échange d'estocades et de coups, venaient à tout moment de nouveaux combattants pour l'un et l'autre parti, jusqu'à ce qu'enfin est arrivé le prince, qui les a séparés.

LA SIGNORA MONTAIGU.--Oh! où est Roméo? l'avez-vous vu aujourd'hui? Je suis bien heureuse qu'il ne se soit pas trouvé à cette bagarre.

BENVOLIO.--Ce matin, madame, une heure avant que le divin soleil lançât son premier regard à travers la fenêtre d'or de l'orient, le trouble de mon âme m'a poussé à sortir hors de chez moi; et là, sous le bosquet de sycomores qui s'élève à l'ouest de la ville, aussi matinal que moi dans sa promenade, j'ai vu votre fils. J'ai marché vers lui; mais il m'a aperçu, et s'est glissé dans l'épaisseur du bois. Jugeant de ses sentiments par les miens, qui ne sont jamais plus actifs que dans la solitude, j'ai suivi mon humeur en ne poursuivant pas la sienne, et j'ai évité avec plaisir celui qui me fuyait avec plaisir.

MONTAIGU.--Plus d'une fois avant le jour on l'a vu dans ce lieu augmenter de ses pleurs la fraîche rosée du matin, accroître les nuages des nuages qu'élevaient ses profonds soupirs; mais aussitôt qu'à la dernière extrémité de l'orient le soleil, qui égaye toutes choses, commence à tirer les obscurs rideaux du lit de l'Aurore, mon fils accablé rentre pour se dérober à sa lumière, se retire seul dans sa chambre, ferme les fenêtres, et, interdisant tout accès au doux éclat du jour, se forme ainsi une nuit artificielle. Cette disposition le conduira nécessairement à une mélancolie noire et funeste, si de bons conseils n'en écartent la cause.

BENVOLIO.--Mon noble oncle, en savez-vous la cause?

MONTAIGU.--Je ne la sais point, et ne puis l'apprendre de lui.

BENVOLIO.--L'avez-vous pressé par quelques moyens?

MONTAIGU.--Il l'a été par moi-même et par beaucoup d'autres amis; mais, n'écoutant que lui-même sur ses propres sentiments, il se garde, je ne saurais dire quelle fidélité, mais du moins un secret complet et absolu; aussi rebelle à toute tentative pour sonder ce mystère, que le bouton piqué par un ver envieux avant d'avoir pu déployer à l'air ses pétales odorants et livrer ses beautés au soleil. Si nous pouvions seulement savoir d'où provient son chagrin, nous serions aussi empressés de le guérir que de le connaître.

(Roméo paraît dans l'éloignement.)

BENVOLIO.--Tenez, le voilà qui vient. Veuillez vous éloigner; il faudra qu'il me refuse bien obstinément si je ne parviens pas à savoir ce qui l'afflige.

MONTAIGU.--Je désire bien que tu sois assez heureux pour obtenir par ton insistance une sincère confession.--Venez, madame, retirons-nous.

(Sortent Montaigu et la signora Montaigu.)

BENVOLIO.--Bonjour, mon cousin.

ROMÉO.--Le jour est-il donc si jeune encore?

BENVOLIO.--Neuf heures viennent de sonner.

ROMÉO.--Hélas! les heures tristes paraissent longues. Était-ce mon père que j'ai vu s'éloigner si vite?

BENVOLIO.--C'était lui.--Quel est donc le chagrin qui allonge les heures de Roméo?

ROMÉO.--La privation de ce qui les rendrait courtes si je le possédais.

BENVOLIO.--Amoureux?

ROMÉO.--Accablé[11].

[Note 11: BENV. _In love?_

ROM. Out.

BENV. _Of love?_

ROM. _Out of her_... etc.

Out of love signifie ici par amour. Benvolio, selon l'usage des jeunes gens de cette pièce de ne parler presque jamais sérieusement, veut tourner en plaisanterie la réponse de Roméo, en lui faisant dire qu'il est _amoureux par amour_. Cela ne

pouvait se rendre.]

BENVOLIO.--D'amour?

ROMÉO.--De la rigueur de celle que j'aime.

BENVOLIO.--Hélas! faut-il que l'Amour, aux regards si doux, soit à l'épreuve si dur et si tyrannique?

ROMÉO.--Hélas! faut-il que l'Amour, avec ses yeux toujours couverts d'un bandeau, trouve sans voir des chemins pour faire sa volonté! Où dînerons-nous?--O dieux!--Quel était donc ce tumulte?--Mais, non, ne me le dis pas; j'ai tout entendu.--Il y a bien à faire avec la haine, mais plus encore avec l'amour.--O amour querelleur, ô haine amoureuse, toi qui es tout et nais d'abord de rien, chose légère qui nous accable, vanité sérieuse, chaos difforme des plus séduisantes apparences, plume de plomb, fumée brillante, feu glacé, santé malade, sommeil toujours éveillé qui n'est point le sommeil! voilà l'amour que je sens, sans y sentir l'amour. Cela ne te fait-il pas rire?

BENVOLIO.--Non, cousin; bien plutôt pleurer.

ROMÉO.--Tendre coeur, et de quoi?

BENVOLIO.--De voir ton tendre coeur si oppressé.

ROMÉO.--Eh bien! telle est l'erreur de l'affection. Mes chagrins demeuraient appesantis dans mon sein; tu les forces à se répandre en les pressant sous le poids du tien, et l'affection que tu me montres ajoute une peine de plus à cet excès de peine que je ressens déjà. L'amour est une fumée qu'élève la vapeur des soupirs: libre de s'échapper, c'est un feu qui éclate dans les yeux des amants; réprimé, une mer que les amants nourrissent de leurs larmes. Qu'est-ce encore autre chose? une folie raisonnable, une bile amère qui suffoque, un doux parfum qui conserve.--Adieu, mon cousin.

(Il veut sortir.)

BENVOLIO.--Doucement, je veux vous accompagner, et c'est me manquer que de me quitter ainsi.

ROMÉO.--Eh! je ne me retrouve plus moi-même: je ne suis point ici; ce n'est point Roméo que tu vois, il est quelque part ailleurs.

BENVOLIO.--Dites-le-moi dans votre tristesse; quelle est celle que vous aimez?

ROMÉO.--Quoi! faut-il te le dire en gémissant?

BENVOLIO.--En gémissant? Non, pas tout à fait; mais dites-le-moi tristement: qui est-ce?

ROMÉO.--Demandez à un malade de faire avec tristesse son testament! Oh! qu'il est mal d'importuner d'un tel mot celui qui est si mal!--Tristement, cousin, j'aime une femme.

BENVOLIO.--J'étais arrivé juste en supposant que vous aimiez.

ROMÉO.--Un bien bon tireur! Et elle est belle celle que j'aime.

BENVOLIO.--Un beau but, beau cousin, est plus facile à frapper.

ROMÉO.--Eh bien! à ce coup-ci, vous manquez, on ne pourrait l'atteindre avec l'arc de Cupidon, car elle est animée de l'esprit de Diane, et solidement armée d'une chasteté à l'épreuve; elle vit invulnérable aux faibles coups de l'arc enfantin de l'Amour; elle ne se laissera point assiéger par d'amoureuses négociations, ne supportera pas la rencontre des yeux qui l'assaillent, n'ouvrira point le pan de sa robe à l'or qui séduit même les saints. Oh! elle est riche en beauté, pauvre seulement en ceci, qu'en mourant son trésor de beauté mourra avec elle.

BENVOLIO.--A-t-elle donc juré de vivre dans la chasteté?

ROMÉO.--Elle l'a juré; et cette parcimonie produira un immense dégât, car la beauté réduite par sa sévérité à mourir de faim prive de beauté toute postérité. Elle est trop belle, trop sagement belle, pour mériter le bonheur en me mettant au désespoir. Elle a fait un voeu contre l'amour; et sous ce voeu ma vie est une mort à moi qui vis pour te le dire.

BENVOLIO.--Suivez mon conseil, oubliez de penser à elle.

ROMÉO.--Oh! apprends-moi donc comment je pourrai oublier de penser.

BENVOLIO.--En donnant à tes yeux quelque liberté: considère d'autres beautés.

ROMÉO.--Ce serait le moyen de me faire penser plus souvent à son exquise beauté. Ces masques fortunés, qui caressent le front de nos belles dames, ne font par leur noirceur que nous rappeler la beauté qu'ils cachent. Celui qui est frappé d'aveuglement ne peut oublier le précieux trésor de la vue qu'il a perdu. Montre-moi une maîtresse belle par-dessus toutes les autres, que me sera sa beauté, sinon un livre de souvenirs où je lirai le nom de celle qui surpasse cette beauté incomparable? Adieu, tu ne peux m'apprendre à oublier.

BENVOLIO.--Tu recevras de moi cette doctrine, ou j'en mourrai ton débiteur.

(Ils sortent.)

SCÈNE II

Une rue.

Entrent CAPULET, PARIS, UN DOMESTIQUE.

CAPULET.--Montaigu est lié par la même défense que moi, et sous des peines semblables; et il ne sera pas difficile, je pense, à deux vieillards comme nous de vivre en paix.

PARIS.--Vous jouissez tous d'une existence honorable, et c'est pitié que vous ayez été si longtemps ennemis. Mais parlez, seigneur, que répondez-vous à ma demande?

CAPULET.--En répétant ce que je vous ai déjà dit. Mon enfant est encore étrangère dans le monde; elle n'a pas vu s'accomplir la révolution de quatorze années: laissons encore pâlir l'orgueil de deux étés avant de la croire mûre pour être une épouse.

PARIS.--De plus jeunes qu'elles sont devenues d'heureuses mères.

CAPULET.--Mais elles se flétrissent trop tôt, ces mères prématurées.--La terre a englouti toutes mes autres espérances; elle est en espérance la maîtresse de mes terres. Mais faites-lui votre cour, aimable Pâris; gagnez son coeur; ma volonté n'est qu'une dépendance de son consentement: si elle vous agrée, c'est dans les limites de son choix que réside mon aveu, et que ma voix vous sera loyalement accordée.--Ce soir je donne une fête dont j'ai depuis longtemps l'usage; j'y ai invité beaucoup de convives, tous mes amis; et parmi eux, je vous verrai avec très-grande joie, comme un de plus, en augmenter le nombre. Attendez-vous à voir ce soir dans ma pauvre maison des étoiles qui foulent aux pieds la terre, éclipsent la lumière des cieux; cette joie bienfaisante que ressent le jeune homme plein d'ardeur lorsqu'avril, dans toute sa parure, marche sur les talons de l'hiver chancelant, vous l'éprouverez ce soir parmi ces jeunes fleurs de beauté prêtes à s'épanouir; écoutez-les toutes, voyez-les toutes, et préférez celle dont le mérite sera le plus grand. Au milieu du spectacle d'une telle réunion, ma fille, réduite à elle-même, pourra faire nombre, mais non pas attirer l'attention.--Allons, venez avec moi.--(_A un domestique_.) Toi, maraud, trotte dans la belle Vérone; trouve toutes les personnes dont les noms sont écrits ici (_il lui donne un papier_), et dis-leur que la maison et le maître attendent leur bon plaisir.

(Sortent Capulet et Pâris.)

LE DOMESTIQUE.--Trouver ceux dont les noms sont écrits, ici! Il est écrit que le cordonnier se servira de sa toises et le tailleur de pierres de sa forme; le pêcheur de son pinceau, et le peintre de ses filets. Mais on m'envoie chercher les personnes dont les noms sont inscrits là-dessus, et je ne pourrai jamais trouver les noms que l'écrivain a écrits là-dessus. Il faut que je m'adresse aux savants... dans un moment...

(Entrent Benvolio et Roméo.)

BENVOLIO.--Allons, mon cher, la flamme est un remède à la brûlure qu'a faite une autre flamme; une douleur est diminuée par l'angoisse d'une autre; tournez jusqu'à vous étourdir et vous vous remettez en tournant dans l'autre sens; un chagrin désespéré se guérit par la langueur d'un nouveau chagrin. Laisse entrer dans tes yeux un nouveau poison, et l'ancien venin perdra toute son âcreté.

ROMÉO.--Votre feuille de plantain est excellente pour cela.

BENVOLIO.--Pour quel mal, je t'en prie?

ROMÉO.--Pour vos os brisés?

BENVOLIO.--Allons, Roméo, es-tu fou?

ROMÉO.--Non, pas fou, mais lié plus que ne le serait un fou, tenu en prison, privé d'aliments, fustigé, tourmenté, et..... Bonsoir, mon bon garçon.

LE DOMESTIQUE.--Dieu vous donne le bonsoir.--Je vous en prie, monsieur, savez-vous lire?

ROMÉO.--Oui, c'est un bonheur que j'ai dans ma misère.

LE DOMESTIQUE.--Peut-être l'avez-vous appris sans livres: mais, je vous prie, pouvez-vous lire tout ce que vous voyez?

ROMÉO.--Oui, si je connais les caractères et la langue.

LE DOMESTIQUE.--C'est répondre sincèrement; tenez vous en joie.

ROMÉO.--Arrêtez, mon ami, je sais lire. (_Il lit_.) «Le seigneur Martino, sa femme et sa fille; le comte Anselme et ses charmantes soeurs; la dame veuve de Vitruvio; le seigneur Placentio et ses aimables nièces; Mercutio et son frère Valentin; mon oncle Capulet, sa femme et ses filles; ma jolie nièce Rosaline; Livia; le seigneur Valentio et son cousin Tybalt, Lucio et l'agréable Hélène.» C'est une belle assemblée. (_Il lui rend le papier_.) Où doit-elle se réunir?

LE DOMESTIQUE.--Là-haut.

ROMÉO.--Où, là-haut?

LE DOMESTIQUE.--A souper, à la maison.

ROMÉO.--A la maison de qui?

LE DOMESTIQUE.--De mon maître.

ROMÉO.--Au fait, c'est ce que j'aurais dû vous demander d'abord.

LE DOMESTIQUE.--Maintenant je vous dirai, sans que vous me le demandiez, que mon maître est le puissant et riche Capulet; et si vous n'êtes pas de la maison de Montaigu, je vous invite à venir avaler un verre de vin. Tenez-vous en joie.

(Il sort.)

BENVOLIO.--A cette ancienne fête des Capulet soupera Rosaline, celle que tu aimes tant: avec toutes les beautés qu'on admire à Vérone. Viens-y, et d'un oeil sans prévention compare sa figure avec quelques autres que je te montrerai, et ton cygne ne te paraîtra plus qu'une corneille.

ROMÉO.--Quand la religieuse dévotion de mes yeux pourra me soutenir un pareil mensonge, que mes larmes se changent en flammes, et que ces hérétiques diaphanes, si souvent noyés sans pouvoir mourir, soient brûlés comme imposteurs. Une femme plus belle que mon amante! Le soleil qui voit tout n'a jamais vu son égale depuis le commencement du monde.

BENVOLIO.--Bon, vous l'avez vue belle parce qu'il n'y avait personne autre à côté; elle se balançait elle-même dans vos deux yeux: mais pesez dans ces balances de cristal la dame de vos pensées avec telle autre jeune fille que je vous montrerai brillant à cette fête, et à peine trouverez-vous bien celle qui vous paraît maintenant la plus belle de toutes.

ROMÉO.--J'irai, non pour y voir un semblable objet, mais pour m'y pénétrer de plaisir dans la splendeur de celui qui m'est cher.

(Ils sortent.)

SCÈNE III

Un appartement de la maison de Capulet.

LA SIGNORA CAPULET, LA NOURRICE de Juliette.

LA SIGNORA CAPULET.--Nourrice, où est ma fille? Appelle-la, qu'elle vienne.

LA NOURRICE.--Dans l'instant, sur mon honneur[12]..... à l'âge de douze ans--Je lui ai dit de venir.....--Quoi, mon agneau, mon oiseau du bon Dieu..... Dieu nous préserve..... Où est donc cette petite fille? Juliette!

[Note 12: _By my maidenhead_.]

(Entre Juliette.)

JULIETTE.--Allons, qui m'appelle?

LA NOURRICE.--Votre mère.

JULIETTE.--Me voici, madame; que voulez-vous?

LA SIGNORA CAPULET.--Voici de quoi il s'agit.--Nourrice, laisse-nous un moment, nous avons à parler en secret.--Non, reviens, nourrice, je me suis ravisée; tu entendras notre entretien.--Tu sais que ma fille est d'un âge raisonnable.

LA NOURRICE.--Ma foi, je puis vous dire son âge à une heure près.

LA SIGNORA CAPULET.--Elle n'a pas quatorze ans.

LA NOURRICE.--J'y mettrais quatorze de mes dents qu'elle n'a pas encore quatorze ans..... (et cependant à mon grand chagrin, je vous dis, je vous douze[13] qu'il ne m'en reste plus que quatre).... Combien avons-nous d'ici à la Saint-Pierre?

LA SIGNORA CAPULET.--Une quinzaine et quelques jours par-dessus[14].

[Note 13: _And yet to my teen be it spoken I have four. Teen_ est un vieux mot qui signifie _chagrin_, il se prononce à peu près comme _ten_, dix. Il a fallu, pour conserver le jeu de mots, employer le quolibet de madame Jourdain.]

[Note 14: _A fortnight and odd days._ Une quinzaine et quelques jours hors de compte. Odd signifie tout ce qui ne rentre pas dans une unité, une mesure, une règle commune. Il signifie aussi impair. La nourrice le prend dans ce sens et répond: _Even or odd_ (pair ou impair).]

LA NOURRICE.--Par-dessus ou par-dessous, c'est précisément ce jour-là. Vienne la veille de la Saint-Pierre au soir, elle aura quatorze ans.--Suzanne et elle (Dieu fasse paix à toutes les âmes chrétiennes!) étaient du même âge....--C'est bien; Suzanne est avec Dieu; elle était trop bonne pour moi.--Mais, comme je disais, la veille au soir de la Saint-Pierre, elle aura quatorze ans; elle les aura, sûr; je me le rappelle à merveille. Il y a à présent onze ans du tremblement de terre, et elle fut sevrée, jamais je ne l'oublierai, précisément ce jour-là parmi tous les jours de l'année; car j'avais frotté d'absinthe le bout de mon sein, j'étais assise au soleil contre le mur du colombier; mon maître et vous étiez alors à Mantoue...--Oh! j'ai de la mémoire; et comme je vous disais, dès qu'elle eut goûté de l'absinthe sur le bout de mon sein, et qu'elle l'eut trouvée amère, il fallait la voir, pauvre petite, se fâcher et se mettre en colère contre le sein. Comme je disais, voilà le colombier qui tremble. Oh! il ne fut pas besoin, je vous jure, de me dire de trotter, et depuis ce temps-là, il y a onze ans, car elle se tenait déjà seule; quoi! avec le bout de la baguette elle courait et roulait tout partout: car, tenez, c'était la veille qu'elle s'était cassé la tête; et alors mon mari, Dieu veuille avoir son âme, c'était un drôle de corps! il releva l'enfant: «Comment, dit-il, tu te laisses tomber sur le nez! quand tu auras plus d'esprit, tu tomberas en arrière; n'est-ce pas, Jules?» et, par Notre-Dame, la petite coquine cessa de pleurer, et dit: «Oui.» Voyez pourtant ce que c'est qu'une plaisanterie. J'en réponds, je vivrais mille ans que je ne l'oublierais jamais: «N'est-ce pas, Jules?» dit mon mari: et la petite morveuse finit tout de suite et dit: «Oui...»

LA SIGNORA CAPULET.--En voilà assez; je t'en prie, tais-toi.

LA NOURRICE.--Oui, madame; et pourtant je ne peux pas m'empêcher de rire quand je pense comme elle cessa de crier et dit: «Oui...» Et pourtant, je vous jure, elle avait sur le front une bosse aussi grosse que la coquille d'un poulet. C'était un coup terrible, et elle pleurait amèrement. «Comment, dit mon mari, tu te laisses tomber sur le nez! Tu tomberas en arrière quand tu seras plus grande; n'est-ce pas, Jules?» Elle finit tout de suite et dit: «Oui.»

JULIETTE.--Finis, nourrice, finis, je t'en prie, quand je te le dis.

LA NOURRICE.--Allons, j'ai fini. Que Dieu te marque de sa grâce! Tu étais la plus jolie petite enfant que j'aie jamais nourrie: si je peux vivre assez pour te voir mariée, je n'en demande pas davantage.

LA SIGNORA CAPULET.--Et le mariage est justement le sujet dont je suis venu causer avec elle.--Dites-moi, ma fille Juliette, avez-vous envie de vous marier?

JULIETTE.--C'est un honneur auquel je n'ai jamais pensé.

LA NOURRICE.--Un honneur! Si je n'avais pas été ta seule nourrice, je dirais que tu as sucé la sagesse avec le lait.

LA SIGNORA CAPULET.--Eh bien! pensez maintenant au mariage. Il y a dans Vérone des femmes plus jeunes que vous, considérées et déjà mères; et moi, je m'en souviens bien, j'étais déjà votre mère longtemps avant l'âge où vous voilà fille encore; enfin, en un mot, le brave Pâris vous adresse ses voeux.

LA NOURRICE.--C'est un homme, jeune dame... madame, c'est un homme comme tout le monde... Vraiment, il semble moulé en cire.

LA SIGNORA CAPULET.--L'été de Vérone n'a pas une fleur qui puisse lui être comparée.

LA NOURRICE.--Oh! vraiment, c'est une fleur; ma foi, oui, une vraie fleur.

LA SIGNORA CAPULET.--Qu'en dites-vous? Vous sentez-vous du goût pour ce gentilhomme? Ce soir, vous le verrez à notre fête. Parcourez tout le livre[15] de la figure du jeune Pâris, et vous y apercevrez le plaisir écrit avec la plume de la beauté. Examinez ces traits si bien d'accord, et vous verrez comme ils s'expliquent l'un l'autre; et ce que peut encore offrir d'obscur ce charmant volume, vous le trouverez écrit dans la marge de ses yeux. Ce précieux livre d'amour, cet amant encore sans liens ne demande, pour compléter sa beauté, que l'ornement dont il va se couvrir. C'est la mer qui fait vivre le poisson; et la beauté doit être orgueilleuse de donner asile à la beauté. Le livre qui sous ses fermoirs d'or enserre la légende dorée en partage la gloire aux yeux de tous: ainsi, en le possédant, vous partagerez tout ce qui lui appartient sans rien diminuer du vôtre.

[Note 15: De toutes ces métaphores sur Pâris, comparé à un livre, une seule a paru impossible à rendre, c'est celle où la signora Capulet l'appelant _unbound lover_, en fait à la fois _un amant sans liens et un amant sans reliure_.]

LA NOURRICE.--Diminuer! non, en vérité; elle grossira plutôt: les femmes grossissent par le moyen des hommes.

LA SIGNORA CAPULET.--Répondez-moi en un mot: l'amour de Pâris pourrait-il vous plaire?

JULIETTE.--Je verrai à le trouver agréable si le voir peut faire qu'il m'agrée. Mais mon regard ne pénétrera pas plus avant que le point où votre consentement lui donnera la force de se lancer.

(Entre un domestique.)

LE DOMESTIQUE.--Madame, les convives sont arrivés, le souper est servi, on vous attend; on demande ma jeune maîtresse; on jure, dans l'office, après la nourrice; toutes choses sont à point. Il faut que j'aille servir, je vous en prie, venez sur-le-champ.

LA SIGNORA CAPULET.--Nous te suivons. Allons, Juliette, le comte nous attend.

LA NOURRICE.--Allez, ma fille, chercher ce qui donnera d'heureuses nuits à vos heureux jours.

(Elles sortent.)

SCÈNE IV

Une rue.

Entrent ROMÉO, MERCUTIO, BENVOLIO, _avec cinq ou six autres masques et des porteurs de flambeaux._

ROMÉO.--Eh bien! est-ce là ce que nous dirons pour notre excuse, ou entrerons nous sans apologie?

BENVOLIO.--Tous ces bavardages-là sont du temps passé[16].

[Note 16: Il paraît qu'autrefois il arrivait souvent qu'on vînt à une fête sans y être invité; alors on paraissait en masque et précédé d'une espèce de hérault, également déguisé et qui prononçait par forme d'excuse un compliment préparé. Apparemment que, du temps de Shakspeare, la mode de ces compliments commençait à passer.]

Nous n'aurons point de Cupidon avec son bandeau et son écharpe, portant un arc à la tartare fait de latte peinte, pour effrayer les dames au hasard, comme un homme qui chasse les corneilles; nous n'aurons pas non plus de ces prologues sans livres répétés en traînant après le souffleur au moment de notre entrée. Qu'ils nous mesurent des yeux comme il leur plaira, nous leur mesurerons une mesure de danse, et nous voilà partis.

ROMÉO.--Donnez-moi une torche; ces gambades ne me vont pas. Sombre[17] comme je le suis, c'est à moi à porter le flambeau.

[Note 17: Chaque troupe de masques était précédée d'un homme portant une torche qui entrait dans l'assemblée, mais ne se mêlait point à la fête.]

MERCUTIO.--Vraiment, mon cher Roméo, il faudra bien que vous dansiez.

ROMÉO.--Non pas moi, croyez-moi. Vous autres, vous avez des souliers à danser et le pied léger; moi, j'ai une âme de plomb qui me cloue tellement à terre que je ne saurais remuer.

MERCUTIO.--Vous êtes amoureux, empruntez les ailes de l'Amour pour vous élancer au delà des hauteurs ordinaires.

ROMÉO.--Il m'a lancé un dard qui me perce trop cruellement pour que je puisse me lancer sur ses ailes légères; et enchaîné[18] comme je le suis, je ne puis m'élever au-dessus de ma sombre tristesse: je succombe sous le pesant fardeau de l'Amour.

[Note 18: Il y a ici abondance et complication de jeux de mots entre _sore_ (cruel) et _soar_ (prendre l'essor), _bound_ (enchaîné) et _bound_ (bond). On en a indiqué ce qui a été possible.]

MERCUTIO.--Et en succombant vous écraserez l'Amour: vous êtes un poids trop fort pour quelque chose de si délicat.

ROMÉO.--L'Amour délicat! il est dur, rude, ingouvernable, piquant comme l'épine.

MERCUTIO.--Si l'Amour vous mène rudement, menez rudement l'Amour; s'il vous pique, donnez de l'éperon et vous le mettrez à bas. Allons, une boîte pour mon visage; c'est un masque pour un masque. (_Il met son masque_.) Que m'importe à présent quel oeil curieux remarque mes difformités? Voici un front refrogné qui rougira pour moi.

BENVOLIO.--Allons, frappe, et entrons; et aussitôt entrés, que chacun ait recours à ses jambes.

ROMÉO.--Donnez-moi une torche. Que des étourdis légers de coeur effleurent de leurs pieds les joncs insensibles[19]. Pour moi, je tiendrai, comme on dit, la chandelle, et je regarderai. Ce qui me convient, c'est le proverbe des grand'mères: «La fête n'a jamais été si belle, et je m'en vas[20].»

[Note 19: Avant de connaître l'usage des tapis, on couvrait de joncs le sol des appartements; de là _joncher_.]

[Note 20: MERCUT.

The game was never so fair and I am done. Tut, dun's the mouse, the constable's word, If thou art dun, we'll draw thee from the mire, etc.

Il y a ici entre _done_ et _dun_ un jeu de mots intraduisible. _Dun's the mouse_ (la souris est grise) serait, selon les commentateurs, un proverbe équivalent à notre proverbe: _A la nuit, tous chats sont gris._ Mais ils se trouvent hors d'état d'expliquer suffisamment l'allusion contenue dans ces mots _the constable's word_. En adoptant dans la traduction leur version sur le _dun's the mouse_, je serais plutôt tenté d'y voir un jeu de mots employé par quelque constable dans une occasion où, ayant à se saisir d'un malfaiteur, il aura employé, pour avertir ses gens sans alarmer celui qu'il cherchait, ces mots insignifiants, _dun's the mouse_ (la souris est grise), pour ceux-ci, _done's the mouse_ (la souris est prise, c'en est fait de la souris). Quoi qu'il en soit, cette explication n'est pas plus mauvaise qu'aucune de celles qu'ont données les commentateurs. _Dun out from the mire_ était une ancienne chanson: on a substitué à cette allusion impossible à rendre un jeu de mots sur ces deux sens du mot _gris_, qui n'est point dans Shakspeare, à charge de revanche.]

MERCUTIO.--Bon, bon, à la nuit tous chats sont gris; c'est le mot du constable: et si tu es gris, nous te tirerons, sauf respect, de la mare où cet amour t'a enfoncé jusqu'aux oreilles. Venez, nous brûlons le jour[21]. Holà!

[Note 21: _We burn day light_, expression proverbiale commune à l'anglais et au français.]

ROMÉO.--Cela n'est pas ainsi.

MERCUTIO.--Je veux dire, mon cher, qu'en nous arrêtant ainsi nous dépensons notre lumière sans profit, comme des lampes qui brûleraient le jour. Il faut voir dans ce que nous disons ce que nous avons intention de dire, car c'est là que la raison se trouvera cinq fois plutôt qu'une seule dans nos cinq sens.

ROMÉO.--Oui, nous avons bonne intention en allant à cette mascarade; mais il n'est pas raisonnable d'y aller.

MERCUTIO.--Peut-on te demander pourquoi?

ROMÉO.--J'ai fait un songe cette nuit.

MERCUTIO.--Et moi aussi.

ROMÉO.--Eh bien! qu'avez-vous rêvé?

MERCUTIO.--Que ceux qui rêvent mentent souvent[22].

[Note 22: Jeu de mots intraduisible entre (lie) mentir, _et (lie)_ être couché.]

ROMÉO.--Oui, lorsqu'endormis dans leur lit ils rêvent des choses vraies.

MERCUTIO.--Oh! je vois que la reine Mab vous a visité cette nuit: c'est la fée sage-femme[23]. Elle vient, petite et légère comme l'agate placée à l'index d'un alderman, traînée par un attelage de minces atomes, et parcourt le nez des hommes pendant leur sommeil. Les rayons de ses roues sont faits de longues pattes de faucheur; l'impériale de sa voiture d'ailes de sauterelles; ses traits de la plus fine toile d'araignée; ses harnais des rayons humides d'un clair de lune. Le manche de son fouet est un os de grillon, et la mèche une mince pellicule. Son postillon est un petit moucheron vêtu de gris, pas à moitié si gros que le petit ver rond retiré avec la pointe d'une aiguille du doigt d'une jeune fille. Son chariot est une coquille de noisette vide travaillée par l'écureuil, ouvrier en bois, ou par le vieux ver, de temps immémorial associé des fées. C'est dans cet équipage qu'elle galope toutes les nuits au travers du cerveau des amants, et ils rêvent d'amour; sur les genoux des hommes de cour, et ils rêvent aussitôt de révérences; sur les doigts des gens de loi, et sur-le-champ ils rêvent d'épices; sur les lèvres des dames, et à l'instant elles rêvent de baisers: mais souvent Mab irritée les punit par des boutons d'avoir empesté leur haleine en mangeant des confitures[24]. Quelquefois elle galope sur le nez d'un courtisan, et il rêve qu'il flaire une place à solliciter. Quelquefois elle vient, avec la queue d'un pourceau de dîme, chatouiller le nez d'un prébendaire endormi, et il rêve d'un second bénéfice. Tantôt elle dirige son char sur le cou d'un soldat, et il rêve d'ennemis qu'il pourfend, de brèches, d'embuscades, de coutelas d'Espagne, de rasades profondes de cinq brasses: alors elle bat le tambour à son oreille; il s'éveille en sursaut, et dans sa frayeur il jure une ou deux invocations, puis se rendort. C'est cette même Mab qui pendant la nuit mêle la crinière des chevaux et la frise en sales tampons de crins ensorcelés, qui, une fois débrouillés, présagent de grands malheurs. C'est la sorcière qui pèse sur le sein des jeunes filles étendues dans leur lit, pour leur apprendre à supporter et en faire des femmes fortes[25]. C'est elle qui...

[Note 23: _She is the fairies midwife_, ce qui ne signifie point _la sage-femme des fées_, mais _la sage-femme entre les fées_. On ne voit nulle part que l'emploi de la reine Mab, la fée des songes, fût d'accoucher les fées; mais c'était elle qui enlevait à leur mère, au moment de leur naissance, les enfants nés pendant la nuit pour y substituer un enfant étranger.]

[Note 24: _Sweet meats_, espèce de confitures parfumées, connues alors sous le nom de _kissing comfits_, et dont les femmes faisaient un grand usage]

[Note 25:

This is the hag, when maids lie on their backs, That presses them, and learn them first to bear, Making them women of good carriage.

La phrase était impossible à rendre exactement.]

ROMÉO.--Paix, paix, Mercutio, paix; ce sont des riens que tu nous dis là.

MERCUTIO.--Tu as raison, car je parle de songes, enfants d'un cerveau oisif, produit de quelques vaines chimères, d'une substance aussi légère que l'air, et plus inconstante que le vent, qui, caressant le sein glacé du nord, s'irrite soudain, et, par une bouffée contraire, tourne sa face vers le midi qui verse la rosée.

BENVOLIO.--Ce vent dont vous nous parlez nous rejette loin de nous-mêmes. Le souper est fini et nous arriverons trop tard.

ROMÉO.--Trop tôt, au contraire, j'en ai peur. Un pressentiment funeste semble me dire qu'au milieu des réjouissances de cette nuit quelque événement encore suspendu dans les astres va commencer son cours terrible, et amener, par le traître coup d'une mort prématurée, le terme de cette vie méprisée que je renferme en mon sein. Mais, que celui qui gouverne ma course dirige ma voile! Allons, joyeux seigneurs.

BENVOLIO.--Battez, tambours.

(Ils sortent.)

SCÈNE V

Une salle de la maison de Capulet, garnie de musiciens.

Entrent des DOMESTIQUES.

PREMIER DOMESTIQUE.--Où est Potpan, qu'il ne m'aide pas à desservir? Lui, manier le tranchoir! jouer du tranchoir!

SECOND DOMESTIQUE.--Quand le bon air d'une maison est remis dans les mains d'un ou deux hommes, et des mains sales encore, cela fait mal au coeur[26].

[Note 26: _Tis a foul thing. A foul thing_ signifie une chose _malpropre_ et une chose _fâcheuse, coupable_, etc.]

PREMIER DOMESTIQUE.--Emporte les pliants, dérange le buffet, aie l'oeil à la vaisselle. Mon cher, mets de côté pour moi un morceau de massepain[27]; et si tu veux me faire plaisir, tu diras au portier de laisser entrer Suzanne Grindstone et Nell.--Antoine! Potpan!

[Note 27: Les massepains étaient alors d'énormes gâteaux, dont nos _macarons_, dit l'un des commentateurs de Shakspeare ne sont qu'un _diminutif dégénéré_.]

SECOND DOMESTIQUE.--Oui, mon garçon, nous voilà.

PREMIER DOMESTIQUE.--On a besoin de vous, on vous appelle, on vous demande, on vous cherche dans la grande salle.

SECOND DOMESTIQUE.--Nous ne pouvons pas être ici et là en même temps. Allons, gai, mes amis; soyons vifs un moment, et que celui qui vivra le dernier emporte tout.

(Ils se retirent.)

(Entrent Capulet, les convives et les masques.)

CAPULET.--Cavaliers, soyez les bienvenus. Voilà des dames à qui les cors ne font pas mal au pied, et qui vous donneront bien un tour de danse.--Ah, ah! mesdames, laquelle de vous refusera de danser maintenant? Celle qui fera la dégoûtée, je protesterai qu'elle a des cors aux pieds. Est-ce là vous serrer de près?--Cavaliers, soyez les bienvenus. J'ai vu le temps où je portais un masque aussi, et où je pouvais conter mes histoires tout bas à l'oreille d'une belle dame, et de manière à ne pas lui déplaire. Ce temps est passé; il est passé, passé.--Vous êtes les bienvenus, cavaliers.--Allons, musiciens, commencez. En cercle, en cercle, faites place; et vous, jeunes filles, sautez. (_Les instruments jouent et l'on danse_.) Holà! valets, encore des lumières, relevez les tables contre le mur; éteignez le feu, la salle devient trop chaude.--Allons, mon cher, voilà un divertissement imprévu qui ne prend pas mal. Asseyez-vous, asseyez-vous, bon cousin Capulet; car vous et moi nous avons passé nos jours de danse. Combien y a-t-il de temps que vous et moi nous avons porté un masque pour la dernière fois?

SECOND CAPULET.--Par Notre-Dame, il y a trente ans.

CAPULET.--Comment donc, mon cher? il n'y a pas tant, il n'y a pas tant. C'était à la noce de Lucentio: il y aura, vienne la Pentecôte quand elle voudra, quelque vingt-cinq ans; nous y allâmes en masque.

SECOND CAPULET.--Il y a davantage, davantage: son fils est plus âgé que cela; son fils a trente ans.

CAPULET.--Vous me direz cela, à moi? Il y a deux ans que son fils était encore mineur.

ROMÉO.--Quelle est cette dame dont s'est enrichie la main de ce cavalier?

UN DOMESTIQUE.--Je ne la connais pas, monsieur.

ROMÉO.--Oh! c'est d'elle que la flamme de ces flambeaux doit apprendre à briller. Sa beauté près de ce visage semblable à la nuit ressemble à un joyau attaché à l'oreille d'un Éthiopien: beauté trop brillante pour les usages de la vie, trop précieuse pour la terre! Telle une blanche colombe parmi les corbeaux, telle paraît cette dame auprès de ses compagnes. Quand la danse aura cessé, j'observerai où elle se tient; et je rendrai heureuse ma main téméraire en touchant la sienne. Mon coeur a-t-il aimé jusqu'à ce moment? Protestez du contraire, mes yeux, car jusqu'à cette nuit je n'avais jamais vu la véritable beauté.

TYBALT.--A sa voix, cet homme doit être un Montaigu. Garçon, donne-moi ma rapière. Comment, ce misérable osera venir ici, caché sous un masque grotesque, pour dénigrer et ridiculiser notre fête! Par la tige et l'honneur de ma race, je ne crois pas pécher en lui donnant le coup de la mort.

CAPULET.--Qu'est-ce que c'est, mon neveu? Pourquoi tempêtez-vous ainsi?

TYBALT.--Mon oncle, cet homme est un Montaigu, notre ennemi; un traître qui est venu ici ce soir, en haine de nous, pour se moquer de notre fête.

CAPULET.--Est-ce le jeune Roméo?

TYBALT.--C'est lui-même, ce traître de Roméo.

CAPULET.--Modère-toi, mon cher neveu; laisse-le en paix, il a l'air d'un noble cavalier; et, pour dire la vérité, tout Vérone le vante comme un jeune homme vertueux et d'une conduite honorable. Je ne voudrais pas, pour tous les trésors de cette ville, lui faire ici, dans ma maison, la moindre insulte. Sois donc patient, ne fais pas attention à lui: c'est ma volonté; et si tu la respectes, tu prendras un visage gracieux et quitteras cet air de mauvaise humeur qui sied mal dans une fête.

TYBALT.--Il sied très-bien quand un pareil traître devient votre convive: je ne le souffrirai pas.

CAPULET.--Vous le souffrirez vraiment, mon petit ami! Je vous dis que vous le souffrirez. Allons donc; est-ce moi qui suis le maître ici, ou bien vous? Allons donc, vous ne le souffrirez pas? Dieu me pardonne! vous allez mettre le trouble parmi mes hôtes, vous prendrez les airs d'un coq sur son panier[28]! vous ferez le maître!....

[Note 28: _You will set cock-a-hoop_: un coq sur un cerceau.]

TYBALT.--Mais, mon oncle, c'est une honte....

CAPULET.--Allez, allez, vous êtes un jeune insolent.... Nous verrons vraiment.... Cette farce pourrait bien vous tourner mal. Je sais ce que je dis. Il faudra que vous veniez ici me contrarier! En vérité, vous prenez bien votre temps.--A merveille, mes enfants.--Vous n'êtes qu'un fat, allez; tenez-vous tranquille, ou....--Encore des lumières; encore des lumières. N'avez-vous pas de honte?--Je vous forcerai bien à être tranquille. Comment!--Allons, gai, mes enfants.

TYBALT.--Cette patience forcée, et la colère à laquelle je voudrais m'abandonner, font, en se heurtant, trembler tout mon corps des assauts qu'elles se livrent. Je m'en irai; mais cette intrusion qui semble douce maintenant, se changera en fiel amer.

(Il sort.)

ROMÉO, _à Juliette_.--Si d'une main trop indigne j'ai profané la sainteté de l'autel, voici la douce expiation de ma faute: mes lèvres, pèlerins rougissants, sont prêtes à adoucir par un tendre baiser la rude impression de ma main.

JULIETTE.--Bon pèlerin, vous faites injure à votre main, qui n'a montré en ceci qu'une dévotion pleine de convenance; car les saints ont des mains que peuvent toucher celles des pèlerins; et joindre les mains est le baiser du pieux voyageur en terre sainte.

ROMÉO.--Les saints n'ont-ils pas des lèvres? et les pieux voyageurs aussi?

JULIETTE.--Oui, pèlerin, des lèvres qu'ils doivent employer à prier.

ROMÉO.--Oh! s'il en est ainsi, chère sainte, permets aux lèvres de faire l'office des mains: elles te prient, exauce leur prière, de peur que ma foi ne se change en désespoir.

JULIETTE.--Les saints ne bougent pas, bien qu'ils exaucent la prière qui leur est faite.

ROMÉO.--Alors ne bougez pas, tandis que je vais recueillir le fruit de ma prière: ainsi vos lèvres auront purifié les miennes de leur péché.

(Il lui donne un baiser.)

JULIETTE.--Alors mes lèvres doivent avoir pris le péché dont elles ont déchargé les vôtres.

ROMÉO.--Pris le péché de mes lèvres! ô faute doucement punie! Rendez-moi mon péché.

JULIETTE.--Vous donnez des baisers avec méthode[29].

[Note 29: _By the book_.]

LA NOURRICE.--Madame, votre mère veut vous dire un mot.

ROMÉO.--Quelle est sa mère?

LA NOURRICE.--Vraiment, jeune homme; sa mère est la maîtresse de la maison, et c'est une bonne dame, sage et vertueuse. J'ai nourri sa fille avec qui vous causiez; et je dis que celui qui mettra la main dessus aura du comptant.

ROMÉO.--C'est une Capulet!--Oh! qu'il va m'en coûter cher! ma vie est engagée à mon ennemie.

BENVOLIO.--Allons, Roméo, partons, la fête est à son plus beau moment.

ROMÉO.--Oui, j'en ai peur, et mon tourment n'en est que plus grand.

CAPULET.--Arrêtez, cavaliers, ne songez pas encore à nous quitter: nous avons là une ridicule petite collation sans cérémonie.--Vous le voulez donc absolument? Allons, je vous remercie tous; je vous remercie, honnêtes cavaliers; bonne nuit.--Encore des torches par là!--Allons, allons donc chercher nos lits. Ah! par ma foi, mon cher (_au second Capulet_), il se fait tard. Je vais aller me reposer.

(Ils sortent.)

JULIETTE.--Approche, nourrice; dis-moi, quel est ce cavalier?

LA NOURRICE.--C'est le fils et l'héritier du vieux Tibério.

JULIETTE.--Quel est celui qui sort actuellement?

LA NOURRICE.--Je crois, ma foi, que c'est le jeune Pétruccio.

JULIETTE.--Et celui qui le suit, qui ne voulait pas danser?

LA NOURRICE.--Je ne le connais pas.

JULIETTE.--Va, demande son nom.--S'il est marié, il est probable que mon tombeau sera mon lit nuptial.

LA NOURRICE.--Son nom est Roméo: c'est un Montaigu, le fils unique de votre grand ennemi.

JULIETTE.--Mon unique amour lié de l'unique objet de ma haine!.... Je l'ai vu trop tôt sans le connaître! et je l'ai connu trop tard! O prodige de l'amour qui vient de naître en moi, que je sois forcée d'aimer un ennemi détesté!

LA NOURRICE.--Qu'est-ce que c'est? qu'est-ce que c'est?

JULIETTE.--Un vers que je viens d'apprendre de quelqu'un avec qui j'ai dansé.

(Une voix dans l'intérieur appelle Juliette.)

LA NOURRICE.--Tout à l'heure, tout à l'heure. (_A Juliette_.) Venez, allons-nous-en; tous les étrangers sont partis.

(Elles sortent.)

(Entre le choeur.)

LE CHOEUR.--Une ancienne passion languit maintenant sur son lit de mort, et de jeunes désirs soupirent après son héritage. Cette beauté pour qui l'amour gémissait et demandait à mourir, comparée à la tendre Juliette, a maintenant cessé d'être belle. Maintenant Roméo est aimé, et il aime à son tour; la magie des regards a jeté sur eux le même charme. Cependant il faut qu'il se plaigne à celle qu'il croit son ennemie, et qu'elle dérobe sur de cruels hameçons le doux appât de l'Amour. Étant tenu pour un ennemi, il ne pourra avoir accès près d'elle pour exprimer ces voeux que les amants ont accoutumé de jurer; tandis qu'elle, aussi pressée d'amour, aura bien moins de moyens encore de chercher à rencontrer celui qu'elle aime depuis un moment, mais la passion leur prête sa puissance, l'occasion leur fournira les moyens de se rapprocher, et tempérera leur détresse par une douceur extrême.

(Il sort.)

FIN DU PREMIER ACTE.

ACTE DEUXIÈME

SCÈNE I

Un lieu ouvert touchant le jardin de Capulet.

Entre ROMÉO.

ROMÉO.--Puis-je aller plus loin lorsque mon coeur est ici? Marche, terre insensible, et retourne vers ton centre.

(Il escalade le mur et saute dans le jardin.)

(Entrent Benvolio et Mercutio.)

BENVOLIO.--Roméo! cousin Roméo!

MERCUTIO.--Il a fait sagement, et, sur ma vie, il s'est échappé pour aller trouver son lit.

BENVOLIO.--Il a couru de ce côté, et a sauté par-dessus le mur de ce verger. Appelle-le, bon Mercutio.

MERCUTIO.--Oui, et je vais même le conjurer.--Roméo! caprice! insensé! passion! amant! apparais-nous sous la forme d'un soupir; dis-nous seulement un vers, et je serai satisfait.--Crie-nous seulement un _hélas!_ Fais seulement rimer _tendresse_ et _maîtresse_; dis quelques mots de douceur à ma commère Vénus, un petit sobriquet à son fils et héritier le jeune aveugle Adam Cupidon[30], qui tira si proprement quand le roi Cophetua devint amoureux de la fille du mendiant[31].--Il ne m'entend point, il ne bouge point, il ne remue point; il faut que ce magot-là soit mort, et je vais l'évoquer.--Je te conjure par les yeux brillants de Rosaline, par son front élevé, par l'incarnat de ses lèvres, par son joli pied, par sa jambe bien faite, et tout ce qui s'ensuit[32], de nous apparaître sous ta propre ressemblance.

[Note 30: _Adam Cupid_. Adam Bell était le nom d'un archer fameux auquel on a dû supposer que Shakspeare voulait faire allusion. C'est ce qui a engagé les critiques à adopter cette leçon à la place d'_Abraham Cupid_, que portent les premières éditions.]

[Note 31: Allusion à un vers d'une ancienne ballade:

The blinded boy that shoots so trim,

(L'enfant aveugle qui tire si proprement). La ballade a pour titre: _King Cophetua and the beggar maid_, et se trouve dans le recueil intitulé _Relics of ancient english poetry_, rassemblé par le docteur Percy.]

[Note 32:

By her fine foot, straight leg, and quivering thigh _And the demesnes that there adjacent lie_.]

BENVOLIO.--S'il t'entend, tu le fâcheras.

MERCUTIO.--Ce que je dis ne peut l'offenser; ce qui pourrait l'offenser serait d'évoquer quelque esprit étrange dans le cercle de sa maîtresse, et de l'y laisser jusqu'à ce qu'elle l'eût conjuré et fait rentrer dans l'abîme; cela pourrait l'irriter; mon invocation est

honnête et obligeante, et je ne conjure au nom de sa maîtresse que pour le faire apparaître.

BENVOLIO.--Viens, il se sera enfoncé sous ces arbres pour l'amour de la nuit; ils sont faits l'un pour l'autre[33]: son amour est aveugle; les ténèbres seules lui conviennent.

[Note 33: _To be consorted with the humorous night, humorous_ veut dire ici _d'une humeur assortie à la sienne._]

MERCUTIO.--Quand l'amour est aveugle, il ne peut toucher le but[34].--Roméo, je te souhaite une bonne nuit; moi, je vais gagner mon alcôve. Ce lit de camp est trop froid pour que j'y puisse dormir.--Eh bien! partons-nous?

[Note 34: Il a fallu passer ces cinq vers:

Now will he sit under a medlar tree And wish his mistress were that kind of fruit As maid call medlars, when they laugh alone. O Roméo, that she were, ah that she were An open et cætera, _thou a propin pear._

Ces deux derniers vers, dont les commentateurs ne sont pas trop parvenus à saisir le sens, leur ont cependant paru d'une telle indécence qu'ils n'ont osé les insérer dans le texte, et les ont rejetés dans une note où ils nous apprennent que _l'et cætera_ est l'indication d'une obscénité encore plus grossière, l'usage, du temps de Shakspeare étant, lorsque quelque expression prononcée sur la scène paraissait trop indécente pour l'impression, de la suppléer par un _et cætera_.]

BENVOLIO.--Allons, car il serait fort inutile de le chercher ici, puisqu'il ne veut pas qu'on le trouve.

(Ils sortent.)

SCÈNE II

Le jardin de Capulet.

Entre ROMÉO.

ROMÉO.--Il se rit des cicatrices, celui qui n'a jamais reçu une blessure. (_Juliette paraît à une fenêtre._)--Mais doucement! Quelle lumière brille soudain à travers cette fenêtre? C'est l'Orient; Juliette est le soleil.--Lève-toi, soleil de beauté; tue la lune jalouse, déjà malade et pâle de douleur de ce que toi, sa servante, es bien plus belle qu'elle. Ne sois pas sa servante, puisqu'elle est jalouse. La couleur dont se revêtent ses vestales est une couleur malade et livide; on ne la voit qu'aux imbéciles, rejette-la loin de toi. Oui, c'est ma dame; oui, ce sont mes amours: oh! si elle pouvait savoir ce qu'elle est pour moi!--Elle parle, et cependant elle ne fait entendre aucun son. Qu'importe! ses yeux ont un langage; je veux leur répondre.--Je suis trop téméraire; ce n'est pas à moi qu'elle parle. Deux des plus brillantes étoiles du ciel, appelées ailleurs par quelque soin, conjurent ses yeux de briller dans leur sphère jusqu'à leur retour. Mais quoi? si ses yeux étaient au ciel, et que les étoiles fussent dans sa tête, l'éclat de ses joues leur ferait honte comme le jour à une lampe; et ses yeux, de la voûte du ciel, verseraient à travers les régions éthérées des flots si brillants de lumière, que les oiseaux chanteraient pensant qu'il n'est pas nuit!--Voyez comme elle appuie sa joue sur sa main. Oh! que ne suis-je un gant placé sur cette main, pour toucher cette joue!

JULIETTE.--Hélas!

ROMÉO.--Elle parle.--Oh! parle encore, ange radieux! car tu parais aussi resplendissant au sein de cette nuit étendue sur ma tête qu'un messager ailé du ciel, lorsqu'aux regard étonnés des mortels, qui, les yeux élevés de tout leur effort, se renversent en arrière pour le contempler, il fend le cours paresseux des nuages et vogue au sein des airs.

JULIETTE.--O Roméo! Roméo!--Pourquoi es-tu Roméo?--Renie ton père et rejette ton nom; ou, si tu ne le veux pas, jure seulement de m'aimer, et je cesse d'être une Capulet.

ROMÉO, _à part_.--Dois-je l'écouter plus longtemps, ou répondrai-je à ceci?

JULIETTE.--Il n'y a que ton nom qui soit mon ennemi. Tu es toujours toi-même, non un Montaigu. Qu'est-ce ce que c'est que Montaigu? Ce n'est ni la main, ni le pied, ni le bras, ni le visage, ni aucune des autres parties qui appartiennent à un homme. Oh! sois quelque autre chose. Qu'y a-t-il dans un nom? Ce que nous appelons une rose, sous tout autre nom sentirait aussi bon. Ainsi Roméo, ne se nommât-il plus Roméo, garderait en perdant ce nom ses perfections chéries. Roméo, dépouille-toi de ton nom; et pour ce nom, qui ne fait pas partie de toi-même, prends-moi tout entière.

ROMÉO.--Je te prends au mot. Appelle-moi ton amant, et je reçois un nouveau baptême, je cesse à jamais d'être Roméo.

JULIETTE.--Qui es-tu, toi qui, couvert par la nuit, viens ainsi t'emparer de mes secrets?

ROMÉO.--Je ne sais de quel nom me servir pour t'apprendre qui je suis. Mon nom, ô ma sainte chérie[35], m'est odieux, puisqu'il est pour toi celui d'un ennemi. S'il était écrit, je le mettrais en pièces.

[Note 35: _Ma sainte_ était à cette époque le nom que les amants donnaient le plus habituellement à leur maîtresse.]

JULIETTE.--Mon oreille n'a pas encore aspiré cent paroles prononcées par cette voix, et cependant j'en reconnais les sons.--N'es-tu pas Roméo, un Montaigu?

ROMÉO.--Ni l'un ni l'autre, ma charmante sainte, si l'un ou l'autre te sont odieux.

JULIETTE.--Comment es-tu arrivé jusqu'ici, dis-le moi, et qu'y viens-tu faire? Les murs du verger sont élevés et difficiles à escalader. Songe qui tu es; ces lieux sont pour toi la mort si quelqu'un de mes parents vient à t'y rencontrer.

ROMÉO.--Des ailes légères de l'amour j'ai volé sur le haut de ces murailles; car des barrières de pierre ne peuvent exclure l'amour; et tout ce que l'amour peut faire, l'amour ose le tenter: tes parents ne sont donc point pour moi un obstacle.

JULIETTE.--S'ils te voient, ils te tueront.

ROMÉO.--Hélas! tes yeux sont pour moi bien plus dangereux que vingt de leurs épées. Donne-moi seulement un doux regard, et je suis à l'épreuve de leur inimitié.

JULIETTE.--Je ne voudrais pas pour le monde entier qu'ils te vissent ici.

ROMÉO.--Le manteau de la nuit me dérobe à leurs regards. A moins que tu ne m'aimes, laisse-les me surprendre: il me vaut mieux perdre la vie par leur haine que mourir lentement sans ton amour.

JULIETTE.--Qui t'a appris à trouver ce lieu?

ROMÉO.--L'amour, qui m'a d'abord excité à le chercher: il m'a prêté son intelligence, et je lui ai prêté mes yeux.--Je ne suis point un pilote; mais fusses-tu aussi loin de moi que ce vaste rivage baigné des mers les plus éloignées, pour un tel chargement j'aventurerais tout.

JULIETTE.--Tu le sais, la nuit étend son masque sur mon visage, sans quoi ce que tu viens de m'entendre dire colorerait devant toi mes joues de la rougeur qui convient à une jeune fille. Je voudrais bien pouvoir conserver encore les apparences; je voudrais, je voudrais pouvoir nier ce que j'ai dit. Mais, adieu tous ces compliments.--M'aimes-tu? Je sais que tu vas me répondre _oui_, et j'en recevrai ta parole.... Cependant, si tu le jures, tu peux devenir perfide: On dit que Jupiter se rit des parjures des amants. O cher Roméo, si tu m'aimes, dis-le-moi sincèrement; ou bien, si tu me trouves trop prompte à me rendre, je prendrai un visage sévère, je me montrerai irritée, et je te dirai _non_; et alors tu me feras la cour: mais autrement je n'en voudrais rien faire pour le monde entier.--En vérité, beau Montaigu, je t'aime trop, et tu peux trouver ma conduite légère. Mais crois-moi, cavalier, tu me trouveras plus fidèle que celles qui ont plus que moi l'art de déguiser. J'aurais été plus réservée, il faut que je l'avoue, si tu n'avais entendu, avant que je pusse m'en apercevoir, les expressions passionnées de mon sincère amour. Pardonne-moi donc, et n'impute point à la légèreté de mon amour cette faiblesse que t'a découverte l'obscurité de la nuit.

ROMÉO.--Madame, par cette heureuse lune qui touche d'une lueur argentée les cimes de ces arbres fruitiers, je jure.....

JULIETTE.--Ah! ne jure point par la lune, l'inconstante lune, qui chaque mois change la forme de son disque; de peur que ton amour ne soit variable.

ROMÉO.--Par quoi jurerai-je?

JULIETTE.--Ne jure point du tout; ou si tu le veux, jure par ta personne gracieuse, toi, le dieu de mon culte idolâtre, et je te croirai.

ROMÉO.--Si le cher amour de mon coeur.....

JULIETTE.--C'est bien; ne jure point. Bien que ma joie soit en toi, je ne ressens point de joie cette nuit de notre engagement: il est trop précipité, trop inconsidéré, trop soudain, trop semblable à l'éclair, qui a cessé d'être avant qu'on ait pu dire: Il éclaire! Mon

doux ami, bonne nuit. Développé par l'haleine de l'été, ce bouton d'amour peut, quand nous nous reverrons, être devenu belle fleur. Bonne nuit! bonne nuit! Qu'un repos, un calme aussi doux que celui qui remplit mon sein arrive à ton coeur!

ROMÉO.--Oh! me laisseras-tu si peu satisfait?

JULIETTE.--Et quelle satisfaction peux-tu obtenir cette nuit?

ROMÉO.--L'échange de tes fidèles serments d'amour contre les miens.

JULIETTE.--Je t'ai donné mon amour avant que tu l'eusses demandé, et je voudrais être encore à te le donner.

ROMÉO.--Voudrais-tu me le retirer? et pourquoi, mon amour?

JULIETTE.--Seulement pour avoir le plaisir d'être franche avec toi, et de te le donner de nouveau. Mais ce que je désire, je le possède déjà: ma libéralité envers toi est sans bornes comme la mer; mon amour est aussi profond: plus je te donne, et plus il me reste; car tous les deux sont infinis.--J'entends du bruit là-dedans. Cher amour, adieu. (_La nourrice appelle de l'intérieur._)--Tout à l'heure, bonne nourrice.--Doux Montaigu, sois fidèle. Demeure un moment encore, je vais revenir.

(Elle sort.)

ROMÉO.--O bienheureuse, bienheureuse nuit! Je crains, comme c'est la nuit, que tout ceci ne soit un songe, trop doucement flatteur pour être réel.

(Juliette reparaît à la fenêtre.)

JULIETTE.--Trois mots, cher Roméo, et puis bonne nuit pour tout de bon. Si les vues de ton amour sont honorables, si le mariage est ton but, fais-moi savoir demain matin, par quelqu'un que je trouverai le moyen de t'envoyer, en quel lieu, en quel temps tu veux accomplir la cérémonie, et j'irai mettre à tes pieds toute la fortune de ma vie, et je te suivrai comme mon seigneur jusqu'au bout de l'univers.

LA NOURRICE, _dans la maison_.--Madame!

JULIETTE.--Je viens, tout à l'heure.--Mais si tes intentions ne sont pas bonnes, je te conjure...

LA NOURRICE, _dans la maison_.--Madame!

JULIETTE.--Dans l'instant, je viens.--De cesser tes poursuites, et de me laisser à ma douleur. Demain j'enverrai.

ROMÉO.--Que mon âme prospère.....

JULIETTE.--Mille fois bonne nuit.

(Elle sort.)

ROMÉO.--Mille fois mauvaise nuit, du moment où lui manque ta lumière! l'Amour court vers l'amour, comme l'écolier loin de ses livres; mais l'amour s'éloigne de l'Amour comme l'enfant retourne à l'école, les yeux chargés de tristesse.

(Il se retire à pas lents.)

(Juliette revient encore à la fenêtre.)

JULIETTE.--St! Roméo! St!--Oh! que n'ai-je la voix du fauconnier pour ramener cet aimable faucon! L'esclavage a la voix éteinte, il ne peut parler haut; autrement je percerais les cavernes où se retire l'écho, et je fatiguerais sa voix aérienne à répéter le nom de mon Roméo jusqu'à ce que les sons en fussent plus affaiblis que les miens.

ROMÉO.--C'est mon âme qui m'appelle par mon nom! Oh! que les sons argentins de la voix des amants portent, durant la nuit, une délicieuse musique à l'oreille qui les attend!

JULIETTE.--Roméo!

ROMÉO.--Ma douce amie!

JULIETTE.--A quelle heure demain matin enverrai-je vers toi?

ROMÉO.--A neuf heures.

JULIETTE.--Je n'y manquerai pas: d'ici à ce moment il y a vingt années..... J'ai oublié pourquoi je t'ai rappelé.

ROMÉO.--Laisse-moi demeurer ici jusqu'à ce que tu t'en souviennes.

JULIETTE.--Je l'oublierais pour te faire rester ici, et ne songerais qu'au plaisir que me fait ta présence.

ROMÉO.--Et moi je veux rester avec toi pour te faire tout oublier, et oublier moi-même toute autre demeure que celle-ci.

JULIETTE.--Le jour est prêt à poindre. Je voudrais que tu fusses parti; mais pas plus loin de moi que l'oiseau d'un enfant capricieux, qui le laisse sautiller à quelque distance de sa main, comme un pauvre prisonnier retenu dans sa chaîne entortillée, puis d'un coup de son fil de soie le retire vers lui, tant son amour lui plaint un moment de liberté.

ROMÉO.--Je voudrais être ton oiseau!

JULIETTE.--Je le voudrais aussi, mon doux ami; cependant je te ferais mourir à force de caresses.--Bonne nuit, bonne nuit! Se quitter est un si doux chagrin, que je dirais bonne nuit jusqu'à ce qu'il fît jour.

(Elle sort.)

ROMÉO.--Que le sommeil descende sur tes yeux, et la paix dans ton coeur! Que ne suis-je le sommeil et la paix, pour obtenir un si doux lieu de repos!--Je vais chercher dans sa cellule mon père spirituel pour implorer son assistance et lui apprendre mon heureuse chance.

(Il sort.)

SCÈNE III

La cellule de frère Laurence.

Entre FRÈRE LAURENCE avec un panier.

FRÈRE LAURENCE.--Le matin, de ses yeux grisâtres, sourit sur le front ténébreux de la nuit, rayant de traits de lumière les nuages de l'orient. La Nuit au teint vergeté s'éloigne, en chancelant comme un ivrogne, de la route du jour et des roues enflammées du char de Titan[36]. Maintenant, avant que le Soleil ait avancé sur l'horizon son oeil brûlant pour égayer le jour et sécher l'humide rosée de la nuit, il faut que je remplisse l'osier de cette corbeille d'herbes malfaisantes et de fleurs d'un suc précieux.--La terre, cette mère de la nature, est aussi son tombeau; et le sépulcre de la mort renferme aussi le germe de la vie. Nous trouvons des enfants de diverses sortes nés de ses flancs et nourris sur son sein maternel, nombre d'entre eux excellent en nombreuses vertus, aucun qui n'en possède quelques-unes, et cependant tous différents. Quelle abondance de puissants bienfaits sont déposés dans les plantes, les pierres, et dans leur véritable destination! car il n'existe sur la terre rien de si méprisable que la terre n'en reçoive quelque bienfait spécial, et rien de si bon qui, s'il est détourné de ce légitime usage, infidèle à sa vraie source, ne se précipite dans l'abus. Mal appliquée, la vertu même se change en vice; et le vice est quelquefois purifié par l'action. Dans l'enveloppe naissante de cette petite fleur, le poison a établi son séjour, et la médecine sa puissance; offerte à l'odorat, elle le réveille et tous les sens à la fois; si on la goûte, elle paralyse en même temps les sens et le coeur. Ainsi, de même que dans les plantes, demeurent toujours en présence dans le sein de l'homme deux ennemis en lutte, la grâce et la volonté grossière; et là où domine le principe pervers, l'ulcère de la mort a bientôt dévoré le germe vital.

[Note 36: _From forth day's path way, and Titan's fiery wheels_. On a suivi la version des anciennes éditions adoptées par M. Malone, M. Steevens a préféré celle des éditions modernes: _From forth day's path way made by Titan's wheels_, parce que _from forth_ signifiant _hors_, on peut s'écarter _hors du chemin_, et non pas _hors des roues_; mais de pareilles irrégularités ne sont pas rares dans Shakspeare, et la version la plus vraisemblable est toujours celle qui présente l'image la plus complète et la plus suivie dans ses détails et ses conséquences: ainsi la Nuit, représentée comme un ivrogne, doit, selon toute apparence, chercher à s'écarter des roues du char qui la poursuit.]

(Entre Roméo.)

ROMÉO.--Bonjour, père.

FRÈRE LAURENCE.--_Benedicite_.--Quelle voix matinale me salue avec tant de douceur?--Jeune fils, cela indique une tête malade de dire sitôt bonjour à ton lit. Les soucis font sentinelle dans les yeux du vieillard; et, au lieu qu'habitent les soucis, le sommeil ne reposera plus. Mais le sommeil doré règne sur la couche où vient s'étendre la jeunesse, la tête libre et les membres exempts de douleur. Ainsi donc, c'est, je m'assure, quelque maladie qui t'a fait lever si matin; ou bien, devinai-je juste, et notre Roméo ne serait-il pas entré cette nuit dans son lit?

ROMÉO.--Cette dernière conjecture est la vraie, et mon repos n'en a été que plus doux.

FRÈRE LAURENCE.--Dieu pardonne au péché! Étais-tu avec Rosaline?

ROMÉO.--Avec Rosaline? Non, mon père spirituel: j'ai oublié ce nom, et les douleurs attachées à ce nom.

FRÈRE LAURENCE.--Tu es mon bon fils. Mais où donc as-tu été?

ROMÉO.--Je te le dirai sans me le faire redemander. J'ai été à une fête chez mon ennemi, et là j'ai tout à coup reçu une blessure de quelqu'un que j'ai blessé. Notre guérison à tous deux dépend de tes secours et de ta sainte médecine; je ne ressens point de haine, saint homme, car tu le vois, je te prie également en faveur de mon ennemi.

FRÈRE LAURENCE.--Parle simplement, mon bon fils, et va au but sans détour: une confession vague ne reçoit qu'une absolution vague.

ROMÉO.--Sache donc clairement que la charmante fille du riche Capulet est l'objet de mes plus chères amours; et de même que je lui ai donné mon coeur, elle m'a donné le sien, et tout est conclu, sauf ce que tu dois conclure par un saint mariage. Quand, où, comment nous nous sommes vus, nous nous sommes parlés d'amour, nous avons échangé nos serments, c'est ce que je te dirai avec le temps; mais ce que je te demande, c'est de consentir à nous marier aujourd'hui.

FRÈRE LAURENCE.--Bienheureux saint François, quel changement est ceci? Rosaline, que vous aimiez si chèrement, est-elle donc si promptement abandonnée? L'amour des jeunes gens n'est pas véritablement dans le coeur, il n'est que dans les yeux. _Jésus Maria!_ quelle abondance de larmes a lavé tes joues pâles pour Rosaline! que d'eau salée prodiguée en vain pour assaisonner un amour que tu ne goûteras pas! Le soleil n'a pas encore éclairci le ciel chargé de tes soupirs; tes gémissements passés résonnent encore à mon oreille vieillie; tiens, voilà encore sur ta joue la trace d'une ancienne larme que tu n'as pas effacée. Si jamais tu fus toi-même, si ces douleurs ont existé pour toi, toi et tes douleurs, tout était pour Rosaline, et tu es changé! Prononce donc cet arrêt: il est permis aux femmes de faillir, puisque les hommes manquent de force.

ROMÉO.--Tu m'as souvent grondé d'aimer Rosaline.

FRÈRE LAURENCE.--D'idolâtrer, mon fils, non pas d'aimer.

ROMÉO.--Tu m'ordonnais d'ensevelir mon amour.

FRÈRE LAURENCE.--Non pas de mettre l'un en terre pour en faire sortir un autre.

ROMÉO.--Je t'en prie, ne me gronde pas; celle que j'aime maintenant me rend bonheur pour bonheur, m'accorde amour pour amour; l'autre n'en usait pas ainsi.

FRÈRE LAURENCE.--Oh! qu'elle savait bien que ton amour lisait par coeur, et ne savait pas épeler!--Viens, jeune inconstant, viens avec moi: un motif m'engage à te secourir. Peut-être cette alliance sera-t-elle assez heureuse pour changer en affection véritable la haine de vos deux familles.

ROMÉO.--Oh! partons: je tiens à ce que nous nous hâtions au plus vite.

FRÈRE LAURENCE.--Sagement et lentement: qui court trébuche.

(Ils sortent.)

SCÈNE IV

Une rue de Vérone.

BENVOLIO, MERCUTIO.

MERCUTIO.--Où diable ce Roméo peut-il être? N'est-il pas rentré chez lui cette nuit?

BENVOLIO.--Il n'est pas rentré chez son père; j'ai parlé à son domestique.

MERCUTIO.--C'est toujours cette pâle cruelle, cette Rosaline, qui le tourmente tant que pour sûr il deviendra fou.

BENVOLIO.--Tybalt, le neveu du vieux Capulet, a envoyé une lettre à la maison de son père.

MERCUTIO.--C'est un cartel, sur ma vie.

BENVOLIO.--Roméo y répondra.

MERCUTIO.--Tout homme qui sait écrire peut répondre à une lettre.

BENVOLIO.--Mais il répondra à l'auteur de la lettre défi pour défi.

MERCUTIO.--Hélas! le pauvre Roméo! il est déjà mort; assassiné par les yeux noirs d'une fille blanche, l'oreille traversée d'un chant d'amour, le coeur percé au beau milieu par le trait du petit archer aveugle, est-ce là un homme en état de faire tête à Tybalt?

BENVOLIO.--Quel homme est-ce donc que ce Tybalt?

MERCUTIO.--Autre chose que le roi des chats[37], je vous en réponds; le plus fier champion de la courtoisie: il se bat comme vous chantez un air sur la note; il garde les temps, la mesure, les distances; il prend le repos d'une note noire, une, deux, et la troisième dans le corps; il vous perce à mort un bouton de soie. Un duelliste, un duelliste; un gentilhomme de la première main, ferme sur la première et la seconde cause[38]: _Ah! la botte immortelle, le revers, le ha!_

[Note 37: On trouve dans de vieux contes un Tybalt, roi des chats.]

[Note 38: _A gentleman of the very first cause, of the first and second cause._ Il y avait des livres où étaient traitées les règles du point d'honneur, et les diverses causes de querelles, qu'on appelait la première, la seconde, la troisième cause.]

BENVOLIO.--Que veux-tu dire?

MERCUTIO.--La peste soit de ces fats ridicules et prétentieux, avec leur grasseyement et leur manière de changer la prononciation. Par Jésus! _une excellente lame! un homme de fort belle taille! une très-bonne créature[39]!_ N'est-ce pas, mon cher grand-père, une chose déplorable, que nous soyons affligés de ces insectes étrangers, ces colporteurs de nouvelles modes, ces _pardonnez-moi_, si attachés aux formes actuelles qu'ils ne sauraient plus se trouver à l'aise sur nos vieux bancs? Ah! leurs _os_, leurs os[40]!

[Note 39: _A very good whore._]

[Note 40: O _their_ bons! _their_ bons! et dans l'ancienne édition _their bones! their bones_. Il est clair que Mercutio veut jouer sur le mot _bones_ (os) et sur le mot français _bon_ employé par ceux qui prétendaient aux belles manières.]

(Entre Roméo.)

BENVOLIO.--Voici Roméo! voici Roméo!

MERCUTIO.--Tout évidé comme un hareng sec. Oh! chair, chair, comme tu ressembles à du poisson! Le voilà pour toute nourriture aux vers qui coulaient de la veine de Pétrarque; mais auprès de sa dame, Laure n'était qu'une servante de cuisine, quoiqu'elle eût un amoureux plus habile à rimer pour elle; Didon n'était qu'une dondon; Cléopâtre qu'une Égyptienne; Hélène et Héro, des créatures, des courtisanes; Thisbé un oeil gris ou quelque chose comme cela. Mais ce n'est pas de cela qu'il s'agit.--Seigneur Roméo, _bonjour_: voilà un salut à la française en l'honneur de vos hauts-de-chausses français. Vous nous avez joliment donné le change hier au soir.

ROMÉO.--Bonjour, vous deux. Comment vous ai-je donné le change[41]?

[Note 41: _The slip, sir, slip._ Jeu de mots qui roule sur _the slip_, qui veut dire s'échapper, et est aussi le nom d'une pièce de monnaie souvent fausse _(counterfeit.)_]

MERCUTIO.--Une escapade, une escapade, mon cher. Vous ne comprenez pas.

ROMÉO.--Pardon, cher Mercutio, j'étais fort occupé; et, dans ma position, il est permis de faillir à quelques révérences[42].

[Note 42: ROMÉO._--Pardon, good Mercutio, my business was great; and in such case as mine, a man may strain courtesy._

MERCUTIO.--_That's as much as to say--such a case as yours constrains a man to bow in the hams._

ROMÉO.--_Meaning to courtesy._

MERCUTIO.--_Thou hast most kindly hit it._

ROMÉO.--_A most courteous exposition._

MERCUTIO.--_Nay, I am the very pink of courtesy._

ROMÉO.--_Pink for flower._

MERCUTIO.--_Right._

ROMÉO--_Why, then is my pump well flowered._

MERCUTIO.--_Well said: follow me this jest now, till thou hast worn thy pump; that, when the single sole of it is worn, the jest may remain, after the wearing, solely singular._

ROMÉO.--_O single-soled jest, solely singular for the singleness!_

MERCUTIO.--_Come between us, good Benvolio; my wits fail._

ROMÉO.--_Switch and spurs, switch and spurs, or I'll cry a match._

MERCUTIO.--_Nay, if thy wits run the wild goose chace, I have done, for thou hast more of the wild goose in one of thy wits, than, I am sure, I have in my whole five: Was I with you there for the goose?_

ROMÉO.--_Thou wast never with me for anything, when thou wast not there for the goose._

MERCUTIO.--_I will bite thee by thee ear for that jest._

ROMÉO.--_Nay, good goose, bite not._

MERCUTIO.--_Thy wit is a very bitter sweeting; it is a most sharp sauce._

ROMÉO.--_And is it not well served in to a sweet goose?_

MERCUTIO.--O, _here's a wit of cheverel, that stretches from an inch narrow to an ell broad!_

ROMÉO.--_I stretch it out for that word--broad: which added to the goose, proves thee far and wide a broad goose._

Il a fallu, en traduisant, se contenter de l'à peu près, la liberté de quelques-unes des plaisanteries, et la puérile recherche de jeux de mots qui fait le sel de presque toutes, les rendant impossibles à traduire exactement.

La première de ces plaisanteries porte sur le mot _courtesy_, qui signifie _révérence_ et _politesse_.

Pour entendre la seconde, il faut savoir que les danseurs portaient des souliers brodés en fleurs ou attachés avec des rubans en forme de fleurs.

La chasse _de l'oie sauvage_ fait allusion à une espèce de course de chevaux qu'on nommait ainsi, et qui consistait à attacher deux chevaux ensemble avec une longe: celui qui gagnait les devants obligeait l'autre à le suivre partout où il lui plaisait; et, lorsque l'un des deux coureurs avait mis son compagnon dans l'impossibilité de le suivre, il était regardé comme vainqueur.]

MERCUTIO.--C'est comme si vous disiez qu'un homme dans votre position est obligé de fléchir du jarret.

ROMÉO.--Vous voulez dire faire la révérence.

MERCUTIO.--Tu as très-obligeamment deviné.

ROMÉO.--C'est là une explication fort polie.

MERCUTIO.--Oh! je me pique de politesse.

ROMÉO.--Tu en es la fleur.

MERCUTIO.--Assurément.

ROMÉO.--La fleur de chardon qui se pique à mes souliers.

MERCUTIO.--Bien répondu. Maintenant c'est une pointe qu'il te faut suivre jusqu'à ce que tes souliers soient usés, parce qu'au moins, quand les souliers seront partis de la semelle, il t'en restera la pointe qui sera seule de son espèce.

ROMÉO.--Tu conviendras qu'elle est boiteuse, celle-là: tout son mérite, c'est de n'avoir pas sa pareille.

MERCUTIO.--Benvolio, viens nous séparer; mon esprit est rendu.

ROMÉO.--Donne du fouet et de l'éperon, du fouet et de l'éperon, ou je demande un autre coureur.

MERCUTIO.--Oh! ma foi, si tu cours la chasse de l'oie sauvage, j'ai fini, car tu tiens plus de l'oie sauvage dans un seul de tes sens, que moi, j'en suis sûr, dans tous les cinq.--Est-ce donc la course de l'oie que je faisais avec vous?

ROMÉO.--Je ne t'ai jamais vu avec moi nulle part que ce ne fût pour faire l'oie.

MERCUTIO.--Je vais te mordre l'oreille pour cette mauvaise plaisanterie.

ROMÉO.--Non, bonne oie, ne mords pas.

MERCUTIO.--C'est ton esprit qui a du mordant; il fait la sauce un peu âpre.

ROMÉO.--Il n'en vaut que mieux pour une oie douce.

MERCUTIO.--Oh! pour celui-là, il prête comme une peau de chevreuil, de la largeur d'un pouce à la longueur d'une demi-toise.

ROMÉO.--Ce qui veut dire qu'en long et en large tu n'es autre chose qu'une grosse oie.

MERCUTIO.--Eh bien, ceci ne vaut-il pas mieux que de gémir d'amour? Te voilà sociable maintenant, te voilà Roméo; te voilà tel que tu es par éducation et par nature; car cet imbécile d'Amour ressemble à un grand nigaud qui court niaisement çà et là pour trouver où cacher sa marotte dans un trou[43].

[Note 43: _That runs lolling up and down to hide his bauble in a hole._]

BENVOLIO.--Allons, allons, ne va pas plus loin.

MERCUTIO.--Ne voilà-t-il pas que tu me coupes la parole au beau milieu de l'histoire?

ROMÉO.--Tu allais l'étendre à n'en pas finir.

MERCUTIO.--Oh! tu te trompes, j'aurais été fort court; j'avais traité la matière à fond, et ne prétendais pas occuper le tapis plus longtemps.

(Entrent la nourrice et Pierre.)

ROMÉO.--Voilà une bonne figure.

MERCUTIO.--Une voile! une voile! une voile!

BENVOLIO.--Il y en a bien deux, une jupe et un caleçon[44].

[Note 44: _A shirt and a smock_, une chemise de femme et une chemise d'homme.]

LA NOURRICE.--Pierre!

PIERRE.--Me voilà!

LA NOURRICE.--Pierre, mon éventail.

MERCUTIO.--Je t'en prie, donne-le-lui, Pierre, pour cacher son visage: son éventail est le plus beau des deux.

LA NOURRICE.--Dieu vous donne le bonjour, cavaliers.

MERCUTIO.--Dieu vous donne le bonsoir[45], belle dame.

[Note 45: _God ye good den, fair gentlewoman._

NURS.--_Is it good den?_

MERC.--_It is no less, I tell you, for the hand of the dial is now upon the first of noon; good den_ s'employait quelquefois pour _goodeven_ (bonsoir).]

LA NOURRICE.--Sommes-nous déjà au soir?

MERCUTIO.--Assurément; la main impudente du cadran est sur le point de midi.

LA NOURRICE.--Ôtez-vous de mon chemin. Quel homme êtes-vous donc?

ROMÉO.--Un homme, ma bonne, ma bonne dame, que Dieu a créé pour se faire tort à lui-même.

LA NOURRICE.--Bien dit, par ma foi.--Pour se faire tort à lui-même, dit-il?--Cavaliers, quelqu'un de vous saura-t-il me dire où je pourrais trouver le jeune Roméo?

ROMÉO.--Je puis vous le dire; mais je vous préviens que le jeune Roméo sera plus vieux quand vous l'aurez trouvé qu'il ne l'était quand vous vous êtes mise à le chercher. Je suis le plus jeune du nom, faute de pis.

LA NOURRICE.--Vous dites fort bien.

MERCUTIO.--Quoi, le pis est bien? C'est le bien prendre, ma foi, sagement, sagement.

LA NOURRICE.--Si vous êtes Roméo, seigneur, je voudrais vous entretenir un instant en particulier.

BENVOLIO.--Elle veut l'inviter _à_ quelque souper.

MERCUTIO.--Une entremetteuse! une entremetteuse! une entremetteuse[46]! holà, hé!

[Note 46: _So ho!_ Cri des chasseurs quand ils ont fait lever le lièvre.]

ROMÉO.--Qu'as-tu donc trouvé?

MERCUTIO.--Ce n'est pas un lièvre, mon cher, à moins que ce ne soit un lièvre dans un pâté de carême, quelque peu passé et moisi avant qu'on puisse le finir.

Un vieux lièvre moisi Et un vieux lièvre moisi Est un très-beau plat pour le carême; Mais dans un lièvre moisi Il y a trop à manger pour vingt personnes S'il est moisi avant d'être fini.

Roméo, rentrez-vous chez votre père? Nous y dînerons.

ROMÉO.--Je vais vous suivre.

MERCUTIO.--Adieu, vieille madame; adieu, madame, madame, madame[47].

[Note 47: _Ladies, ladies, ladies_, refrain d'une vieille chanson.]

(Mercutio et Benvolio sortent.)

LA NOURRICE.--Adieu, de tout mon coeur.--Qu'est-ce donc, s'il vous plaît, seigneur, que ce marchand d'insolences qui était si plein de ses sottises?

ROMÉO.--C'est un homme, nourrice, qui aime à s'entendre parler, et qui en dit plus en une minute qu'il n'en fait en un mois.

LA NOURRICE.--S'il s'avise de rien dire contre moi, je le ferai bien taire, voyez-vous, fût-il plus fort qu'il ne l'est, lui et vingt gamins de son espèce; et, si je ne pouvais pas, je trouverais bien qui m'aiderait. Vilain polisson! Je ne suis pas de ses coureuses, moi, je

ne suis pas de ses camarades de couteau.--Et toi aussi, il faut que tu te tiennes là et que tu laisses le premier polisson user de moi à son plaisir!

PIERRE.--Je n'ai vu personne user de vous à son plaisir; si je l'avais vu, mon épée aurait été bientôt dehors, je vous en réponds; je dégaine aussi vite qu'un autre quand je vois l'occasion d'une bonne querelle et que j'ai la loi de mon côté.

LA NOURRICE.--En vérité, je le dis devant Dieu, je suis si en colère que je tremble de tous mes membres. Vilain polisson!--Seigneur, un mot, je vous prie. Comme je vous l'ai dit, ma jeune maîtresse m'a envoyée vous chercher: ce qu'elle m'a chargée de vous dire je le garderai pour moi. Mais laissez-moi vous dire d'abord que si vous aviez l'intention de la mener dans le paradis des fous, comme on dit, ce serait un bien vilain procédé, comme on dit; car la demoiselle est jeune, et par conséquent si vous étiez double avec elle, ce serait une chose qui n'est pas à faire vis-à-vis d'une jeune demoiselle, et une conduite fort méprisable.

ROMÉO.--Nourrice, recommande-moi à ta dame et maîtresse. Je te proteste...

LA NOURRICE.--Bon coeur! oui, ma foi, je lui dirai tout cela. Seigneur, seigneur! qu'elle va être une femme contente!

ROMÉO.--Que lui diras-tu, nourrice? Tu ne m'écoutes pas.

LA NOURRICE.--Je lui dirai, seigneur, que vous _protestez_; et c'est là, je le vois bien, parler en gentilhomme[48].

[Note 48: _Je vous proteste_ était, à ce qu'il paraît, une des locutions françaises les plus indispensables à un homme du bel air.]

ROMÉO.--Dis-lui de trouver quelque prétexte pour aller à confesse cette après-midi; elle viendra à la cellule de frère Laurence, qui la confessera et la mariera. Voilà pour ta peine.

LA NOURRICE.--Non, en vérité, seigneur, pas une obole.

ROMÉO.--Allez, allez, je vous dis que vous l'accepterez.

LA NOURRICE.--Cette après-midi, seigneur? Bien, elle s'y trouvera.

ROMÉO.--Et toi, bonne nourrice, va attendre derrière le mur de l'abbaye; avant une heure mon domestique t'y rejoindra et te portera des cordes tressées en échelle, qui, dans le mystérieux silence de la nuit, m'élèveront au dernier degré du plus glorieux bonheur. Adieu, sois fidèle, et je reconnaîtrai tes soins. Adieu! recommande-moi à ta maîtresse.

LA NOURRICE.--Que le Dieu du ciel vous bénisse!--Un mot, seigneur.

ROMÉO.--Que me veux-tu, chère nourrice?

LA NOURRICE.--Votre domestique est-il discret? Vous avez peut-être ouï dire que deux personnes peuvent garder un secret quand on en a mis une à la porte?

ROMÉO.--Je te garantis mon domestique fidèle comme l'acier.

LA NOURRICE.--Bien, seigneur. Ma maîtresse est la plus douce créature..... Oh! seigneur, seigneur, lorsqu'elle était encore une petite babillarde...--Il y a dans la ville un noble cavalier, un certain Pâris qui voudrait bien en tâter; mais elle, la bonne âme, aimerait autant voir un crapaud, oui, un crapaud, que de le voir. Pour la mettre en colère, je lui dis quelquefois que Pâris est le plus joli garçon des deux; mais je vous réponds que, quand je lui dis cela, elle devient aussi blanche que quelque linge qui soit au monde.--_Romarin_ et _Roméo_ ne commencent-ils pas tous deux par la même lettre[49]?

[Note 49: Le romarin était un emblème de fidélité, mais l'R s'appelait la lettre de chien, parce qu'ils paraissent la prononcer dès qu'ils commencent à montrer les dents, et la nourrice, qui ne sait pas lire, croit que Roméo veut se moquer d'elle en lui disant que son nom commence par un R.]

ROMÉO.--Oui, nourrice; pourquoi? Tous deux commencent par un R.

LA NOURRICE.--Ah! moqueur que vous êtes! c'est le nom du chien. R est pour le chien. Non, cela commence par une autre lettre, je le sais bien, et elle a fait de ça la plus jolie petite versification de vous et de _Romarin_, ça vous ferait plaisir à entendre.

ROMÉO.--Parle de moi à ta maîtresse.

LA NOURRICE.--Oui, mille et mille fois. Pierre!

(Roméo sort.)

PIERRE.--Me voilà.

LA NOURRICE.--Prends mon éventail et marche devant.

(Ils sortent.)

SCÈNE V

Le jardin de Capulet.

JULIETTE.

JULIETTE.--Neuf heures sonnaient quand j'ai envoyé la nourrice: elle m'avait promis qu'elle serait de retour au bout d'une demi-heure; peut-être n'aura-t-elle pu le trouver. Non, ce n'est pas cela.--Oh! elle est boiteuse! La messagère de l'Amour devrait être la pensée, dix fois plus rapide que les rayons du soleil lorsqu'ils chassent les ombres des sombres collines. Aussi l'Amour est-il traîné par des colombes aux ailes agiles; aussi, prompt comme le vent, Cupidon porte-t-il des ailes.--Déjà le soleil arrive au point le plus élevé de sa course journalière, et depuis neuf heures jusqu'à midi il s'est écoulé trois longues heures, et cependant elle ne revient pas. Si elle avait les affections et le sang brûlant de la jeunesse, son mouvement serait aussi prompt que celui d'une balle; d'un mot je la ferais bondir vers mon tendre amant, et un mot de lui me la renverrait. Mais ces vieilles gens, il semble qu'ils soient morts; on ne saurait les remuer; ils sont d'une lenteur! lourds et pâles comme le plomb! (_Entrent la nourrice et Pierre._)--O Dieu! la voilà qui revient. O ma douce nourrice! quelle nouvelle? l'as-tu vu? L'as-tu trouvé? Renvoie ton valet.

LA NOURRICE.--Pierre, restez à la porte.

JULIETTE.--Eh bien, bonne, chère nourrice?--O Dieu! pourquoi cet air triste? Eusses-tu de mauvaises nouvelles, annonce-les moi gaiement; si elles sont bonnes, c'est faire honte à la musique des douces nouvelles que de me les dire sur un air si discordant.

LA NOURRICE.--Je suis fatiguée; laissez-moi me reposer un moment. Fi donc! comme les os me font mal! Ai-je assez couru!

JULIETTE.--Je voudrais que tu eusses mes os et moi tes nouvelles..... Je t'en prie, allons, parle; bonne, bonne nourrice, parle.

LA NOURRICE.--Jésus! que vous êtes pressée! ne pouvez-vous pas attendre un instant? Ne voyez-vous pas que je suis hors d'haleine?

JULIETTE.--Comment peux-tu être hors d'haleine, puisque tu en as assez pour me dire que tu es hors d'haleine? Les raisons que tu me donnes pour me faire attendre sont plus longues que le récit que tu me refuses. Tes nouvelles sont-elles bonnes ou mauvaises? Réponds à cela _oui_ ou _non_, et après j'attendrai patiemment les détails. Contente-moi; sont-elles bonnes ou mauvaises?

LA NOURRICE.--Eh bien! vous avez fait le choix d'une sotte; vous n'entendez rien à choisir un homme. Roméo! Non, ce n'est pas ça.--Quoiqu'il soit plus beau de visage que personne, malgré cela, il a la jambe mieux faite que tous les autres. Pour la main, le pied, la taille, il n'en faut pas parler; cependant ça n'a pas son pareil. Il n'est pas la fleur de la politesse!... non! mais, j'en réponds, il a la douceur d'un agneau. Va ton chemin, jeune fille, et sers Dieu.--Comment! est-ce qu'on a dîné ici?

JULIETTE.--Non, non, mais je savais déjà tout cela. Que dit-il de notre mariage? qu'en dit-il?

LA NOURRICE.--Ah Dieu! que la tête me fait mal! Quelle tête j'ai! elle me bat comme si elle allait se fendre en mille pièces; et mon dos, de l'autre côté! oh! le dos! le dos! Vous devriez vous maudire d'avoir eu le coeur de m'envoyer comme cela me tuer à courir de tous côtés.

JULIETTE.--En vérité, je suis bien fâchée de te voir souffrir. Chère, chère, chère nourrice, réponds; que dit mon amant?

LA NOURRICE.--Votre amant parle comme un honnête gentilhomme, poli, obligeant, gracieux, et, j'en réponds, plein de vertu.--Où est votre mère?

JULIETTE.--Où est ma mère? Eh bien! elle est là dedans. Où veux-tu qu'elle soit? Que tu me réponds singulièrement! _Votre amant parle comme un honnête gentilhomme... Où est votre mère?_

LA NOURRICE.--Oh! bonne sainte Vierge! est-ce que le feu y est? Ma foi! comme vous voudrez; si c'est là l'emplâtre que vous mettez sur mes os malades, vous pourrez dorénavant faire vos commissions vous-même.

JULIETTE.--Est-ce donc la peine de se fâcher ainsi? Allons! que dit Roméo?

LA NOURRICE.--Avez-vous obtenu la permission d'aller à confesse aujourd'hui?

JULIETTE.--Oui.

LA NOURRICE.--Eh bien! dépêchez-vous de vous rendre à la cellule du père Laurence; il y a là un mari qui va vous rendre femme. A présent, voilà le sang léger qui vous monte aux joues: elles deviennent écarlates à la moindre nouvelle. Dépêchez-vous d'aller _à_ l'église; moi, il faut que j'aille d'un autre côté chercher une échelle au moyen de laquelle votre amant grimpera aussitôt qu'il fera nuit, pour vous dénicher un oiseau. J'ai toute la peine, et je travaille pour votre plaisir; mais bientôt, ce soir, vous aurez votre part du fardeau. Allez, je vais dîner; dépêchez-vous de vous rendre à la cellule.

JULIETTE.--De voler au plus beau sort.--Excellente nourrice, adieu.

(Elles sortent.)

SCÈNE VI

La cellule du frère Laurence.

Entrent FRÈRE LAURENCE et ROMÉO.

FRÈRE LAURENCE.--Veuille le ciel, souriant à notre cérémonie sainte, ne pas envoyer le chagrin nous la reprocher dans les heures à venir!

ROMÉO.--_Amen, amen._ Mais viennent les chagrins qui pourront, ils ne suffiront pas à payer le bonheur que me donne un seul et court instant de sa vue. Unissez seulement nos mains au son des paroles sacrées, et qu'ensuite la mort, qui dévore l'amour, fasse tout ce qu'elle peut oser; c'en est assez pour moi d'avoir pu la nommer mienne.

FRÈRE LAURENCE.--Ces violents transports ont une fin violente au milieu de leur triomphe, comme la poudre et le feu, que le même instant voit s'unir et s'épuiser. Le miel le plus doux rassasie par sa délicieuse saveur, et dans les plaisirs du goût s'éteint l'appétit. Aimez donc avec modération; ainsi font les longues amours: qui va trop vite arrive aussi tard que qui va trop lentement. _(Entre Juliette.)_--Voici la dame. Oh! un pied si léger n'usera jamais ces pierres inaltérables. Un amant monterait à cheval sur ces fils qui l'été flottent dans le vague de l'air, qu'il ne tomberait point à terre, tant sont légères les vanités de ce monde.

JULIETTE.--Je souhaite le bonjour à mon vénérable confesseur.

FRÈRE LAURENCE.--Roméo, ma fille, te remerciera pour nous deux.

JULIETTE.--Je lui en souhaite autant à lui-même, sans quoi ses remerciements seraient un prix trop élevé.

ROMÉO.--Ah! Juliette, si la mesure de ta joie est comblée comme la mienne, et que tu aies plus de talent pour la peindre, parfume de ton haleine l'air qui nous environne, et que la brillante harmonie de ta voix déploie les images du bonheur que nous recevons l'un de l'autre en une si chère entrevue.

JULIETTE.--Il est des pensées qui sont plus riches de fond que de paroles, et qui se sentent de leur trésor et non de leur parure. Ils sont dans la misère ceux qui peuvent calculer ce qu'ils possèdent. Mais tel est l'excès de fortune où s'est élevé mon sincère amour, que je ne saurais compter seulement jusqu'à moitié la valeur de mes richesses.

FRÈRE LAURENCE.--Allons, allons, venez avec moi, et nous aurons bientôt fait; car, avec votre permission, vous ne resterez pas seuls jusqu'à ce que la sainte Église ait fait de vous deux une seule chair.

(Ils sortent.)

FIN DU DEUXIÈME ACTE.

ACTE TROISIÈME

SCÈNE I

Un lieu public.

Entrent BENVOLIO, MERCUTIO, UN PAGE _et des_ VALETS.

BENVOLIO.--Je t'en prie, cher Mercutio, retirons-nous. Le jour est brûlant, les Capulet sont dehors, si nous venons à les rencontrer, jamais nous n'éviterons une querelle, car dans ces chaleurs où nous sommes le sang bouillonne avec furie[50].

[Note 50: _In the warm time the people for the most part be more unruly._

P. Smith, _Commonwealth of England_.]

MERCUTIO.--Tu ressembles à ces hommes qui, en entrant dans une taverne, vous campent leur épée sur la table en disant: «Dieu me fasse la grâce de n'avoir pas besoin de toi,» et qui n'ont pas plutôt senti l'effet du second verre de vin qu'ils la tirent contre le cabaretier, lorsqu'il n'y en a réellement aucun besoin.

BENVOLIO.--Moi! je ressemble à ces gens-là?

MERCUTIO.--Allons, allons, tu es dans ton espèce un gaillard aussi bouillant que personne en Italie, aussi prompt à t'emporter et aussi emporté dans ta promptitude.

BENVOLIO.--Et à quoi revient ceci?

MERCUTIO.--C'est que, s'il y en avait deux comme toi, bientôt nous ne les aurions plus, car ils se tueraient l'un l'autre. Toi, tu te prendrais de querelle avec un homme pour un poil de plus ou de moins à la barbe; tu te prendrais de querelle avec un homme parce qu'il casserait des noisettes, sans autre raison, si ce n'est que tu as les yeux couleur de noisette. Quel autre oeil qu'un oeil ainsi fait pourrait découvrir un pareil sujet de querelle? Ta tête est pleine de querelles, comme l'oeuf est plein de nourriture; cependant elle a été rendue, à force de querelles et de coups, aussi vide qu'un oeuf éclos. N'as-tu pas cherché dispute à un homme sur ce qu'il toussait dans la rue, parce que cela éveillait ton chien qui dormait au soleil; à un tailleur, parce qu'il portait son habit neuf avant les fêtes de Pâques; à un autre encore, parce qu'un vieux ruban nouait ses souliers neufs? Et tu veux me faire la leçon pour m'empêcher de quereller?

BENVOLIO.--Si j'étais aussi querelleur que toi, le premier que je rencontrerais pourrait acheter le revenu de toute ma vie pour le prix d'une heure et quart.

MERCUTIO.--De toute ta vie, imbécile[51]!

[Note 51: _The fee simple of my life_! BENV.

The fee simple; oh! simple, MERCUT.

Ce jeu de mots de Mercutio a été impossible à rendre.]

(Entrent Tybalt et plusieurs autres.)

BENVOLIO.--Par mon chef, voici venir les Capulet.

MERCUTIO.--Par mon talon, je m'en moque.

TYBALT.--Tenez-vous près de moi, je veux leur parler.--Cavaliers, bonsoir; un mot avec un de vous.

MERCUTIO.--Rien qu'un seul mot avec un de nous? Accouplez quelque chose avec, que cela fasse un mot et un coup.

TYBALT.--Vous m'y trouverez assez disposé, mon gentilhomme, pour peu que vous m'en donniez l'occasion.

MERCUTIO.--Ne pouvez-vous prendre l'occasion sans qu'on vous la donne?

TYBALT.--Mercutio, tu es de concert avec Roméo.

MERCUTIO.--De concert? Comment! nous prend-il pour des ménétriers, c'est que si nous étions des ménétriers, faites attention que vous ne nous trouveriez pas d'accord avec vous. Voilà mon archet, voilà qui vous fera danser. Corbleu, de concert!

BENVOLIO.--Nous parlons ici dans un lieu fréquenté de tout le monde: ou retirons-nous en quelque lieu écarté, ou raisonnez tranquillement sur vos griefs, ou bien allons-nous-en; tous les yeux se fixent sur nous.

MERCUTIO.--Les hommes ont des yeux pour regarder. Qu'ils nous regardent, si cela leur plaît; pour moi, je ne bouge pas d'ici pour faire plaisir à qui que ce soit.

(Entre Roméo.)

TYBALT.--Eh bien! la paix soit avec vous, cavalier. J'aperçois mon homme.

MERCUTIO.--Que je sois pendu pourtant, mon gentilhomme, s'il porte votre livrée. Par ma foi, vous pouvez marcher devant sur le pré, il vous y suivra; et dans ce sens votre seigneurie peut dire qu'elle a trouvé son homme.

TYBALT.--Roméo, la haine que je te porte ne me permet pas un mot plus doux: tu es un traître.

ROMÉO.--Tybalt, les raisons que j'ai de t'aimer me font pardonner à la fureur qu'annonce un pareil salut. Je ne suis point un traître: ainsi donc, adieu, je vois que tu ne me connais pas.

TYBALT.--Jeune homme, cela ne répare point les outrages que tu m'as faits: ainsi reviens et mets l'épée à la main.

ROMÉO.--Je proteste que je ne t'ai jamais offensé, et que je t'aime plus que tu ne saurais le penser jusqu'à ce que tu connaisses les motifs de mon affection. Ainsi, brave Capulet, dont le nom m'est aussi cher que le mien, accepte cette satisfaction.

MERCUTIO.--Oh! lâche sang-froid! déshonorante soumission!--_A la stoccata_, pour effacer cela. Tybalt, le preneur de rats, voulez-vous faire un tour avec moi?

TYBALT.--Que veux-tu de moi?

MERCUTIO.--Bon roi des chats, rien du tout qu'une de vos neuf vies, afin d'en faire ce qu'il me plaira; et ensuite, selon que vous en userez à mon égard, je pourrai bien battre à plat les huit autres. Veuillez donc prendre votre épée par les oreilles pour la faire sortir de son étui, et dépêchez-vous; ou bien, avant qu'elle soit dehors, la mienne sera sur vos oreilles.

TYBALT, _tirant l'épée._--Je suis à vous.

ROMÉO.--Cher Mercutio, remets ton épée.

MERCUTIO.--Allons, mon gentilhomme, votre passade.

(Il se battent.)

ROMÉO.--Tire ton épée, Benvolio, désarmons-les.--Gentilshommes, c'est une honte: ne tombez pas dans une pareille désobéissance.--Tybalt, Mercutio, le prince a expressément défendu toute querelle dans les rues de Vérone.--Tybalt, arrêtez.--Cher Mercutio.....

(Sortent Tybalt et ses partisans.)

MERCUTIO.--Je suis blessé! Malédiction sur les deux maisons! me voilà expédié!--Est-ce qu'il est parti, et sans rien avoir?

BENVOLIO.--Quoi, tu es blessé?

MERCUTIO.--Oui, oui, une égratignure: par ma foi, c'est assez. Où est mon page?--Drôle, va chercher un chirurgien.

(Le page sort.)

ROMÉO.--Prends ton courage, ami, ta blessure ne peut être grave.

MERCUTIO.--Non, elle n'est pas aussi profonde qu'un puits, ni aussi large que la porte d'une église; mais c'en est assez, elle suffira. Venez me voir demain matin, et vous me trouverez tombé[52] dans le sérieux. Je suis poivré, j'en réponds, du moins pour

ce monde-ci. Malédiction sur vos deux maisons! Corbleu! un chien, un rat, une souris, un chat, égratigner un homme à mort! un bravache, un faquin, un traître, qui ne combat que par règles d'arithmétique! pourquoi diable êtes-vous venu vous jeter entre nous deux? J'ai reçu le coup par-dessous votre bras.

[Note 52: _A grave man_, un homme grave et un homme bon pour le tombeau.]

ROMÉO.--Je faisais pour le mieux.

MERCUTIO.--Aidez-moi, Benvolio, à entrer dans quelque maison voisine, ou bien je vais m'évanouir. Malédiction sur vos deux maisons! elles ont fait de moi une pâture à vers. Oh! j'ai la botte et bien à fond. Ah! vos deux maisons!

(Mercutio et Benvolio sortent.)

ROMÉO.--C'est pour moi que ce gentilhomme, le proche parent du prince, mon intime ami, a reçu cette blessure mortelle: ma réputation est entachée par l'affront que m'a fait Tybalt; Tybalt, mon parent depuis une heure! O chère Juliette! ta beauté a fait de moi un homme efféminé, elle a amolli la trempe vigoureuse de mon courage.

(Entre Benvolio.)

BENVOLIO.--O Roméo, Roméo! le brave Mercutio est mort: cette âme généreuse, dédaignant trop tôt la terre, s'est élevée vers les nuages.

ROMÉO.--Les noires destinées de ce jour vont s'étendre sur des jours nombreux: celui-ci commence seulement les malheurs, d'autres les finiront.

(Rentre Tybalt.)

BENVOLIO.--Voici le furieux Tybalt qui revient.

ROMÉO.--Vivant, triomphant, et Mercutio est tué! Retourne dans les cieux, prudente douceur, et toi, fureur à l'oeil enflammé, sois maintenant mon guide.--A présent, Tybalt, reprends pour toi ce nom de traître que tu me donnais tout à l'heure: l'âme de Mercutio, arrêtée à peu de distance au-dessus de nos têtes, attend que la tienne vienne lui tenir compagnie. Il faut que toi ou moi, ou tous les deux, nous allions le rejoindre.

TYBALT.--C'est toi, qui étais ici-bas de son parti, misérable enfant, qui dois l'aller trouver.

ROMÉO.--Voici qui en décidera.

(Ils se battent. Tybalt tombe.)

BENVOLIO.--Fuis, Roméo; va-t'en: les citoyens sont en alarme, et Tybalt est tué. Ne reste point ainsi dans la stupeur. Le prince va te condamner à mort si tu es pris. Fuis, sauve-toi, va-t'en.

ROMÉO.--Oh! je suis le jouet de la fortune[53].

[Note 53: _I am fortune's fool._]

BENVOLIO.--Pourquoi es-tu encore ici?

(Roméo sort.)

(Entrent des citoyens, etc.)

UN CITOYEN.--Par quelle rue s'est-il enfui, celui qui a tué Mercutio? Tybalt, cet assassin, par où s'est-il sauvé?

BENVOLIO.--Le voilà étendu là, ce Tybalt.

LE CITOYEN.--Levez-vous, seigneur, suivez-moi, je vous somme au nom du prince; obéissez.

(Entrent le prince et sa suite, Montaigu, Capulet, leurs femmes et autres personnages.)

LE PRINCE.--Où sont les vils auteurs de ce tumulte?

BENVOLIO.--Noble prince, je puis raconter toutes les malheureuses circonstances de cette fatale querelle. Voilà celui que le jeune Roméo a tué, et qui avait tué ton parent le brave Mercutio.

LA SIGNORA CAPULET.--Tybalt! mon neveu! ô fils de mon frère! Cruelle vue! hélas! le sang de mon cher neveu tout répandu!--Prince, si tu es juste, pour notre sang, le sang des Montaigu doit être versé.--Mon neveu, mon neveu!

LE PRINCE.--Benvolio, qui a commencé cette rixe sanglante?

BENVOLIO.--Tybalt, que vous voyez ici tué de la main de Roméo. Roméo lui a parlé raisonnablement; il l'a prié de considérer combien la querelle était légère; il lui a représenté en outre quel serait votre courroux. Tout cela dit d'un ton plein de douceur, d'un regard tranquille, et même dans l'humble attitude d'un suppliant, n'a pu faire trêve à la violence désordonnée de Tybalt, qui, sourd aux paroles de paix, tourne la pointe de son épée contre le sein du brave Mercutio: celui-ci, tout aussi bouillant que lui, engage le fer homicide contre le fer, et, avec un dédain martial, d'une main écarte la froide mort, et de l'autre la renvoie à Tybalt, qui par son adresse la repousse vers lui. Roméo crie de toutes ses forces: «Arrêtez, amis; séparez-vous;» et d'un bras plus prompt que sa parole, il abaisse leurs pointes meurtrières et se précipite entre eux deux: mais un coup cruel de Tybalt se fait jour par-dessous le bras de Roméo, et atteint aux sources de la vie l'intrépide Mercutio. Alors Tybalt se sauve; mais quelques moments après il revient vers Roméo, chez qui venait de naître le désir de la vengeance: tous deux y courent comme la foudre; car avant que j'eusse eu le temps de tirer mon épée pour les séparer, le courageux Tybalt était tué. Roméo l'ayant vu tomber a pris la fuite. Voilà la vérité, ou Benvolio consent à mourir.

LA SIGNORA CAPULET.--Il est parent des Montaigu; l'affection le rend imposteur: il ne dit pas la vérité. Près de vingt d'entre eux ont combattu dans cette odieuse rencontre, et les vingt ensemble n'ont pu tuer qu'un seul homme. Je demande justice; et toi, prince, tu nous la dois: Roméo a tué Tybalt; Roméo ne doit plus vivre.

LE PRINCE.--Roméo a tué Tybalt, mais Tybalt a tué Mercutio: qui de vous payera le prix d'un sang si cher?

LA SIGNORA MONTAIGU.--Ce n'est pas Roméo, prince; il était l'ami de Mercutio: sa faute a seulement terminé la vie de Tybalt, comme l'aurait fait la loi.

LE PRINCE.--Et pour cette offense, nous l'exilons sur l'heure. Je suis intéressé dans l'effet de vos haines: mon sang coule ici pour vos querelles féroces; mais je saurai vous imposer une si forte amende que je vous ferai tous repentir de mes pertes. Je serai sourd à toute défense et à toute excuse; ni larmes ni prières ne pourront racheter de pareils délits: ne songez donc point à en faire usage. Que Roméo quitte ces lieux en toute hâte, ou l'heure qui l'y verra surprendre sera la dernière de sa vie. (_A sa suite._)--Emportez ce corps, et attendez mes ordres: la clémence devient meurtrière quand elle pardonne à l'homicide.

(Ils sortent.)

SCÈNE II

Un appartement dans la maison de Capulet.

Entre JULIETTE.

JULIETTE.--Qu'un galop rapide, coursiers aux pieds brûlants, vous emporte vers le palais du Soleil: de son fouet, un conducteur tel que Phaéton vous aurait précipités vers le couchant et aurait ramené la sombre Nuit. Étends ton épais rideau. Nuit qui couronne l'amour; ferme les yeux errants, et que Roméo puisse voler dans mes bras sans qu'on le dise et sans qu'on le voie. La lumière de leurs mutuelles beautés suffit aux amants pour accomplir leurs amoureux mystères; ou si l'Amour est aveugle, il ne s'en accorde que mieux avec la Nuit. Viens, Nuit obligeante, matrone aux vêtements modestes, tout en noir, apprends-moi à perdre au jeu de qui perd gagne, où l'enjeu est deux virginités sans tache; couvre de ton obscur manteau mes joues où se révolte mon sang effarouché, jusqu'à ce que mon craintif amour, devenu plus hardi dans l'épreuve d'un amour fidèle, n'y voie plus qu'un chaste devoir.--Viens, ô Nuit; viens, Roméo; viens, toi qui es le jour au milieu de la nuit; car sur les ailes de la nuit tu arriveras plus éclatant que n'est sur les plumes du corbeau la neige nouvellement tombée. Viens, douce nuit; viens, nuit amoureuse, le front couvert de ténèbres: donne-moi mon Roméo; et quand il aura cessé de vivre, reprends-le, et, partage-le en petites étoiles, il rendra la face des cieux si belle, que le monde deviendra amoureux de la nuit et renoncera au culte du soleil indiscret. Oh! j'ai acheté une demeure d'amour, mais je n'en suis pas encore en possession, et celui qui m'a acquise n'est pas encore en jouissance. Ce jour est aussi ennuyeux que la veille d'une fête pour l'enfant qui a une robe neuve et qui ne peut encore la mettre.--Oh! voilà ma nourrice. (_Entre

la nourrice avec une échelle de cordes._) Elle m'apporte des nouvelles, et la bouche qui prononce seulement le nom de Roméo devient l'organe d'une éloquence céleste.--Eh bien! nourrice, quelles nouvelles? Qu'as-tu là? l'échelle que Roméo t'a dit d'apporter?

LA NOURRICE.--Oui, oui, l'échelle.

(Elle la jette à terre.)

JULIETTE.--Ah ciel! quelles nouvelles? Pourquoi tordre ainsi tes mains?

LA NOURRICE.--O jour de malheur! il est mort, il est mort, il est mort! Nous sommes perdues, madame, nous sommes perdues. O malheureux jour! il n'est plus, il est tué, il est mort!

JULIETTE.--Le ciel a-t-il pu être si cruel?

LA NOURRICE.--Ce n'est pas le ciel, non; c'est Roméo. O Roméo! ô Roméo! qui l'aurait jamais pensé? Roméo!....

JULIETTE.--Quel démon es-tu, pour me tourmenter ainsi? L'horrible enfer devrait seul retentir des hurlements d'un pareil supplice. Roméo s'est-il tué lui-même? Dis seulement _oui_, et ce simple monosyllabe _oui_ renfermera plus de poison que l'oeil empoisonné du basilic. L'existence de ce _oui_[54] terminera la mienne; ou ferme ces yeux qui me répondent _oui_, ou s'il est mort dis _oui_, et s'il ne l'est pas dis _non_: qu'un mot bien court décide de mon bonheur ou de mon malheur.

[Note 54: Juliette joue sur le mot _I_, qui signifiait alors également _moi_ et _oui_, _I_ pour _yes_.]

LA NOURRICE.--J'ai vu la blessure, je l'ai vue de mes yeux, Dieu me pardonne! là, sur sa mâle poitrine. Un pauvre cadavre, un pauvre cadavre tout sanglant, pâle, pâle comme les cendres, tout souillé de sang, d'un sang tout noir. A cette vue je me suis évanouie.

JULIETTE.--Oh! manque, mon coeur! Pauvre banqueroutier, manque pour toujours[55]; emprisonnez-vous, mes yeux; ne jetez plus un seul regard sur la liberté. Terre vile, rends-toi à la terre; que tout mouvement s'arrête, et qu'une même bière presse de son poids et Roméo et toi.

[Note 55: _O break my heart, poor bankrupt, break at once; break_ signifie se briser et faire banqueroute.]

LA NOURRICE.--O Tybalt, Tybalt! le meilleur ami que j'eusse! O aimable Tybalt, honnête cavalier, faut-il que j'aie vécu pour te voir mort!

JULIETTE.--Quelle est donc cette tempête qui souffle ainsi dans les deux sens contraires? Roméo est-il tué, et Tybalt est-il mort? Mon cousin chéri et mon époux plus cher encore? Que la terrible trompette sonne donc le jugement universel. Qui donc est encore en vie, si ces deux-là sont morts?

LA NOURRICE.--Tybalt est mort, et Roméo est banni: Roméo, qui l'a tué, est banni.

JULIETTE.--O Dieu! la main de Roméo a-t-elle versé le sang de Tybalt?

LA NOURRICE.--Il l'a fait, il l'a fait! O jour de malheur! il l'a fait!

JULIETTE.--O coeur de serpent caché sous un visage semblable à une fleur! jamais dragon a-t-il choisi un si charmant repaire? Beau tyran, angélique démon, corbeau couvert des plumes d'une colombe, agneau transporté de la rage du loup, méprisable substance de la plus divine apparence, toi, justement le contraire de ce que tu paraissais à juste titre, damnable saint, traître plein d'honneur! O nature, qu'allais-tu donc chercher en enfer, lorsque de ce corps charmant, paradis sur la terre, tu fis le berceau de l'âme d'un démon? Jamais livre contenant une aussi infâme histoire porta-t-il une si belle couverture? et se peut-il que la trahison habite un si brillant palais?

LA NOURRICE.--Il n'y a plus ni sincérité, ni foi, ni honneur dans les hommes; tous sont parjures, corrompus, hypocrites. Ah! où est mon valet? Donnez-moi un peu d'_aqua vitæ_..... Tous ces chagrins, tous ces maux, toutes ces peines me vieillissent. Honte soit à Roméo!

JULIETTE.--Maudite soit ta langue pour un pareil souhait! Il n'est pas né pour la honte: la honte rougirait de s'asseoir sur son front; c'est un trône où on peut couronner l'honneur, unique souverain de la terre entière. Oh! quelle brutalité me l'a fait maltraiter ainsi?

LA NOURRICE.--Quoi! vous direz du bien de celui qui a tué votre cousin?

JULIETTE.--Eh! dirai-je du mal de celui qui est mon mari? Ah! mon pauvre époux, quelle langue soignera ton nom, lorsque moi, ta femme depuis trois heures, je l'ai ainsi déchiré? Mais pourquoi, traître, as-tu tué mon cousin? Ah! ce traître de cousin a voulu tuer mon époux.--Rentrez, larmes insensées, rentrez dans votre source; c'est au malheur qu'appartient ce tribut que par méprise vous offrez à la joie. Mon époux vit, lui que Tybalt aurait voulu tuer; et Tybalt est mort, lui qui aurait voulu tuer mon époux. Tout ceci est consolant, pourquoi donc pleuré-je? Ah! c'est qu'il y a là un mot, plus fatal que la mort de Tybalt, qui m'a assassinée.--Je voudrais bien l'oublier; mais, ô ciel! il pèse sur ma mémoire comme une offense digne de la damnation sur l'âme du pécheur. _Tybalt est mort, et Roméo est..... banni!_ Ce _banni,_ ce seul mot _banni_, a tué pour moi dix mille Tybalt. La mort de Tybalt était un assez grand malheur, tout eût-il fini là; ou si les cruelles douleurs se plaisent à marcher ensemble, et qu'il faille nécessairement que d'autres peines les accompagnent, pourquoi, après m'avoir dit: «Tybalt est mort,» n'a-t-elle pas continué: «ton père aussi, ou ta mère, ou tous les deux?» cela eût excité en moi les douleurs ordinaires[56]. Mais par cette arrière-garde qui a suivi la mort de Tybalt, _Roméo est banni_; par ce seul mot, père, mère, Tybalt, Roméo, Juliette, tous sont assassinés, tous morts. Roméo banni! Il n'y a ni fin, ni terme, ni borne, ni mesure dans la mort qu'apporte avec lui ce mot, aucune parole ne peut sonder ce malheur.--Mon père, ma mère, où sont-ils, nourrice?

[Note 56: _Modern lamentation_ (douleurs d'usage).]

LA NOURRICE.--Pleurants et gémissants sur le corps de Tybalt. Voulez-vous aller les trouver? Je vais vous y conduire.

JULIETTE.--Ils lavent donc ses blessures de leurs larmes! Quand elles se sécheront, les miennes seront finies par le bannissement de Roméo.--Remporte ces cordes.--Pauvre échelle, te voilà trompée comme moi, car Roméo est exilé. Il t'avait faite pour lui servir de route vers mon lit; et moi, fille encore, je meurs fille et veuve.--Viens, échelle; viens, nourrice; je vais à mon lit nuptial: c'est à la mort, et non à Roméo qu'appartient ma virginité.

LA NOURRICE.--Hâtez-vous de vous rendre à votre chambre: je trouverai Roméo pour vous consoler; je sais bien où il est. Écoutez-moi, votre Roméo sera ici _ce _soir; je vais le trouver; il est caché dans la cellule du frère Laurence.

JULIETTE.--Oh! trouve-le. Donne cet anneau à mon fidèle chevalier, et dis-lui de venir recevoir mon dernier adieu.

(Elles sortent.)

SCÈNE III

La cellule du frère Laurence.

Entrent FRÈRE LAURENCE et ROMÉO.

FRÈRE LAURENCE.--Roméo, sors de ta retraite: viens ici, homme craintif; l'affliction s'est éprise de tes mérites, et la calamité t'a épousé.

ROMÉO.--Mon père, quelles nouvelles? quel est l'arrêt du prince? quelle infortune encore inconnue demande à s'attacher à moi?

FRÈRE LAURENCE.--Mon cher fils n'est que trop accoutumé à cette cruelle société. Je t'apporte la nouvelle de l'arrêt du prince.

ROMÉO.--Eh bien! le jugement du prince est-il plus doux que le jour du jugement?

FRÈRE LAURENCE.--Un arrêt moins rigoureux s'est échappé de sa bouche: ce n'est pas la mort de ton corps, mais son bannissement.

ROMÉO.--Ah! le bannissement! aie pitié de moi; dis la mort. L'aspect de l'exil porte avec lui plus de terreur, beaucoup plus que la mort. Ah! ne me dis pas que c'est le bannissement.

FRÈRE LAURENCE.--Tu es banni de Vérone. Prends patience; le monde est grand et vaste.

ROMÉO.--Le monde n'existe pas hors des murs de Vérone; ce n'est plus qu'un purgatoire, une torture, un véritable enfer. Banni de ce lieu, je le suis du monde, c'est la mort. Oui, le bannissement, c'est la mort sous un faux nom; et ainsi, en nommant la mort un bannissement, tu me tranches la tête avec une hache d'or, et souris au coup qui m'assassine.

FRÈRE LAURENCE.--O mortel péché! ô farouche ingratitude! Pour ta faute, notre loi demandait la mort; mais le prince indulgent, prenant ta défense, a repoussé de côté la loi, et a changé ce mot funeste de _mort_ en celui de _bannissement_: c'est une rare clémence, et tu ne veux pas la reconnaître.

ROMÉO.--C'est un supplice et non une grâce. Le ciel est ici, où vit Juliette: les chats, les chiens, la moindre petite souris, tout ce qu'il y a de plus misérable vivra ici dans le ciel, pourra la voir; et Roméo ne le peut plus! La mouche qui vit de charogne jouira d'une condition plus digne d'envie, plus honorable, plus relevée que Roméo; elle pourra s'ébattre sur les blanches merveilles de la chère main de Juliette, et dérober le bonheur des immortels sur ces lèvres où la pure et virginale modestie entretient une perpétuelle rougeur, comme si les baisers qu'elles se donnent étaient pour elles un péché; mais Roméo ne le peut pas, il est banni! Ce que l'insecte peut librement voler, il faut que je vole pour le fuir; il est libre et je suis banni[57]; et tu me diras encore que l'exil n'est pas la mort!... N'as-tu pas quelque poison tout préparé, quelque poignard affilé, quelque moyen de mort soudaine, fût-ce la plus ignoble? Mais banni! me tuer ainsi! banni! O moine, quand ce mot se prononce en enfer, les hurlements l'accompagnent.--Comment as-tu le coeur, toi un prêtre, un saint confesseur, toi qui absous les fautes, toi mon ami déclaré, de me mettre en pièces par ce mot _bannissement_?

[Note 57:_They may do this, when I am from this must fly They are free men, but I am banished._

Le jeu de mots du premier de ces deux vers est entre _fly_ (mouche) et _fly_ (fuir); celui du second entre _free-men_ (hommes libres) et _freaming_ (bourdonnant), qui se prononcent à peu près de même, a été impossible à rendre.]

FRÈRE LAURENCE.--Amant insensé, écoute seulement une parole.

ROMÉO.--Oh! tu vas me parler encore de bannissement.

FRÈRE LAURENCE.--Je veux te donner une arme pour te défendre de ce mot: c'est la philosophie, ce doux baume de l'adversité; elle te consolera, quoique tu sois exilé.

ROMÉO.--Encore l'exil! Que la philosophie aille se faire pendre: à moins que la philosophie n'ait le pouvoir de créer une Juliette, de déplacer une ville, ou de changer l'arrêt d'un prince, elle n'est bonne à rien, elle n'a nulle vertu; ne m'en parle plus.

FRÈRE LAURENCE.--Oh! je vois maintenant que les insensés n'ont point d'oreilles.

ROMÉO.--Comment en auraient-ils, lorsque les hommes sages n'ont pas d'yeux?

FRÈRE LAURENCE.--Laisse-moi discuter avec toi ta situation.

ROMÉO.--Tu ne peux parler de ce que tu ne sens pas. Si tu étais aussi jeune que moi, amant de Juliette, marié seulement depuis une heure, meurtrier de Tybalt, éperdu d'amour comme moi, et comme moi banni, alors tu pourrais parler; alors tu pourrais t'arracher les cheveux et te jeter sur la terre comme je fais, pour prendre la mesure d'un tombeau qui n'est pas encore ouvert.

FRÈRE LAURENCE.--Lève-toi, on frappe; bon Roméo, cache-toi.

(On frappe derrière le théâtre.)

ROMÉO.--Me cacher? Non, à moins que la vapeur des gémissements de mon coeur malade, m'enveloppant comme un brouillard, ne me dérobe aux yeux qui me cherchent. (On frappe.)

FRÈRE LAURENCE.--Écoute comme ils frappent.--Qui est là?--Roméo, lève-toi; tu seras pris.--Attendez un instant.--Lève-toi, fuis dans mon cabinet.--_(On frappe.)_ Dans un moment.--Volonté de Dieu! quelle obstination est la tienne?--J'y vais, j'y vais.--_(On frappe.)_ Qui frappe si fort? D'où venez-vous? que demandez-vous?

LA NOURRICE, _en dehors_.--Laissez-moi entrer, et vous apprendrez mon message. Je viens de la part de la signora Juliette.

FRÈRE LAURENCE.--En ce cas, soyez la bienvenue.

(Entre la nourrice.)

LA NOURRICE.--O saint frère, oh! dites-moi, saint frère, où est l'époux de ma maîtresse? où est Roméo?

FRÈRE LAURENCE.--Le voilà étendu sur la terre, ivre de ses propres larmes.

LA NOURRICE.--Oh! il est dans le même état que ma maîtresse, juste dans le même état.

FRÈRE LAURENCE.--O funeste sympathie, déplorable situation!

LA NOURRICE.--Voilà comme elle est étendue, pleurant et sanglotant, sanglotant et pleurant.--Levez-vous, levez-vous, levez-vous, si vous êtes un homme. Pour l'amour de Juliette, pour l'amour d'elle, levez-vous et soutenez-vous. Comment pouvez-vous être tombé si bas?

ROMÉO.--O nourrice!

LA NOURRICE.--Ah! seigneur, seigneur!--Eh bien! la mort est la fin de tous.

ROMÉO.--Parles-tu de Juliette? En quel état est-elle? Ne me regarde-t-elle pas comme un assassin de profession, depuis que j'ai souillé l'enfance de notre bonheur d'un sang qui tient de si près au sien? Où est-elle? comment est-elle? que dit ma secrète épouse du lien qui a scellé nos amours[58]?

[Note 58: _What say My conceal'd lady to our cancell'd love_?]

LA NOURRICE.--Ah! elle ne dit rien, seigneur; mais elle pleure, et puis elle pleure: tantôt elle tombe sur son lit, tantôt elle se relève en sursaut et elle appelle Tybalt, et puis elle appelle en criant Roméo; et puis elle retombe.

ROMÉO.--Comme si ce nom, parti d'une arme meurtrière, la tuait, comme la main maudite de celui qui le porte a tué son parent.--Dis-moi, frère, dis-moi en quelle vile partie de mon corps habite ce nom; dis-le moi, pour que j'en ravage l'odieuse demeure.

(Il tire son épée.)

FRÈRE LAURENCE.--Arrête ta main désespérée. Es-tu un homme? Ta figure crie que tu en es un; mais tes pleurs sont d'une femme, et tes actions désordonnées indiquent la fureur d'une bête privée de raison. Femme dépourvue de grâces, homme seulement en apparence, n'es-tu donc sous la ressemblance de tous les deux qu'un animal difforme? Tu m'as confondu. Par mon saint ordre, j'avais cru ton âme mieux trempée. Après avoir tué Tybalt, veux-tu te tuer toi-même, et, par le coup d'une damnable haine contre toi-même, tuer aussi ton épouse qui ne vit qu'en toi? Pourquoi t'emporter ainsi contre ta naissance, le ciel et la terre? Ta naissance, le ciel et la terre se sont réunis pour avoir part à ton existence, et tu veux tout perdre à la fois! Fi donc! fi donc! tu déshonores ta personne, ton amour, ton intelligence; toi qui, riche de ces dons précieux, comme l'avare, n'en emploies aucun à son véritable usage, seul capable de donner du lustre à ta personne, à ton intelligence, à ton amour. Ta noble figure devient un simulacre de cire dépouillé de ce qui fait la valeur d'un homme: tes serments du plus tendre amour ne sont qu'un noir parjure, lorsque tu détruis cet amour que tu avais fait voeu de chérir: ton intelligence, cet ornement de ta personne et de ton amour, trompée elle-même dans la règle qu'elle doit leur prescrire à tous deux, de même que la poudre dans le carnier d'un soldat maladroit, prend feu par ton impéritie et te met en pièces par les moyens destinés à ta défense.--Allons, homme, relève-toi, ta Juliette est vivante, ta Juliette pour l'amour de qui tu étais mort, il n'y a qu'un moment. Tu es heureux par là, Tybalt voulait te tuer, et c'est toi qui as tué Tybalt; là encore tu es heureux. La loi, qui te menaçait de la mort, devenue ton amie, n'a prononcé que l'exil; en cela tu es heureux; un amas de bénédictions est descendu sur ta tête; le bonheur s'empresse autour de toi dans ses plus doux atours; et toi, comme une jeune fille obstinée et perverse, tu boudes avec humeur ta fortune et ton amour. Prends-y garde, prends-y garde; c'est ainsi qu'on meurt misérable. Allons, va rejoindre ton amante, comme il a été convenu; monte dans sa chambre; pars et va la consoler. Mais souviens-toi de la quitter avant que la garde soit placée; car alors tu ne pourrais plus arriver à Mantoue, où tu dois rester jusqu'à ce que nous puissions trouver l'occasion d'annoncer votre mariage, de réconcilier vos parents, d'obtenir ta grâce du prince, et de te rappeler, cinq cent mille fois plus transporté de bonheur que tu n'as répandu de lamentations en partant.--Va devant, nourrice; parle de moi à ta maîtresse; dis-lui de hâter dans toute la maison le moment de se mettre au lit: le chagrin dont ils sont accablés doit les y disposer. Roméo va venir.

LA NOURRICE.--O Seigneur mon Dieu, je resterais ici toute la nuit pour entendre ces bons avis. Oh! ce que c'est que la science!--Mon cher maître, je vais annoncer à ma maîtresse que vous allez venir.

ROMÉO.--Va, et dis à ma douce amie de se préparer à me gronder.

LA NOURRICE.--Voici, seigneur, un anneau qu'elle m'a chargé de vous donner. Hâtez-vous, ne perdez pas de temps, car il se fait déjà bien tard.

(Elle sort.)

ROMÉO.--Comme ce don a ranimé mon courage!

FRÈRE LAURENCE.--Partez, bonne nuit. Toute votre destinée dépend de ceci: ou sortez de la ville avant que la garde soit postée, ou au point du jour sortez déguisé. Restez à Mantoue; je trouverai votre domestique; de temps en temps, il vous instruira de tout ce qu'il arrivera de favorable pour vous ici. Donne-moi ta main; il est tard; adieu, bonne nuit.

ROMÉO.--Si je n'étais appelé par une joie au-dessus de toutes les joies, ce serait un chagrin de me séparer de toi si brusquement. Adieu!

(Ils sortent.)

SCÈNE IV

La maison de Capulet.

CAPULET, LA SIGNORA CAPULET, PARIS.

CAPULET.--Il est arrivé, seigneur, des choses si malheureuses, que nous n'avons pas eu le temps de disposer notre fille. Voyez-vous, elle aimait chèrement son cousin Tybalt, et moi je l'aimais bien aussi. Enfin, nous sommes nés pour mourir.--Il est très-tard, elle ne descendra pas ce soir; et je vous réponds que, sans votre compagnie, il y a une heure que je serais au lit.

PARIS.--Ces moments amers ne sont pas des moments d'amour[59].--Bonne nuit, madame; présentez mes hommages à votre fille.

[Note 59: _Those times of woe afford no time to woo._]

LA SIGNORA CAPULET.--Je n'y manquerai pas, et demain, dès le matin, je saurai sa pensée: pour ce soir, son accablement l'a forcée à se retirer.

CAPULET.--Moi, Pâris, je veux témérairement vous répondre de l'amour de ma fille. Je pense bien qu'à tous égards elle se laissera gouverner par moi; je dis plus, je n'en doute pas.--Ma femme, allez la trouver avant de vous mettre au lit, instruisez-la de l'amour de mon fils Pâris, et donnez-lui ordre, faites-y bien attention, pour mercredi prochain. Mais doucement: quel jour est-ce aujourd'hui?

PARIS.--Lundi, seigneur.

CAPULET.--Lundi? Ah ah! mercredi est trop tôt: ce sera donc pour jeudi. Dites-lui que jeudi elle sera mariée à ce noble comte.--Serez-vous prêt? Cette précipitation est-elle de votre goût? Nous ne ferons pas grand embarras. Un ami ou deux; car, écoutez donc, le meurtre de Tybalt étant si récent, on pourrait trouver que pour un parent, nous en faisions bien peu de cas, si nous donnions de grands divertissements. Ainsi nous inviterons quelque demi-douzaine d'amis, et voilà tout.... Mais que dites-vous de jeudi?

PARIS.--Seigneur, je voudrais que jeudi vînt demain.

CAPULET.--Fort bien; allons, retirez-vous.--Ainsi, jeudi.--Vous, ma femme, voyez Juliette avant de vous mettre au lit; préparez-la au jour de ses noces.--Adieu, seigneur.... Holà! de la lumière dans ma chambre; marchez devant moi.... Il est si tard que bientôt l'on pourra dire qu'il est de bonne heure.--Bonne nuit.

(Ils sortent.)

SCÈNE V

La chambre de Juliette.

Entrent ROMÉO et JULIETTE.

JULIETTE.--Veux-tu donc déjà me quitter? le jour n'est pas encore prêt de paraître: c'est le rossignol, et non l'alouette, dont la voix a pénétré ton oreille inquiète; toute la nuit il chante là-bas sur ce grenadier. Crois-moi, cher amour, c'était le rossignol.

ROMÉO.--C'est l'alouette qui proclame le matin, et non pas le rossignol. Vois, ma bien-aimée, ces traits d'une lumière jalouse qui traversent les nuages entr'ouverts à l'orient: tous les flambeaux de la nuit sont consumés; et au sommet des montagnes couvertes de brouillards s'élève sur la pointe du pied le joyeux matin. Il me faut partir et vivre, ou rester et mourir.

JULIETTE.--Cette lumière n'est point la lumière du jour, je le sais bien, moi: c'est quelque météore qu'exhale le soleil pour te servir de flambeau cette nuit, et t'éclairer dans ta route vers Mantoue. Reste donc, il n'est pas encore nécessaire que tu t'en ailles.

ROMÉO.--Qu'on me surprenne ici, qu'on me mette à mort, je suis content si tu le veux ainsi. Je dirai que cette teinte grisâtre n'est pas l'oeil du matin, mais le pâle reflet du front de Cynthie, et que ce n'est pas l'alouette dont les accents vont frapper la voûte des cieux, si haut au-dessus de nos têtes. J'ai bien plus de penchant à rester que de volonté de partir.--Viens, Mort, et sois la bienvenue; Juliette le veut ainsi.--Que dis-tu, mon amour? causons, ce n'est pas le jour.

JULIETTE.--C'est le jour, c'est le jour: hâte-toi de partir, va-t'en. C'est l'alouette qui chante si faux, qui roule des sons si péniblement discordants, et d'une aigreur si désagréable. On prétend que l'alouette sait observer dans son chant de gracieuses séparations; cela n'est pas vrai, puisqu'elle nous sépare[60]. Quelques-uns disent que l'alouette a changé d'yeux avec le crapaud dégoûtant: oh! que je voudrais qu'ils eussent aussi changé de voix, puisque cette voix nous arrache des bras l'un de l'autre, et te chassent d'ici par ces sons qui appellent le jour. Oh! maintenant, va-t'en; le ciel s'éclaircit de plus en plus.

[Note 60:_Some say the lark makes sweet division, It is not so for she divideth us._]

ROMÉO.--Le ciel s'éclaircit de plus en plus, et de plus en plus notre sort s'obscurcit.

(Entre la nourrice.)

LA NOURRICE.--Madame!

JULIETTE.--Qu'y a-t-il, nourrice?

LA NOURRICE.--Madame votre mère vient à votre chambre: le jour paraît; prenez garde; ayez l'oeil au guet.

(Elle sort.)

JULIETTE.--Eh bien! fenêtre, laisse entrer le jour et sortir ma vie.

ROMÉO.--Adieu, adieu! Un baiser, et je vais descendre.

(Roméo descend.)

JULIETTE.--Te voilà donc parti, mon amant, mon maître, mon ami! Il me faut de tes nouvelles à chaque jour de chacune de mes heures, car dans chaque minute il y aura pour moi plus d'un jour. Oh! qu'à ce compte je serai chargée d'années avant de revoir mon Roméo!

ROMÉO.--Adieu! je ne laisserai échapper aucune occasion de te faire passer, ô ma bien-aimée! l'expression de mes voeux.

JULIETTE.--Ah! crois-tu que nous nous revoyions jamais?

ROMÉO.--Je n'en doute point, et toutes tes peines serviront de sujet aux entretiens de nos jours à venir.

JULIETTE.--O Dieu! j'ai dans l'âme un funeste présage: il me semble que je te vois, maintenant que tu es descendu, comme un mort couché au fond d'un tombeau; ou ma vue se trouble, ou tu me parais pâle.

ROMÉO.--Je vous assure, mon cher amour, que vous paraissez de même à mes yeux.--Le chagrin dévorant dessèche notre sang. Adieu, adieu!

(Roméo sort.)

JULIETTE.--O Fortune, Fortune! les hommes te nomment inconstante. Si tu es inconstante, qu'as-tu à faire avec lui, qui est connu pour garder sa foi? Sois inconstante, ô Fortune! car alors j'espère que tu ne me le garderas pas longtemps, mais que tu le renverras bientôt.

LA SIGNORA CAPULET, _derrière le théâtre_.--Hé! ma fille! êtes-vous levée!

JULIETTE.--Qui m'appelle? Est-ce madame ma mère? Quoi! si tard n'est-elle pas couchée, ou bien est-elle levée si matin? Quelle cause extraordinaire l'amène ici?

LA SIGNORA CAPULET.--Eh bien! Juliette, comment cela va-t-il maintenant?

JULIETTE.--Madame, je ne suis pas bien.

LA SIGNORA CAPULET.--Toujours pleurant la mort de ton cousin? Eh quoi! tes larmes le laveront-elles de la poussière du tombeau? et quand tu y parviendrais, tu ne pourrais le faire revivre. Finis-en donc: une certaine douleur montre beaucoup d'affection; mais beaucoup de douleur montre toujours un défaut de jugement.

JULIETTE.--Laissez-moi pleurer encore une perte aussi sensible.

LA SIGNORA CAPULET.--De cette manière, vous sentirez la perte, mais ne jouirez pas de l'ami que vous pleurez.

JULIETTE.--Sentant aussi vivement sa perte, je ne puis m'empêcher de le pleurer toujours.

LA SIGNORA CAPULET.--Je le vois bien, mon enfant, ce qui te fait pleurer, ce n'est pas tant sa mort que de savoir vivant le misérable qui l'a tué.

JULIETTE.--Quel misérable, madame?

LA SIGNORA CAPULET.--Le misérable Roméo.

JULIETTE.--Un misérable et lui sont à bien des lieues de distance. Que Dieu lui pardonne; moi, je lui pardonne de tout mon coeur; et cependant nul homme n'afflige mon coeur comme lui.

LA SIGNORA CAPULET.--Oui, vous souffrez de voir que ce perfide meurtrier respire.

JULIETTE.--Oui, madame, de ce qu'il respire hors de la portée de mes mains. Je voudrais être seule chargée de venger la mort de mon cousin.

LA SIGNORA CAPULET.--Nous en aurons vengeance, sois tranquille: ne pleure donc plus. J'enverrai à Mantoue, où est maintenant cet apostat de banni: il y a là quelqu'un qui lui donnera un breuvage si efficace, qu'il ira bientôt tenir compagnie à Tybalt; et alors j'espère que tu seras satisfaite.

JULIETTE.--En vérité, je ne serai jamais satisfaite de Roméo, que je ne le voie..... mort.--Mon pauvre coeur est si cruellement affligé pour mon cousin!--Madame, si vous pouviez seulement trouver un homme pour porter le poison, je le préparerais, et de manière à ce que Roméo, après l'avoir reçu, dormît bientôt en paix.--Oh! comme mon coeur abhorre de l'entendre nommer..... et de ne pouvoir aller le joindre..... et venger l'amitié que je portais à mon cousin Tybalt sur la personne de celui qui l'a tué!

LA SIGNORA CAPULET.--Trouve les moyens, et moi je trouverai l'homme.--Mais je vais, mon enfant, _t'_apprendre de joyeuses nouvelles.

JULIETTE.--La joie vient à propos dans un temps où nous en avons si grand besoin. De grâce, madame, quelles sont ces nouvelles?

LA SIGNORA CAPULET.--Oui, oui, tu as un père soigneux, mon enfant, un père qui, pour te tirer de ton accablement, t'a préparé tout de suite un heureux jour auquel tu ne t'attends pas, et dont je n'avais pas eu la pensée.

JULIETTE.--Madame, à la bonne heure: quel est ce jour?

LA SIGNORA CAPULET.--Vraiment, ma fille, jeudi prochain, de bon matin, un brillant, jeune et noble cavalier, le comte Pâris, dans l'église de Saint-Pierre, aura le bonheur de faire de toi une joyeuse épouse.

JULIETTE.--Ma foi! par l'église de Saint-Pierre, et par saint Pierre lui-même, il ne fera point de moi une joyeuse épouse. Je suis étonnée de cette précipitation, et qu'il me faille épouser avant que l'homme qui doit être mon mari vienne me faire sa cour. Je vous prie, madame, dites à mon seigneur et père que je ne veux pas me marier encore, et que quand je me marierai, je jure que j'épouserai Roméo, que vous savez que je hais, plutôt que Pâris.--Ce sont là des nouvelles, en vérité!

LA SIGNORA CAPULET.--Voilà votre père qui vient: faites-lui cette réponse vous-même, et voyez comment il la recevra de votre part.

(Entrent Capulet et la nourrice.)

CAPULET.--Lorsque le soleil est couché, l'humidité de l'air se répand en gouttes de rosée; mais pour le couchant du fils de mon frère, il pleut tout à fait.--Comment, une gouttière, jeune fille! Quoi, toujours en larmes! toujours des torrents! Tu fais à la fois de ta petite personne une barque, une mer, un ouragan; car je vois dans tes yeux, que je peux appeler la mer, un flux et reflux perpétuel de larmes; ton corps est la barque qui flotte dans ces ondes salées; les vents sont tes soupirs, qui font avec tes larmes un mutuel assaut de violence; en sorte que, s'il ne survient un calme soudain, ils feront chavirer ton corps battu de la tempête.--Où en sommes-nous, ma femme? Lui avez-vous annoncé ma résolution?

LA SIGNORA CAPULET.--Oui, seigneur, mais elle ne veut pas; elle vous remercie. Je voudrais que l'insensée fût mariée à son tombeau.

CAPULET.--Attendez, ma femme, j'en suis, j'en suis. Comment, elle ne veut pas! Elle ne nous remercie pas, elle n'est pas fière, elle ne se trouve pas bien heureuse de ce que, tout indigne qu'elle est, nous lui avons ménagé pour époux un si digne gentilhomme!

JULIETTE.--Non, je n'en suis pas fière, mais j'en suis reconnaissante. Je ne peux jamais être fière de ce que je déteste; mais je puis être reconnaissante même de ce que je déteste, lorsque c'est l'affection qui l'a fait faire.

CAPULET.--Comment, raisonneuse, qu'est-ce que cela veut dire?--Fière,... et je vous remercie,... et je ne vous remercie pas,... et pourtant je ne suis pas fière--Eh bien! madame la mignonne, je ne me soucie point d'être remercié par vos remerciements, ni que vous me fassiez fièrement de la fierté: mais préparez vos petites jambes à aller jeudi prochain avec Pâris à l'église de Saint-Pierre; ou je t'y traînerai, moi, sur une claie. Va-t'en, charogne moisie; va-t'en, malheureuse, face de suif!

LA SIGNORA CAPULET.--Fi! fi! êtes-vous fou?

JULIETTE.--Mon bon père, je vous en conjure à genoux; écoutez-moi avec patience, seulement un mot.

CAPULET.--Va te faire pendre, petite drôlesse, désobéissante coquine. Je te le répète: ou rends-toi à l'église jeudi, ou ne me regarde jamais en face. Pas un mot, pas une réponse, pas une réplique. Les doigts me démangent....--Eh bien! ma femme, nous nous tenions à peine pour heureux parce que Dieu ne nous avait donné que cette unique enfant: maintenant je vois que c'est encore trop d'un, et que nous avons reçu en elle une malédiction.--Qu'elle s'en aille, la malheureuse!

LA NOURRICE.--Que le Dieu du ciel la bénisse! vous avez tort, seigneur, de la maltraiter ainsi.

CAPULET.--Et pourquoi, madame la Sagesse? Tenez votre langue, mère Prudence, allez bavarder avec vos commères.

LA NOURRICE.--Je ne fais pas un crime en parlant.

CAPULET.--Oh! que Dieu nous soit en aide!

LA NOURRICE.--Est-ce qu'on ne peut pas parler?

CAPULET.--Taisez-vous, sotte bougonneuse; allez débiter vos maximes sur la tasse de votre commère; nous n'en avons que faire ici.

LA SIGNORA CAPULET.--Vous êtes trop vif.

CAPULET.--Paix de Dieu! j'en deviendrai fou: le jour, la nuit, le matin, le soir, chez moi ou dehors, seul ou en compagnie, dormant ou veillant, j'ai toujours pensé à la marier! et aujourd'hui, après l'avoir pourvue d'un gentilhomme de famille princière, ayant de beaux domaines, qui est jeune, de belles manières, regorgeant, comme on dit, des qualités les plus avantageuses, fait en tout à plaisir, il faut qu'une malheureuse petite sotte de pleurnicheuse, une poupée gémissante, vienne, à cette bonne fortune qui lui arrive, vous répondre: Je ne ne veux pas me marier;... je ne peux aimer;... je suis trop jeune;... je suis trop jeune, pardonnez-moi....--Mais si vous ne voulez pas vous marier, je vous pardonnerai: allez paître où vous voudrez; vous n'habiterez toujours pas avec moi. Faites attention à ce que je vous dis; songez-y bien; je n'ai pas l'habitude de plaisanter; jeudi est près, mettez la main sur votre coeur; avisez-y. Si vous êtes ma fille, je vous donnerai à mon ami. Si tu ne l'es pas, va te faire pendre,

mendier, périr de faim, mourir dans les rues; car, sur mon âme, jamais je ne te reconnaîtrai, jamais rien de ce qui m'appartient ne te fera du bien. Comptez là-dessus; faites vos réflexions, car je vous tiendrai parole.

(Il sort.)

JULIETTE.--N'y a-t-il donc plus pour moi un regard de pitié, qui, du haut des nuages, pénètre les profondeurs de mon chagrin? O ma tendre mère, ne me rejetez pas loin de vous; différez ce mariage d'un mois, d'une semaine; ou si vous ne le voulez pas, faites donc dresser mon lit nuptial dans le sombre monument où l'on a déposé Tybalt.

LA SIGNORA CAPULET.--Ne me parle pas, car je ne te répondrai pas un mot. Fais ce que tu voudras, je ne me mêle plus de ce qui te regarde.

(Elle sort.)

JULIETTE.--O Dieu!.... O ma nourrice, comment prévenir ceci? Mon époux est sur la terre, ma foi est dans le ciel; comment cette foi reviendra-t-elle sur la terre, à moins que mon époux ne quitte la terre et ne me la renvoie des cieux? Console-moi, conseille-moi.--Hélas! hélas! comment le ciel peut-il entourer d'embûches une créature aussi faible que moi!--Que dis-tu? N'as-tu pas un seul mot de joie, quelque consolation, nourrice?

LA NOURRICE.--Ma foi, je n'en connais qu'une: Roméo est banni, et je gagerais le monde contre rien qu'il n'osera jamais revenir vous réclamer; ou, s'il le fait, il faudra que ce soit en cachette. Alors, les choses étant comme elles sont, je pense que ce que vous avez de mieux à faire c'est d'épouser le comte. Oh! c'est un aimable cavalier! Roméo n'est qu'un torchon auprès de lui. Un aigle, ma dame, n'a pas un oeil aussi clair, aussi perçant, aussi beau que celui de Pâris. Que mal m'advienne si je ne pense pas que vous êtes heureuse de trouver ce second parti! car il est bien au-dessus du premier: et d'ailleurs, quand cela ne serait pas, votre premier mari est mort, ou il vaudrait autant qu'il le fût que de l'avoir vivant sans en profiter.

JULIETTE.--Parles-tu du fond du coeur?

LA NOURRICE.--Du fond de l'âme aussi, ou que je sois maudite dans tous les deux!

JULIETTE.--_Amen_.

LA NOURRICE.--Et à quoi?

JULIETTE.--Eh bien! tu m'as merveilleusement consolée. Rentre, et dis à ma mère qu'ayant fâché mon père, je suis allée à la cellule de frère Laurence m'en confesser et demander l'absolution.

LA NOURRICE.--Vraiment, je vais le lui aller dire, et vous prenez un parti très-sage.

(Elle sort.)

JULIETTE.--Vieille réprouvée! démon maudit! je ne sais quel est ton plus grand péché, ou de souhaiter que je me parjure ainsi, ou de déprécier mon époux avec cette même langue qui l'avait tant de milliers de fois exalté au-dessus de toute comparaison. Va, conseillère: mon coeur et toi sommes désormais séparés. Je vais trouver le frère, savoir quel expédient il aura à m'offrir; et si tout le reste me manque, moi, j'ai le pouvoir de mourir.

(Elle sort.)

FIN DU TROISIÈME ACTE.

ACTE QUATRIÈME

SCÈNE I

La cellule du frère Laurence.

Entrent FRÈRE LAURENCE ET PARIS.

FRÈRE LAURENCE.--Quoi! jeudi, seigneur? le terme est bien court.

PARIS.--Mon père Capulet le veut ainsi, et je n'irai pas refroidir son empressement par des retards.

FRÈRE LAURENCE.--Vous dites que vous ne connaissez pas les dispositions de la dame: cette conduite n'est pas régulière; je ne l'approuve point.

PARIS.--Elle pleure sans mesure la mort de Tybalt, et voilà pourquoi je l'ai si peu entretenue de mon amour: Vénus n'ose sourire dans une maison de larmes. Son père voit du danger à laisser le chagrin prendre sur elle tant d'empire; et, dans sa sagesse, il hâte notre mariage, pour arrêter ce déluge de pleurs. La société d'un époux pourra éloigner d'elle un souvenir devenu trop puissant dans la solitude. Vous concevez maintenant le motif de cette précipitation.

FRÈRE LAURENCE, _à part_--Je voudrais ignorer le motif qui devrait la ralentir.--Tenez, seigneur, voici la dame qui vient à ma cellule.

(Entre Juliette.)

PARIS.--Quelle heureuse rencontre, ma souveraine, ma femme!

JULIETTE.--Tout cela sera peut-être, seigneur, quand je pourrai être votre femme.

PARIS.--Cela peut être et doit être, mon amour, jeudi prochain.

JULIETTE.--Ce qui doit être sera.

FRÈRE LAURENCE.--Ceci est une sentence certaine.

PARIS.--Venez-vous vous confesser à ce père?

JULIETTE.--Si je vous répondais, ce serait me confesser à vous.

PARIS.--N'allez pas lui nier que vous m'aimerez.

JULIETTE.--Je vous confesserai à vous que je l'aime.

PARIS.--Et vous lui confesserez aussi, j'en suis sûr, que vous m'aimez.

JULIETTE.--Si je le fais, cela aura plus de prix quand vous aurez le dos tourné qu'en votre présence.

PARIS.--Chère âme, ton visage est bien terni de larmes.

JULIETTE.--Elles n'ont pas remporté là une grande victoire; il n'était déjà pas trop beau avant qu'elles l'eussent gâté.

PARIS.--Tu lui fais, par cette réponse, plus de tort que par tes pleurs.

JULIETTE.--Je ne le calomnie point, seigneur: c'est une vérité; et ce que je dis là, je me le suis dit en face.

PARIS.--Ton visage est à moi, et tu l'as calomnié.

JULIETTE.--Cela peut être, car il ne m'appartient pas.--Saint père, êtes-vous de loisir à présent, ou reviendrai-je vous trouver à la messe du soir?

FRÈRE LAURENCE.--J'ai tout loisir, ma triste fille.--Seigneur, je dois vous prier de nous laisser seuls.

PARIS.--Dieu me préserve de troubler la dévotion! Juliette, je vous réveillerai jeudi de grand matin: jusqu'à ce jour, adieu, et recevez ce saint baiser.

(Il sort.)

JULIETTE.--Oh! ferme la porte, et ensuite viens pleurer avec moi: je suis sans espoir, sans ressource, sans secours.

FRÈRE LAURENCE.--Ah! Juliette, je connais déjà tes chagrins: et ma tête n'est pas assez forte pour les supporter. J'apprends que tu dois, sans que rien puisse le retarder, être mariée à ce comte jeudi prochain.

JULIETTE.--Frère, ne me dis point que tu le sais sans me dire en même temps comment je puis l'empêcher. Si dans ta sagesse tu n'as pas les moyens de me secourir, dis-moi seulement que tu approuves ma résolution, et de ce poignard je vais moi-même me

secourir sur-le-champ. Dieu a uni mon coeur à celui de Roméo; tu as joint nos mains; et avant que cette main, qui a scellé par toi mon union avec Roméo, devienne le sceau d'un autre titre, avant que mon coeur fidèle, par une déloyale trahison, se déclare pour un autre, ceci les fera périr tous deux. Ainsi, cherche dans l'expérience de ta longue vie un conseil à me donner pour le moment, ou bien, vois, ce poignard sanglant deviendra médiateur entre moi et l'extrémité où je suis; il décidera en arbitre de ce que tes lumières et tes années réunies n'auront pu conduire à une issue digne du véritable honneur. Ne sois pas si lent à me répondre: il me tarde de mourir si ta réponse ne me parle pas de moyens de salut.

FRÈRE LAURENCE.--Arrête, ma fille, j'entrevois une sorte d'espérance, qui demande une exécution aussi désespérée qu'est désespéré le cas que nous voulons prévenir.--Si, plutôt que d'épouser le comte Pâris, tu as la force de vouloir te tuer toi-même, il est vraisemblable que toi, qui recherches la mort pour éviter cette ignominie, tu entreprendras bien pour y échapper une chose qui ressemble à la mort. Si tu as ce courage, je te donnerai un moyen.

JULIETTE.--Oh! plutôt que d'épouser Pâris, commande-moi de me précipiter du haut des remparts de cette tour, ou d'aller par les chemins fréquentés par les voleurs; ordonne-moi de me glisser au milieu des serpents; enchaîne-moi avec des ours rugissants; ou enferme-moi la nuit dans un cimetière, entièrement couvert d'os de morts s'entre-choquant, de jambes encore infectes, de crânes jaunis et informes; ou commande-moi d'entrer dans un tombeau nouvellement creusé, et de me cacher avec un mort dans son linceul, choses qui me faisaient trembler, seulement à en entendre parler; j'obéirai sans crainte ou hésitation, pour demeurer l'épouse sans tache de mon cher bien-aimé.

FRÈRE LAURENCE.--Eh bien! retourne chez toi, montre un air joyeux, consens à épouser Pâris. C'est demain mercredi: demain au soir fais en sorte de coucher seule; que ta nourrice ne couche point dans ta chambre. Prends cette fiole, et quand tu seras dans ton lit, avale cette liqueur distillée: soudain coulera dans toutes tes veines une froide et assoupissante humeur; les artères, interrompant leur mouvement naturel, cesseront de battre; nulle chaleur, nul souffle n'attestera que tu vis encore; les roses de tes lèvres et de tes joues se faneront et deviendront pâles comme la cendre; les rideaux de tes yeux s'abaisseront comme à l'instant où la mort les ferme à la lumière de la vie; chaque partie de ton corps, privée de la souplesse qui te permet d'en disposer, paraîtra roide, inflexible et froide, comme dans la mort. Tu demeureras quarante-deux heures sous cette apparence empruntée d'une mort glacée, après quoi tu te réveilleras comme d'un sommeil agréable. Le lendemain, ton nouvel époux viendra dès le matin pour te faire sortir de ton lit; tu seras morte. Alors, suivant l'usage de notre pays, parée dans ton cercueil de tes plus beaux atours, et le visage découvert, tu seras portée dans cet antique tombeau où reposent tous les descendants des Capulet. Cependant, avant que tu sois réveillée, Roméo, instruit par mes lettres de notre entreprise, viendra ici; lui et moi nous épierons le moment de ton réveil, et cette nuit-là même Roméo t'emmènera d'ici à Mantoue. Voilà l'expédient qui te préservera de l'ignominie dont tu es menacée, si aucun caprice d'inconstance, aucune crainte de femme ne vient dans l'exécution abattre ton courage.

JULIETTE.--Donne, oh! donne-moi! Ne me parle pas de crainte.

FRÈRE LAURENCE.--Tiens, et va-t'en: sois forte et prospère dans cette résolution! J'enverrai en hâte à Mantoue un moine porter mes lettres à ton époux.

JULIETTE.--Amour, donne-moi la force, et la force me sauvera. Adieu, mon bon père.

(Ils se quittent.)

SCÈNE II

Un appartement de la maison de Capulet.

Entrent CAPULET, LA SIGNORA CAPULET, LA NOURRICE _et des_ DOMESTIQUES.

CAPULET.--Invite toutes les personnes dont le nom est écrit là-dessus. (_Le domestique sort_.)--Toi, drôle, va m'arrêter vingt habiles cuisiniers.

SECOND DOMESTIQUE.--Vous n'en aurez pas un mauvais, seigneur, car je verrai s'ils se lèchent les doigts.

CAPULET.--Et qu'est-ce que tu verras par-là?

SECOND DOMESTIQUE.--Vraiment, seigneur, c'est un mauvais cuisinier que celui qui ne se lèche pas les doigts. Ainsi, celui qui ne se lèche pas les doigts ne viendra pas avec moi.

CAPULET.--Va vite. (_Le domestiqua sort_.) Nous serons bien mal préparés pour cette noce.--Est-ce que ma fille est allé trouver le frère Laurence?

LA NOURRICE.--Oui, vraiment.

CAPULET.--Bon, il lui fera peut-être un peu de bien. C'est une insolente petite coquine bien entêtée.

(Entre Juliette.)

LA NOURRICE.--Tenez, voyez comme elle revient de confesse avec un visage riant.

CAPULET.--Eh bien! obstinée, où avez-vous été courir?

JULIETTE.--Où j'ai appris à me repentir du péché d'une désobéissante résistance à vous et à vos ordres. Le saint frère Laurence m'a enjoint de tomber ici à vos genoux, et de vous demander pardon. Pardon, je vous en conjure; désormais je me laisserai toujours gouverner par vous.

CAPULET.--Envoyez chercher le comte: allez et qu'on l'instruise de ceci. Je veux que ce noeud soit formé dès demain matin.

JULIETTE.--J'ai rencontré le jeune comte à la cellule du frère Laurence, et je lui ai accordé ce qui se peut accorder des droits de l'amour sans passer les bornes de la pudeur.

CAPULET.--Allons, j'en suis bien aise, tout va bien, relevez-vous; les choses vont comme elles doivent aller.--Il faut que je voie le comte; oui vraiment, allez, je vous dis, et amenez-le ici. En vérité, devant Dieu, toute notre ville a de grandes obligations à ce respectable religieux.

JULIETTE.--Nourrice, voulez-vous venir avec moi dans mon cabinet? Vous m'aiderez à assortir la parure que vous croirez convenable pour m'habiller demain.

LA SIGNORA CAPULET.--Non, pas avant jeudi. Nous avons le temps.

CAPULET.--Allez, nourrice, allez avec elle; nous irons à l'église demain.

(Juliette et la nourrice sortent.)

LA SIGNORA CAPULET.--Nous serons bien à court pour nos préparatifs: il est déjà presque nuit.

CAPULET.--Bon, bon; je me donnerai du mouvement et tout ira bien, je te le garantis, ma femme. Va rejoindre Juliette, aide-la à se parer; je ne me coucherai point cette nuit. Laisse-moi tranquille: pour cette fois, c'est moi qui ferai la ménagère.--Holà! mon chapeau.--Ils sont tous sortis. Allons, je vais aller moi-même chez le comte Pâris, et le disposer à la cérémonie de demain.--Mon coeur est merveilleusement léger depuis que cette fille entêtée est rentrée dans son devoir.

(Ils sortent.)

SCÈNE III

La chambre de Juliette.

Entrent JULIETTE ET LA NOURRICE.

JULIETTE.--Oui, cet ajustement est celui qui conviendra le mieux; mais, bonne nourrice, je t'en prie, laisse-moi seule cette nuit: j'ai besoin de bien des oraisons pour obtenir du ciel un regard propice dans l'état où je suis, qui est plein, comme tu sais, d'irrégularités et de péché.

(Entre la signora Capulet.)

LA SIGNORA CAPULET.--Eh bien! êtes-vous bien occupée? Avez-vous besoin que je vous aide?

JULIETTE.--Non, madame; nous avons fait un choix de tout ce qui est nécessaire pour paraître convenablement à la cérémonie de demain. Si c'est votre bon plaisir, permettez qu'on me laisse seule maintenant, et que ma nourrice veille cette nuit avec vous; car, j'en suis sûre, vous devez avoir des affaires par-dessus les yeux pour une chose qui se fait si précipitamment.

LA SIGNORA CAPULET.--Bonne nuit, va te mettre au lit et te reposer, tu en as besoin.

(La signora Capulet et la nourrice sortent.)

JULIETTE.--Adieu.--Dieu sait quand nous nous reverrons. (_Elle ferme la porte._) Je sens courir dans mes veines un frisson de peur, qui glace presque en moi la chaleur de la vie. Il faut que je les rappelle pour me rassurer.--Nourrice! Ah! que ferait-elle ici? il faut que je joue seule ma scène funèbre.--Viens, fiole.--Mais si ce breuvage n'opérait aucun effet, serais-je donc mariée de force au comte? Non, non, ceci me préservera. Repose ici. (_Elle place un poignard à côté d'elle._)--Mais si c'était un poison que le frère m'eût adroitement fourni pour me faire mourir, dans la crainte de se voir déshonoré par ce mariage, lui qui m'a mariée avec Roméo... Je crains qu'il n'en soit ainsi, et cependant quand j'y songe, cela ne doit pas être, car il a toujours été reconnu pour un saint homme. Je ne veux pas entretenir une si mauvaise pensée.--Mais quoi! si, après que je serai déposée dans le tombeau, j'allais me réveiller avant le moment où Roméo doit venir me délivrer... C'est là une chose bien effrayante. Ne serais-je pas alors suffoquée sous cette voûte dont la sombre entrée ne reçoit aucun air salutaire, et étouffée avant que mon Roméo arrivât? ou, si je suis vivante, n'est-il pas vraisemblable que l'horrible idée de la mort et de la nuit jointe à la terreur du lieu, sous cette voûte, antique réceptacle où depuis tant de siècles sont entassés les ossements de mes ancêtres qu'on y a tous ensevelis; où Tybalt, tout sanglant et encore tout frais enterré, est là à se corrompre dans son linceul; où l'on dit que les spectres nocturnes viennent s'assembler à certaines heures de la nuit?... Hélas! hélas! n'est-il pas probable que, trop tôt éveillée, au milieu de ces odeurs infectes, de ces cris semblables à ceux de la mandragore[61] qu'on arrache de la terre, et qui font, dit-on, perdre la raison à ceux qui les entendent... Oh! si je m'éveille, ne pourra-t-il pas arriver que ma tête s'égare, assiégée de ces hideuses terreurs? Ne puis-je pas dans ma folie aller me jouer avec les restes de mes aïeux, et arracher de son linceul Tybalt tout défiguré; ou, dans cette frénésie, me servir, comme d'un bâton, de quelque os d'un de mes grands-pères pour briser ma cervelle désespérée?--Oh! regardez! Il me semble voir l'ombre de mon cousin chercher Roméo, qui a enfoncé dans son corps la pointe d'une épée.... Arrête, Tybalt, arrête!--Roméo, je viens. Je bois ceci à ta santé.

(Elle se jette sur le lit.)

[Note 61: On attribuait à la mandragore, entre autres propriétés singulières, celle de pousser, lorsqu'on l'arrachait, des cris qui faisaient perdre la raison à ceux qui les entendaient. On prétendait qu'elle croissait sur la fosse des hommes mis à mort pour quelque crime, et qu'elle était le produit de la corruption de leur corps; aussi la regardait-on comme douée de vie.]

SCÈNE IV

Une salle dans la maison de Capulet.

Entrent LA SIGNORA CAPULET et LA NOURRICE.

LA SIGNORA CAPULET.--Nourrice, prenez ces clefs et allez chercher encore des épices.

LA NOURRICE.--Ils demandent des dattes et des coings à l'office.

(Entre Capulet.)

CAPULET.--Allons, levez-vous, levez-vous, levez-vous; le coq a chanté pour la seconde fois; la cloche du couvre-feu a sonné; il est trois heures.--Ayez l'oeil au four, bonne Angélique; qu'on n'épargne rien.

LA NOURRICE.--Et vous, allez, tracassier, allez, allez vous mettre au lit; en vérité, vous serez malade demain pour avoir passé la nuit.

CAPULET.--Non, pas du tout. Bon, j'ai bien veillé d'autres nuits pour moins que cela, et je n'en ai jamais été incommodé.

LA SIGNORA CAPULET.--Oui, vous avez été, de votre temps, un coureur d'aventures[62]; mais je veillerai à ce que vous ne fassiez plus de ces sortes de veillées.

[Note 62: _A mouse hunt_ (un chasseur de souris).]

CAPULET.--Jalouse! jalouse! (_Entrent des domestiques avec des broches, du bois, des corbeilles._) Qu'est-ce que c'est que tout cela, mon ami?

PREMIER DOMESTIQUE.--Ce sont des affaires pour le cuisinier, seigneur, mais je ne sais pas ce que c'est.

CAPULET.--Dépêche-toi, dépêche-toi. (_Le domestique sort._) Toi, apporte des fagots plus secs; appelle Pierre, et il te dira où ils sont.

LE DOMESTIQUE.--Ah! j'ai dans ma tête, seigneur, des fagots tout trouvés, sans déranger Pierre pour cela.

(Il sort.)

CAPULET.--Par la messe, c'est bien dit; tu es un joyeux compère[63]! Ah! je te fagoterai.--Par ma foi! voilà le jour. Le comte ne tardera pas à venir ici avec la musique; il me l'a dit. (_On entend des instruments._) Mais je l'entends qui s'approche.--Nourrice! ma femme! allons. Eh bien, nourrice! Allons, dis-je. (_Entre la nourrice._) Allez éveiller Juliette; allez, habillez-la: je vais, moi, causer avec Pâris.... Allons, dépêchez-vous, dépêchez-vous; voilà le marié déjà arrivé: dépêchez-vous, vous-dis-je.

(Ils sortent.)

[Note 63:

SERVANT. _I have a head, sir, that will find out logs And never trouble Peter for the matter_.

CAPULET. _'Mass, and well said; a merry whoreson! ha! Thou shalt be logger-head._

Logs et _Logger-head_ (bûches, têtes de bois). Il a fallu trouver un équivalent.]

SCÈNE V

La chambre de Juliette.--Juliette est sur son lit.

Entre LA NOURRICE.

LA NOURRICE.--Ma maîtresse! allons, ma maîtresse! Juliette!... Ma foi, pour elle, elle dort profondément.--Eh bien! mon agneau; eh bien, madame! Fi! paresseuse! Allons, mon amour, levez-vous, dis-je. Madame! mon cher coeur, allons, madame la mariée...--Quoi, pas le mot! Vous vous en donnez pour quatre sous maintenant[64], vous dormez pour huit jours; car la nuit prochaine, j'en réponds, le comte Pâris a gagé son repos que vous ne sommeilleriez guère.... Dieu me pardonne (ma foi, _amen_)! Comme elle dort profondément! Il faut absolument que je l'éveille.--Madame, madame, madame! Voulez-vous que le comte vous surprenne au lit[65]? Vous vous lèveriez bien vite, de frayeur, j'en suis sûre, n'est-ce pas?... Comment! tout habillée! vous n'avez pas quitté votre robe, et vous voilà encore couchée! il faut absolument que je vous réveille.--Madame, madame, madame!... Hélas! au secours! au secours! ma maîtresse est morte. Oh! malheureux jour, faut-il que je sois jamais née! De l'eau-de-vie! oh! seigneur! oh! madame!

[Note 64: _You take your penny-worths now._]

[Note 65: Il paraîtrait que l'usage était alors que le marié allât chercher sa fiancée dans son lit, si elle n'avait pas le soin de le prévenir par sa diligence.]

(Entre la signora Capulet.)

LA SIGNORA CAPULET.--Quel bruit fait-on ici!

LA NOURRICE.--O journée lamentable!

LA SIGNORA CAPULET.--Qu'est-ce que c'est?

LA NOURRICE.--Voyez, voyez. O funeste jour!

LA SIGNORA CAPULET.--O malheureuse, malheureuse que je suis! Mon enfant, mon unique vie! Reviens à la vie, rouvre tes yeux ou je mourrai avec toi. Au secours! au secours! que tout le monde vienne au secours!

(Entre Capulet.)

CAPULET.--Fi donc! amenez Juliette, son époux est arrivé.

LA NOURRICE.--Elle est morte, décédée; elle est morte, O jour maudit!

LA SIGNORA CAPULET.--Hélas! hélas! elle est morte, elle est morte, elle est morte.

CAPULET.--Ah! laissez-moi la voir...--Hélas! elle est déjà froide; son sang est arrêté et ses muscles roides: il y a déjà longtemps que la vie a abandonné ses lèvres. La mort pèse sur elle comme une gelée intempestive sur la plus douce des fleurs de toute la prairie.

LA NOURRICE.--O déplorable jour!

LA SIGNORA CAPULET.--O temps de désastres!

CAPULET.--La mort, qui l'a enlevée pour me faire gémir, enchaîne ma langue et m'ôte la parole.

(Entrent frère Laurence et Pâris, avec les musiciens.)

FRÈRE LAURENCE.--Eh bien! la mariée est-elle prête à aller à l'église?

CAPULET.--Elle est prête à y aller, mais pour n'en revenir jamais.--O mon fils, dans la nuit qui précède tes noces, la mort a envahi la couche de ton épouse. Vois, elle est là étendue, cette jeune fleur qu'elle a défleurée;[66] c'est le trépas qui est mon gendre. Le trépas est mon héritier; il a épousé ma fille; je mourrai et lui laisserai tout: quand on meurt, tout appartient à la mort.

[Note 66: _Flower as she was, deflowered by him._]

PARIS.--N'ai-je donc si longtemps désiré de voir le visage de ce jour que pour qu'il m'offrît un pareil spectacle!

LA SIGNORA CAPULET.--O jour malheureux et maudit! jour de misère, jour odieux! O heure la plus déplorable que le temps ait jamais rencontré dans les travaux éternels de son pèlerinage! N'avoir qu'une seule, une pauvre et seule enfant qui m'aimait, mon unique joie, ma seule consolation; et la cruelle mort la ravit à ma vue!

LA NOURRICE.--O malheur! O malheureux, malheureux, malheureux jour! jour lamentable! le plus malheureux que j'aie jamais encore vu! O jour! O jour! jour, jour odieux! Jamais on n'a vu un jour si cruel que celui-ci. O malheureux jour! ô malheureux jour!

PARIS.--Trompé, divorcé, outragé, déchiré, assassiné par toi, ô détestable mort! par toi, toi, cruelle, perdu sans ressource. O amours, ô vie! non plus la vie, mais l'amour dans la mort.

CAPULET.--Avili, désespéré, haï, martyrisé, tué! O heure de désolation, pourquoi es-tu venue frapper de mort, de mort, notre fête solennelle? O mon enfant, mon enfant! mon âme et non plus mon enfant..... te voilà morte, morte! Hélas! mon enfant est morte, et avec mon enfant sont ensevelies toutes mes joies.

FRÈRE LAURENCE.--Paix, silence! n'avez-vous pas de honte? Le remède au désespoir n'est pas dans le désespoir.--Le ciel et vous aviez une part dans cette belle enfant: maintenant le ciel la possède tout entière, et ce n'en est que mieux pour elle. Vous ne pouviez sauver de la mort cette part qui en elle vous appartenait, mais le ciel garde sa part dans la vie éternelle. Le comble de vos voeux était son bonheur; c'était votre paradis de la voir s'élever; et maintenant pleurerez-vous en la voyant élevée au-dessus des nuages, à la hauteur du ciel même! Oh! dans votre amour vous savez si mal aimer votre enfant, que vous voilà hors de sens de la voir heureuse. Ce n'est pas la mieux mariée celle qui vit longtemps mariée; la mieux mariée est celle qui meurt mariée jeune. Séchez vos larmes; attachez vos branches de romarin sur ce beau cadavre, et, suivant l'usage, portez-la à l'église parée de ses plus brillants atours. Bien que les tendres faiblesses de la nature nous contraignent tous à nous plaindre, les larmes de la nature excitent le sourire de la raison.

CAPULET.--Tout ce que nous avions préparé pour une fête change d'objet et va servir à de sombres funérailles, nos instruments seront des cloches lugubres; le festin des noces va devenir un triste banquet funéraire; à nos hymnes solennels seront substitués des chants funèbres; et ces bouquets de noces vont servir à un cadavre enseveli; toute chose s'est convertie en la chose contraire.

FRÈRE LAURENCE.--Rentrez, seigneur... et vous, madame, avec lui. Seigneur Pâris, allez. Que chacun se prépare à accompagner ce beau cadavre à son tombeau. Le ciel, pour quelque offense, s'est assombri pour vous: ne l'irritez pas davantage en résistant à sa volonté suprême.

(Sortent Capulet, la signora Capulet, Pâris et le frère Laurence.)

PREMIER MUSICIEN.--Ma foi, nous pouvons serrer nos flûtes et nous en aller.

LA NOURRICE.--Ah! serrez-les, serrez-les, mes bons et honnêtes amis; car vous voyez que c'est une aventure bien triste.

(Elle sort.)

PREMIER MUSICIEN.--Oui, par ma foi! il y aurait mieux à faire.

(Entre Pierre)

PIERRE.--O musiciens, musiciens! _O contentement du coeur, contentement du coeur!_[67] Si vous voulez me rendre la vie, jouez _Contentement du coeur_.

[Note 67: _Heart's ease_, air d'une ballade.]

PREMIER MUSICIEN.--Et pourquoi _Contentement du coeur_?

PIERRE.--O musiciens, parce que mon coeur joue de lui-même _Mon coeur est plein de tristesse_[68]. Jouez-moi quelque complainte un peu gaie pour me réconforter.

[Note 68: _My heart is full of woe_, refrain d'une autre ballade.]

SECOND MUSICIEN.--Nous ne vous jouerons pas de complainte; ce n'est pas le moment de jouer.

PIERRE.--Vous ne voulez donc pas?

SECOND MUSICIEN.--Non.

PIERRE.--Eh bien, je vous en donnerai, moi, et qui sonnera.

PREMIER MUSICIEN.--Qu'est-ce que vous nous donnerez?

PIERRE.--Pas d'argent, sur ma foi[69], mais une danse. Vous aurez de ma musique.

[Note 69: PETER. _No money on my faith; but the gleek: I will give you the minstrel._

1 MUS. _Then I will give you the serving creature_.

PETER. _Then will I lay the serving creature's dagger on your pate. I will carry no crotchets: I'll_ re _you, I'll_ fa _you; do you note me._

1 MUS. _An you_ re _us, and_ fa _us, you note us._

2 MUS. _Pray you, put up your dagger, and put out your wit._

PETER. _Then have at you with my wit: I will dry-beat you with an iron wit, and put up my iron dagger_.

Presque toutes les plaisanteries de ce dialogue portent sur des locutions et des manières de parler tellement hors d'usage, que les commentateurs sont fort embarrassés à en rendre raison. Il a fallu chercher des équivalents.]

PREMIER MUSICIEN.--Oh bien! je vous ferai aller en mesure, moi.

PIERRE.--Prenez garde que mon poignard ne batte la mesure sur votre tête, et je ne m'arrêterai pas aux paroles, voyez-vous; et si je veux que vous me fassiez une fugue, j'aurais bientôt dit _ut_: mettez cela en note.

PREMIER MUSICIEN.--C'est vous qui donnez la note avec votre _ut_.

SECOND MUSICIEN.--Je vous en prie, mettez votre poignard dans le fourreau et votre esprit en dehors.

PIERRE.--Eh bien! garde à vous contre mon esprit. Mon esprit a le fil, il va vous percer à jour; ainsi, je puis vous faire grâce du fil de mon poignard. Répondez-moi en hommes de tête:

Quand le chagrin poignant a blessé le coeur Et que l'esprit est accablé d'une douloureuse tristesse, La musique aux sons argentins...

Pourquoi _sons argentins_? pourquoi _la musique aux sons argentins_? Qu'en dites-vous, Simon Corde-à-boyau?

PREMIER MUSICIEN.--Vraiment, c'est que l'argent a un son très-agréable.

PIERRE.--Joli! Et vous, qu'en dites-vous, Hugues Rebec[70]?

[Note 70: _Rebec, rebecquin_, nom d'un ancien violon à trois cordes.]

SECOND MUSICIEN.--Je dis moi, que _sons argentins_, cela veut dire des sons qui nous valent de l'argent.

PIERRE.--Joli aussi!--Et qu'en dites-vous, Jacques Du Son?

TROISIÈME MUSICIEN.--Ma foi, je ne sais que dire.

PIERRE.--Ah! pardon; j'oubliais que vous êtes le chanteur.--Eh bien! je répondrai pour vous. On dit _la musique aux sons argentins_, parce que ce n'est pas ordinairement avec de l'or qu'on paye des gaillards comme vous de leur musique.

La musique aux sons argentins Apporte promptement un remède à leurs maux.

(Il sort en chantant.)

PREMIER MUSICIEN.--Quel malin diable est-ce là?

SECOND MUSICIEN.--Qu'il s'aille faire pendre. Venez entrons là dedans; nous y attendrons le retour du convoi et nous resterons à dîner.

(Ils sortent.)

FIN DU QUATRIÈME ACTE.

ACTE CINQUIÈME

SCÈNE I

Une rue de Mantoue.

Entre ROMÉO.

ROMÉO.--Si l'oeil du sommeil ne m'a pas trompé par de flatteuses illusions, mes songes m'annoncent prochainement d'heureuses nouvelles. Le maître de ma poitrine siége légèrement sur son trône, et une humeur inaccoutumée m'a, durant toute cette journée, élevé au-dessus de la terre dans des pensées joyeuses. J'ai rêvé que mon épouse arrivait et me trouvait mort (étrange songe, qui laisse à un mort la faculté de penser!) et que ses baisers communiquaient à mes lèvres un tel souffle de vie, que je me suis ranimé et me suis vu empereur. O ciel! quelle est donc la douceur des jouissances réelles de l'amour, puisque l'ombre de l'amour seulement est si riche de bonheur? (_Entre Balthasar._)--Des nouvelles de Vérone!--Eh bien! Balthasar, ne m'apportes-tu pas des lettres du frère Laurence? Comment se porte ma Juliette? Mon père jouit-il d'une bonne santé? Comment se porte ma Juliette? C'est cela que je te redemande, car rien ne peut être mal si ma Juliette est bien.

BALTHASAR.--Elle est bien; ainsi rien ne peut être mal... Son corps sommeille dans le tombeau des Capulet, et l'immortelle partie de son être vit avec les anges. Je l'ai vu déposer dans le tombeau de sa famille, et j'ai pris sur-le-champ la poste pour venir vous l'apprendre. Oh! pardonnez si je vous apporte ces funestes nouvelles, puisque c'est la mission que vous m'aviez laissée, seigneur.

ROMÉO.--En est-il ainsi?--A présent, astres contraires, je vous défie.--Tu connais ma demeure. Va, procure-moi de l'encre et du papier; arrête des chevaux de poste, je veux partir cette nuit.

BALTHASAR.--Pardonnez-moi, seigneur, mais je ne puis vous laisser seul; vous êtes pâle, et votre air égaré annonce quelque malheur.

ROMÉO.--Allons donc, tu te trompes. Laisse-moi, et fais ce que je t'ordonne.--N'as-tu point de lettres pour moi du frère Laurence?

BALTHASAR.--Non, mon cher maître.

ROMÉO.--N'importe. Va-t'en, et arrête-moi ces chevaux; je te rejoins à l'instant. (_Balthasar sort._)--C'est bien, Juliette; je reposerai avec toi cette nuit; occupons-nous d'en trouver les moyens.--O mal, tu es prompt à entrer dans les pensées de l'homme

au désespoir! Je me souviens d'un apothicaire que j'ai remarqué dernièrement ici aux environs, couvert de vêtements déchirés, le regard sombre, et épluchant des simples; son aspect était celui de la maigreur; la misère dévorante l'avait rongé jusqu'aux os. Du plafond de son indigente boutique pendaient une tortue, un crocodile empaillé et d'autres peaux de poissons difformes; et le long de ses rayons des tiroirs vides annonçaient par leurs étiquettes ce qui leur manquait; des pois de terre verte, des vessies et des graines moisies, des restes de ficelle et de vieux pains de roses, étaient clair-semés çà et là pour servir de montre. En voyant sa misère, je me dis à moi-même: Si un homme avait besoin de quelque poison dont la vente fût punie d'une mort certaine à Mantoue, voilà un malheureux coquin qui lui en vendrait. Oh! cette pensée n'a fait que prévenir mes besoins: il faut que ce misérable m'en vende.--Autant que je m'en souviens, ce doit être ici sa demeure.--Comme c'est aujourd'hui fête, la boutique du pauvre hère est fermée.--Holà, holà, apothicaire!

(Entre l'apothicaire.)

L'APOTHICAIRE.--Qui appelle donc si fort?

ROMÉO.--Viens ici, mon ami. Je vois que tu es pauvre, tiens, voilà quarante ducats; donne-moi une drachme de poison qui expédie si promptement qu'aussitôt qu'elle se sera répandue dans les veines, celui qui, las de la vie, en aura fait usage tombe mort sur-le-champ, et que son corps perde la respiration avec la même rapidité qu'en met la poudre enflammée à s'échapper des fatales entrailles du canon.

L'APOTHICAIRE.--J'ai de ces poisons mortels, mais la loi de Mantoue punit de mort quiconque en débite.

ROMÉO.--Quoi! si dénué de tout, si plein de misère, et tu as peur de mourir! La famine est sur tes joues; le besoin et la souffrance ont peint la mort dans tes yeux; sur ton dos traîne la misère en haillons. Le monde ne t'est point ami, ni la loi du monde; le monde n'a point de loi qui puisse t'enrichir; cesse donc d'être pauvre; enfreins seulement la loi, et prends cet or.

L'APOTHICAIRE.--C'est ma pauvreté et non pas ma volonté qui consent.

ROMÉO.--C'est ta pauvreté que je paye, et non ta volonté.

L'APOTHICAIRE.--Mettez ceci dans un liquide quelconque, celui que vous voudrez; avalez-le, et eussiez-vous la force de vingt hommes ensemble, il vous aura expédié sur-le-champ.

ROMÉO.--Tiens, voilà ton or, poison plus funeste pour la vie des hommes, et qui commet bien plus de meurtres dans ce monde odieux que ces pauvres compositions que tu n'as pas la permission de vendre. C'est moi qui te vends du poison; toi tu ne m'en as pas vendu.--Adieu, achète de quoi manger et te remettre en chair.--Viens, cordial et non pas poison, viens avec moi au tombeau de Juliette: c'est là que tu dois me servir!

(Il sort.)

SCÈNE II

La cellule du frère Laurence.

Entre FRÈRE JEAN.

FRÈRE JEAN.--Saint franciscain, mon frère, holà!

(Entre frère Laurence.)

FRÈRE LAURENCE.--Je crois entendre la voix du frère Jean.--Soyez le bienvenu de Mantoue. Que dit Roméo? ou bien, s'il a écrit ce qu'il pensait, donnez-moi sa lettre?

FRÈRE JEAN.--Cherchant pour m'accompagner un frère déchaussé, membre de notre ordre, qui visitait les malades de cette ville, au moment où je le trouvai, les inspecteurs de la cité, soupçonnant que nous étions tous deux entrés dans une maison infectée de la contagion, ont fermé les portes et n'ont jamais voulu nous laisser sortir. Ma course vers Mantoue a été arrêtée là.

FRÈRE LAURENCE.--Qui donc a porté ma lettre à Roméo?

FRÈRE JEAN.--Je n'ai pu l'envoyer, la voilà. Je n'ai pas même pu trouver de messager qui te la rapportât, tant ils redoutaient la contagion!

FRÈRE LAURENCE.--Funeste circonstance! Par notre communauté, cette lettre n'était pas indifférente; elle portait un message de la plus grande importance, et ce retard peut être d'un grand danger.--Frère Jean, va me chercher un levier de fer, et me l'apporte promptement dans ma cellule.

FRÈRE JEAN.--Frère, je vais te l'apporter.

(Il sort.)

FRÈRE LAURENCE.--Maintenant il faut que je me rende seul au monument. Dans trois heures la belle Juliette s'éveillera. Elle va me maudire en apprenant que Roméo n'a pas été instruit de ce qui vient d'arriver. Mais j'écrirai de nouveau à Mantoue, et je garderai Juliette dans ma cellule jusqu'à l'arrivée de Roméo.--Pauvre cadavre vivant enfermé dans la tombe d'un mort!

(Il sort.)

SCÈNE III

Un cimetière dans lequel se voit un monument appartenant à la famille des Capulet.

Entre PARIS _et son_ PAGE _qui porte une torche et des fleurs._

PARIS.--Page, donne-moi ton flambeau. Éloigne-toi et te tiens à l'écart.--Non, éteins-le; je ne veux pas être vu. Va te coucher sous ces cyprès, et applique ton oreille contre le sol creusé: les nombreux tombeaux qu'on y a ouverts ont tellement ébranlé sa solidité que personne ne pourra marcher dans le cimetière que tu ne l'entendes: alors, siffle pour m'avertir que tu entends approcher quelqu'un.--Donne-moi ces fleurs; fais ce que je t'ordonne: va.

LE PAGE.--Je suis presque effrayé de rester seul ici dans ce cimetière, cependant je vais m'y aventurer.

(Il s'éloigne.)

PARIS.--Douce fleur, je sème de fleurs ton lit nuptial. Tombeau chéri, qui renferme dans ton enceinte la plus parfaite image des êtres éternels; belle Juliette, qui habites avec les anges, accepte cette dernière marque d'amour. Vivante, je t'honorai; morte, mes hommages funéraires viennent orner ta tombe. (_Le page siffle._)--Mon page a fait le signal; quelqu'un approche: quel pied sacrilége erre dans ces lieux pendant la nuit, pour troubler mes tristes fonctions et le culte d'un fidèle amour? Quoi! avec un flambeau!--Nuit, couvre-moi un moment de ton voile.

(Il se retire.)

(Entrent Roméo et Balthasar qui le précède avec une torche, une pioche, etc.)

ROMÉO.--Donne-moi cette pioche et ce croc de fer. Prends cette lettre, et demain de bonne heure aie soin de la remettre à mon seigneur et père. Donne-moi la lumière. Sur ta vie, je t'enjoins, quoi que tu puisses entendre ou voir, de rester au loin à l'écart, et de ne pas m'interrompre en ce que je veux faire. Si je descends dans ce lit de la mort, c'est en partie pour contempler encore les traits de ma bien-aimée; mais surtout pour ôter de son doigt insensible un anneau précieux, un anneau dont j'ai besoin pour un usage qui est cher à mon coeur. Ainsi, éloigne-toi; va-t'en.--Si, poussé par quelque inquiétude, tu reviens épier ce que je veux faire ensuite, par le ciel, je te déchirerai morceau par morceau, et je joncherai de tes membres ce cimetière affamé. La circonstance, mes projets sont sauvages et farouches, plus terribles, plus inexorables que les tigres à jeun ou la mer en furie.

BALTHASAR.--Je m'en vais, seigneur, et ne vous troublerai point.

ROMÉO.--C'est ainsi que tu me prouveras ton attachement. Prends cela. Vis et sois heureux, honnête serviteur.

BALTHASAR.--Précisément cause de tout cela, je veux me cacher ici à l'entour. Ses regards me font peur, et j'ai mes doutes sur ses intentions.

(Il sort.)

ROMÉO.--Toi, gouffre de mort, ventre détestable assouvi du plus précieux repas que pût offrir la terre, c'est ainsi que je saurai forcer tes mâchoires pourries à s'ouvrir, et que dans ma haine je veux te gorger d'une nouvelle proie.

(Il enfonce la porte du monument.)

PARIS.--C'est cet orgueilleux Montaigu, ce banni, qui a tué le cousin de ma bien-aimée, dont le chagrin, à ce qu'on croit, a causé la mort de la belle Juliette. Il vient ici faire aux cadavres quelque infâme outrage. Je vais l'arrêter. (_Il s'avance._)--Suspends tes efforts sacriléges, vil Montaigu: peut-on poursuivre la vengeance au delà de la mort? Scélérat condamné, je t'arrête: obéis et suis-moi, car il faut que tu meures.

ROMÉO.--Oui, il le faut, et c'est pour cela que je suis ici. Bon et noble jeune homme, ne tente point un homme désespéré; fuis loin d'ici, et laisse-moi. Pense à ceux qui sont là morts, et qui t'effrayent. Je t'en conjure, jeune homme, ne charge point ma tête d'un nouveau péché en me poussant à la fureur. Oh! va-t'en. Par le ciel, je t'aime plus que moi-même, car c'est contre moi-même que je viens armé dans ce lieu. Ne t'arrête pas ici plus longtemps; va-t'en; vis, et tu diras que la pitié d'un furieux t'a commandé de fuir.

PARIS.--Je défie tes conjurations, et je t'arrête comme tombé en félonie par ton retour.

ROMÉO.--Tu veux donc me provoquer? Eh bien! songe à te défendre, jeune homme.

(Ils se battent.)

LE PAGE.--O ciel! ils se battent. Je vais chercher la garde.

(Il sort.)

PARIS.--Oh! je suis mort! (_Il tombe._) Si tu es capable de pitié, ouvre la tombe; et couche-moi près de Juliette.

ROMÉO.--Sur ma foi, je le ferai.--Il faut que je contemple ces traits.--Le parent de Mercutio, le noble comte Pâris.--Que m'a dit Balthasar tandis que nous cheminions ensemble? Mon âme en tumulte ne lui prêtait aucune attention. Il m'a dit, je crois, que Pâris avait dû épouser Juliette. Ne me l'a-t-il pas dit? ou l'aurais-je rêvé? ou bien est-ce dans un moment de folie, tandis qu'il me parlait de Juliette, que je l'aurai imaginé ainsi?--Oh! donne-moi ta main, toi dont le nom est écrit avec le mien dans le funeste livre du malheur. Je vais t'ensevelir dans un tombeau glorieux. Un tombeau! Oh! non, c'est un dôme brillant, jeune homme assassiné, car Juliette y repose, et sa beauté fait de cette voûte un séjour de fête plein de clarté. Mort, sois déposé ici par les mains d'un homme mort. (_Il couche Pâris dans le monument._)--Combien de fois des hommes, à l'article de la mort, ont eu un rayon de joie! C'est ce que ceux qui les soignent appellent un éclair avant la mort. Mais comment puis-je appeler ceci un éclair?--O mon amante, ma femme! la mort, qui a sucé le miel de ton haleine, n'a pas encore eu de pouvoir sur ta beauté: tu n'es pas vaincue; les couleurs de la beauté brillent encore de tout leur vermillon sur tes lèvres et tes joues, et le pâle étendard de la mort n'en a pas encore pris la place.--Tybalt, es-tu là couché dans ton drap sanglant? Quelle faveur plus grande puis-je te faire que d'abattre, de la même main qui a moissonné ta jeunesse, la jeunesse de celui qui fut ton ennemi?--Pardonne-moi, cousin.--O chère Juliette, pourquoi es-tu si belle encore? Dois-je croire que ce fantôme appelé la Mort est amoureux, et que cet odieux monstre décharné te garde ici dans l'obscurité pour faire de toi sa maîtresse? De peur qu'il n'en soit ainsi, je resterai toujours avec toi, et ne sortirai plus jamais de ce palais de la sombre nuit. Je demeurerai avec les vers qui sont tes femmes de chambre. Ici je veux établir mon éternel repos, et débarrasser du joug des étoiles funestes cette chair fatiguée du monde. Mes yeux, regardez pour la dernière fois; mes bras, pressez-la pour la dernière fois; et vous, mes lèvres, portes de la respiration, scellez d'un baiser légitime un marché sans terme avec la mort qui possède sans partage.--(_Au poison._) Viens, amer conducteur, guide rebutant, pilote désespéré; lance maintenant tout d'un coup, sur les rochers qui vont la briser en éclats, ta barque fatiguée du travail de la mer. Voici que je bois à mes amours! (_Il boit le poison._)--O fidèle apothicaire, tes remèdes sont actifs.--Avec ce baiser, je meurs.

(Il meurt.)

(Entre dans le cimetière frère Laurence avec une lanterne, un levier et une bêche.)

FRÈRE LAURENCE.--O saint François, sois mon guide. Combien de fois cette nuit mes pieds vieillis ont-ils chancelé, en se heurtant contre des tombeaux!--Qui est là?

BALTHASAR.--Celui qui est ici est un ami, et un homme qui vous connaît bien.

FRÈRE LAURENCE.--Que la bénédiction repose sur vous.--Dites-moi, mon bon ami, quel est ce flambeau là-bas, qui prête en vain sa lumière à des vers et à des crânes sans yeux? Il brûle, à ce qu'il me semble, dans le monument des Capulet.

BALTHASAR.--Oui, père vénérable, c'est là qu'il brûle; et dans ce monument est mon maître, un homme que vous aimez.

FRÈRE LAURENCE.--Qui est votre maître?

BALTHASAR.--Roméo.

FRÈRE LAURENCE.--Y a-t-il longtemps qu'il est là?

BALTHASAR.--Une grande demi-heure.

FRÈRE LAURENCE.--Entrez avec moi sous la voûte.

BALTHASAR.--Je n'ose, mon père. Mon maître ignore que je n'ai pas quitté ce lieu; et avec un accent terrible il m'a menacé de la mort si je demeurais pour épier ses desseins.

FRÈRE LAURENCE.--Eh bien! reste donc ici; j'irai seul. La crainte s'empare de moi. Oh! je crains bien qu'il ne soit arrivé quelque accident funeste.

BALTHASAR.--Comme je dormais sous ce cyprès que vous voyez, j'ai rêvé que mon maître se battait avec un autre homme, et que mon maître l'avait tué.

FRÈRE LAURENCE.--Roméo! (_Il s'avance._)--Hélas! hélas! quel est ce sang qui souille les pierres de l'entrée du caveau? Que signifient ces épées sanglantes et sans maîtres, que je vois à terre teintes de sang dans ce séjour de paix? (_Il entre dans le monument._)--Roméo! Oh! qu'il est pâle!--Et qui encore? Quoi! Pâris aussi, baigné dans son sang! Ah! quelle heure cruelle est coupable de ce lamentable événement!--Juliette se remue!

(Juliette se réveille et se soulève.)

JULIETTE.--O frère secourable, où est mon seigneur? Je me rappelle bien où je devais me trouver, et m'y voilà. Où est mon Roméo?

(Bruit derrière le théâtre.)

FRÈRE LAURENCE.--J'entends du bruit.--Madame, sortez de cet antre de la mort, de la contagion, et d'un sommeil contre nature. Une puissance supérieure à toutes nos résistances a traversé nos desseins. Venez, sortez d'ici; votre époux est là, mort à vos côtés, et Pâris aussi.--Suivez-moi, je vous placerai dans une communauté de saintes religieuses. Ne vous arrêtez pas à me faire des questions: la garde approche; venez, venez, chère Juliette, je n'ose rester plus longtemps ici. (_Il s'éloigne._)

JULIETTE.--Va, sors d'ici, car je ne veux pas m'en aller.--Qu'est-ce que cela! Une coupe que serre la main de mon bien-aimé! C'est le poison, je le vois, qui a terminé sa vie avant le temps.--Quoi! égoïste! avoir tout bu, sans m'en laisser une seule goutte amie pour me secourir après toi! Je veux baiser tes lèvres; peut-être y recueillerai-je quelques restes du poison, suffisants pour me faire mourir au moyen d'un cordial. (_Elle l'embrasse._)--Tes lèvres sont chaudes encore!

PREMIER SOLDAT, _derrière le théâtre_.--Conduis-nous, jeune homme. Par quel chemin?

JULIETTE.--Oui vraiment, du bruit? Alors j'aurai bientôt fait. Oh! bienheureux poignard (_elle saisit le poignard de Roméo_), voici ton fourreau (_elle se frappe_), tu peux t'y rouiller; laisse-moi mourir.

(Elle tombe sur le corps de Roméo et meurt.)

(Entre la garde avec le page de Pâris.)

LE PAGE.--Voilà l'endroit; là, où brûle ce flambeau.

PREMIER SOLDAT.--La terre est ensanglantée. Cherchez autour du cimetière: allez quelques-uns de vous, et qui que vous rencontriez, saisissez-le. (_Sortent quelques soldats._) Oh! spectacle pitoyable! Ici le comte tué, et Juliette sanglante, chaude encore et morte il n'y a qu'un moment, elle qui est enterrée depuis deux jours. Allez instruire le prince; courez chez les Capulet; avertissez les Montaigu. Allez chercher encore quelques autres personnes. (_Sortent les autres soldats._) Nous voyons bien le lieu où se sont accumulés tant de malheurs; mais pour expliquer ce qui a donné lieu[71] à ces malheurs si déplorables, il nous en faut connaître les circonstances.

[Note 71: _We see the ground whereon these woes do lie; but the true ground of all these piteous woes, we cannot_, etc. _Ground_ (lieu, endroit), et _ground_ (fondement).]

(Rentrent quelques soldats avec Balthasar.)

SECOND SOLDAT.--Voici le domestique de Roméo, nous l'avons trouvé dans le cimetière.

PREMIER SOLDAT.--Gardez-le en sûreté jusqu'à l'arrivée du prince.

(Un autre soldat arrive avec le frère Laurence.)

TROISIÈME SOLDAT.--Voici un religieux qui tremble, soupire et pleure. Nous lui avons pris cette bêche et ce levier comme il venait de cette partie du cimetière.

PREMIER SOLDAT.--Cela est très-suspect. Retenez aussi ce religieux.

(Entre le prince avec sa suite.)

LE PRINCE.--Quel malheur s'est donc éveillé si matin, qu'il nous oblige avant le jour d'interrompre notre sommeil?

(Entrent Capulet, sa femme et plusieurs autres personnes.)

CAPULET.--Qui est-ce qui se passe donc qu'on crie ainsi dehors?

LA SIGNORA CAPULET.--Le peuple crie dans les rues, Roméo! d'autres, Juliette! d'autres, Pâris! et tous courent en poussant des clameurs, vers notre monument.

LE PRINCE.--Quelle est donc cette alarme dont le bruit a frappé nos oreilles?

PREMIER SOLDAT.--Mon souverain, ici est le comte Pâris tué, et Roméo mort, et Juliette, morte depuis deux jours, qui n'est pas froide encore, et vient d'être tuée.

LE PRINCE.--Regardez, cherchez, et tâchez de découvrir d'où viennent ces meurtres horribles.

PREMIER SOLDAT.--Voici un religieux et le domestique de Roméo qui est là assassiné; ils avaient sur eux des instruments propres à ouvrir la tombe qui renferme ces morts.

CAPULET.--O ciel! ô ma femme! voyez comme notre fille est sanglante! Ce poignard s'est mépris: hélas! en voilà le fourreau sur le corps de Montaigu; et le fer s'est égaré dans le sein de ma fille.

LA SIGNORA CAPULET.--O malheureuse! ce spectacle de mort est comme la cloche qui appelle ma vieillesse au tombeau.

(Entre Montaigu.)

LE PRINCE.--Approche, Montaigu. Tu t'es levé de bonne heure pour voir ton fils et ton héritier couché là de meilleure heure encore.

MONTAIGU.--Hélas! prince, ma femme est morte cette nuit, la douleur de l'exil de mon fils l'a suffoquée. Quels malheurs nouveaux conspirent encore contre ma vieillesse?

LE PRINCE.--Regarde, et tu verras.

MONTAIGU.--O fils mal-appris, où est le respect de te presser ainsi d'arriver avant ton père au tombeau?

LE PRINCE.--Ferme pour un moment ta bouche à l'outrage, jusqu'à ce que nous ayons pu éclaircir ces mystères et en découvrir la source, la cause et la marche véritable. Alors je me mets à la tête de vos communes douleurs, et vous conduirai, s'il le faut, à la tombe. En attendant, contenez-vous, et que le malheur subisse le joug de la patience. (_Aux gardes._)--Qu'on amène devant moi tous ceux que l'on soupçonne.

FRÈRE LAURENCE.--Je suis le plus considérable, le moins capable d'action, et cependant, comme le temps et le lieu déposent contre moi, le plus soupçonné de cet horrible meurtre; et je comparais ici pour m'accuser et me justifier, me condamner et m'absoudre.

LE PRINCE.--Alors, dites tout de suite ce que vous savez de ceci.

FRÈRE LAURENCE.--Je serai court, car je n'ai plus l'haleine aussi longue que le serait un ennuyeux récit.--Roméo, que vous voyez mort, était l'époux de Juliette; et cette Juliette, que vous voyez morte, l'épouse fidèle de Roméo. Je les avais mariés, et le jour de leur mariage secret fut le jour fatal de Tybalt, dont la mort prématurée a banni de cette ville le nouvel époux de Juliette. C'était à cause de cela, et non à cause de la mort de Tybalt, que dépérissait Juliette.--Vous, Capulet, pour éloigner le chagrin qui la tenait assiégée, vous l'avez fiancée et vous vouliez la marier de force au comte Pâris. Alors elle vint me trouver, et, les yeux égarés, elle me pressa de trouver les moyens de la garantir de ce second mariage, sans quoi elle allait se tuer dans ma cellule. Alors, usant des secrets de mon art, je lui donnai un breuvage assoupissant qui eût pour effet, comme je me l'étais proposé, de produire en elle les apparences de la mort. Cependant j'écrivis à Roméo de revenir ici dans cette fatale nuit, pour m'aider à la retirer de sa tombe empruntée: c'était le terme où la force du breuvage devait expirer. Mais celui qui portait ma lettre, le frère Jean, a été retenu par un accident, et me l'a rendue hier au soir: alors tout seul, à l'heure marquée pour son réveil, je suis venu dans l'intention de la tirer du tombeau de sa famille, et de la tenir cachée dans ma cellule jusqu'à ce que j'eusse une occasion favorable d'envoyer vers Roméo. Mais à mon arrivée ici, qui a précédé de quelques moments celui où elle s'est réveillée, j'y ai trouvé le noble Pâris couché avant le temps, et le fidèle Roméo mort. Elle s'éveille, et je la pressais de sortir, et de supporter avec patience cette oeuvre du ciel; mais en cet instant un bruit est venu m'effrayer et m'écarter du tombeau: elle, livrée au désespoir, n'a pas voulu me suivre, et, selon toute apparence, elle a elle-même attenté à ses jours. C'est là tout ce que je sais: sa nourrice est instruite de son mariage. Si dans tout ceci il est arrivé quelque malheur par ma faute, que ma vieille existence soit, quelques heures avant le temps, sacrifiée à la rigueur des lois les plus sévères.

LE PRINCE.--Nous t'avons toujours connu pour un saint homme. Où est le domestique de Roméo? Qu'a-t-il à nous apprendre là-dessus?

BALTHASAR.--Je portai à mon maître la nouvelle de la mort de Juliette. Aussitôt il partit de Mantoue en poste pour venir à ce lieu même, à ce monument. Là, il m'ordonna de remettre de bonne heure cette lettre à son père, et, entrant sous cette voûte, me menaça de la mort si je ne m'en allais pas et ne le laissais seul.

LE PRINCE.--Donne-moi la lettre, je veux la lire. Où est le page du comte, qui est allé chercher la garde? (_Au page._)--Maraud, que faisait ton maître en ce lieu?

LE PAGE.--Il y est venu avec des fleurs pour les jeter sur le tombeau de la signora, et il m'a ordonné de me tenir à l'écart: je lui ai obéi. Dans ce moment, un homme avec une torche est venu pour ouvrir le monument; et bientôt après mon maître s'est élancé sur lui l'épée à la main: alors j'ai couru avertir la garde.

LE PRINCE.--Cette lettre confirme le récit du religieux: elle contient le récit de leurs amours, les nouvelles qu'il a reçues de la mort de Juliette: il dit qu'il a acheté du poison d'un pauvre apothicaire, et qu'il est venu à ce monument pour y mourir et reposer auprès de Juliette.--Où sont ces deux ennemis, Capulet, Montaigu?--Voyez quelle verge s'est étendue sur vos haines. Le ciel a trouvé le moyen de détruire votre bonheur par l'amour; et moi, pour avoir fermé les yeux sur vos querelles, j'ai perdu deux parents. Nous sommes tous punis.

CAPULET.--O mon frère Montaigu, donne-moi ta main; ce sera le douaire de ma fille: je ne peux rien te demander de plus.

MONTAIGU.--Et moi je puis te donner davantage, car je ferai élever sa statue en or pur, et tant que Vérone sera connue sous ce nom, nulle statue n'approchera du prix de celle de la tendre et fidèle Juliette.

CAPULET.--Roméo, aussi riche que son épouse, reposera près d'elle: chétives expiations de nos inimitiés!

LE PRINCE.--L'aurore de ce jour apporte avec elle une sombre paix, et de douleur le soleil a caché son visage. Sortez de ce lieu, et allez vous entretenir de ces tristes aventures. Quelques-uns auront leur pardon, quelques-uns aussi seront punis, car il n'y eut jamais une histoire plus douloureuse que celle de Juliette et de son Roméo.

(Ils sortent.)

FIN DU CINQUIÈME ET DERNIER ACTE.

End of Project Gutenberg's Roméo et Juliette, by William Shakespeare

Sein Wesen

Seine Wandlungen

Das »System Nietzsche«

[Illustration]

Ein Brief Friedrich Nietzsches zum Vorwort.

I. ABSCHNITT

SEIN WESEN.

MOTTO:

»Der Mensch mag sich noch so weit mit seiner Erkenntniss ausrecken, sich selber noch so objectiv Vorkommen: zuletzt trägt er doch Nichts davon, als seine eigene Biographie.«

(Menschliches, Allzumenschliches I. 513.)

»Mihi ipsi scripsi!« ruft Friedrich Nietzsche in seinen Briefen wiederholt nach Vollendung eines Werkes aus. Und gewiss hat es etwas zu bedeuten, wenn der erste lebende Stilist dies von sich selber sagt, er, dem es, wie keinem Zweiten, gelungen ist, für jeden seiner Gedanken, und noch für die feinste Schattirung darin, den erschöpfenden Ausdruck zu finden. Dem, der Nietzsches Schriften zu lesen weiss, ist es denn auch ein verrätherisches Wort: es deutet die Verborgenheit an, in welcher alle seine Gedanken stehen, die lebendige Hülle, die sie vielgestaltig umkleidet, es deutet an, dass er im Grunde nur für sich dachte, für sich schrieb, weil er nur sich selbst beschrieb, sein eignes Selbst in Gedanken umsetzte.

* * * * *

Die »Bitte« in der »Fröhlichen Wissenschaft«, auf welche in dem vorstehend facsimilirten Briefe Bezug genommen ist, lautet:

»Ich kenne mancher Menschen Sinn Und weiss nicht, "Wer ich selber bin! Mein Auge ist mir viel zu nah-- Ich bin nicht, was ich seh und sah. Ich wollte mir schon besser nützen, Könnt' ich mir selber ferner sitzen. Zwar nicht so ferne wie mein Feind! Zu fern sitzt schon der nächste Freund-- Doch zwischen dem und mir die Mitte! Errathet ihr, um was ich bitte?«

(Scherz, List und Rache 25.)

Wenn es überhaupt die Aufgabe des Biographen ist, den Denker durch den Menschen zu erläutern, so gilt dies in ungewöhnlich hohem Masse für Nietzsche, denn bei keinem Andern fallen äusseres Geisteswerk und inneres Lebensbild so völlig in Eins zusammen. Auf ihn trifft es ganz besonders zu, was er in dem vorangestellten Briefe von den Philosophen überhaupt ausspricht: dass man ihre Systeme auf die Personalacten ihrer Urheber hin prüfen solle. Später hat er der gleichen Auffassung in den Worten Ausdruck gegeben: »Allmählig hat sich mir herausgestellt, was jede grosse Philosophie bisher war: nämlich das Selbstbekenntniss ihres Urhebers und eine Art ungewollter und unvermerkter mémoires.« (Jenseits von Gut und Böse 6.)

Dies war denn auch der leitende Gedanke in meinem in dem vorstehenden Briefe erwähnten Entwurf zu einer Charakteristik Nietzsches, den ich ihm im October 1882 vorlas und mit ihm durchsprach. Die Arbeit enthielt im Umriss den ersten Theil des vorliegenden Buches und einzelne Abschnitte des zweiten Theiles,--der Inhalt des dritten, das eigentliche »System Nietzsche« war damals noch nicht geboren. Im Laufe der Jahre erweiterte sich, im Anschlüsse an die rasch aufeinander folgenden Werke, jene Charakteristik immer mehr, und Einzelnes daraus ist bereits in besonderen Aufsätzen veröffentlicht worden.[1] Es handelte sich für mich ausschliesslich darum, die Hauptzüge von Nietzsches geistiger Eigenart zu schildern, aus denen allein seine Philosophie und ihre Entwicklung begriffen werden können. Zu diesem Zwecke beschränkte ich mich freiwillig sowohl nach der Seite der rein theoretischen Betrachtungsweise, als auch hinsichtlich der rein persönlichen Lebensbeschreibung. Beides durfte nicht zu weit geführt werden, wenn die Grundlinien seines Wesens deutlich hervortreten sollten. Wer Nietzsche auf seine Bedeutung als Theoretiker hin prüfen wollte, auf das, was etwa die zünftige Philosophie aus ihm zu lernen vermöchte, der würde sich enttäuscht abwenden, ohne zum Kern seiner Bedeutung vorzudringen. Denn der Werth seiner Gedanken liegt nicht in ihrer theoretischen Originalität, nicht in dem, was dialektisch begründet oder widerlegt werden kann, sondern durchaus in der intimen Gewalt, mit welcher hier eine Persönlichkeit zur Persönlichkeit redet,--in dem, was nach seinem eigenen Ausdruck wohl zu widerlegen, aber doch nicht »todtzumachen« ist. Wer andererseits von Nietzsches äusserem Erleben ausgehen wollte, um sein Inneres zu erfassen, der würde ebenfalls nur eine leere Schale in der Hand behalten, aus welcher der Geist entwichen ist. Denn man kann von Nietzsche sagen, dass er nach aussen hin eigentlich nichts erlebte:[2] all sein Erleben war ein so tief innerliches, dass es sich nur im Gespräch, von Mund zu Mund, und in den Gedanken seiner Werke kundthat. Die Summe von Monologen, aus denen im Wesentlichen seine vielbändigen Aphorismensammlungen bestehen, bilden ein einziges grosses Memoirenwerk, dem sein Geistesbild zu Grunde liegt. Dieses Bild ist es, das ich hier zu zeichnen versuche: das _Gedanken-Erlebniss_ in seiner Bedeutung für Nietzsches Geisteswesen--das _Selbstbekenntniss_ in seiner Philosophie.

Obgleich Nietzsche seit einigen Jahren häufiger genannt wird als irgend ein anderer Denker, obgleich viele Federn damit beschäftigt sind, theils Jünger für ihn zu werben, theils gegen ihn zu polemisiren, so ist er doch in den Grundzügen seiner geistigen Individualität nahezu unbekannt geblieben. Denn seitdem die kleine, zerstreute Schaar seiner Leser, die er stets besass, und die ihn wahrhaft zu lesen verstand, zu einer grossen Schaar von Anhängern angewachsen ist, seitdem weite Kreise sich seiner bemächtigt haben, ist ihm das Schicksal widerfahren, welches jedem Aphoristiker droht; einzelne seiner Ideen, aus dem Zusammenhang gelöst und dadurch beliebig deutbar, sind zu Stich- und Schlagworten ganzer Richtungen gemacht worden, erklingen im Kampf von Meinungen, im Streit von Parteien, denen er selbst völlig fern stand. Wohl verdankt er diesem Umstand

seinen raschen Ruhm, den plötzlichen Lärm um seinen stillen Namen,--aber im Besten, durchaus Einzigartigen und Unvergleichlichen, das er zu geben hat, ist er dadurch vielleicht übersehen worden und unbeachtet geblieben,--ja in eine vielleicht noch tiefere Verborgenheit zurückgetreten als vorher. Viele feiern ihn zwar noch laut, mit der ganzen Naivetät gläubiger Kritiklosigkeit, doch gerade sie gemahnen unwillkürlich an sein bitteres Wort: Der Enttäuschte spricht: »Ich horchte auf Widerhall, und ich. hörte nur Lob--« (Jenseits von Gut und Böse 99). Kaum Einer von ihnen ist ihm wahrhaft nachgegangen,--fernab von den Andern und ihrem Tagesstreit und allein in der Ergriffenheit seines eigenen Innern; kaum Einer hat diesen einsamen, schwer ergründlichen, heimlichen und auch unheimlichen Geist begleitet, der Ungeheures zu tragen wähnte und an einem ungeheuren Wahn zusammenbrach.

Daher ist es, als stände er da inmitten derer, die ihn am meisten preisen, wie ein Fremdling und Einsiedler, dessen Fuss sich in ihren Kreis nur verirrte, und von dessen verhüllter Gestalt Keiner den Mantel gehoben,--ja, als stände er da mit der Klage seines »Zarathustra« auf den Lippen:

»Sie reden Alle von mir, wenn sie Abends ums Feuer sitzen, aber Niemand--denkt an mich! Dies ist die neue Stille, die ich lernte: ihr Lärm um mich breitet einen Mantel um meine Gedanken.«

Friedrich Wilhelm Nietzsche ist am 15. October 1844 als der einzige Sohn eines Predigers in Röcken bei Lützen geboren, von wo sein Vater später nach Naumburg versetzt wurde. Seine Schulbildung empfing er in der nahegelegenen Schulpforta und ging dann als Student der classischen Philologie an die Universität Bonn, wo damals der berühmte Philologe Ritschl lehrte. Er studirte fast ausschliesslich unter Ritschl, verkehrte auch persönlich viel mit ihm und folgte ihm im Herbst 1865 nach Leipzig. In seine Leipziger Studienzeit fällt Nietzsches erste persönliche Beziehung zu Richard Wagner, den er 1868 im Hause von dessen Schwester, der Frau Prof. Brockhaus, kennen lernte, nachdem er sich schon früher mit seinen Werken vertraut gemacht. Noch vor seiner Promotion berief 1869 die Universität Basel den 24jährigen Nietzsche auf den Lehrstuhl des Philologen Kiessling, der von dort an das Johanneum in Hamburg ging. Nietzsche erhielt erst eine ausserordentliche, kurz darauf eine ordentliche Professur für classische Philologie, und die Universität Leipzig verlieh ihm den Doctorgrad ohne vorhergehende Promotion. Neben seinen Universitätscollegien übernahm er den Unterricht des Griechischen in der dritten (höchsten) Classe des Baseler Pädagogiums,--einer Mittelanstalt zwischen Gymnasium und Universität,--an welcher noch andere Universitätsprofessoren, wie der Culturhistoriker Jacob Burckhardt und der Philologe Mähly, lehrten. Hier gewann er grossen Einfluss auf seine Schüler; sein seltnes Talent, junge Geister an sich zu fesseln und entwickelnd, anregend auf sie zu wirken, kam zu voller Geltung. Burckhardt sagte damals von ihm: einen solchen Lehrer habe Basel noch niemals besessen. Burckhardt gehörte zum engsten Freundeskreise Nietzsches, zu dem noch der Kirchenhistoriker Franz Overbeck und der Kantphilosoph Heinrich Romundt zählten. Mit den beiden Letztem wohnte Nietzsche zusammen in einem Hause, welches nach Veröffentlichung der »Unzeitgemässen Betrachtungen« in der Baseler Gesellschaft den Beinamen: »Die Gifthütte« erhielt. Gegen Schluss seines Baseler Aufenthalts lebte Nietzsche eine Zeit lang mit seiner einzigen, fast gleichaltrigen Schwester Elisabeth zusammen, die später seinen Jugendfreund Bernhard Förster heiratete und mit diesem nach Paraguay ging. 1870 machte Nietzsche den deutschfranzösischen Krieg als freiwilliger Krankenpfleger mit; nicht lange darauf traten die ersten drohenden Anzeichen eines Kopfleidens hervor, das sich in periodisch wiederkehrenden heftigen Schmerzen und Uebelkeiten äusserte. Will man Nietzsches eigenen, mündlichen Aeusserungen Glauben schenken, so war dieses Leiden erblicher Natur, und ist sein Vater demselben erlegen. Neujahr 1876 fühlte er sich bereits so köpf- und augenkrank, dass er sich im Pädagogium vertreten lassen musste, und von da ab verschlimmerte sich sein Zustand derartig, dass er mehrere Male dem Tode nahe war.

»Ein paar Mal den Pforten des Todes entwischt, aber fürchterlich gequält,--so lebe ich von Tag zu Tage; jeder Tag hat seine Krankengeschichte.« Mit diesen Worten schildert Nietzsche in einem Briefe an einen Freund die Leiden, unter welchen er ungefähr 15 Jahre zugebracht hat.

Umsonst verlebte er den Winter 1876-1877 in dem milden Klima von Sorrent, wo er sich in Gesellschaft einiger Freunde befand: von Rom war seine langjährige Freundin Malwida von Meysenbug (Verfasserin der bekannten »Memoiren einer Idealistin« und Anhängerin R. Wagners) zu ihm gekommen; von Westpreussen Dr. Paul Rée, mit dem ihn schon damals Freundschaft und Gleichheit der Bestrebungen-verband. Dem kleinen gemeinschaftlichen Hauswesen hatte sich auch noch ein junger brustkranker Baseler, Namens Brenner, zugesellt, der jedoch bald darauf starb. Als auch der Aufenthalt im Süden ohne günstige Wirkung auf seine Schmerzen blieb, gab Nietzsche 1878 seine Lehrthätigkeit am Pädagogium und 1879 seine Professur an der Universität endgiltig auf. Seitdem führte er nur noch ein Einsiedlerleben, theils in Italien--meistens in Genua--theils im Schweizer Gebirge, namentlich in dem kleinen Engadiner Dorfe Sils-Maria, unweit des Maloja-Passes.

Sein äusserer Lebenslauf erscheint damit abgeschlossen und gleichsam beendet, während sein Denkerleben erst jetzt recht eigentlich beginnt: so dass uns der Denker Nietzsche, mit dem wir uns zu beschäftigen haben, erst am Ausgang dieser Lebensereignisse vollkommen deutlich entgegentritt. Trotzdem werden wir auf alle Schicksalswendungen und Erlebnisse, die hier nur kurz skizzirt worden sind, bei Gelegenheit der verschiedenen Perioden seiner Geistesentwicklung noch ausführlicher zurückkommen müssen. Sein Leben und Schaffen zerfällt in der Hauptsache in drei ineinander übergreifende Perioden, die je ein Jahrzehnt umfassen:

Zehn Jahre, 1869--1879, dauerte Nietzsches Lehrthätigkeit in Basel; diese philologische Wirksamkeit fällt der Zeit nach fast völlig zusammen mit dem Jahrzehnt seiner Jüngerschaft Wagner gegenüber und mit der Veröffentlichung derjenigen Werke, welche von der Metaphysik Schopenhauers beeinflusst sind: sie währte von 1868 bis 1878, in welchem Jahre er zum Zeichen seiner philosophischen Sinnesänderung Wagner sein positivistisches Erstlingswerk: »Menschliches, Allzumenschliches« übersandte.

Seit dem Anfang der Siebzigerjahre bestand seine Verbindung mit Paul Rée, die im Herbst 1882 ihren Abschluss fand,--gleichzeitig mit der Vollendung der »Fröhlichen Wissenschaft«, des letzten derjenigen Werke Nietzsches, die noch auf positivistischer Grundlage ruhen.

Im Herbst 1882 fasste Nietzsche den Entschluss, sich zehn Jahre lang aller schriftstellerischen Thätigkeit zu enthalten. In dieser Zeit tiefsten Schweigens wollte er seine neue, dem Mystischen sich zuwendende Philosophie auf ihre Richtigkeit prüfen und dann 1892 als ihr Verkündiger auftreten. Diesen Vorsatz hat er nicht ausgeführt, sondern gerade in den Achtzigerjahren eine fast ununterbrochene Productivität entfaltet und ist dann noch vor Ablauf des von ihm angesetzten Jahrzehntes verstummt: 1889 setzte ein gewaltsamer Ausbruch seines Kopfleidens plötzlich aller weiteren Geistesarbeit ein Ziel.

Der Zeitraum aber zwischen der Niederlegung seiner Baseler Professur und dem Aufhören aller geistigen Thätigkeit überhaupt umfasst wiederum ein Jahrzehnt, die Zeit von 1879--1889. Seitdem lebt Nietzsche als Kranker, nach einem vorübergehenden Aufenthalt in der Anstalt von Professor Binswanger in Jena, bei seiner Mutter in Naumburg.

Die beiden diesem Buche beigegebenen Bilder zeigen Nietzsche inmitten dieser letzten zehn Leidensjahre. Und gewiss ist dies die Zeit gewesen, in welcher seine Physiognomie, sein ganzes Aeussere, am charakteristischesten ausgeprägt erschien: die Zeit, in welcher der Gesammtausdruck seines Wesens bereits völlig vom tief bewegten Innenleben durchdrungen war, und selbst noch in dem bezeichnend blieb, was er zurückhielt und verbarg. Ich möchte sagen: dieses Verborgene, die Ahnung einer verschwiegenen Einsamkeit,--das war der erste, starke Eindruck, durch den Nietzsches Erscheinung fesselte. Dem flüchtigen Beschauer bot sie nichts Auffallendes; der mittelgrosse Mann in seiner überaus einfachen, aber auch überaus sorgfältigen Kleidung, mit den ruhigen Zügen und dem schlicht zurückgestrichenen braunen Haar konnte leicht übersehen werden. Die feinen, höchst ausdrucksvollen Mundlinien wurden durch einen vornübergekämmten grossen Schnurrbart fast völlig verdeckt; er hatte ein leises Lachen, eine geräuschlose Art zu sprechen und einen vorsichtigen, nachdenklichen Gang, wobei er sich ein wenig in den Schultern beugte; man konnte sich schwer diese Gestalt inmitten einer Menschenmenge vorstellen,--sie trug das Gepräge des Abseitsstehens, des Alleinstehens. Unvergleichlich schön und edel geformt, so dass sie den Blick unwillkürlich auf sich zogen, waren an Nietzsche die Hände, von denen er selbst glaubte, dass sie seinen Geist verriethen,--eine darauf zielende Bemerkung findet sich in »Jenseits von Gut und Böse« (288): »Es giebt Menschen, welche auf eine unvermeidliche Weise Geist haben, sie mögen sich drehen und wenden, wie sie wollen, und die Hände vor die verrätherischen Augen halten --als ob die Hand kein Verräther wäre!--.«[3]

Wahrhaft verrätherisch sprachen auch die Augen. Halbblind, besassen sie dennoch nichts vom Spähenden, Blinzelnden, ungewollt Zudringlichen vieler Kurzsichtigen; vielmehr sahen sie aus wie Hüter und Bewahrer eigener Schätze, stummer Geheimnisse, die kein unberufener Blick streifen sollte. Das mangelhafte Sehen gab seinen Zügen eine ganz besondere Art von Zauber dadurch, dass sie, anstatt wechselnde, äussere Eindrücke wiederzuspiegeln, nur das Wiedergaben, was durch sein Inneres zog. In das Innere blickten diese Augen und zugleich,--weit über die nächsten Gegenstände hinweg,--in die Ferne, oder besser: in das Innere wie in eine Ferne. Denn im Grunde war seine ganze Denkerforschung nichts als ein Durchforschen der Menschenseele nach unentdeckten Welten, nach »ihren noch unausgetrunkenen Möglichkeiten« (Jenseits von Gut und Böse 45), die er sich rastlos schuf und umschuf. Wenn er sich einmal gab, wie er war, im Bann eines ihn erregenden Gesprächs zu Zweien, dann konnte in seine Augen ein ergreifendes Leuchten kommen und schwinden;--wenn er aber in finsterer Stimmung war, dann sprach die Einsamkeit düster, beinahe drohend aus ihnen, wie aus unheimlichen Tiefen,--aus jenen Tiefen, in denen er immer allein blieb, die er mit Niemandem theilen konnte, vor denen ihn selbst bisweilen Grauen erfasste,--und in die sein Geist zuletzt versank.

Einen ähnlichen Eindruck des Verborgenen und Verschwiegenen machte auch Nietzsches Benehmen. Im gewöhnlichen Leben war er von grosser Höflichkeit und einer fast weiblichen Milde, von einem stetigen, wohlwollenden Gleichmuth,--er hatte Freude an den vornehmen Formen im Umgang und hielt viel auf sie. Immer aber lag darin eine Freude an der _Verkleidung_,--Mantel und Maske für ein fast nie entblösstes Innenleben. Ich erinnere mich, dass, als ich Nietzsche zum ersten Male sprach,--es war an einem Frühlingstage in der Peterskirche zu Rom,--während der ersten Minuten das gesucht Formvolle an ihm mich frappirte und täuschte. Aber nicht lange täuschte es an diesem Einsamen, der seine Maske doch nur so ungewandt trug, wie Jemand, der aus Wüste und Gebirge kommt, den Rock der Allerweltsleute trägt; sehr bald tauchte die Frage auf, die er selbst in die Worte zusammengefasst hat: »Bei Allem, was ein Mensch _sichtbar werden_ lässt, kann man fragen: was soll es _verbergen_? Wovon soll es den Blick ablenken? Welches Vorurtheil soll es erregen? Und dann noch: bis wie weit geht die Feinheit dieser Verstellung? Und worin vergreift er sich dabei?«

Dieser Zug stellt nur die Kehrseite der Einsamkeit dar, aus welcher Nietzsches Innenleben ganz herausbegriffen werden muss,--einer sich stetig steigernden Selbstvereinsamung und Selbstbeziehung auf sich.

In dem Maasse, als sie zunimmt, wird alles nach Aussen gewandte Sein zum Schein,--zum blossen täuschenden Schleier, den die Einsamkeitstiefe nur um sich webt, um zeitweilig für Menschenaugen erkennbare Oberfläche zu werden. »Tiefdenkende Menschen kommen sich im Verkehr mit Andern als Komödianten vor, weil sie sich da, um verstanden zu werden, immer erst eine Oberfläche anheucheln müssen.« (Menschliches, Allzumenschliches II 232). Ja, man kann selbst Nietzsches Gedanken, sofern sie sich theoretisch aussprechen, noch mit zu dieser Oberfläche rechnen, hinter der, abgründig tief und stumm, das innere Erleben ruht, dem sie entstiegen sind. Sie gleichen einer »Haut, welche Etwas verräth, aber noch mehr verbirgt« (Jenseits von Gut und Böse 32); »denn«, sagt er »entweder verstecke man seine Meinungen, oder man verstecke sich hinter seine Meinungen« (Menschliches, Allzumenschliches II 338). Er findet eine schöne Bezeichnung für sich selbst, wenn er in diesem Sinne von den »Verborgenen unter den Mänteln des Lichts« redet (Jenseits von Gut und Böse 44),--von denen, die sich in ihre Gedankenklarheit verhüllen.

In jeder Periode seiner Geistesentwicklung finden wir daher Nietzsche in irgend einer Art und Form der Maskirung, und immer ist sie es, welche die jeweilige Entwicklungsstufe recht eigentlich charakterisirt. »Alles, was tief ist, liebt die Maske.... Jeder tiefe Geist braucht eine Maske: mehr noch, um jeden tiefen Geist wächst fortwährend eine Maske« (Jenseits von Gut und Böse 40).

»Wanderer, wer bist Du?-- -- --Ruhe Dich hier aus.-- -- --erhole Dich!-- -- --Was dient Dir zur Erholung?-- -- --« »Zur Erholung? Zur Erholung? Oh du Neugieriger, was sprichst du da! Aber gieb mir, ich bitte-- --« »Was? Was? sprich es aus!--»Eine Maske mehr! Eine zweite Maske!...« (Jenseits von Gut und Böse 278).

Und zwar wird es sich uns aufdrängen, dass in dem Grade, als seine Selbstvereinsamung und grüblerische Selbstbeziehung auf sich ausschliesslicher wird, auch die Bedeutung der jedesmaligen Verkleidung eine tiefere wird, und das wirkliche Wesen hinter seiner Aeusserungsform, das wirkliche Sein hinter dem vorgehaltenen Schein immer weniger sichtbar zurückweicht. Schon in »Der Wanderer und sein Schatten« (175) weist er auf die »Mediocrität als Maske« hin. »Die Mediocrität ist die glücklichste Maske, die der überlegene Geist tragen kann, weil sie die grosse Menge, das heisst die Mediocren, nicht an Maskirung denken lässt--: und doch nimmt er sie gerade ihretwegen vor,--um sie nicht zu reizen, ja nicht selten aus Mitleid und Güte.« Von dieser Maske des Harmlosen an wechselt er sie bis zu der des Grauenhaften, die noch Grauenhafteres hinter sich verbirgt: »--bisweilen ist die Narrheit selbst die Maske für ein unseliges allzu gewisses Wissen.« (Jenseits von Gut und Böse 270),--und endlich bis zu einem täuschenden Lichtbild des göttlich Lachenden, das den Schmerz in Schönheit zu verklären strebt. So ist Nietzsche innerhalb seiner letzten philosophischen Mystik allmälig in jene letzte Einsamkeit versunken, in deren Stille wir ihm nicht mehr folgen können, die uns nur noch, wie Symbole und Wahrzeichen, seine lachenden Gedankenmasken und deren Deutung übrig lässt, während er für uns bereits zu dem geworden ist, als den er sich einmal in einem Briefe unterschreibt: »Der auf ewig Abhandengekommene.« (Brief vom 8. Juli 1881 aus Sils-Maria.)

Dieses innere Alleinsein, diese Einsamkeit ist in allen Wandlungen Nietzsches der unveränderliche Rahmen, aus welchem sein Bild uns anschaut. Mag er sich verkleidet haben, wie er will,--immer trägt er »die Einöde und den heiligen unbetretbaren Grenzbezirk mit sich, wohin er auch gehe«. (Der Wanderer und sein Schatten 387.) Und es drückt daher auch nur das Bedürfniss aus, dass das äussere Dasein seiner einsamen Innerlichkeit entsprechen möge, wenn er einem Freunde schreibt: (Am 31 October 1880 aus Italien.)

»Als Recept, sowie als natürliche Passion erscheint mir immer deutlicher die Einsamkeit und zwar die vollkommene,--und den Zustand, in dem wir unser Bestes schaffen können, muss man hersteilen und viele Opfer dafür bringen können.«

Den zwingenden Anlass aber, sein inneres Alleinsein so vollkommen wie möglich zu einem äusseren zu machen, bot ihm erst sein _körperliches Leiden_, welches ihn von den Menschen forttrieb und selbst den Verkehr mit einzelnen seiner Freunde,--immer einen seltenen Verkehr zu Zweien,--nur mit grossen Unterbrechungen möglich machte.

Leiden und Einsamkeit,--das sind also die beiden grossen Schicksalszüge in Nietzsches Entwicklungsgeschichte, immer stärker ausgeprägt, je näher man dem Ende kommt. Und sie tragen bis an das Ende jenes wundersame Doppelgesicht, welches sie als ein äusserlich _gegebenes Lebenslos_, und zugleich als eine rein psychisch bedingte, eine _gewollte innere_ Nothwendigkeit erscheinen lassen. Auch sein physisches Leiden, nicht minder als seine Verborgenheit und Einsamkeit, reflectirte und symbolisirte etwas Tiefinnerliches--und dies so unmittelbar, dass er es auch in seine äussere Schickung aufnahm wie einen ihm zugedachten ernsten Freund und Wegegenossen. So schreibt er einmal bei Gelegenheit einer Beileidsäusserung (Ende August 1881 aus Sils-Maria): »Es jammert mich immer zu hören, dass Sie leiden, dass Ihnen irgend etwas fehlt, dass Sie Jemanden verloren haben: während bei mir Leiden und Entbehrung _zur Sache_ gehören und nicht, wie bei Ihnen, zum Unnöthigen und zur Unvernunft des Daseins.«

Hierauf beziehen sich die einzelnen, in seinen Werken zerstreuten Aphorismen über den _Werth des Leidens für die Erkenntniss_.

Er schildert den Einfluss der Stimmungen des Kranken und des Genesenden auf das Denken, er begleitet die feinsten Uebergänge solcher Stimmungen bis ins Geistigste hinauf. Eine periodisch wiederkehrende Erkrankung, wie die seinige es war, scheidet beständig eine Lebensperiode, und damit auch eine Gedankenperiode von der vorhergehenden. Sie gibt durch dieses Doppeldasein die Erfahrungen und das Bewusstsein zweier Wesenheiten. Sie lässt alle Dinge immer wieder auch dem Geiste neu werden,--»_neu schmecken_« nennt er es einmal höchst treffend,--und setzt ganz neue Augen auch noch für das Gewohnteste, Alltäglichste ein. Ein Jegliches erhält etwas von der Frische und dem lichten Thau der Morgenschönheit, weil _eine Nacht_ es vom vorhergehenden Tage getrennt hat. So wird jede Genesung ihm zu einer Palingenesis seiner selbst und darin zugleich des Lebens um ihn,--und immer wieder ist der Schmerz »verschlungen in den Sieg«.

Deutet Nietzsche es schon selbst an, dass die Natur seines physischen Leidens sich gewissermassen in seinen Gedanken und Werken widerspiegle, so springt der enge Zusammenhang von Denken und Leiden noch auffälliger hervor, wenn man sein Schaffen und dessen Entwicklung als Ganzes betrachtet. Man steht nicht jenen allmäligen Veränderungen des Geisteslebens gegenüber, wie sie ein Jeder durchmacht, der seiner natürlichen Grösse entgegenwächst,-- nicht den Wandlungen des _Wachsthums_: sondern einem jähen Wandel und Wechsel, einem fast rhythmischen Auf und Nieder von Geisteszuständen, die letzten Grundes nichts Anderem zu entspringen scheinen, als einem _Erkranken an Gedanken und einem Genesen an Gedanken_.

Nur aus der innersten Bedürftigkeit seiner ganzen Natur, nur aus dem quälendsten Heilungsverlangen heraus erschliessen sich ihm neue Erkenntnisse. Kaum aber ist er völlig in ihnen aufgegangen, kaum hat er an ihnen ausgeruht und sie seiner eignen Kraft assimilirt,--da ergreift es ihn auch schon wieder wie ein neues Fieber, etwas wie ein unruhig drängender Ueberschuss an innerer Energie, der zuletzt seinen Stachel gegen ihn selbst kehrt und ihn an sich selber erkranken lässt. »Das Zuviel von Kraft erst ist der Beweis der Kraft», sagt Nietzsche im Vorwort zur Götzen-Dämmerung (s. I);--in diesem Zuviel thut seine Kraft sich Schmerzen an, tobt sie sich aus in leidvollen Kämpfen, reizt sich auf zu den Qualen und Erschütterungen, an denen sein Geist fruchtbar werden will.[4] Mit der stolzen Behauptung: »Was mich nicht umbringt, macht mich stärker!« (Götzen-Dämmerung, Sprüche und Pfeile 8) geisselt er sich,--nicht bis zum Umbringen, nicht bis zum Tode, aber eben bis zu jenen Fiebern und Verwundungen, deren er bedarf. Dieses Schmerzheischende zieht sich durch die ganze Entwicklungsgeschichte Nietzsches als die eigentliche Geistesquelle in ihr; er spricht es am treffendsten in den Worten aus: »Geist ist das Leben, das selber ins Leben schneidet: an der eignen Qual mehrt es sich das eigne Wissen,--wusstet ihr das schon? Und des Geistes Glück ist dies: gesalbt zu sein und durch Thränen geweiht zum Opferthier,-- wusstet ihr das schon?------Ihr kennt nur des Geistes Funken: aber ihr seht den Amboss nicht, der er' ist, und nicht die Grausamkeit seines Hammers!« (Also sprach Zarathustra II 33.) »Jene Spannung der Seele im Unglück,---- --ihre Schauer im Anblick des grossen Zügrundegehens, ihre Erfindsamkeit und Tapferkeit im Tragen, Ausharren, Ausdeuten, Ausnützen des Unglücks, und was ihr nur je von Tiefe, Geheimniss, Maske, Geist, List, Grösse geschenkt worden ist:--ist es nicht ihr unter Leiden, unter der Zucht des grossen Leidens geschenkt worden?« (Jenseits von Gut und Böse 225.)

Und immer wieder tritt Zweierlei an diesem Vorgang besonders auffällig hervor: Einmal der enge Zusammenhang von Gedankenleben und Seelenleben in seinem Wesen, die Abhängigkeit seines Geistes von den Bedürfnissen und Erregungen seines Innern. Dann aber die Eigenthümlichkeit, dass aus dieser so engen Zusammengehörigkeit sich immer von Neuem Leiden ergeben müssen; jedesmal bedarf es einer höhen Gluth der Seele, wo es zu höchster Klarheit, zu hellem Licht der Erkenntniss kommen soll,--aber nie darf diese Gluth in wohlthuender Wärme ausströmen, sondern muss verwunden mit sengenden Feuern und brennenden Flammen: auch hier gehört,--wie er es in dem oben angeführten Briefe ausdrückt,--»das Leiden zur Sache«.

Wie Nietzsches körperliches Leiden der Anlass zu seiner äusseren Vereinsamung wurde, so muss auch in seinem psychischen Leidenszustand einer der tiefsten Gründe gesucht werden für seinen scharf zugespitzten Individualismus, für die strenge Betonung des »Einzelnen« als des »Einsamen« in Nietzsches besonderem Sinn. Die Geschichte des »Einzelnen« ist durchaus eine _Leidensgeschichte_ und nicht irgend welchem allgemeinen Individualismus zu vergleichen,--ihr Inhalt lautet viel weniger: »Selbstgenügsamkeit« als: »_Selbsterduldung«_.Betrachtet man das leidensvolle Auf und Nieder seiner Geisteswandlungen, dann liest man die Geschichte eben so vieler Selbstverwundungen, und es verbirgt einen langen, schmerzlichen Heldenkampf mit sich selbst, wenn Nietzsche über seine Philosophie die kühnen Worte setzt: »Dieser Denker braucht Niemanden, der ihn widerlegt: er genügt sich dazu selber!« (Der Wanderer und sein Schatten 249.)

Seine ausserordentliche Fähigkeit, sich immer wieder in die härteste Selbstüberwindung einzuleben, in jeder neuen Erkenntniss immer wieder heimisch zu werden, scheint nur da zu sein, um die Trennung vom Neuerrungenen jedesmal um so erschütternder zu gestalten. »Ich komme! brich Deine Hütte ab und wandre mir entgegen!« gebietet ihm der Geist, und mit trotziger Hand macht er sich selbst obdachlos und sucht von Neuem das Dunkel, das Abenteuer und die Wüste auf mit der Klage auf den Lippen: »Ich muss den Fuss weiter heben, diesen müden, verwundeten Fuss: und weil ich muss, so habe ich oft für das Schönste, das mich nicht halten konnte, einen grimmigen Rückblick,--weil es mich nicht halten konnte!« (Fröhliche Wissenschaft 309.) Sobald ihm in einer Anschauungsweise wahrhaft wohl geworden ist, erfüllt sich an ihm selbst sein Wort: »Wer sein Ideal erreicht, kommt eben damit über dasselbe hinaus.« (Jenseits von Gut und Böse 73.)[5]

Der _Meinungswechsel_, der _Wandlungsdrang_ stecken daher der Philosophie Nietzsches tief im Herzen, sie sind durchaus bestimmend für die Art seines Erkennens. Nicht umsonst nennt er sich im Schlusslied von »Jenseits von Gut und Böse« einen: »Ringer, der zu oft sich selbst bezwungen,--Zu oft sich gegen eigne Kraft gestemmt,-- --Durch eignen Sieg verwundet und gehemmt.«

Im Heroismus der Bereitwilligkeit, die eigne Ueberzeugung preiszugeben, nimmt dieser Drang in seinem Innern geradezu die Stelle der _Ueberzeugungstreue_[6] ein. »Wir würden uns für unsere Meinungen nicht verbrennen lassen:« heisst es in Der Wanderer und sein Schatten (333), »wir sind ihrer nicht so sicher. Aber vielleicht dafür, dass wir unsere Meinungen haben dürfen und ändern dürfen.« Und in der Morgenröthe (370) spricht sich diese Gesinnung in den schönen Worten aus: »Nie etwas zurückhalten oder Dir verschweigen, was _gegen Deinen Gedanken_ gedacht werden kann. Gelobe es Dir! Es gehört zur ersten Redlichkeit des Denkens. Du musst jeden Tag auch Deinen Feldzug gegen Dich selber führen. Ein Sieg und eine eroberte Schanze sind nicht mehr Deine Angelegenheit, sondern die der Wahrheit,--aber auch Deine Niederlage ist nicht mehr Deine Angelegenheit!« Darüber steht als Titel: »Inwiefern der Denker seinen Feind liebt.« Aber diese Feindesliebe entspringt der dunklen Ahnung, dass im Feind ein künftiger Genosse verborgen sein könne, und dass nur des Unterliegenden neue Siege harren: sie entspringt der Ahnung, dass für ihn der stets gleiche, schmerzliche Seelenprocess der Selbstverwandlung unumgängliche Bedingung aller Schaffenskraft sei. »Der Geist ist es, der uns rettet, dass wir nicht ganz verglühen und verkohlen.-- --Vom Feuer erlöst, schreiten wir dann, durch den Geist getrieben, von Meinung zu Meinung,-- --als _edle Verräther_ aller Dinge.« (Menschliches, Allzumenschliches, I 637.) »--wir _müssen_ Verräther werden, Untreue üben, unsere Ideale immer wieder preisgeben. (Menschliches, Allzumenschliches, I 629.) Dieser Einsame musste gleichsam sich selber vervielfältigen, in eine Mehrheit von Denkern zerfallen, in dem Masse, als er sich in sich selber abschloss;--nur so vermochte er geistig zu leben. Der Selbstverwundungstrieb war nur eine Art seines Selbsterhaltungstriebes: nur indem er sich immer wieder in Leiden stürzte, entlief er seinen Leiden. »Unverwundbar bin ich allein an meiner Ferse!-- -- -- -- --Und nur wo Gräber sind, gibt es Auferstehungen!-- -- --Also sang Zarathustra;« (II 46)--Er, zu dem das Leben einst »dies Geheimniss redete«: »Siehe, sprach es, ich bin das, was sich immer selber überwinden muss« (II 49).[7]

Ueber nichts hat wohl Nietzsche so oft und so tief nachgedacht, wie über dieses sein eignes Wesensräthsel, und über nichts können wir uns daher aus seinen Werken so gut unterrichten wie gerade hierüber: im Grunde waren ihm alle seine Erkenntnissräthsel nichts anderes. Je tiefer er sich selbst erkannte, desto rückhaltsloser wurde seine ganze Philosophie zu einer ungeheuren Widerspiegelung seines Selbstbildes,--und desto naiver legte er es dem Allbilde als solchem unter. Wie unter den Philosophen abstracte Systematiker ihre eignen Begriffe zu einer Weltgesetzlichkeit verallgemeinert haben, so verallgemeinert

Nietzsche seine Seele zur Weltseele. Aber um sein Bild zu zeichnen, bedarf es nicht erst der Zurückführung seiner sämmtlichen Theorien auf ihn selbst, wie es in den folgenden Theilen geschieht. Ein gewisses Verständniss dafür ist auch schon hier möglich, wo Nietzsche lediglich in Bezug auf seine geistige Veranlagung betrachtet wird, Der Reichthum derselben ist zu mannigfaltig, als dass er in einer bestimmten Ordnung erhalten werden könnte; die Lebendigkeit und der Machtwillen jedes einzelnen Talentes und Geistestriebes führen nothwendig zu einer nie beschwichtigten Nebenbuhlerschaft aller Talente. In Nietzsche lebten in stetem Unfrieden, nebeneinander und sich gegenseitig tyrannisirend, ein Musiker von hoher Begabung, ein Denker von freigeisterischer Richtung, ein religiöses Genie und ein geborener Dichter. Nietzsche selbst versuchte, daraus die Besonderheit seiner geistigen Individualität zu erklären, und erging sich häufig in eingehenden Gesprächen darüber.

Er unterschied zwei grosse Hauptgruppen von Charakteren: solche, deren verschiedene Regungen und Triebe in Harmonie zueinander stehen, eine gesunde Einheit bilden, und solche, deren Triebe und Regungen sich gegenseitig hemmen und befehden. Die erste Gruppe verglich er,--innerhalb des einzelnen Individuums,--mit dem Zustande der Menschheit zur Zeit des Heerdenwesens, vor aller staatlichen Gliederung: wie dort der Einzelne seine Individualität und sein Machtgefühl nur besitzt im geschlossenen Ganzen der Heerde, so hier die einzelnen Triebe im Ganzen der geschlossenen Persönlichkeit, deren Inbegriff sie bilden. Die Naturen der zweiten Gruppe dagegen leben in ihrem Innern, wie die Menschen bei einem Kriege Aller gegen Alle leben würden;--die Persönlichkeit selbst löst sich gewissermassen in eine Unsumme von eigenmächtigen Triebpersönlichkeiten auf, in eine Subject-Vielheit. Dieser Zustand wird nur überwunden, wenn von aussen her eine höhere Macht, eine stärkere Autorität geschaffen werden kann, die über Alle zu herrschen weiss: gleich einem Gesetz staatlicher Gliederung, für das es nur unterworfene Gewalten gibt. Denn was in den zuerst geschilderten Naturen ganz instinctmässig vor sich geht--die Einordnung des Einzelnen ins Ganze,--das muss hier erst erobert und den tyrannischen Einzelgelüsten abgezwungen werden als eine unerbittlich feste Rangordnung der Triebe untereinander.[8] Man sieht, hier ist der Punkt, an welchem Nietzsche die Möglichkeit einer Selbstbehauptung als_ Ganzes durch das Leiden alles Einzelnen_ aufgegangen ist. Hier liegt wie in einer Knospe eingeschlossen die ursprüngliche Bedeutung seiner späteren Decadenz-Lehre mit dem Grundgedanken: es giebt die Möglichkeit eines höchsten Vermögens und Schaffens durch ein beständiges Erdulden und Verwunden. Mit einem Wort: hier ging ihm die Bedeutung des _Heroismus als Ideal_ auf. Die eigene qualvolle Unvollkommenheit riss ihn dem Ideal und dessen Tyrannei entgegen: »Unsere Mängel sind die Augen, mit denen wir das Ideal sehen.« (Menschliches, Allzumenschliches, II 86).

»Was macht heroisch? zugleich seinem höchsten Leide und seiner höchsten Hoffnung entgegengehen« sagt er (Fröhliche Wissenschaft 268). Und ich füge dem noch drei Aphorismen bei, die er mir einmal niederschrieb, und die mir seine Auffassung mit besonderer Schärfe zu verdeutlichen scheinen:

»Der Gegensatz des heroischen Ideals ist das Ideal der harmonischen Allentwicklung,--ein schöner Gegensatz und ein sehr wünschenswerther! Aber nur ein Ideal für grundgute Menschen. (Zum Beispiel: Goethe).[9]

Weiter: »Heroismus--das ist die Gesinnung eines Menschen, der ein Ziel erstrebt, gegen welches gerechnet er gar nicht mehr in Betracht kommt. Heroismus ist der gute Wille zum absoluten Selbst-Untergang.«

Und als drittes: »Menschen, die nach Grösse streben, sind gewöhnlich böse Menschen; es ist ihre _einzige Art, sich zu ertragen_.« Das Wort »böse« will hier ebenso wie oben das Wort »gut« weder im Sinn des landläufigen Urtheils noch überhaupt im Sinne eines Urtheils genommen werden, sondern blos als Bezeichnung eines Thatbestandes: und als eine solche bezeichnet es für Nietzsche stets den »innern Krieg« in einer Menschenseele,--dasselbe, was er später »Anarchie in den Instincten« nennt. In seiner letzten Schaffensperiode hat sich ihm, auf dem Wege einer bestimmten Gedankenentwicklung, das Bild dieses Seelenzustandes bis zum Culturbilde der Menschheit ausgedehnt; die Losungsworte heissen da: Innenkrieg = Décadence, und Sieg = Selbstuntergang der Menschheit zur Erschaffung einer Uebermenschheit. Ursprünglich aber handelt es sich für ihn um sein eigenes Seelenbild.

Er unterscheidet nämlich die harmonische oder einheitliche und die heroische oder vielspältige Naturanlage als die beiden Typen des _handelnden_ und des _erkennenden_ Menschen, mit anderen Worten: den Typus seines Wesens-Gegensatzes und seinen eigenen.

Zum handelnden Menschen wird ihm der Ungetheilte und Unzersetzte, der Instinct-Mensch, die Herrennatur. Wenn dieser seiner natürlichen Entwicklung folgt, muss sein Wesen sich immer selbstsicherer und fester zuspitzen und seine gedrängte Kraft in gesunden Thaten sich entladen. Die Hemmnisse, welche die Aussenwelt ihm möglicherweise entgegenstellt, enthalten zugleich eine Anregung und Förderung dafür: denn nichts ist ihm naturgemässer, als der tapfere Kampf nach aussen hin, in nichts erweist sich seine ungebrochene Gesundheit so sehr als in seiner Kriegstüchtigkeit. Mag sein Intellect klein oder gross sein: in jedem Fall

steht er im Dienst dieser frischen Wesenskraft und dessen, was ihr wohl thut und noth thut,-- er hat sich ihr in seinen Zielen nicht entgegengesetzt, er hat sie nicht zersetzt, er folgt nicht eignen Wegen.

Ganz anders der erkennende Mensch. Anstatt nach einem festen Zusammenschluss seiner Triebe zu suchen, der sie schützt und erhält, lässt er sie so weit als irgend möglich auseinanderlaufen; je breiter das Gebiet, das sie zu umfassen lernen, desto besser, je mehr der Dinge, bis zu denen sie ihre Fühlhörner ausstrecken, und die sie betasten, sehen, hören, riechen, desto tüchtiger sind sie ihm für seine Zwecke,--für die Zwecke des Erkennens. Denn ihm ist nunmehr »das Leben ein Mittel der Erkenntniss« (Fröhliche Wissenschaft 324) und erruft seinen Genossen zu (Fröhliche Wissenschaft 319): »Wir selber wollen unsere Experimente und Versuchstiere sein!« So gibt er sich selbst freiwillig als Einheit auf,--je polyphoner sein Subject, desto lieber ist es ihm:

»Scharf und milde, grob und fein, Vertraut und seltsam, schmutzig und rein, Der Narren und Weisen Stelldichein: Dies Alles bin ich, will ich sein, Taube zugleich, Schlange und Schwein!«

(Fröhliche Wissenschaft, Scherz, List und Rache 11.)

Denn wir Erkennenden, sagt er, müssen dankbar sein »gegen Gott, Teufel, Schaf und Wurm in uns,-- -- -- --mit Vorder- und Hinterseelen, denen Keiner leicht in die letzten Absichten sieht, mit Vorder- und Hintergründen, welche kein Fuss zu Ende laufen dürfte, wir die geborenen, geschworenen, eifersüchtigen Freunde der _Einsamkeit_-- --«. (Jenseits von Gut und Böse 44.) Der Erkennende hat die Seele, welche »die längste Leiter hat und am tiefsten hinunter kann,-- -- --die _umfänglichste_ Seele, welche am weitesten in sich laufen und irren und schweifen kann;-- -- --die sich selber fliehende, die sich selber im weitesten Kreise einholt; die weiseste Seele, welcher die Narrheit am süssesten zuredet: -- -- --die sich selber bebendste, in der alle Dinge ihr Strömen und Wiederströmen und Ebbe und Fluth haben-- -- --.« (Also sprach Zarathustra III 82.)

Mit solcher Seele wird man zum »Tausendfuss und Tausend-Fühlhorn« (Jenseits von Gut und Böse 205), immer im Begriff, sich selbst zu entlaufen, um sich bis in fremdes Wesen hinein zu erstrecken: »Wenn man erst sich selber gefunden hat, muss man verstehen, sich von Zeit zu Zeit zu _verlieren_--und dann wieder zu finden: vorausgesetzt, dass man ein Denker ist. Diesem ist es nämlich nachtheilig, immer an Eine Person gebunden zu sein.« (Der Wanderer und sein Schatten 306.) Das Gleiche besagen die Verse (Fröhliche Wissenschaft, Scherz, List und Rache 33):

»Verhasst ist mir's schon, selber mich zu führen! Ich liebe es, gleich Wald- und Meeresthieren, Mich für ein gutes Weilchen zu verlieren, In holder Irrniss grüblerisch zu hocken. Von ferne her mich endlich heimzulocken, Mich selber zu mir selber--zu verführen.«

Das Versehen ist überschrieben »Der Einsame«, d. h. der von den Anforderungen und Kämpfen der Aussenwelt möglichst Abgeschiedene; denn kriegstüchtig nach aussen hin wird ein solches Innenleben in dem Masse immer weniger, je vollkommener es benommen und bewegt ist von den Kriegen, Siegen, Niederlagen und Eroberungen innerhalb seiner eignen Triebe. In der Einsamkeit seiner geistigen Selbstversenkung und Selbsterweiterung sucht es vielmehr eine Hülle, die es schonend behüte vor den lauten und verwundenden Lebensereignissen draussen,--steht es doch schon ohnedies in Kampf und Wunden; gilt doch von diesem Erkennenden die Schilderung:--das ist ein Mensch, der beständig ausserordentliche Dinge erlebt, sieht, hört, argwöhnt, hofft, träumt; der von _seinen eigenen Gedanken wie von Aussen her_,-- --als von _seiner Art Ereignissen und Blitzschlägen_ getroffen wird.« (Jenseits von Gut und Böse 292.)

Denn die kriegerische Stellung der Triebe zu einander in seinem Innern ist damit nicht aufgehoben, sondern eher gesteigert: »Wer aber die Grundtriebe des Menschen darauf hin ansieht, wie weit sie gerade hier als inspirirende Genien (oder Dämonen und Kobolde--) ihr Spiel getrieben haben mögen, wird finden,-- -- -- -- --dass jeder Einzelne von ihnen gerade sich gar zu gerne als letzten Zweck des Daseins und als berechtigten _Herrn_ aller übrigen Triebe darstellen möchte. Denn jeder Trieb ist herrschsüchtig und _als solcher_ versucht er zu philosophiren« (Jenseits von Gut und Böse 6).

Daher grade legt die Erkenntniss des Erkennenden ein »entscheidendes Zeugniss dafür ab, _wer er ist_,--das heisst, in welcher Rangordnung die innersten Triebe seiner Natur zu einander gestellt sind« (ebendaselbst).

Trotzdem aber wird durch das Erkennen in diesem Innen-Krieg eine Verwandlung vollzogen, die demselben eine neue Bedeutung gibt,--eine rettende und erlösende Bedeutung: in der Erkenntniss ist ein allen Trieben gemeinsames Ziel gegeben, eine Richtung, der ein jeder von ihnen insofern zustrebt, als sie alle das Nämliche erobern wollen. Die Zersplitterung des Beliebens, die Tyrannei der Willkür ist damit gebrochen. Die Triebe halten an ihrer »Subjects-Vielheit« fest, aber sie unterstellen dieselbe einer höheren

Macht, die ihnen als Dienern und Werkzeugen befiehlt; sie bleiben wild und kriegerisch, aber sie werden in ihrem Kriegs-Ziel unvermerkt zu Helden, die zu kämpfen und zu bluten berufen sind;--das heroische Ideal ist inmitten ihrer Selbstsucht aufgerichtet und zeigt den für sie einzig möglichen Weg zur Grösse. So ist die Gefahr der Anarchie beseitigt zu Gunsten eines sichern »Gesellschaftsbaues der Triebe und Affecte«.

Ich erinnere mich eines mündlichen Ausspruches von Nietzsche, der sehr bezeichnend diese Freude des Erkennenden an der umfassenden Breite und Tiefe seiner Natur ausdrückt,--die Lust, die daraus entspringt, dass er sein Leben nunmehr als ein »Experiment des Erkennenden« (Fröhliche Wissenschaft 324) auffassen darf: »Einer alten, wetterfesten Burg gleiche ich, die viele versteckte Keller und Unterkeller hat; in meine eignen verborgensten Dunkelgänge bin ich noch nicht ganz hinabgekrochen, in meine unterirdischen Kammern bin ich noch nicht gekommen. Sollte mit ihnen nicht alles unterbaut sein? sollte ich nicht aus meiner Tiefe zu allen Oberflächen der Erde hinaufklettern können? sollten wir nicht auf jedem Dunkelgang zu uns selber wiederkehren?«

Dasselbe Gefühl gibt auch in der »Fröhlichen Wissenschaft« (249) der Aphorismus wieder, der die Ueberschrift trägt: »Der Seufzer des Erkennenden«: »Oh über meine Habsucht! In dieser Seele wohnt keine Selbstlosigkeit,-- vielmehr ein Alles begehrendes Selbst, welches durch viele Individuen wie durch _seine_ Augen sehen und wie mit _seinen_ Händen greifen möchte,--ein auch die ganze Vergangenheit noch zurückholendes Selbst, welches nichts verlieren will, was ihm überhaupt gehören könnte! Oh über diese Flamme-meiner Habsucht! Oh dass ich in hundert Wesen wiedergeboren würde!«

Auf diese Weise wird das Umfassende und Verschlungene der unharmonischen, der »stillosen« Natur zu einem gewaltigen Vorzug: »Wollten und wagten wir eine Architektur nach _unserer_ Seelen-Art,-- -- -- -- so müsste das Labyrinth unser Vorbild sein!« (Morgenröthe 169.)--aber kein Labyrinth, in welchem die Seele sich selbst verliert, sondern aus dessen Wirrnis sie zur Erkenntniss hindurchdringt. »Man muss noch Chaos in sich haben, um einen tanzenden Stern gebären zu können«,-- dieses Wort Zarathustras (I 15) gilt von ihr, die zum Sternendasein, zum Licht geboren ist als zu ihrem eigensten Wesensgenius, ihrer eigensten Verklärung. Nietzsche hat dies unter dem Namen: »Eine lichte Art von Schatten« geschildert (Der Wanderer und sein Schatten 258): »Dicht neben den ganz nächtigen Menschen befindet sich fast regelmässig, wie an sie angebunden, eine Lichtseele. Sie ist gleichsam der negative Schatten, den jene werfen.«

Diese Lichtseele ist um so strahlender, je mächtiger und nächtiger, also je tyrannischer und gefährlicher die Natur ist, welche sich gleichsam in ihr verbrennen lässt,--alle ihre Neigungen als Brennstoff in diese heilige Gluth wirft. Die Art, in welcher dies geschieht, wechselt mit dem Erkenntnissstandpunkt des Erkennenden: Nietzsches Auffassung dessen, was »Erkenntnisse ist, ist in seinen verschiedenen Geistesperioden eine verschiedene, und dementsprechend verschiebt sich auch jedesmal das, was er die »innere Rangordnung der Triebe« nennt, innerhalb des wogenden Kampfes in dieser reichen Genie-Natur. Man kann sagen, dass aus den wechselnden Bildern solcher Verschiebungen sich die Geschichte seiner Entwicklung im Wesentlichen zusammensetzt, bis in seiner letzten Schaffensperiode sein ganzes Innenleben sich in philosophischen Theorien widerspiegelt: bis ihm Dunkelseele und Lichtseele zu Repräsentanten des Menschlichen und Uebermenschlichen werden.

Der geschilderte Seelenprocess selbst aber bleibt durch alle Wandlungen hindurch in seinen Grundzügen der nämliche. »Hat man Charakter, so hat man auch sein typisches Erlebniss, das immer wiederkommt,« sagt Nietzsche (Jenseits von Gut und Böse 70). Nun, dieses ist sein typisches Erlebniss, das immer wiederkommt, an dem er sich immer wieder aufrichtete, über sich selbst erhob,--an dem er auch endlich sich in sich selbst überschlug und zu Grunde ging.

Und daran _musste_ er wohl zu Grunde gehen. Denn in dem gleichen Process, der ihm stets von neuem Heilung und Erhebung sicherte, lag auch schon das pathologische Moment dieser Art von Geistesentwicklung verborgen. Auf den ersten Blick fällt es nicht auf. Man sollte vielmehr meinen, in einer Kraft, die sich selber so zu heilen weiss, müsse mindestens ebensoviel Gesundheit stecken wie in dem ruhigen Frieden einer harmonischen Kräfteentfaltung. Ja, sogar eine weit grössere Gesundheit: denn sie ist im Stande, selbst an dem, was Wunden schlägt und Fieber erzeugt, sich noch zu befestigen und zu beweisen; sie ist im Stande, Krankheit und Kampf zu einem _Stimulans_ für Leben und Erkennen umzuwandeln, zu einem Sporn und Hellsehen für ihre Zwecke,--sie _umfasst_ also schadlos Kampf und Krankheit. Auf solche Weise wollte Nietzsche, namentlich zuletzt, namentlich als er am krankhaftesten war, seine Leidensgeschichte aufgefasst wissen: alseine _Genesungs_geschichte. Allerdings vermochte diese gewaltige Natur es, sich mitten aus Schmerzen und Widerstreit heraus in ihrem Erkenntnissideal selbst zu heilen und zusammenzufassen. Aber, nach erlangter Genesung, _bedurfte_ sie wiederum ebenso nothwendig der Leiden und Kämpfe, der Fieber und Wunden. Sie, die sich selbst Heilung geschafft, ruft jene wieder, hervor; sie wendet sich gegen sich selbst, schäumt gleichsam über, um sich in neue Krankheitszustände zu ergiessen. Ueber jedem erreichten Erkenntnissziel, jedem erlangten

Genesungsglück stehen immer wieder die Worte: »Wer sein Ideal erreicht, kommt eben damit über dasselbe hinaus«, denn: »sein Ueberglück ward ihm zum Ungemach« (Fröhliche Wissenschaft, Scherz, List und Rache 47), und er fühlt sich: »verwundet von seinem Glücke«[10] (Also sprach Zarathustra II 2). »_Sich Schmerzen machen_. Rücksichtslosigkeit des Denkens ist oft das Zeichen einer unfriedlichen inneren Gesinnung, welche Betäubung begehrt.« Menschliches, Allzumenschliches I 581.

Die Gesundheit ist hier also nicht das Ueberlegene und Ueberragende, welches das Pathologische, als ein Nebensächliches, zu einem Werkzeug für sich umschafft, sondern beide bedingen sich, ja _enthalten_ sich gegenseitig,--beide zusammen stellen thatsächlich eine eigenthümliche _Selbstspaltung_ innerhalb ein und desselben Geisteslebens dar.

Eine solche innere Spaltung liegt nämlich dem ganzen geschilderten Seelenprocess zu Grunde. Anscheinend zwar sollte in ihm die Vielspältigkeit, die Subjects-Vielheit der unharmonisch veranlagten Natur, in einer hohem Einheit, in einem richtunggebenden Ziel aufgehoben werden. Nun vollzieht sich aber dieser Vorgang _innerhalb_ der vielspältigen Seele in der Weise, dass ein einziger Trieb sich alle übrigen unterordnet; mit anderen Worten: die Vielspältigkeit wird auf eine um so tiefer gehende _Zweispaltung_ reducirt. So wenig wie die Gesundheit hier überragend das Krankhafte mit _umfasst_, so wenig umfasst und überragt der herrschende Trieb wahrhaft das gesammte Innere, indem er es in den Dienst der Erkenntniss stellt: der Erkennende blickt wohl mit seinen Geistesaugen auf sich selbst wie auf eine zweite Wesenheit, aber er bleibt doch in der eigenen Wesenheit gefangen; er ist nur im Stande sie zu spalten, nicht über sie hinauszugreifen. Die Macht der Erkenntniss also, weit davon entfernt, eine einigende zu sein, ist vielmehr eine trennende,--aber die Tiefe der Trennung erweckt den _Schein_, als läge das Ziel aller Regungen _ausser ihnen_. In Folge dieser Selbsttäuschung drängen alle Kräfte begeistert der Erkenntniss zu, als vermöchten sie damit sich selbst und ihrem Zwiespalt zu entlaufen.

Man sollte allerdings glauben, es werde wenigstens eine Art von Zusammenschluss des Gesammtlebens dadurch erreicht, dass auf der einen Seite das Triebleben, unter dem darauf gerichteten Erkenntnissblick, zu ungeheurer Bewusstheit gesteigert wird,--dass auf der anderen das Denken durch die Welt der Stimmungen und Triebe eine ungemeine Belebung erhält. Aber das Resultat ist ein gerade entgegengesetztes, indem der Gedanke die Unmittelbarkeit aller inneren Regungen _zersetzt_, die Erregungen des Inneren hinwiederum die beherrschte Strenge des Gedankens beständig _lockern_. So durchdringt thatsächlich die Spaltung des Ganzen alles Einzelne nur immer weiter und tiefer.

Was ist es nun, das trotzdem eine so hohe, geradezu erlösend wirkende Befriedigung aus einer so durchsichtigen Selbsttäuschung quellen lässt? Was ist es, das einen Schein dazu befähigt, das ganze Sein, wenn auch unter steten Erkrankungen und Verwundungen, zu beseligen und zu verklären? Mit dieser Frage stehen wir vor dem eigentlichen Nietzsche-Problem; sie erst weist uns auf den geheimen Zusammenhang des Gesunden und Pathologischen in ihm.

Indem nämlich die Vielheit unverbundener Einzeltriebe sich in zwei einander gleichsam gegenüber stehende Wesenheiten zerspaltet, von denen die Eine herrscht, die Andere dient,--wird es dem Menschen ermöglicht, zu sich selber nicht nur wie zu einem _anderen_, sondern auch wie zu einem _höhern_ Wesen zu empfinden. Indem er einen Theil seiner selbst sich selber zum Opfer bringt, ist er einer _religiösen Exaltation_ nahe gekommen. In den Erschütterungen seines Geistes, in denen er das heroische Ideal eigener Preisgebung und Hingebung zu verwirklichen wähnt, bringt er _an sich selbst einen religiösen Affect_ zum Ausbruch.

Von allen grossen Geistesanlagen Nietzsches gibt es keine, die tiefer und unerbittlicher mit seinem geistigen Gesammtorganismus verbunden gewesen wäre, als sein religiöses Genie. Zu einer anderen Zeit, in einer andern Culturperiode würde dasselbe diesem Predigerssohn sicherlich nicht gestattet haben, zum Denker zu werden. Unter den Einflüssen unserer Zeit erhielt jedoch sein religiöser Geist die Richtung aufs Erkennen und vermochte dasjenige, wonach es ihn instinctiv am drängendsten verlangte, wie nach dem natürlichen Ausdruck seiner Gesundheit, nur in krankhafter Weise zu befriedigen,--das heisst, er vermochte es nur vermittelst einer Rückbeziehung auf sich selbst anstatt auf eine ihn mit umfassende, ausser ihm liegende Lebensmacht. So erreichte er das gerade Gegentheil des Angestrebten: nicht eine höhere Einheit seines Wesens, sondern dessen innerste Zweitheilung, nicht den Zusammenschluss aller Regungen und Triebe zu einem einheitlichen Individuum, sondern ihre Spaltung zum »_Dividuum_«. Es war immerhin eine Gesundheit erreicht,--doch mit den Mitteln der Krankheit; eine wirkliche Anbetung, doch mit den Mitteln der Täuschung; eine wirkliche Selbstbehauptung und Selbsterhebung, doch mit den Mitteln der Selbstverwundung. Deshalb liegen in dem gewaltigen religiösen Affect, aus dem ganz allein bei Nietzsche alle Erkenntniss hervorgeht, unlöslich in einen Knoten verschlungen: eigne _Aufopferung_ und _eigne Apotheose_, Grausamkeit der eignen _Vernichtung_ und Wollust der eignen _Vergötterung_, leidvolles Siechen und siegende Genesung, glühender Rausch und kühle Bewusstheit. Man fühlt hier die enge Verknüpfung der Gegensätze, die einander unaufhörlich bedingen: man fühlt das Ueberschäumen und freiwillige

Hinabstürzen der aufs Höchste erregten und gespannten Kräfte ins Chaotische, Dunkle, Schauerliche, und dann wieder aus diesem heraus ein Drängen ins Lichte, Zarteste,--das Drängen eines Willens, der sich«-- --von der Noth der Fülle und Ueberfülle, vom Leiden der in ihm gedrängten Gegensätze löst«,[11]--ein Chaos, das den Gott gebären möchte,--gebären _muss_.

»Im Menschen ist _Geschöpf_ und _Schöpfer_ vereint: im Menschen ist Stoff, Bruchstück, Ueberfluss, Lehm, Koth, Unsinn, Chaos; aber im Menschen ist auch Schöpfer, Bildner, Hammer-Härte, Zuschauer-Göttlichkeit und siebenter Tag...«. (Jenseits von Gut und Böse 225.) Und hier zeigt sich, dass unablässiges Leiden und unablässige Selbstvergöttlichung sich gegenseitig bedingen, indem ein jedes seinen eignen Gegensatz immer wieder neu erzeugt,-- wie es Nietzsche in der Geschichte des Königs Viçvamitra ausgedrückt findet, »der aus tausendjährigen Selbstmarterungen ein solches Machtgefühl und Zutrauen zu sich gewann, dass er es unternahm, einen _neuen Himmel_ zu bauen:-- -- --Jeder, der irgendwann einmal einen »neuen Himmel« gebaut hat, fand die Macht dazu erst in der eignen Hölle...« (Genealogie der Moral III 10.) Eine andere Stelle, wo er dieser Sage gedenkt, steht in der Morgenröthe (113) und folgt unmittelbar auf die Schilderung jener machtdurstigen Leidenden, die als das würdigste Object ihrer Vergewaltigungslust sich selbst auserlesen haben: »Der Triumph des Asketen über sich selber, sein dabei nach Innen gewendetes Auge, welches den Menschen zu einem Leidenden und zu einem Zuschauenden zerspaltet sieht und fürderhin in die Aussenwelt nur hineinblickt, um aus ihr gleichsam Holz zum eigenen Scheiterhaufen zu sammeln, diese letzte Tragödie des Triebes nach Auszeichnung, bei der es nur noch Eine Person gibt, welche in sich selber _verkohlt_-- --« Dieser Abschnitt, der die Beschreibung aller bisherigen Askese und ihrer Motive enthält, schliesst mit der Bemerkung: -- --ja, ist denn wirklich der Kreislauf im Streben nach Auszeichnung mit dem Asketen am letzten Ende angelangt und in sich abgerollt? Könnte dieser Kreis nicht noch einmal von Anfang an durchlaufen werden, mit der festgehaltenen Grundstimmung des Asketen und zugleich des mitleidenden Gottes?«

In »Menschliches, Allzumenschliches« (I 137) sagt er darüber: Es gibt einen _Trotz gegen sich selbst_, zu dessen sublimirtesten Aeusserungen manche Formen der Askese gehören. Gewisse Menschen haben nämlich ein so hohes Bedürfniss, ihre Gewalt und Herrschsucht auszuüben, dass sie-- -- --endlich darauf verfallen, _gewisse Theile ihres eigenen Wesens_-- -- --zu tyrannisiren.-- -- --Dieses Zerbrechen seiner selbst, dieser Spott über die eigene Natur, dieses spernere se sperni, aus dem die Religionen so viel gemacht haben, ist eigentlich _ein sehr hoher Grad der Eitelkeit_.-- -- --Der Mensch hat eine wahre Wollust darin, sich durch übertriebene Ansprüche zu vergewaltigen und _dieses tyrannisch fordernde Etwas in seiner Seele nachher zu vergöttern_.«--und 138: »-- --Eigentlich liegt ihm also nur an der Entladung seiner Emotion; da fasst er wohl, um seine Spannung zu erleichtern, die Speere der Feinde zusammen und begräbt sie in seine Brust,«--und 142: »-- --er geisselt seine Selbstvergötterung mit Selbstverachtung und Grausamkeit, er freut sich an dem wilden Aufruhre seiner Begierden,-- -- --er versteht es, seinem Affect, zum Beispiel dem der äussersten Herrschsucht, einen Fallstrick zu legen, so dass er in den der äussersten Erniedrigung übergeht und seine aufgehetzte Seele durch diesen Contrast aus allen Fugen gerissen wird;-- -- --es ist im Grunde eine seltene Art von Wollust, welche er begehrt, aber vielleicht jene Wollust, in der alle anderen in einen Knoten zusammengeschlungen sind. Novalis, eine der Autoritäten in Fragen der Heiligkeit durch Erfahrung und Instinct, spricht das ganze Geheimniss einmal mit naiver Freude aus: »Es ist wunderbar genug, dass nicht längst die Association von Wollust, Religion und Grausamkeit die Menschen aufmerksam auf ihre innige Verwandtschaft und gemeinschaftliche Tendenz gemacht hat.«

In der That ist eine rechte Nietzsche-Studie in ihrer Hauptsache eine _religionspsychologische_ Studie, und nur insoweit als das Gebiet der Religionspsychologie bereits aufgehellt ist, fallen auch helle Streiflichter auf die Bedeutung seines Wesens, seines Leidens und seiner Selbst-Beseligung. Seine ganze Entwicklung ging gewissermassen davon aus, dass er den Glauben verlor, also von der »Emotion über den Tod Gottes«,--dieser ungeheuren Emotion, die bis in das letzte Werk hineinklingt, das Nietzsche, schon auf der Schwelle des Wahnsinns verfasste,-- bis in den vierten Theil seines: »Also sprach Zarathustra«. _Die Möglichkeit, einen Ersatz[12] »für den verlorenen Gott« in den verschiedensten Formen der Selbstvergottung_ zu finden, das ist die Geschichte seines Geistes, seiner Werke, seiner Erkrankung. Es ist die Geschichte des »_religiösen Nachtriebes im Denker_«, der noch mächtig bleibt, auch nachdem der Gott zerbrach, auf den er sich bezog, und auf den Nietzsches Worte Anwendung finden können: (Menschliches, Allzumenschliches I 223): »Die Sonne ist schon hinunter gegangen, aber der Himmel unseres Lebens glüht und leuchtet noch von ihr her, ob wir sie schon nicht mehr sehen.« Man lese darüber den ergreifenden Gefühlsausbruch des »tollen Menschen« in der »Fröhlichen Wissenschaft« (125). »Wohin ist Gott?« rief er, »ich will es Euch sagen! _Wir haben ihn getödtet_!--ihr und ich! Wir Alle sind seine Mörder!-- -- -- -- -- --Hören wir noch nichts vom Lärm der Todtengräber, welche Gott begraben? Riechen wir noch nichts von der göttlichen Verwesung?--auch Götter verwesen! Gott ist todt! Gott bleibt todt! Und wir haben ihn getödtet! Wie trösten wir uns, die Mörder aller Mörder? Das Heiligste und Mächtigste, was die Welt bisher besass, ist unter unseren Messern verblutet,--wer wischt dies Blut von uns ab? Mit welchem Wasser könnten wir uns reinigen?-- -- -- --_Ist nicht die Grösse dieser That zu gross für uns? Müssen wir nicht selber zu Göttern werden, um nur ihrer würdig zu erscheinen_? Es

gab nie eine grössere That,--und wer nur immer nach uns geboren wird, gehört um dieser That willen in eine höhere Geschichte, als alle Geschichte bisher war!«-- --

Die Antwort auf diesen Ausbruch von Qual und Sehnsucht gab sich Nietzsche in seiner letzten Schaffensperiode mit den Worten Zarathustras (I Schluss): »Todt sind alle Götter: nun wollen wir, dass der Uebermensch lebe!«--und sprach damit den innersten Seelengrund seiner Philosophie aus.

Die Gottsehnsucht wird in ihrer Qual zu einem Drang der Gott-Schöpfung, und dieser musste sich nothwendig in Selbstvergottung äussern. Mit richtigem Blick erkannte Nietzsche im religiösen Phänomen die ungeheure Auslebung des individuellsten Verlangens, den Willen zur höchsten Selbstbeseligung. Dieser Individualismus, der als Kern in allem Religiösen steckt, dieser »sublime Egoismus«, der in allem Religiösen frei und naiv ausströmt, indem er sich auf eine von aussen gegebene Lebens-oder Gottesmacht zu beziehen glaubt, wurde in ihm, dem »Erkennenden«, auf sich selbst zurückgeworfen. Und so gelangt er dazu, sich die ihm vom Verstände aufgedrungene Gottlosigkeit mit dem vermessenen Schlüsse innerlich anzueignen: »_Wenn_ es Götter gäbe, wie hielte ich's aus, kein Gott zu sein! Also gibt es keine Götter.« Diese Worte stehen im zweiten Theil des »Also sprach Zarathustra« (6); an sie lassen sich jene anderen anschliessen (55): »_Und Anbetung wird noch in Deiner Eitelkeit sein_!« In ihnen ist die ganze Gefahr ausgesprochen, die über dem »Einsamen« und »Einzelnen« schwebt, der sich spalten und verdoppeln muss. »Einer ist immer zu viel um mich.-- -- --Immer Einmal Eins--das gibt auf die Dauer Zwei!« (Also sprach Zarathustra I 76.)

Die Art, wie er sich zu dieser Zweiheit stellte, wie er sich gegen sie zur Wehre setzte oder ihr nachgab, und worin er sie jedesmal suchte,--das alles bedingt den Wandel seiner Erkenntniss, sowie die Eigenart seiner verschiedenen Geistesperioden--bis endlich seine Zweiheit ihm zu einer Hallucination und Vision, zu einer leibhaften Wesenheit wurde, die seinen Geist verdüsterte, seinen Verstand erstickte. Er vermochte nicht sich länger gegen sich selbst zu wehren: Dieses war das dionysiche Drama vom »Schicksal der Seele« (Zur Genealogie der Moral, Vorrede XIII) in Nietzsche selbst. Die Einsamkeit des Innenlebens, in welcher der Geist über sich selbst hinausgelangen will, ist nirgends tiefer und schmerzvoller als zum Schluss. Man könnte sagen, die stärkste Mauer in dieser verhängnissvollen Selbstvermaurung sei ein zarter, glänzender, göttlicher Schein, der sie umgaukelt, eine Luftspiegelung, die ihm die eigenen Grenzen verwischt und verbirgt. Jeder Gang nach aussen führt immer wieder in die Tiefe dieses Selbst zurück, das sich schliesslich zu Gott und Welt, zu Himmel und Hölle werden muss--jeder Gang führt es einen Schritt weiter in seine letzte Tiefe und in seinen Untergang.

Diese Grundzüge von Nietzsches Eigenart enthalten die Ursachen des zugleich _Raffinirten_ und _Exaltirten_, das auch dem Grossen und Bedeutenden in seiner Philosophie beigemischt ist gleich einer brennenden Würze. Am schärfsten wird es wohl von der unverdorbenen Zunge junger und gesunder Geister herausgeschmeckt werden,--oder auch von denen, die, im ruhigen Frieden glaubensvoller Anschauungen geborgen, niemals den ganzen furchtbaren Kampf und Brand eines religiös veranlagten Freigeistes am eignen Leibe erfahren haben. Aber es ist auch dasjenige, was Nietzsche in so hohem Masse zum Philosophen unserer Zeit hat werden lassen. Denn in ihm hat typische Gestalt gewonnen, was sie in ihrer Tiefe bewegt: jene »Anarchie in den Instincten« schöpferischer und religiöser Kräfte, die zu gewaltig nach Sättigung begehren, um sich mit den Brosamen begnügen zu können, welche vom Tisch der modernen Erkenntniss für sie abfallen. Dass sie sich nicht mit ihnen begnügen können. aber ebensowenig ihre Stellung zur Erkenntniss preisgeben,-- gleich unersättlich im leidenschaftlichen Verlangen wie unermüdlich im Darben und Entbehren,--das ist der grosse und erschütternde Zug im Bilde der Philosophie Nietzsches. Das ist es auch, was sie in immer neuen Wendungen zum Ausdruck bringt:--eine Reihe von gewaltigen Versuchen, dieses Problem moderner Tragik, das Räthsel der modernen Sphinx zu lösen und sie in den Abgrund zu stürzen.

Aber deshalb ist es eben der _Mensch_ und nicht der _Theoretiker_, auf den wir unsern Blick richten müssen, um uns in den Werken Nietzsches zurechtzufinden,--und deshalb wird auch der Gewinn, das Resultat unserer Betrachtung nicht darin bestehen, dass uns ein neues theoretisches Weltbild in seiner Wahrheit aufgeht, sondern das Bild einer Menschenseele in ihrer Zusammensetzung von Grösse und Krankhaftigkeit. Zunächst scheint die philosophische Bedeutung in Nietzsches Wandlungen dadurch abgeschwächt zu werden, dass sich jedesmal genau derselbe innere Process abspielt. Aber sie wird vertieft und verschärft, weil der Wechsel der Ansichten immer wieder auf das Wesen übergreift. Nicht nur die äusseren Umrisslinien einer Theorie sind jedesmal verändert, sondern die ganze Stimmung, Luft, Beleuchtung wandelt sich mit ihnen. Während wir Gedanken einander widerlegen hören, sehen wir Welten versinken, neue Welten emporsteigen. Gerade hierauf beruht die wahre Originalität des Nietzscheschen Geistes: durch das Medium seiner Natur, die Alles auf sich und ihre intimsten Bedürfnisse bezieht, aber sich auch an Alles hingebend verliert, erschliessen sich ihm jene inneren Erlebnisse und Ergebnisse von Gedankenwelten, die wir sonst nur mit dem Verstände streifen, ohne sie jemals in ihren Tiefen auszuschöpfen und ohne daher an ihnen schöpferisch zu werden. Theoretisch betrachtet, lehnt er sich häufig an fremde Muster und Meister an, aber das, worin diese ihre Reife, ihren

Productionspunkt haben, wird ihm nur zum Anlass, daran zu eigner Productivität zu gelangen.[13] Die geringste Berührung, die sein Geist empfand, genügte, um in ihm eine Fülle innern Lebens,--Gedanken-Erlebens, auszulösen. Er hat einmal gesagt: »Es gibt zwei Arten des Genie's: eins, welches vor allem zeugt und zeugen will, und ein andres, welches sich gern befruchten lässt und gebiert.« (Jenseits von Gut und Böse 248.) Zweifellos gehörte er der letzteren Art an. In Nietzsches geistiger Natur lag--ins Grosse gesteigert--etwas Weibliches;[14] aber er ist darin in einem solchen Masse Genie, dass es fast gleichgiltig erscheint, woher er die erste Anregung empfängt. Wenn wir alles zusammenlesen, was sein Erdreich befruchtet hat, dann haben wir einige unscheinbare Samenkörner vor uns: wenn wir in seine Philosophie eintreten, umrauscht uns ein Wald schattenspendender Bäume, umfängt uns die verschwenderische Vegetation einer wildgrossen Natur. Seine Ueberlegenheit bestand darin, dass er jedem Samenkorn, welches in sein Inneres fiel, entgegenbrachte, was er selbst als das Kennzeichen des echten Genies anführt: »den neuen, treibenden Fruchtboden mit einer urwaldfrischen unausgenutzten Kraft.« (Der Wanderer und sein Schatten 118.)

[1] Eine zusammenfassende Charakteristik Nietzsches, in der zum ersten Male die drei Perioden seiner geistigen Entwicklung unterschieden und bestimmt charakterisirt sind, erschien in der Sonntags-Beilage der Vossischen Zeitung 1891, Nr. 2, 3 und 4. Ausserdem brachte die »Freie Bühne« eingehendere Ausführungen einzelner Punkte unter dem Titel »Zum Bilde Friedrich Nietzsches, Jahrg. II (1891), Heft 3, 4 und 5, Jahrg. III (1892), Heft 3 und 5; das Magazin für Literatur 1892, October, »Ein Apokalyptiker«; Der Zeitgeist 1893, Nr. 20, »Ideal und Askese«.

[2] Was das Leben--, die sogenannten »Erlebnisse« angeht,-- wer von uns hat dafür auch nur Ernst genug? Oder Zeit genug? Bei solchen Sachen waren wir, fürchte ich, nie recht »bei der Sache«, wir haben eben unser Herz nicht dort--und nicht einmal unser Ohr!« (Zur Genealogie der Moral, Vorrede III.)

[3] Eine ähnliche Bedeutung legte er seinen selten kleinen und feinmodellirten Ohren bei, von denen er sagte, sie seien die wahren »Ohren für Unerhörtes«. (Zarathustra I 25.)

[4] »Giebt es--eine Vorneigung für das Harte, Schauerliche, Böse, Problematische des Daseins aus Wohlsein, aus überströmender Gesundheit, aus der Ueberfülle selbst?------Giebt es vielleicht--eine Frage für Irrenärzte--_Neurosen der Gesundheit_?« (Versuch einer Selbstkritik zur neuen Ausgabe der »Geburt der Tragödie aus dem Geiste der Musik« IV u. IX.)

[5] Vgl. auch »Die fröhliche Wissenschaft« 253, »Eines Tages erreichen wir unser Ziel--und weisen nunmehr mit Stolz darauf hin, was für lange Reisen wir dazu gemacht haben. Wir kamen aber dadurch so weit, dass wir an jeder Stelle wähnten, zu Hause zu sein.«

[6] Daher nennt er die Ueberzeugungen _Feinde der Wahrheit_: »Ueberzeugungen sind gefährlichere Feinde der Wahrheit als Lügen.« (Menschliches, Allzumenschliches, I 483).

[7] Durch diesen Trieb entwickelte er sich mehr, als er es selbst wahr haben wollte, zu jenem »Don Juan der Erkenntniss«, den er (Morgenröthe 327) folgendermassen schildert: »Er hat Geist, Kitzel und Genuss an Jagd und Intriguen der Erkenntniss--bis an die höchsten und fernsten Sterne der Erkenntniss hinauf!--bis ihm zuletzt Nichts mehr zu erjagen übrig bleibt, als das absolut _Wehethuende_ der Erkenntniss, glefich dem Trinker, der am Ende Absinth und Scheidewasser trinkt. So gelüstet es ihn am Ende nach der Hölle,--es ist die letzte Erkenntniss, die ihn _verführt_. Vielleicht, dass auch sie ihn enttäuscht, wie alles Erkannte! Und dann müsste er in alle Ewigkeit stehen bleiben, an die Enttäuschung festgenagelt und selber zum steinernen Gast geworden, mit einem Verlangen nach einer Abendmahlzeit der Erkenntniss, die ihm nie mehr zu Theil wird!--denn die ganze Welt der Dinge hat diesem Hungrigen keinen Bissen mehr zu reichen.«

[8] »Die Instincte bekämpfen _müssen_--das ist die Formel für décadence: so lange das Leben _aufsteigt_, ist Glück gleich Instinct«, sagt er (Götzen-Dämmerung, Das Problem des Sokrates 11), und unterscheidet so den Dekadenten von der geborenen Herrennatur.

[9] Nietzsche fasst hier, nebenbei bemerkt, Goethe durchaus anders auf als einige Jahre später (in der Götzen-Dämmerung). Hier sieht er noch in ihm den Antipoden seiner eigenen, unharmonischen Natur--später hingegen einen ihm tief verwandten Geist, der nicht harmonisch war, sondern sich durch Ausgestaltung und Hingabe seiner selbst zum Harmonischen _umschuf_.

[10] Vgl. auch Jenseits von Gut und Böse 224: »wir-- -- --sind erst dort in unsrer Seligkeit, wo wir auch am meisten--in Gefahr sind.«

[11] »Versuch einer Selbstkritik«, in der neuen Ausgabe der »Geburt der Tragödie aus dem Geiste der Musik« XI.

[12] Siehe in der Fröhlichen Wissenschaft (Scherz, List und Rache 38) über die menschliche Bestimmung als erfüllt in der Gottschöpfung des Menschen:

»Der Fromme spricht: »Gott liebt uns, weil er uns erschuf!« »Der Mensch schuf Gott!« sagt drauf ihr Feinen. Und soll nicht lieben, was er schuf? Soll's gar, weil er es schuf, verneinen? Das hinkt, das trägt des Teufels Huf.

[13] Auch wenn man von denjenigen Denkern absieht, welche die verschiedenen Phasen von Nietzsches Entwicklung direct bestimmt haben, lassen sich viele seiner Gedanken schon bei früheren Philosophen nachweisen. Auf diese für die wahre Bedeutung Nietzsches durchaus unwesentliche Thatsache ist neuerdings mit dem grössten Lärm von Leuten hingewiesen worden, denen lediglich der Zufall das eine oder andere philosophische Buch in die Hände gespielt hat. In der vorliegenden Schrift ist absichtlich auf die Stellung Nietzsches in der Geschichte der Philosophie kein Bezug genommen, da dies eine eingehende systematische Prüfung seiner einzelnen Theorien auf ihren objectiven Werth zur Voraussetzung haben würde, was einer besonderen Arbeit Vorbehalten bleiben muss.

[14] Manchmal, wenn er dies besonders empfand, war er geneigt, das weibliche Genie als das eigentliche Genie zu nehmen. »Die Thiere denken anders über die Weiber, als die Menschen; ihnen gilt das Weibchen als das productive Wesen.-- -- -- -- --Die Schwangerschaft hat die Weiber milder, abwartender, furchtsamer, unterwerfungslustiger gemacht; und ebenso erzeugt die geistige Schwangerschaft den Charakter des Contemplativen, welcher dem weiblichen Charakter verwandt ist:--es sind die männlichen Mütter.--« (Die fröhliche Wissenschaft 72.)

II. ABSCHNITT

SEINE WANDLUNGEN.

MOTTO:

»Die Schlange, welche sich nicht häuten kann, geht zu Grunde. Ebenso die Geister, welche man verhindert, ihre Meinungen zu wechseln; sie hören auf, Geist zu sein.«

(Morgenröthe 573)

Die erste Wandlung, die Nietzsche in seinem Geistesleben durchkämpfte, liegt weit zurück in der Dämmerung seiner Kindheit oder doch wenigstens seiner Knabenjahre.

Es ist der Bruch mit dem christlichen Kirchenglauben. In seinen Werken findet diese Trennung selten Erwähnung. Trotzdem kann sie als der Ausgangspunkt seiner Wandlungen angesehen werden, weil schon von ihr aus ein charakteristisches Licht auf die Eigenart seiner Entwicklung fällt. Seine Aeusserungen über diesen Gegenstand, den ich besonders eingehend mit ihm besprochen habe, betrafen hauptsächlich die Gründe, welche den Glaubensbruch hervorrufen. Weitaus die meisten religiös veranlagten Menschen werden erst durch intellectuelle Gründe dahin gedrängt, sich in schmerzlichen Kämpfen von ihren Glaubensvorstellungen loszusagen. Wo aber, in selteneren Fällen, die erste Entfremdung vom Gemüthsleben selbst ausgeht, da ist der Process ein kampfloser und schmerzloser; der Verstand zersetzt nur, was schon vorher abgestorben,--eine Leiche war. In Nietzsches Fall fand eine eigenthümliche Kreuzung dieser beiden Möglichkeiten statt: weder waren es nur intellectuelle Gründe, die ihn ursprünglich von den anerzogenen Vorstellungen frei machten, noch auch hatte der alte Glaube aufgehört, den Bedürfnissen seines Gemüths zu entsprechen. Vielmehr betonte Nietzsche immer wieder, dass das Christenthum des elterlichen Pfarrhauses seinem inneren Wesen »glatt und weich« angelegen habe--»gleich einer gesunden Haut«, und dass ihm die Erfüllung all seiner Gebote so leicht geworden sei wie das Befolgen einer eignen Neigung. Dieses gleichsam angeborene, unveräusserliche »Talent« zu aller Religion hielt er für eine der Ursachen der Sympathie, die ihm ernste Christen selbst dann noch entgegenbrachten, als er bereits durch eine tiefe Geisteskluft von ihnen getrennt war.

Der dunkle Instinct, der ihn hier zum ersten Mal aus lieb und theuer gewordnen Gedankenkreisen forttrieb, erwachte grade in diesem Heimathsgefühl, in diesem warmen »Zu Hause«, von dem sich Nietzsches Wesen darin umfangen fühlte. Um in machtvoller Entwicklung zu sich selbst zu gelangen, bedurfte sein Geist der seelischen Kämpfe, Schmerzen und Erschütterungen,--er bedurfte dessen, dass sein Gemüth sich die Trennung von diesem ruhigen Friedenszustand _anthat_, weil seine Schaffenskraft von der Emotion und Exaltation seines Innern abhängig war: hier tritt uns die Erscheinung des

Schmerzheischenden in der »Decadenten-Natur« zum ersten Mal in Nietzsches Leben entgegen.

»Unter friedlichen Umständen fällt der kriegerische Mensch über sich selbst her,« (Jenseits von Gut und Böse 76) und verbannt sich selbst in eine Gedankenfremde, in der er von nun an zu einem ewigen Wandern ohne Rast und Ruhe bestimmt ist. Aber in dieser Rastlosigkeit lebt von nun an eine unersättliche Sehnsucht in Nietzsche, die nach dem verlorenen Paradies zurückstrebt, während seine Geistesentwicklung ihn zwingt, sich in grader Linie immer weiter davon zu entfernen.

Im Gespräch über die Wandlungen, die schon hinter ihm lagen, äusserte Nietzsche einmal halb im Scherz: »Ja, so beginnt nun der Lauf und wird fortgesetzt,--bis wohin? wenn Alles durchlaufen ist,--wohin läuft man alsdann? Wenn alle Combinationsmöglichkeiten erschöpft wären,--was folgte dann noch? wie? müsste man nicht wieder beim Glauben anlangen? Vielleicht bei einem _katholischen_ Glauben?« Und der Hintergedanke, der sich in dieser Aeusserung verbarg, trat in den ernst hinzugefügten Worten aus seinem Versteck:

»_In jedem Fall könnte der Kreis wahrscheinlicher sein als der Stillstand._«

Eine in sich selbst zurücklaufende, niemals stillstehende Bewegung,--das ist in Wahrheit das Kennzeichen der ganzen Geistesart Nietzsches. Die Combinationsmöglichkeiten sind keineswegs unendlich, sind im Gegentheil sehr begrenzt, da der vorwärts treibende, selbstverwundende Drang, der die Gedanken nicht zur Ruhe kommen lässt, ganz und gar der innern Eigenart der Persönlichkeit entspringt: so weit auch die Gedanken zu schweifen scheinen, so bleiben sie doch stets an die gleichen Seelenvorgänge gebunden, die sie immer wieder zurück unter die herrschenden Bedürfnisse zwingen. Wir werden sehen, inwiefern Nietzsches Philosophie in der That einen Kreis beschreibt, und wie zum Schlüsse der Mann in einigen seiner intimsten und verschwiegensten Gedankenerlebnisse sich wieder dem _Knaben_ nähert, so dass von dem Gang seiner Philosophie die Worte gelten: siehe einen Fluss, der in vielen Windungen zurück zur Quelle fliesst!« (Also sprach Zarathustra III 23.) Es ist kein Zufall, dass Nietzsche in seiner letzten Schaffensperiode zu seiner mystischen Lehre von einer ewigen Wiederkunft gelangte: das Bild des _Kreises,--eines ewigen Wechsels in einer ewigen Wiederholung,_--steht wie ein wundersames Symbol und Geheimzeichen über der Eingangspforte zu seinen Werken.

Als sein erstes »literarisches Kinderspiel« (Zur Genealogie der Moral, Vorrede VI) nennt Nietzsche einen Aufsatz aus seiner Knabenzeit, »über den Ursprung des Bösen«, worin er, »wie es billig ist«, Gott »zum _Vater_ des Bösen« machte. Auch gesprächsweise erwähnte er diesen Aufsatz als Beweis dafür, dass er sich schon zu einer Zeit philosophischen Grübeleien hingegeben habe, wo er sich noch in dem philologischen Schulzwang der Schulpforte befand.

Wenn wir Nietzsche aus seiner Kindheit in seine Lehrjahre und dann in die lange Zeit seiner philologischen Thätigkeit folgen, dann erkennen wir auch hier deutlich, wie seine Entwicklung von Anfang an auch rein äusserlich unter dem Einfluss eines gewissen Selbstzwanges verläuft. Schon die strenge philologische Schulung musste einen solchen Zwang für den jungen Feuergeist enthalten, dessen reiche schöpferische Kräfte dabei leer ausgingen. Ganz besonders aber galt dies von der Richtung seines Lehrers Ritschl. Grade bei diesem wurde das Hauptaugenmerk, sowohl nach Seite der Methode wie nach Seite der Probleme, auf formale Beziehungen und äussere Zusammenhänge gerichtet, während die innere Bedeutung der Schriftwerke zurückstand. Für Nietzsches ganze Eigenart aber war es bezeichnend, dass er später seine Probleme ausschliesslich der Welt des Innern entnahm und geneigt war, das Logische dem Psychologischen unterzuordnen.

Und doch war es eben hier, in dieser strengen Zucht und auf diesem steinigen Boden, dass sein Geist so früh reife Frucht trug und Ausgezeichnetes leistete. Eine Reihe vortrefflicher philologischer Untersuchungen[1] bezeichnet den Weg von seinen Studienjahren an bis zu der Baseler Professur. Es ist nicht unwahrscheinlich, dass eine zu frühe Entfesselung des ganzen Geistesreichthums Nietzsches durch das Studium der Philosophie oder der Künste ihn von vornherein zu jener Zügellosigkeit verführt hätte, der sich einige seiner letzten Werke nähern. So aber gab für seine »vielspältigen Triebe« die kühle Strenge philologischer Wissenschaft eine Zeit lang das einigende und zusammenhaltende Band ab, indem es für Manches, das in ihm schlummerte, zur Fessel wurde.

In welchem Grade jedoch Nietzsches unberücksichtigte starke Talente ihn quälten und störten, während er seinen Fachstudien nachging, das empfand er darum nicht minder als ein tiefes Leiden. Namentlich war es der Drang nach Musik, den er nicht abzuweisen vermochte, und oft musste er Tönen lauschen, während er Gedanken lauschen wollte. Wie eine tönende Klage begleiten jene ihn durch die Jahre hindurch, bis ihm sein Kopfleiden jede Ausübung der Musik unmöglich machte.

Aber wie gross auch der Gegensatz war, den Nietzsches Philologenthum zu seinem spätem Philosophenthum bildete, so fehlt es doch nicht an zahlreichen vermittelnden Zügen, die von der einen Periode zu der andern überleiten.

Grade die Richtung Ritschls, welche diesen Gegensatz zu verschärfen scheint, kam in einer bestimmten Besonderheit Nietzsches Geistesart sogar entgegen, indem sie seinen Hang zum Produciren noch verstärkte und ausbildete. Es lag in ihr das Streben nach einer gewissen formell künstlerischen Abrundung und virtuosen Behandlung wissenschaftlicher Fragen, möglich gemacht durch strenge Begrenzung derselben und Concentrirung auf einen gegebenen Punkt. Bei Nietzsche stand nun das Bedürfniss, durch freiwillige und concentrirte Beschränkung einer Aufgabe, dieselbe in rein künstlerischer Weise zum Abschluss zu bringen, in engem Zusammenhang mit dem Grundtrieb seiner Natur, über das Selbstgeschaltene immer wieder hinauszugehen, es als ein endgültig Erledigtes, Vergangenes, von sich abzustossen. Für den Philologen ist ein solcher Wechsel der Aufgaben und Probleme von selbst gegeben,--den für Nietzsche charakteristischen Ausspruch: »Eine Sache, die sich aufgeklärt hat, hört auf, uns etwas anzugehen,« (Jenseits von Gut und Böse 80)--könnte ein Philologe gethan haben, denn für diesen wird thatsächlich ein aufgeklärtes Dunkel zu einer völlig erledigten Sache, die ihn nicht länger zu beschäftigen braucht. Aber es sind hiervon tief verschiedene Gründe, die Nietzsches häufigen Gedankenwechsel bedingen, und daher ist es in hohem Grade interessant zu sehen, wie sich hier die Gegensätze des Philologenthums und Philosophenthums dennoch zu berühren scheinen, und wie Nietzsche auch in dieser ihm fremdesten Verkleidung,--der nüchtern philologischen,-- in dieser äussersten geistigen Selbstunterordnung, sein Selbst durchsetzte.

Der Philologe tritt einem Problem mit seiner Gesinnung, seinem innern Menschen, überhaupt nicht nahe, assimilirt es sich in keiner Weise und wird von ihm daher auch nur so lange festgehalten, als er zur Lösung der Aufgabe bedarf. Für Nietzsche dagegen bedeutete Beschäftigung mit einem Problem, bedeutete _erkennen_, vor allem andren: sich erschüttern lassen; und von einer Wahrheit sich überzeugen bedeutete ihm: von einem Erlebniss überwältigt werden,--»über den Haufen geworfen werden«, wie er es nannte. Er nahm einen Gedanken auf, wie man ein Schicksal auf sich nimmt, das den ganzen Menschen ergreift und in Bann schlägt: er _lebte_ den Gedanken noch viel mehr, als er ihn dachte, aber er that es mit einer so leidenschaftlichen Inbrunst, einer so maasslosen Hingebung, dass er sich an ihm erschöpfte,-- und, gleich einem Schicksal, das ausgelebt ist, fiel der Gedanke wieder von ihm ab. Erst in der Ernüchterung, wie sie naturgemäss einer jeden derartigen Erregung folgen musste, Hess er seine überwundene Erkenntniss rein intellectuell auf sich wirken; erst dann ging er ihr mit still und klar nachprüfendem Verstände nach. Sein merkwürdiger Wandlungsdrang auf dem Gebiete philosophischer Erkenntniss war durch den ungeheuren Drang nach immer neuen Emotionen geistigster Art bedingt, und daher war für ihn vollkommene Klarheit stets nur die Begleiterscheinung von Ueberdruss und Erschöpfung.

Aber selbst in dieser Erschöpfung verlassen ihn seine _Probleme_ nicht, der Ueberdruss gilt nur ihren _Lösungen_, durch welche die Quelle der Erschütterung momentan verschüttet worden ist. Die gefundene Lösung war deshalb für Nietzsche jedesmal ein Signal zu einem _Gesinnungswechsel_, denn nur so liess sich das Problem festhalten, die Lösung von neuem versuchen. Mit wahrem _Hass_ verfolgte er hinterher Alles, was ihn zu ihr getrieben, Alles, was ihm geholfen hatte, sie zu finden. Da »eine Sache, die sich aufgeklärt hat, aufhört, uns etwas anzugehen«, so wollte Nietzsche im Grunde nichts von der endgiltigen Aufklärung eines Problems wissen, und jenes Wort, das scheinbar die volle Befriedigung erfolgreichen Denkens zum Ausdruck bringt, bezeichnete für ihn die Tragik seines Lebens: er wollte nicht, dass; die Probleme seiner Forschung jemals aufhören sollten, ihn etwas anzugehen, er wollte, dass sie fortfahren sollten, ihn im Tiefsten seiner Seele aufzuwühlen, und daher war er gewissermaassen der Auflösung gram, die ihm sein Problem raubte, daher warf er sich jedesmal auf sie mit der ganzen Feinheit und Ueberfeinheit seiner Skepsis und zwang sie schadenfroh,--seines eigenen Leids und des Schadens, den er sich damit zufügte, froh!--ihm seine Probleme wieder herauszugeben. Deshalb kann man von vorn herein mit einem gewissen Recht von Nietzsche sagen: was innerhalb einer Denkrichtung, einer Betrachtungsweise diesen leidenschaftlichen Geist dauernd festhalten, was einen neuen Wandel und Wechsel unmöglich machen soll, das muss im letzten Grunde _unaufklärbar_ für ihn bleiben, es muss der Energie aller Lösungsversuche widerstehen, seinen Verstand an tödtlichen Räthseln aufreiben,--an Räthseln gleichsam kreuzigen. Als endlich in der That auf diesem; Wege die Erschütterung seines Innern stärker geworden war, als die durch sie gewaltsam gespornte Verstandeskraft, da erst gab es für ihn kein Entrinnen und kein Entweichen mehr. Doch da verlor sich auch nothwendig das Ende in Dunkel, Schmerz und Geheimniss: in eine Besessenheit der Gedanken durch die Gefühlserregungen, die einem stürmischen Meere gleich über ihnen zusammenschlugen.

Wer Nietzsches Zickzack-Pfaden bis zuletzt folgt, der tritt dicht an diesen Punkt heran, wo er sich, im Grauen vor einer letzten Aufklärung und Problemlösung, endgiltig in die ewigen Räthsel der Mystik hinabstürzt.--

Die Geistesbegabung Nietzsches zeichnete sich aber noch durch zwei Eigenschaften aus, die in gleicher Weise dem Philologen wie später dem Philosophen zu statten kamen. Die erste war sein Talent für Subtilitäten, seine Genialität in der Behandlung feinster Dinge, die von einer zarten und sichern Hand angefasst sein wollen, um nicht verwischt und entstellt zu werden. Es ist dasselbe, was ihn später nach meinem Dafürhalten als Psychologen noch mehr _fein_ als _gross_ erscheinen lässt,--oder lieber: am grössten im Erfassen und Gestalten von Feinheiten. Höchst bezeichnend ist dafür der Ausdruck, den er einmal (Der Fall Wagner 3) von den Dingen gebraucht, wie sie sich dem Blick des Erkennenden darstellen: »Das _Filigran_ der Dinge«.

In Verbindung mit diesem Zuge steht die Neigung, Verborgenem und Heimlichem nachzuspüren, Verstecktes ans Licht zu ziehen--; der Blick für das Dunkel, und die instinctiv ergänzende Anempfindung und Nachempfindung, wo dem Wissen Lücken bleiben. Ein grosser Theil von Nietzsches Genialität beruht hierauf. Es hängt dies aufs engste mit seiner hohen künstlerischen Kraft zusammen, in der sich der Blick für das Feine und Einzelne in wundervoller Weise zu einem grossen, freien Schauen des Zusammenhanges, des Gesammtbildes erweitert. Im Dienste strengphilologischer Kritik hat er dieses Talent geübt, um aus den Texten das Verblasste und Vergessene gewissenhaft herauszulesen,[2]--aber in diesem Bemühen ist er zugleich schon über seine rein gelehrten Studien hinausgeführt worden. Der Weg, auf dem dieses geschah, führt uns zu seiner bedeutendsten philologischen Arbeit, zu der Arbeit über die Quellen des Diogenes Laertius.

Denn die Beschäftigung mit dieser Schrift wurde für ihn der Anlass, dem Leben der alten griechischen Philosophen und seiner Beziehung zum Gesammtleben der Griechen nachzugehen. In seinen späteren Werken kommt er einmal darauf zu sprechen (Menschliches, Allzumenschliches I 261). Man sieht es, wie er über den Trümmern der Ueberlieferung gesessen und gegrübelt haben mag, in die Lücken, in die entstellten Theile die verlornen Gestalten hineindichtend, sie nachschaffend und entzückt wandelnd »unter Gebilden von mächtigstem und reinstem Typus«. Er schaut hinein in die Dämmerung jener Zeiten »wie in eine Bildner-Werkstätte solcher Typen«. Und es ergreift ihn wunderbar, sich vorzustellen, dass dort die Ansätze gelegen haben mögen zu einem noch höhern Philosophentypus, wie ihn vielleicht Plato »von der sokratischen Verzauberung frei geblieben« gefunden hätte. Dies Alles ist aber mehr als ein blosser Uebergang vom Philologen zum Philosophen. Was sich da in seinen sehnsüchtig schaffenden Gedanken verrieth, während er gezwungen war, trockene Kritik zu üben, legt schon den letzten und höchsten Punkt seines Ehrgeizes bloss; nicht umsonst ist es gewesen, dass Nietzsche in die Philosophie nicht auf dem Wege abstracter philosophischer Fachstudien eintrat, sondern auf dem einer tiefen Auffassung des philosophischen Lebens in seiner innersten Bedeutung. Und wenn wir das Ziel bezeichnen wollten, welchem durch alle Wandlungen hindurch die Kämpfe dieses unersättlichen Geistes galten, so vermöchten wir dafür kein bezeichnenderes Wort zu finden als das von der ersehnten Entdeckung »einer neuen, bis dahin unentdeckt gebliebenen Möglichkeit des philosophischen Lebens«. (Menschliches, Allzumenschliches i 261.)

So steht jene rein philologische Schrift dicht vor der ganzen Reihe der späteren Werke,--einer kleinen, in der Mauer halb verborgenen Pforte vergleichbar, die in ein umfangreiches Gebäude einführt. Wenn wir sie öffnen, streift unser Blick schon die lange Flucht der Innenräume, bis zum letzten, zum dunkelsten. Und wer hier auf der Schwelle stehen bleibt und hindurchblickt, der vermag der gewaltigen Kraft nicht ohne Staunen zu gedenken, die Stein um Stein zu einem Ganzen fügte: einer Kraft, die jeden Einzeltheil mit verschwenderischem Reichthum ausschmückte, ihn spielend zu so zahllosen Seitengängen und verborgenen Verstecken ausbaute, als beabsichtige sie ein Labyrinth,--und die dennoch mit eiserner Consequenz stets in gerader Grundlinie an ihrem Werke weiter schuf.

An seinen griechischen Studien ging aber Nietzsche nicht nur die Ahnung seines innerlichsten Strebens und die erste Fernsicht auf das Ziel seiner geheimen Sehnsucht auf, sondern sie wiesen ihm auch den Weg, auf dem er sich diesem Ziel nähern konnte. Denn sie waren es, die ihm das ganze Culturbild des alten Hellenenthums zeigten, die ihm jene Bilder einer versunkenen Kunst und Religion entrollten, in deren Anschauen er in durstigen Zügen »frisches volles Leben« trank. So stellt er seine philologische Gelehrsamkeit in den Dienst culturhistorischer, ästhetischer, geschichtsphilosophischer Forschung und überwindet ihren Formalismus.

Es verwandelt und vertieft sich für ihn damit die Bedeutung der Philologie, »die zwar weder eine Muse noch eine Grazie, aber eine Götterbotin ist; und wie die Musen zu den trüben, geplagten, böotischen Bauern niederstiegen, so kommt sie in eine Welt voll düsterer Farben und Bilder, voll von allertiefsten und unheilbarsten Schmerzen, und erzählt tröstend von den lichten Göttergestalten eines fernen, blauen, glücklichen Zauberlandes«.

Diese Worte sind der Antrittsvorlesung Nietzsches an der Baseler Universität »Homer und die Klassische Philologie« (24) entnommen, die (Basel 1869) nur für Freunde gedruckt worden ist. Zwei Jahre später erschien (Basel 1871) eine andere kleine

Schrift derselben Geistesrichtung: »Sokrates und die griechische Tragödie«, welche indessen fast vollständig, mit nur äusserlichen Umstellungen des Gedankenzusammenhangs, in das 1872 veröffentlichte erste grössere philosophische Werk Nietzsches: »Die Geburt der Tragödie aus dem Geiste der Musik« (Leipzig, E. W. Fritsch, jetzt C. G. Naumann)[3] aufgenommen worden ist. In diesen beiden Arbeiten baute Nietzsche seine culturphilosophischen Ausführungen noch auf streng philologischer Grundlage auf; und sie alle haben dazu beigetragen, seinen Namen unter den philologischen Fachgenossen zu verbreiten. Dennoch bezeichnen sie schon den Weg, den er, von seinem ursprünglichen Fachstudium aus, durch Kunst und Geschichte hindurch, zurückgelegt hatte, um schliesslich in die geschlossene Weltanschauung einer bestimmten Philosophie einzutreten. Es war die Weltanschauung Richard Wagners, die Verknüpfung seines Kunststrebens mit Schopenhauers Metaphysik. Wenn wir das Werk aufschlagen, so befinden wir uns mitten im Bannkreis des Meisters von Bayreuth.

Durch ihn erst vollzog sich für Nietzsche die volle Verschmelzung von Philologenthum und Philosophenthum, wurde erst jenes Wort wahr, womit er seinen »Homer und die klassische Philologie« schliesst, indem er einen Ausspruch des Seneca umkehrt: »philosophia facta est quae philologia fuit,« »damit soll ausgesprochen sein, dass alle und jede philologische Thätigkeit umschlossen und eingehegt sein soll von einer philosophischen Weltanschauung, in der alles Einzelne und Vereinzelte als etwas Verwerfliches verdampft und nur das Ganze und Einheitliche bestehen bleibt.«

Der Zauber, der Nietzsche auf Jahre hinaus zum Jünger Wagners machte, erklärt sich namentlich daraus, dass Wagner innerhalb des germanischen Lebens dasselbe Ideal einer Kunstcultur verwirklichen wollte, welches Nietzsche innerhalb des griechischen Lebens als Ideal aufgegangen war. Mit der Metaphysik Schopenhauers trat im Grunde nichts anderes hinzu, als eine Steigerung dieses Ideals ins Mystische, ins unergründlich Bedeutungsvolle,--gleichsam ein Accent, den es durch die _metaphysische Interpretation_ alles Kunsterlebens und Kunsterkennens noch erhielt. Diesen Accent empfindet man am deutlichsten, wenn man den »Sokrates und die griechische Tragödie« vergleicht mit der Ergänzung und Erweiterung, die derselbe in dem Hauptwerk: »Die Geburt der Tragödie aus dem Geiste der Musik« erhalten hat. In diesem Buche sucht Nietzsche alle Kunstentwicklung auf die Bethätigung zweier entgegengesetzter »Kunsttriebe der Natur« zurückzuführen, die er nach den beiden Kunstgottheiten der Griechen als das Dionysische und das Apollinische bezeichnet. Unter ersterem versteht er das orgiastische Element, wie es sich in den wonnevollen Verzückungen, in der Mischung von Schmerz und Lust, von Freude und Entsetzen, in der selbstvergessenen Trunkenheit Dionysischer Feste auslebte. In ihnen sind die gewöhnlichen Schranken und Grenzen des Daseins vernichtet, scheint das Individuum wieder mit dem Naturganzen zu verschmelzen; zerbrochen ist das Principium individuationis; »der Weg zu den Müttern des Seins, zu dem innersten Kern der Dinge liegt offen« (86). Näher gebracht wird uns das Wesen dieses Triebes durch die physiologische Erscheinung des Rausches. Die ihm entsprechende Kunst ist die Musik. Den Gegensatz bildet der formenbildende Trieb, der in Apollo, dem Gott aller bildnerischen Kräfte, verkörpert ist. In ihm vereinigt sich maassvolle Begrenzung, Freiheit von allen wilderen Regungen und weisheitsvolle Ruhe. Er muss als der erhabene Ausdruck, als »die Vergöttlichung des »Principii individuationis« (16) betrachtet weiden, »dessen Gesetz das Individuum, d. h. die Einhaltung der Grenzen desselben, das Maass im hellenischen Sinne ist« (17). Die Macht des durch ihn symbolisirten Triebes offenbart sich physiologisch in dem schönen Schein der Welt des Traumes. Seine Kunst ist die plastische des Bildners.

In der Versöhnung und Verbindung dieser beiden sich anfänglich bekämpfenden Triebe erkennt Nietzsche Ursprung und Wesen der attischen Tragödie, die als die Frucht der Versöhnung der beiden widerstrebenden Kunstgottheiten ebenso sehr dionysisches als apollinisches Kunstwerk ist. Entstanden aus dem dithyrambischen Chor, der die Leiden des Gottes feierte, ist sie ursprünglich nur Chor, dessen Sänger durch die dionysische Erregung so verwandelt und verzaubert wurden, dass sie sich selbst als Diener des Gottes, als Satyrn, empfanden und als solche ihren Herrn und Meister Dionysos schauten. Mit dieser Vision, die der Chor aus sich erzeugt, gelangt sein Zustand zu apollinischer Vollendung. Das Drama als »die apollinische Versinnlichung dionysischer Erkenntnisse und Wirkungen« ist vollständig. »Jene Chorpartien, mit denen die Tragödie durchflochten ist, sind also gewissermassen der Mutterschoss des eigentlichen Dramas« (41); sie sind das dionysische Element desselben, während der Dialog den apollinischen Bestandteil bildet. In ihm sprechen von der Scene aus die Helden des Dramas als die apollinischen Erscheinungen, in denen sich der ursprüngliche tragische Held Dionysos objectivirt, als blosse Masken, hinter denen allen die Gottheit steckt.

Wir werden am Schlüsse unseres Buches sehen, in welch eigenthümlicher Weise Nietzsche ganz zuletzt noch einmal auf diesen Gedanken zurückgriff, indem er seine verschiedenen Entwicklungsperioden und Gesinnungswandlungen so darzustellen versuchte, als seien sie nicht unmittelbare Aeusserungen seines Geistes gewesen, sondern gewissermaassen nur willkürlich vorgehaltene Masken, »apollinische Scheinbilder«, hinter denen sein dionysisches Selbst, göttlich überlegen, das ewig gleiche geblieben sei. Die Ursachen dieser Selbsttäuschung werden wir am Schlüsse erkennen.

Die Bedeutung, die Nietzsche dem Dionysischen beimisst, ist charakteristisch für seine ganze Geistesart: als Philolog hat er mit seiner Deutung der Dionysoscultur einen neuen Zugang zur Welt der Alten gesucht; als Philosoph hat er diese Deutung zur Grundlage seiner ersten einheitlichen Weltanschauung gemacht; und über alle seine spätem Wandlungen hinweg taucht sie noch in seiner letzten Schaffensperiode wieder auf; verwandelt zwar, insofern ihr Zusammenhang mit der Metaphysik Schopenhauers und Wagners zerrissen ist: aber sich doch gleich geblieben in dem, worin schon damals seine eignen verborgenen Seelenregungen nach einem Ausdruck suchten; verwandelt erscheint sie zu Bildern und Symbolen seines letzten, einsamsten und innerlichsten Erlebens. Und der Grund dafür ist, dass Nietzsche im Rausch des Dionysischen etwas seiner eignen Natur Homogenes herausfühlte: jene geheimnissvolle Wesenseinheit von Weh und Wonne, von Selbstverwundung und Selbstvergötterung,--jenes Uebermass gesteigerten Gefühlslebens, in welchem alle Gegensätze sich bedingen und verschlingen, und auf das wir immer wieder zurückkommen werden.

Den schärfsten Contrast zum Dionysischen und der aus ihm geborenen Kunstcultur bildet die Geistesrichtung des theoretischen, aller Intuition entfremdeten Menschen, die auf den Namen des Sokrates getauft wird. In der »Geburt der Tragödie« sucht Nietzsche die Entwicklung dieser Geistesrichtung von Sokrates an durch die Philosophie und Wissenschaft aller Jahrhunderte bis auf unsere Zeit in grossen Zügen zu schildern. Mit Sokrates, dessen Vernunftlehre sich gegen die ursprünglichen hellenischen Instincte kehrte, um sie zu zügeln,--»schlägt der griechische Geschmack zu Gunsten der Dialektik um«, und es beginnt jener Triumphzug des Theoretischen, das durch Vernunft-Einsicht die letzten Gründe des Seins zu erforschen und dasselbe corrigiren zu können vermeint. Diesem Optimismus hat erst Kants Kritik ein Ende bereitet, indem sie auf die Grenzen des theoretischen Erkennens hinwies und, wie Nietzsche später witzig bemerkt, die Philosophie zu einer »Enthaltsamkeitslehre« reducirt, »die gar nicht über die Schwelle hinwegkommt und sich peinlich, das Recht zum Eintritt _verweigert_« (Jenseits von Gut und Böse 204). Dadurch schaffte sie, nach Nietzsche, Raum für die Regeneration der Philosophie durch Schopenhauer, der endlich einen Zugang zum unerforschten Sein und zu dessen Umgestaltung auf dem Wege der intuitiven Erkenntniss erschlossen habe.

In den Jahren 1873--1876 veröffentlichte Nietzsche im Geist und Sinn seines vorhergehenden Werkes, unter dem Gesammttitel: »_Unzeitgemässe Betrachtungen_«, vier kleinere Schriften,--bestimmt: »gegen die Zeit, und dadurch auf die Zeit und hoffentlich zu Gunsten einer kommenden Zeit«, zu wirken. Die erste derselben, die den Titel führte: »_David Strauss, der Bekenner und der Schriftsteller_«, bestand in einer vernichtenden Kritik des damals überaus gefeierten Buches »Der alte und der neue Glaube«, und einer energischen Befehdung des einseitigen Intellectualismus unserer modernen Bildung. Von dauernderem Interesse ist die zweite höchst werthvolle Schrift: »_Vom Nutzen und Nachtheil der Historie für das Leben_«, deren Grundgedanke in Nietzsches letzten Werken, wenn auch modificirt, aber darum nicht weniger deutlich wiederkehrt als seine Auffassung des Dionysischen. Das Wort Historie bezeichnet hier den Begriff des Gedankenlebens, ganz allgemein gefasst, im Gegensatz zum Instinctleben;--Erkennen des Vergangenen, Wissen vom Gewesenen, im Gegensatz zur vollen Lebenskraft des Gegenwärtigen und Werdenden. Die Schrift behandelt die Frage: »Wie ist das Wissen dem Leben unterthan zu machen?« und präcisirt den Standpunkt des Verfassers in dem Satze: »Nur soweit die Historie dem Leben dient, wollen wir ihr dienen.« Sie dient ihm aber nur so lange, als gegenüber den zersetzenden, belastenden und überall eindringenden Einflüssen des Gedanklichen die wichtigste Seelenfunction im Menschen noch völlig intact geblieben ist. »-- --die _plastische Kraft_ eines Menschen, eines Volkes, einer Cultur,-- --ich meine jene Kraft, aus sich heraus eigenartig zu wachsen, Vergangenes und Fremdes umzubilden und einzuverleiben, Wunden auszuheilen, Verlorenes zu ersetzen, zerbrochene Formen aus sich nachzuformen« (10). Sonst entsteht in uns ein Chaos fremder, uns nur zugeströmter Reichthümer, die wir nicht zu bewältigen, nicht zu assimiliren im Stande sind, und deren Mannigfaltigkeit daher das Einheitliche und Organische unserer Persönlichkeit schwer gefährdet. Wir werden dann zum passiven Schauplatz durcheinanderwogender Kämpfe, in denen sich die verschiedensten Gedanken, Stimmungen, Werthurtheile unaufhörlich befehden; wir leiden unter den Siegen der Einen wie unter den Niederlagen der Andern, ohne im Stande zu sein, unser Selbst zu ihrer Aller Herrn zu machen.

Hier findet sich zum ersten Mal eine Hindeutung auf Nietzsches so viel besprochenen _Decadenzbegriff_, der in seinen späteren Werken eine so grosse Rolle spielt. Nicht umsonst gemahnt uns diese erste Beschreibung der Decadenzgefahr an die von uns gegebene Schilderung seines eignen Seelenzustandes;--wir können hier schon den seelischen Ursprung derselben deutlich erkennen: es ist die geheime Qual, die es diesem leidenschaftlichen Geist verursachte, den steten Andrang überwältigender Erkenntnisse und Gedankenströmungen auszuhalten,-- Gewalt, mit der all sein Denken und Wissen auf sein Innenleben einwirkte, so dass die Fülle innerer einander widerstreitender Erlebnisse die geschlossenen Grenzen der Persönlichkeit zu sprengen drohte. Er sagt selbst im Vorwort (V) zu jener Schrift: »--Auch soll-- -- --nicht verschwiegen werden, dass ich die Erfahrungen, die mir jene quälenden Empfindungen erregten, meistens aus mir selbst und nur zur Vergleichung aus Anderen entnommen habe.«[4] Was er in sich selbst vorfand, das wurde ihm zur allgemeinen Gefahr des ganzen Zeitalters,--und steigerte sich später sogar zu einer

Todesgefahr für das ganze Menschenthum, die ihn zum Erlöser und Erretter aufrief. Die Folge aber dieses Umstandes ist ein eigenthümlicher Doppelsinn, der durch die ganze Schrift hindurch geht und einem kundigen Nietzsche-Leser sofort auffällt: da nämlich dasjenige, was am herrschenden Zeitgeist seine Bedenken hervorrief, doch etwas wesentlich Anderes war als sein eigenes Seelenproblem, so wendet er sich ohne Unterschied gegen zwei voneinander völlig verschiedene Dinge: Einmal gegen die Verkümmerung eines vollen, reichen Seelenlebens durch den erkältenden und lähmenden Einfluss einseitiger Verstandesbildung: »Der moderne Mensch schleppt zuletzt eine ungeheure Menge von unverdaulichen Wissenssteinen mit sich herum, die dann bei Gelegenheit ordentlich im Leibe rumpeln, wie es im Märchen heisst« (36). »Im Inneren ruht dann wohl die Empfindung jener Schlange gleich, die ganze Kaninchen verschluckt hat und sich dann still gefasst in die Sonne legt und alle Bewegungen ausser den nothwendigsten vermeidet.-- --Jeder, der vorübergeht, hat nur den einen Wunsch, dass eine solche »Bildung« nicht an Unverdaulichkeit zu Grunde gehe« (37).--Das andere Mal aber gerade gegen die allzu heftige, aufreizende und aufrührerische Einwirkung des Gedanklichen auf das psychische Leben, gegen den dadurch hervorgerufenen Kampf zusammenhangloser wilder Triebkräfte.

Es ist ein Unterschied wie zwischen Seelenstumpfsinn und Seelenwahnsinn. In Nietzsche selbst pflegten die abstractesten Gedanken sich in Gemüthsmächte umzusetzen, die ihn mit unmittelbarer und unberechenbarer Gewalt fortrissen. In dem von ihm gezeichneten Bilde unseres Zeitalters mussten sich ihm daher die beiden entgegengesetzten Wirkungen des Intellectuellen vermischen, und in Bezug auf die eine von ihnen,--auf die chaotische Entfesselung des Seelenlebens,--verschmolzen ihm in ähnlicher Weise zwei verschiedene Ursachen mit einander. Es handelt sich nämlich nicht nur um die rein intellectuellen Einflüsse, nicht nur um die Gefahr des Verstandesmässigen für das Instinctmässige, sondern auch um die uns vererbten und einverleibten Einflüsse längst verflossener Zeiten, die, einst einer intellectuellen Quelle entsprungen, jetzt nur in der Form von Trieben und Gefühlsschätzungen in uns leben.

Der geschlossenen Persönlichkeit droht also nicht nur die Gefahr, die von aussen kommt, sondern auch diejenige, die sie in sich trägt, die mit ihr geboren ist,--jene »Instinct-Widersprüchlichkeit«, die das Erbe aller Spätlinge ist, denn--Spätlinge sind Mischlinge.

Die Ueberwindung des Nachtheils, den die »Historie« in diesem Sinn,--erlernt oder erlebt,--bringen kann, liegt in der Hinwendung auf das Unhistorische. Unter dem Unhistorischen versteht Nietzsche die Rückkehr zum Unbewussten, zum Willen des Nichtwissens, zum Horizont-Abschliessenden, ohne das es kein Leben gibt. »Jedes Lebendige kann nur innerhalb eines Horizontes gesund, stark und fruchtbar werden« (11),-- --»Das Unhistorische ist einer umhüllenden Atmosphäre ähnlich, in der sich Leben allein erzeugt«.-- --Es ist wahr: erst dadurch, dass der Mensch denkend, überdenkend, vergleichend, trennend, zusammenschliessend jenes unhistorische Element einschränkt, erst dadurch dass innerhalb jener umschliessenden Dunstwolke ein heller, blitzender Lichtschein entsteht, also erst durch die Kraft, das Vergangene zum Leben zu gebrauchen und aus dem Geschehenen wieder Geschichte zu machen, wird der Mensch zum Menschen: aber in einem, Uebermaasse von Historie hört der Mensch wieder auf« (12 f.). Seine Kraft misst sich an dem Maass des Historischen, das er verträgt und besiegt,--an der Kraft des Unhistorischen in ihm: »Je stärkere Wurzeln die innere Natur eines Menschen hat, um so mehr wird er auch von der Vergangenheit sich aneignen oder anzwingen; und dächte man sich die mächtigste und ungeheuerste Natur, so wäre sie daran zu erkennen, dass es für sie gar keine Grenze des historischen Sinnes geben würde, an der sie überwuchernd und schädlich zu wirken vermöchte; alles Vergangene, eigenes und fremdestes, würde sie an sich heran, in sich hineinziehen und gleichsam zu Blut umschaffen. Das was eine solche Natur nicht bezwingt, weiss sie zu vergessen; es ist nicht mehr da, der Horizont ist geschlossen und ganz, und nichts vermag daran zu erinnern, dass es noch jenseits desselben Menschen, Leidenschaften, Lehren, Zwecke gibt.« (11) Ein solcher Geist treibt Historie auf alle drei Weisen, auf die sie überhaupt getrieben werden kann, ohne ihr nach irgend einer der drei Richtungen hin zu verfallen: er schaut sie an als _Monumentalgeschichte_, indem er seinen Blick auf den grossen Gestalten der Vorzeit ruhen lässt und sie auf sein Werk und sein Wollen bezieht, ohne sich jedoch an sie zu verlieren: als begeisternde Vorgänger und Genossen. Er vertieft sich in _antiquarische Geschichte_, indem er alles Vergangene durchwandert! wie die Stätte seines eignen Vorlebens,--wie Jemand, der die Stätte seiner eignen Kindheit betritt, an welcher ihm auch das Geringste werthvoll und bedeutsam erscheint:-- --»--er versteht die Mauer, das gethürmte Thor, die Rathsverordnung, das Volksfest wie ein ausgemaltes Tagebuch seiner Jugend und findet sich selbst in diesem Allen, seine Kraft, seinen Fleiss, seine Lust, sein Urtheil, seine Thorheit und Unart wieder. Hier Hess es sich leben, sagt er sich, denn es lässt sich leben, hier wird es sich leben lassen, denn wir sind zäh und nicht über Nacht umzubrechen. So blickt er, mit diesem »Wir«, über das vergängliche wunderliche Einzelleben hinweg und fühlt sich selbst als den Haus-, Geschlechts- und Stadtgeist« (28). Er wird endlich drittens auch _kritisch_ auf die Geschichte blicken, um zum Aufbau einer Zukunft eine Vergangenheit umzubrechen, und hierzu bedarf er der grössten Lebenskraft, denn grösser als die Gefahr, ein Schwärmer oder ein Sammler zu werden, ist die, ein Verneinender zu bleiben. »Es ist immer ein gefährlicher, nämlich für das Leben selbst gefährlicher Process:-- -- --Denn da wir nun einmal die Resultate früherer

Geschlechter sind,-- -- --ist (es) nicht möglich sich ganz von dieser Kette zu lösen.-- --Wir bringen es im besten Falle zu einem Widerstreite der ererbten, angestammten Natur und unserer Erkenntniss,-- -- --wir pflanzen eine neue Gewöhnung, einen neuen Instinct, eine zweite Natur an, so dass die erste Natur abdorrt. Es ist ein Versuch, sich gleichsam a posteriori eine Vergangenheit zu geben, aus der man stammen möchte, im Gegensatz zu der, aus der man stammt-- -- --. Aber hier und da gelingt der Sieg doch, und es gibt-- -- -- -- --einen merkwürdigen Trost: nämlich zu wissen, dass auch jene erste Natur irgend wann einmal eine zweite Natur war und dass jede siegende zweite Natur zu einer ersten wird« (33 f.).--Man kann diese drei Betrachtungsweisen der Historie in gewissem Sinne auf drei Perioden von Nietzsches eigener Entwicklung anwenden, indem man mit der antiquarischen, die dem Philologen zukommt, den Anfang macht, darauf die monumentale Auffassung folgen lässt, die ihn veranlasst, als Jünger zu Füssen grosser Meister zu sitzen, und endlich seine spätere positivistische Periode als die kritische bezeichnet. Nachdem aber Nietzsche auch diese letztere überwunden hatte, verschmolzen ihm alle drei Standpunkte zu einem einzigen, auf dem, wie sich zeigen wird, die in dieser Schrift enthaltenen Gedanken in geheimnissvoller und ergreifender Weise wiederkehren sollten, in der extremen und paradoxen Zuspitzung des Satzes: das Historische sei unterthan dem individuellen Leben, dessen ständige Bedingung das Unhistorische ist.--Die starke Natur, die er als zugleich historisch und unhistorisch beschreibt, ist somit ein Erbe aller Vergangenheit und dadurch ungeheuer in der Fülle des Erlebens, aber ein Erbe, der seinen Reichthum wahrhaft fruchtbar zu machen weiss, weil er ihn wahrhaft besitzt, über ihn gebietet,--nicht von ihm besessen und beherrscht wird. Ein solcher Erbe und Spätling ist dann immer zugleich der _Erstling_ einer neuen Cultur und, als Träger der Vergangenheit, ein Gestalter der Zukunft: der Reichthum, den er ausstreut, trägt noch den künftigen Zeiten Früchte. Er ist einer von den grossen »Unzeitgemässen«, welche in die fernste Vergangenheit niedertauchen, in die fernste Zukunft hinausweisen, in ihrer Zeit aber immer als Fremdlinge dastehen, obgleich in ihnen die Gegenwart ihre höchste Kraft sammelt und ausgibt.

Hier liegt der erste Ansatz zu den Gedanken der letzten Schaffensperiode Nietzsches: ein Einzelner der Genius der gesammten Menschheit, allein, fähig, von der Gegenwart aus die Vergangenheit als Ganzes zu deuten und damit auch die Zukunft, als fernstes Ganzes, bis in alle Ewigkeit in ihrem Ziel und Sinn zu bestimmen.

Rein äusserlich betrachtet, reichen die Wurzeln dieser Anschauung hinab bis zu Nietzsches Philologenthum, welches ihn dazu führte, sich alter Culturen erkennend zu bemächtigen. Wissen und Sein waren seiner geistigen Eigenart stets Eins: und so hiess für Nietzsche classischer Philologe sein so viel als Grieche sein. Gewiss musste dies die ihn quälende Instinctwidersprüchlichkeit, welche sich für ihn zum Gegensatz von Antik und Modern zuspitzte, noch verstärken, gleichzeitig aber auch die Mittel zu ihrer Bekämpfung enthalten, nämlich: durch die Vergangenheit, der Gegenwart überlegen, die Zukunft bauen; aus einem Mann der Zeit zu einem Spätling älterer Culturen und einem Erstling neuer Cultur werden.[5]

Zweien solcher »Unzeitgemässen«,--das ist Vorzeitgemässen und Zukunftgemässen, sind die beiden letzten von Nietzsches »Unzeitgemässen Betrachtungen« geweiht: »_Schopenhauer als Erzieher_«, und »_Richard Wagner in Bayreuth_«. In diesen beiden, mit überströmender Begeisterung aufgerichteten, Standbildern des Genius wird es besonders klar, 'bis zu welchem Grade die angestrebte Cultur des Unzeitgemässen in einem Cultus des Genies gipfelte. Im Genie besitzt die Menschheit nicht nur ihren Erzieher, ihren Führer, ihren Verkünder, sondern auch ihren eigentlichen und ausschliesslichen Endzweck. Die Vorstellung von den »erhabenen Einzelnen«, um derentwillen allein die übrige »Fabrikwaare der Natur« vorhanden sei, ist einer von jenen Schopenhauerischen Grundgedanken, die Nietzsche nie wieder losgelassen haben. Etwas in seinem innersten Geist dürstete ebenso unersättlich nach der ungeheuren Steigerung des Egoistischen in das Idealselbstische, das darin liegt, als auch nach der dunklen Kehrseite dieses höchsten Menschenlooses, nach dem »Einsamen« und »Heroischen«. In seiner mittleren Schaffensperiode ging er scheinbar von dieser ursprünglichen Genievorstellung ab, weil sie ihren metaphysischen Hintergrund eingebüsst hatte, von dem allein der grosse »Einzelne« sich in übermenschlicher Bedeutsamkeit abheben konnte,--wie eine Gestalt aus der höheren und wahren Welt. Aber der Gedanke des Geniecultus barg einen Ansatz zu dem, was Nietzsche, am Ende seiner Entwicklung, mit einem Griff genialen Wahnsinns, dann wieder aus ihm gestaltet hat. Denn zum Ersatz einer metaphysischen Deutung steigerte sich ihm der _positive Lebenswerth_ des Genies noch so hoch über Schopenhauers Auffassung desselben hinaus, dass diese letztere nur ein schwaches Gegenbild zu der seinen bietet.

Solange nämlich der Geniecultus ein Cultus des Metaphysischen in der menschlichen Physis blieb, erstreckte er sich auf eine fortlaufende Reihe, eine Kette solcher »Einzelner«, die einander in Sinn und Wesen ebenbürtig und gleichwerthig waren. Sie werden nicht als Bestandtheile einer Entwicklungslinie des Menschlichen betrachtet, sie: »--setzen nicht etwa einen Prozess fort, sondern leben zeitlos-gleichzeitig«,--sie bilden »eine Art von Brücke über den wüsten Strom des Werdens«. »-- -- --ein Riese ruft dem anderen durch die öden Zwischenräume der Zeiten zu, und ungestört durch muthwilliges, lärmendes Gezwerge, welches unter ihnen wegkriecht, setzt sich das hohe Geistergespräch fort.« (Nutzen u. Nachtheil d. Histor. 91). Weil es dieses »Gezwerge«

ist, das die ganze Entwicklungsgeschichte sowohl in ihren Geschehnissen, wie in ihren Gesetzen bestimmt, so ist Eins sicher: »Das Ziel der Menschheit kann nicht am Ende liegen,sondern nur in ihren höchsten Exemplaren.« (A. a. O.)

Aber da auch die höchsten Exemplare nur das zum Ausdruck bringen, was in der Tiefe des Menschlichen überhaupt, als sein metaphysisches Grundwesen, ruht, so unterscheiden sie sich von der Masse der Menschen weniger durch eine Wesens_verschiedenheit_, als vielmehr durch eine _Wesensenthüllung_, durch eine göttliche Nacktheit,--während der Mensch der Masse tausend über sein wahres Wesen gebreitete Schichten trägt, die alle der Welt und Lebensoberfläche angehören und sich hier und da bis zur Undurchdringlichkeit verhärten. »Wenn der grosse Denker die Menschen verachtet, so verachtet er ihre Faulheit: denn ihrethalben erscheinen sie als Fabrikware.-- --Der Mensch, welcher nicht zur Masse gehören will, braucht nur aufzuhören, gegen sich bequem zu sein« (Schopenhauer als Erzieher 4). Daher ist liebevolle Erziehung und Bemühung um Alle die Folge dieser Anschauungsweise, die im tiefsten Sinn Alle gleichstellt, weil sie den metaphysischen Kern in jeder Schale ehrt; sie entfernt sich darum von nichts so weit als von Nietzsches späteren Forderungen der Sklaverei und Tyrannei.

Ist aber wie in Nietzsches späterer Philosophie dieser metaphysische Hintergrund zerstört, löst sich das übersinnliche Sein in das unendliche Werden des Wirklichen auf, so vermag sich der Einzelne über die Masse nur durch einen Wesensunterschied zu erheben, der einem höchsten Gradesunterschied gleichkommt: indem er die Quintessenz dieses Werdeprocesses repräsentirt, umfasst er denselben möglichst in seiner Totalität, während der Mensch der Masse ihn nur blind und bruchstückweise zu erleben und in sich darzustellen weiss. Dieser Einzelne wäre gewissermassen als der Einziges imstande, der langen Entwicklung, die sich Geschichte nennt, einen Sinn zu geben; er selbst wäre nicht wie der Schopenhauerische Mensch geschaffen aus übersinnlichem Stoff, aber dafür wäre er durch und durch Schöpfer und als solcher imstande, der Welt jene Bedeutsamkeit der Dinge zu ersetzen, an die der Metaphysiker glaubt. Anstatt vieler einander ebenbürtiger Einzelner, die sich wie ein gleichmässig hoher zusammenhängender Bergrücken über dem Menschengetriebe erheben, gibt es daher in Nietzsches letzter Philosophie nur den grossen Einsamen, der sich als Gipfel des Ganzen darstellt; nach oben hin ist er noch viel einsamer als sie, denn er ist als Abschluss der Entwicklung das höchste Exemplar der Gattung, nach unten aber ist er viel härter und herrischer als sie, denn die Masse und das Leben bedeuten an sich, oder metaphysisch, nichts; er muss ihnen erst bis an seinen Gipfel hinan eine bestimmte Rangordnung verleihen. Es ist leicht begreiflich, warum erst mit ihm der Geniecultus ins Ungeheure wächst, denn in Ermangelung der metaphysischen Deutung, durch die der Schopenhauerische Mensch von vornherein in eine höhere Ordnung der Dinge erhoben wird, kann Er nur durch das Mittel des Ungeheuren überzeugen.

Folgendes sind die vier Gedanken der ersten philosophischen Periode Nietzsches, womit er sich, wenn auch in stets veränderter Auffassung bis zuletzt beschäftigt hat: es sind das Dionysische, die Decadenz, das Unzeitgemässe, der Geniecultus. Wie wir ihn selbst, so werden wir auch sie immer wiederfinden, und in demselben Maasse, als er sich selbst immer persönlicher in seiner Philosophie zum Ausdruck bringt, gestaltet er auch sie immer charakteristischer. Betrachtet man seine Gedanken in ihrem Wechsel und ihrer Mannigfaltigkeit, dann erscheinen sie fast unübersehbar und allzu complicirt; versucht man hingegen aus ihnen herauszuschälen, was sich im Wechsel stets gleich bleibt, dann erstaunt man über die Einfachheit und Beständigkeit seiner Probleme. »Immer ein Anderer und immer Derselbe!« konnte Nietzsche von sich sagen.

Dass die Wagner-Schopenhauerische Weltanschauung eine so tiefe Bedeutung für Nietzsche gewann, dass er später noch nach allen Kämpfen und von ganz entgegengesetzten Richtungen seines Geisteslebens aus sich wieder ihren Grundgedanken annäherte, zeigt, wie sehr dieselbe seiner ganzen Natur entgegenkam, wie sehr sich in ihr aussprach, was in ihm schlummerte. Aus seinem Philologenthum in dieses Philosophenthum erhoben, fühlte er sich ohne Zweifel einem Gefangenen gleich, von dem die Ketten fallen. Waren doch vorher seine besten Kräfte gebunden gewesen; jetzt durfte er aufathmen, jetzt wurde Alles in ihm befreit. Seine künstlerischen Instincte schwelgten in den Offenbarungen der Wagner'schen Musik; seine starke Veranlagung zu religiösen und moralischen Exaltationen genoss in der metaphysischen Ausdeutung dieser Kunst eine beständige Möglichkeit der Erhebung. Sein umfassendes gründliches Wissen diente der neuen Weltanschauung, die sich in seiner Auffassung des Griechenthums wiederspiegelte. Da in Wagners Person das Kunstgenie Thatsache geworden, in ihm gleichsam der »erlösende Heiland« gegeben war, so fiel Nietzsche die Stellung des Erkennenden, des wissenschaftlichen Vermittlers, zu: damit blieb er in der Aufgabe des Philosophen. Aber die gewonnene Erkenntniss selbst bildete nur den Anlass zur vollen Entfaltung seiner künstlerischen und religiösen Eigenart, und eben dies bezeichnet ihren Werth für seinen Geist. Wonach er sich schon während seiner philologischen Studien gesehnt hatte, als er dem Leben der alten Philosophen nachforschte, das war hier zur Wahrheit geworden: das Denken ein Erleben, die Erkenntniss ein Mitarbeiten und Mitschaffen an der neuen Cultur; im Gedanken durften alle Seelenkräfte Zusammenwirken: er forderte den ganzen Menschen. Nietzsche gibt nur dem befreienden Entzücken Ausdruck, das er hier genoss, wenn er am Schluss seines »Sokrates und die klassische Philologie« in die Worte ausbricht: »Ach! Es ist der

Zauber dieser Kämpfe, dass, wer sie schaut, sie auch kämpfen muss!«

Und wie seine einzelnen Geistesanlagen sich jetzt freier ausleben und entwickeln durften, so bot diese Periode in Nietzsches Leben auch jenem tiefsten, fast weiblichen Bedürfnisse seines Inneren nach persönlicher Anbetung, nach Aufblick, volle Befriedigung, das sich später so schmerzlich an sich selbst befriedigen musste. Mochte die Wagner-Schopenhauerische Philosophie, ihrer ganzen Anschauungsweise nach, ihm ein noch so tiefes Glück gewähren, so war doch das Werthvollste für ihn hier das persönliche Verhältniss zu Wagner, der unbedingte Aufblick zu ihm. Seine Begeisterung entzündete sich darin an einer ausser ihm stehenden Persönlichkeit, in der er gleichsam das Ideal seines eigenen Wesens verkörpert zu sehen glaubte. Das Glück eines solchen Glaubens breitet über die Gedanken der ersten philosophischen Schriften Nietzsches etwas Gesundes, beinahe Naives, das von der Eigenart seiner späteren Werke scharf absticht. Es ist, als sähe man ihn erst an dem Bilde seines Meisters Wagner und dessen Philosophen Schopenhauer sich selbst begreifen und errathen. Denn mit instinctiver Scheu weist er noch jene Kunst zurück, sein eigenes Selbst in bewusster Weise zum »Object und Experiment des Erkennenden« zu machen, die Kunst, an der er später so gross und so krank werden sollte. »Wie kann sich der Mensch kennen? Er ist eine dunkle und verhüllte Sache; und wenn der Hase sieben Häute hat, so kann der Mensch sich siebenmal siebzig abziehen und wird doch nicht sagen können »das bist du nun wirklich, das ist nicht mehr Schaale«. Zudem ist es ein quälerisches gefährliches Beginnen, sich selbst derartig anzugraben und in den Schacht seines Wesens auf dem nächsten Wege gewaltsam hinabzusteigen. Wie leicht beschädigt er sich dabei so, dass kein Arzt ihn heilen kann« (Schopenhauer als Erzieher 7). Und deshalb ruft er der Jugend, die nach Einsicht in ihr eigenes Selbst begehrt, die Worte zu: »was hat deine Seele hinangezogen, was hat sie beherrscht und zugleich beglückt? Stelle dir die Reihe dieser verehrten Gegenstände vor dir auf, und vielleicht ergeben sie dir-- -- --ein Gesetz, das Grundgesetz deines eigentlichen Selbst. Vergleiche diese Gegenstände, sieh,-- -- --wie sie eine Stufenleiter bilden, auf welcher du bis jetzt zu dir selbst hingeklettert bist; denn dein wahres Wesen liegt nicht tief verborgen in dir, sondern unermesslich hoch über dir -- -- --.« (A. a. O.)

Mit einer Offenheit, die ihm später während der Zeit peinlichster Selbstanalyse ganz abhanden kam, legt er die Motive bloss, aus denen es ihn von Anfang an inbrünstig nach einer solchen Jüngerschaft verlangt habe--nach einem überlegenen »Wegweiser zugleich und Zuchtmeister« (Schopenhauer als Erzieher 14): »-- --darf ich ein wenig bei einer Vorstellung verweilen, welche in meiner Jugend so häufig und so dringend war, wie kaum eine andre. Wenn ich früher recht nach Herzenslust in Wünschen ausschweifte, dachte ich mir, dass mir die schreckliche Bemühung und Verpflichtung, mich selbst zu erziehen, durch das Schicksal abgenommen würde: dadurch dass ich zur rechten Zeit einen Philosophen zum Erzieher fände, einen wahren Philosophen, dem man ohne weiteres Besinnen gehorchen könnte, weil man ihm mehr vertrauen würde als sich selbst.« (Schopenhauer als Erzieher 8 f.) Es ist interessant, zu beobachten, wie er zu diesem Zwecke hinter dem Denker Schopenhauer einen Idealmenschen Schopenhauer zu entdecken sucht,[6] und wie er Wagner gegenüber von einer tiefen Verwandtschaft ihrer beiderseitigen Naturen ausgeht. In der That überrascht die Uebereinstimmung der von ihm geschilderten natürlichen und geistigen Anlagen Wagners mit der »Vielstimmigkeit« seiner eigenen Anlagen, wie sie im ersten Theil dieses Buches dargelegt ist. So sagt er in »Richard Wagner in Bayreuth« (13): »Jeder seiner Triebe strebte ins Ungemessene, alle daseinsfreudigen Begabungen wollten sich einzeln losreissen und für sich befriedigen; je grösser ihre Fülle, um so grösser war der Tumult, um so feindseliger ihre Kreuzung«.

Dann, beim Eintritt der »geistigen und sittlichen« Mannbarkeit Wagners, gelangt diese »Vielheit« zum Zusammenschluss und zugleich zu einer eigentümlichen »Spaltung in sich«. »Seine Natur erscheint in furchtbarer Weise vereinfacht, in zwei Triebe oder Sphären auseinandergerissen. Zu unterst wühlt ein heftiger Wille in jäher Strömung, der gleichsam auf allen Wegen, Höhlen und Schluchten ans Licht will und nach Macht verlangt. (10.)-- -- -- -- -- --Der gesammte Strom stürzte sich bald in dieses, bald in jenes Thal und bohrte in die dunkelsten Schluchten:--in der Nacht dieses halb unterirdischen Wühlens erschien ein Stern hoch über ihm-- --« (12.) »Wir thun einen Blick in die _andere_ Sphäre Wagners. Es ist die eigenste Urerfahrung, welche Wagner in sich selbst erlebt und wie ein religiöses Geheimniss verehrt:-- -- --jene wundervolle Erfahrung und Erkenntniss, dass die eine Sphäre seines Wesens der andern treu blieb,-- -- --die schöpferische, schuldlose lichtere Sphäre der dunkelen, unbändigen, tyrannischen.« (13.)

»Im Verhalten der beiden tiefsten Kräfte zu einander, in der Hingebung der einen an die andere, lag die grosse Nothwendigkeit, durch welche er allein ganz und er selbst bleiben konnte.« (13.)

Gegen den Schluss der Schrift sucht Nietzsche auch die Musik Wagners aus dieser ihm selbst so verwandten Eigenart heraus zu begreifen, indem er das musikalische Genie Wagners als eine Art Wiederspieglung von dessen seelischen Zuständen auffasste:

»-- --wie seine Musik sich mit einer gewissen Grausamkeit des Entschlusses dem Gange des Dramas, der wie das Schicksal unerbittlich ist, unterwirft, während die feurige Seele dieser Kunst darnach lechzt, einmal ohne alle Zügel in der Freiheit und

Wildniss umherzuschweifen.« (82.)

»Ueber allen den tönenden Individuen und dem Kampfe ihrer Leidenschaften, über dem ganzen Strudel von Gegensätzen, schwebt,-- --ein übermächtiger symphonischer Verstand, welcher aus dem Kriege fortwährend die Eintracht gebiert.« (79.)

»Nie ist Wagner mehr Wagner, als wenn die Schwierigkeiten sich verzehnfachen und er in ganz grossen Verhältnissen mit der Lust des Gesetzgebers walten kann. Ungestüme, widerstrebende Massen zu einfachen Rhythmen bändigen, durch eine verwirrende Mannigfaltigkeit von Ansprüchen und Begehrungen Einen Willen durchführen«--. (80.)

Aber gerade diese Verwandtschaft ihrer beiderseitigen Naturen musste Nietzsche schliesslich zu einer Weiterentwicklung seines Geistes auf einsamen Bahnen führen, sie musste ihn irgend wann einmal von Wagner losreissen. Sobald Nietzsche in dieser Periode den Höhepunkt erreicht hat, ist auch schon der erste Schritt vorgezeichnet, der ihn unvermeidlich abwärts führen musste. Es erscheint als eine völlige Verkehrung des Sachverhalts, wenn er später in seinem ungerechten Büchlein »Der Fall Wagner« behauptet: »Mein grösstes. Erlebniss war eine _Genesung_. Wagner gehört bloss zu meinen Krankheiten.« (Vorwort.) Denn in das Krankhafte geht seine Entwicklung erst lange nach seinem Bruch mit Wagner, ja man kann von seiner Wagnerperiode in gewissem Sinne sagen, dass sie zu seinen überwundenen Gesundheiten gehört habe. Trotzdem aber darf man das Wahre in seiner Behauptung nicht überhören: dass er nämlich damals seinen eigenen Höhepunkt noch nicht erreicht habe, wie gesund und glücklich er auch zu jener Zeit gewesen sei.

Diese Gesundheit hätte er sich nur erhalten können um den Preis der Grösse. Um aus dem Jünger ein Meister zu werden, musste er erst in sein Selbst einkehren; da aber seine Natur mit zwingender Nothwendigkeit nach einer Jüngerschaft im religiösen Sinne verlangte, so blieb nur die eine Möglichkeit, Jünger und Meister in sich selbst zu vereinigen,-- sei es auch, um daran zu leiden, sei es auch, um an einer krankhaften Verschmelzung Beider zu Grunde zu gehen. Von seinem Weg zur Grösse gilt Zarathustras Wort: »Gipfel und Abgrund--das ist jetzt in Eins beschlossen!«

Man hat dem Abfall Nietzsches von Wagner die verschiedenartigsten Deutungen gegeben, man hat ihn aus rein idealen Beweggründen--unwiderstehlichem Wahrheitsdrang--und auch aus menschlichen-allzumenschlichen Motiven zu erklären gesucht. In Wirklichkeit kreuzte sich aber wohl beides darin in ganz ähnlicher Weise, wie dies schon in der allerersten Wandlung Nietzsches, in seiner Abwendung vom Glauben, der Fall gewesen war; gerade der Umstand, dass er volles Genügen, Seelenfrieden und eine Geistesheimat gefunden hatte, dass ihm Wagners Weltanschauung so weich und glatt anlag wie eine »gesunde Haut«, kitzelte ihn, sie sich abzustreifen, Hess ihm sein »Ueberglück als Ungemach« erscheinen, Hess ihn »verwundet werden von seinem Glück«. Auf diese Art der Entstehungseiner freigeisterischen Richtung findet seine »Vermuthung über den Ursprung der Freigeisterei« überhaupt (Menschliches, Allzumenschliches I 232) Anwendung, die durch allzu starke Empfindungsseligkeit in der gegebenen Weltanschauung erzeugt werde: »Ebenso wie die Gletscher zunehmen, wenn in den Aequatorialgegenden die Sonne mit grösserer Gluth als früher auf die Meere niederbrennt, so mag auch wohl eine sehr starke, um sich greifende Freigeisterei Zeugniss dafür sein, dass irgendwo die Gluth der Empfindung ausserordentlich gewachsen ist.«

Erst in der selbstgewollten, selbstgesuchten Peinigung wuchs seinem Geist die streitbare, harte Rüstung, mit der gewappnet er dann gegen seine alten Ideale zu Felde zog. Gewiss empfand er es als eine Befreiung, sich mit dem Verzicht auf Erhebendes und Schönes zugleich aus einer letzten Abhängigkeit loszulösen; aber dennoch stellte diese Selbstbefreiung einen Act der Entsagung dar; er litt unter ihr, wie man unter Wunden leidet, auch wenn man sie sich selbst geschlagen hat.

Der Bruch vollzog sich endgiltig und für Wagner völlig unerwartet, als dieser mit seiner Parsifal-Dichtung bei katholisirenden Tendenzen angelangt--war, während Nietzsches Geistesentwicklung in einer jähen Wandlung sich der positivistischen Philosophie der Engländer und Franzosen zugewandt hatte. Der Abfall Nietzsches von Wagner bedeutete aber nicht nur eine Trennung der Geister, sondern zerriss zugleich ein Verhältniss, in welchem sich beide so nahe gestanden hatten, wie nur der Sohn dem Vater, der Bruder dem Bruder nahe steht. Ganz vergessen, ganz verschmerzen konnte es wohl keiner von ihnen. Noch im Herbst 1882, ein halbes Jahr vor dem Tode Wagners, wurde während der Bayreuther Festspiele,--der Erstaufführung des Parsifal--, der Versuch gemacht, Nietzsche vor dem Meister zu erwähnen. Nietzsche weilte damals in der Nähe, in dem thüringischen Dörfchen Tautenburg bei Dornburg, und seine alte Freundin Fräulein von Meysenbug meinte, obschon mit Unrecht, dass im Fall des Gelingens Nietzsche zu bewegen gewesen wäre, nach Bayreuth zu kommen und Sich mit Wagner zu versöhnen. Indessen der Versuch misslang; Wagner verliess in grosser Erregung das Zimmer und verbot, den Namen jemals wieder vor ihm auszusprechen. Aus ungefähr derselben Zeit stammt folgender in Facsimile wiedergegebene Brief Nietzsches, der seine eigene Stellung in dem Bruch mit Wagner beredt genug schildert:

Wenn ich diese kurze Schilderung lese, dann sehe ich ihn selbst vor mir, wie er, während einer gemeinsamen Reise von Italien her durch die Schweiz, mit mir das Gut Triebschen bei Luzern besuchte, den Ort, an welchem er mit Wagner unvergessliche Zeiten verlebt hatte. Lange, lange sass er dort schweigend am Seeufer, in schwere Erinnerungen versunken; dann, mit dem Stock im feuchten Sande zeichnend, sprach er mit leiser Stimme von jenen vergangenen Zeiten. Und als er aufblickte, da weinte er.

Mit seiner innern und äussern Loslösung von dem Wagnerthum und der Philosophie Schopenhauers fällt Nietzsches schwerstes körperliches Leiden zusammen. So lebte er damals, körperlich wie geistig, unter Stürmen und Schmerzen, die ihn in die Nähe »leiblichen wie seelischen Todes« brachten. Seine Krankheit war zum Ausbruch gekommen in den Jahren gesteigertster Productivität, allzu vielseitiger und aufreibender Beschäftigung mit wissenschaftlichen Untersuchungen, philosophischen Problemen, mit der geistigen Bewegung der Gegenwart, der Kunst Wagners und mit der Musik selbst. Es ist gewiss nicht zufällig, dass auch der letzte, verhängnissvolle Ausbruch seines Kopfleidens am Ende der Achtziger Jahre ebenfalls auf eine Periode ungeheurer geistiger Schaffenskraft und Regsamkeit folgte. Wenn er sich am gesundesten und rüstigsten, in der Vollkraft seiner Leistungsfähigkeit fühlte, dann kam er stets der Krankheit am nächsten; und die Zeiten unfreiwilliger Müsse und Ruhe waren es, die ihm immer wieder Erholung brachten und die Katastrophe noch aufhielten.

Dieser Vorgang spiegelt rein körperlich etwas von jenem eigenthümlich pathologischen Zuge der »Uebergesundheit« seines Geisteslebens wieder, welche in Krankheitszustände überzuströmen pflegte, nachdem sie ihren Höhepunkt erreicht hatte. Aus ihnen rang er sich aber mit der zähen Kraft seiner ungeheuren Natur stets wieder zur Gesundheit durch.

Solange er noch die Schmerzen bezwang und die volle Arbeitskraft in sich fühlte, konnte selbst das Leiden seiner lebensvollen Unverwüstlichkeit und Selbstbehauptung noch nichts anhaben. Noch am 12. Mai 1878 schreibt er im Ton getrosten Muthwillens in einem Briefe aus Basel: »Die Gesundheit schwankend und gefährlich, aber--fast hätte ich gesagt: was geht mich meine Gesundheit an?«

Aber dann folgt, am 14. December 1878, die Hindeutung auf den voraussichtlich nothwendigen Rücktritt von der Professur: »Mein Zustand ist eine Thierquälerei und Vorhölle, ich kanns nicht leugnen. _Wahrscheinlich_ hört es mit meiner akademischen Thätigkeit auf, _vielleicht_ mit der Thätigkeit überhaupt, _möglicherweise_ mit-- --u. s. w.« Und dann die bittere Klage: »Es scheint mir nichts mehr zu helfen, die Schmerzen waren gar zu toll.-- -- --Immer heisst es: Ertrage! Entsage! Ach, man bekommt die Geduld auch satt. Wir haben die Geduld zur Geduld nöthig!«

Endlich, im Tone stiller Ergebung, ein Brief aus Genf, vom 15. Mai 1879:

»Mir geht es nicht gut, aber ich bin ein alter routinirter Leidtragender und werde meine Bürde weiterschleppen,--aber _nicht_ mehr lange, so hoffe ich!«

Bald darauf legte er seine Professur nieder, und auf immer umfing ihn die Einsamkeit, Der Verzicht auf seine Lehrthätigkeit fiel ihm schwer,--war es doch im Grunde der Verzicht auf jede fernere strengwissenschaftliche Arbeit. Kopf und Augen,--er nennt sich selbst einen »Kranken, der jetzt leider auch ein Sieben-Achtel-Blinder ist, und nicht mehr lesen kann, ausser mit Schmerzen und auf ein Viertelstündchen« (Brief an Rée)--, hinderten ihn nunmehr dauernd an einem stofflichen Ausbau seiner Gedanken durch ausgebreitete Studien. Wie umfangreich und vielseitig er seine Forschungen angelegt hatte, zeigt die grosse Mannigfaltigkeit seiner an der Universität und am Pädagogium zu Basel gehaltenen Vorlesungen.

Allerdings beschränkte er sich damals noch auf die Erforschung des Hellenenthums und blieb philosophisch in den Fesseln eines bestimmten metaphysischen Systems gebunden. Aber seine spätere Selbstbefreiung vom Zwang dieses Systems hätte unter andern Gesundheitsverhältnissen um so günstiger wirken müssen. Das Culturbild des griechischen Lebens, aus dem er damals mit den Augen des Metaphysikers die tiefsten Grundzüge des Weltbildes und Menschenlebens herauszulesen meinte, würde sich ihm, auf dem Wege wissenschaftlicher Weiterarbeit, allmählig zu einem Totalbilde der Weltentwicklung erweitert haben. In der Genialität seiner feinen Anempfindung und künstlerischen Nachgestaltungskraft war er geradezu prädestinirt zu geschichtsphilosophischen Leistungen im Grossen. Sein Drang zum Produciren wäre dadurch gehindert worden, sich allzusehr ins Subjective zu verlieren;

empfand er es doch oftmals selbst, dass, je beflügelter, drängender und leidenschaftlicher geartet die Gedanken sind, desto umfassender und strenger der Stoff sein müsse, an dem sie gebunden, von dem sie beherrscht werden. Daher begegnen wir in seinen Werken bis zuletzt immer wieder erneuten fruchtlosen Anstrengungen, sich nach aussen hin auszubreiten und sein Denken wissenschaftlich zu begründen,--es ist etwas vom vergeblichen Flügelschlagen eines gefangenen Adlers darin. Er war durch seine Gesundheit _genöthigt_, sich selbst zum Stoff seiner Gedanken zu nehmen, sein eignes Ich seinem philosophischen Weltbilde unterzulegen und dieses aus dem eignen Innern herauszuspinnen. Vielleicht hätte er im andern Falle etwas so ganz Eigenartiges,--und daher so ganz Einzigartiges, nicht geleistet. Aber trotzdem vermag man nicht ohne das tiefste Bedauern auf diesen Wendepunkt in Nietzsches Schicksal zurückzublicken,--auf diesen unheimlichen _Zwang_ zur Selbstvereinsamung und Selbstabschliessung,--man vermag sich dem Gefühl nicht zu entziehen, dass er hier an einer Grösse, die ihm Vorbehalten war, _vorübergeht_.

An dieser Stelle wird es um Nietzsche Nacht. Seine bisherigen Ideale, seine Gesundheit, seine Arbeitskraft, sein Wirkungskreis,--Alles, was seinem Leben Licht und Glanz und Wärme gegeben hatte, entschwand ihm eins nach dem andern. Es war ein ungeheurer Zusammenbruch, unter dessen Trümmern er wie begraben wurde. Es begannen seine »_Dunkel-Zeiten_.« (S. Der Wanderer u. sein Schatten 191.)

Die jetzt folgenden Schriften sind nicht, wie die bisherigen, aus einer Fülle herausgeschöpft, die in ihm angesammelt und bereit lag, von einem Ziel aus verfasst, das er erreicht zu haben glaubte,--sie erzählen vielmehr davon, wie er sich in seiner Nacht orientirt und langsam vorwärts tastet, sie sind die qualvollen, kampfvollen, endlich sieghaften Schritte nach einem dunklen Ziele hin.

»Als ich allein weiter ging,« bekennt er viele Jahre später (Einführende Vorrede zum zweiten Bande von »Menschliches, Allzumenschliches«) von dieser Zeit, »zitterte ich: nicht lange darauf, und ich war krank, mehr als krank, nämlich müde, aus der unaufhaltsamen Enttäuschung über Alles, was uns modernen Menschen zur Begeisterung übrig blieb-- --«. Aber nicht als einen Klagenden sehen wir ihn sich durch die Trümmer hindurchkämpfen,--und mit Recht bezeichnet er dies als den Reiz jener Schriften: »dass hier ein Leidender und Entbehrender redet, wie als ob er _nicht_ ein Leidender und Entbehrender sei.« (Ebendaselbst.)

Immer wieder wird er zu einem Neu-Schaffenden und Neu-Entdeckenden. Tief unter die Trümmerwelt steigt er hinab, er untergräbt und unterwühlt noch ihre letzten Fundamente und späht mit nachtgewöhntem Auge nach den verborgenen Schätzen und Heimlichkeiten des Erdinnern aus. Ein zweiter Trophonius, listig aus-und einschlüpfend, weiss er auch aus der Tiefe noch Aufschluss zu geben über die Welt da droben und ihr Räthsel zu deuten. So sehen wir ihn: »einen Unterirdischen, an der Arbeit, einen Bohrenden, Grabenden, Untergrabenden,-- --wie er langsam, besonnen, mit sanfter Unerbittlichkeit vorwärts kommt, ohne dass die Noth sich allzusehr, verriethe, welche jede lange Entbehrung von Licht und Luft mit sich bringt.« Und darüber kommt uns jene zuversichtliche Frage, mit der er selbst auf diese Jahre zurückblickte, und die die Betrachtung seiner ferneren Entwicklungsgeschichte uns beantworten soll: »--Scheint es nicht, dass-- -- --er vielleicht seine eigne lange Finsterniss haben will, sein Unverständliches, Verborgenes, Rätselhaftes, weil er weiss, was er auch haben wird: seinen eignen Morgen, seine-eigne Erlösung, seine eigne Morgenröte?...« (Einführende Vorrede zur neuen Ausgabe der »Morgenröte«.)

Mit solchen Gefühlen von Selbstmitleid und Selbstbewunderung blickte Nietzsche auf die Geistesperiode zurück, vor welcher wir nunmehr stehen. Wir sehen: das Charakterische sind von vornherein die Kämpfe und Wunden, die es ihn kostete, sich die neue Weltanschauung anzueignen; es ist das tiefe Erkranken an ihr, aus dem er sich alsdann seine neue Gesundheit schuf. Seine Originalität musste sich daher zunächst viel weniger in den Einsichten und Theorien selbst aussprechen, die sich ihm damals erschlossen, als vielmehr in der Kraft, mit der er sich vom alten Ideal losriss, um sie erfassen zu können. Er gelangte eben nicht wie die Meisten zum Bewusstsein erhöhter Selbständigkeit und eigenster Geistesthätigkeit auf Grund einer intellectuellen Entwicklung, die uns gleichgiltig und kalt stimmt gegenüber den verlassenen unreiferen Gedanken. Er gelangte dazu nur durch eine gewaltsame Empörung gegen das Ehemalige, wobei die intellectuellen Gründe den Gesinnungswechsel weniger bedingten als begleiteten. Daher sehen wir anfänglich immer, dass Nietzsche die neuen Gedanken in einer gewissen Unselbständigkeit so hinnimmt, wie er sie gerade vorfindet,--dass er sie zunächst wieder kritiklos empfängt; denn seine ganze Kraft ist inzwischen

vollständig in Anspruch genommen von den allerinnerlichsten Erlebnissen, und die neuen Theorien als solche bilden,--um einen Lieblingsausdruck von Nietzsche zu gebrauchen,--nur eine vorläufige »Vordergrundsphilosophie«, während im verborgenen Hintergründe, den Kämpfen des Seelenlebens, sich der eigentlich entscheidende Process abspielt.

Je fester er mit dem Alten verwachsen ist, je gewaltsamer der Sprung ins Neue eine vollständige Entwurzelung aus dem heimischen Geistesboden verlangt, desto tiefer ist die innere Bedeutung der Wandlung. So kann man in gewissem Sinne sagen, dass gerade die scheinbare innere Unselbständigkeit, mit welcher Nietzsche sich einer fremden Denkweise vorläufig hingiebt, eine Kraft heroischester Selbständigkeit verbürgt. Während die theuersten Gedanken ihn heimlocken, überlässt er sich wehrlos Gedankenkreisen, denen gegenüber er sich noch als Fremdling, ja insgeheim noch als Gegner fühlt,--aber mit jenem schönen Wort im Herzen: »Ein Sieg und eine eroberte Schanze sind nicht mehr deine Angelegenheit, sondern die der Wahrheit,--aber auch deine Niederlage ist nicht mehr deine Angelegenheit.« (Morgenröthe 370 »Inwiefern der Denker seinen Feind liebt.«)

Man muss dies im Auge behalten, wenn man Nietzsches unvermitteltem Gesinnungswechsel gerecht werden und die Entstehung seines positivistischen Erstlingswerkes begreifen will,--dieses Werkes, welches so überraschend und unerwartet seinem Geiste entsprang. Erst im Jahre 1876 war die letzte der »Unzeitgemässen Betrachtungen«, das in überströmender Begeisterung geschriebene Büchlein »Richard Wagner in Bayreuth«, erschienen, und schon in dem Winter 1876/1877 entstand die erste seiner Aphorismensammlungen: _Menschliches, Allzumenschliches_. Ein Buch für freie Geister. (Dem Andenken Voltaire's geweiht zur Gedächtniss-Feier seines Todestages, des 30. Mai 1778) nebst einem Anhang: Vermischte Meinungen und Sprüche. (Verlag von Ernst Schmeitzner, Chemnitz, 1878.) Von keinem Buche gilt mit grösserm Recht das Wort, das er über die Werke dieser Periode schrieb: »Meine Schriften reden _nur_ von meinen _Ueberwindungen_: ich bin darin, mit Allem, was mir feind war.-- -- --Einsam nunmehr,-- --nahm ich-- --Partei _gegen_ mich und _für_ Alles, was gerade mir wehe that und hart fiel«. (Einführende Vorrede zur Neuen Ausgabe von Menschliches, Allzumenschliches II, VIII.) Jenes Werk spiegelt den damaligen Zustand seines Geistes so deutlich wieder, dass es zwei völlig von einander verschiedene Bestandtheile zu enthalten scheint: einerseits den noch unselbständigen Positivisten Nietzsche, der uns in den neu übernommenen Theorien fast nichts Eigenes giebt, sondern uns nur darüber orientirt, wo er sich jetzt befindet,--in welche neue »Haut« er sich fast passiv hat kleiden lassen; andererseits den Kämpfer und Dulder Nietzsche, der sich entschlossen von den ehemaligen Idealen losringt und uns in diesem Kampfe eine ergreifende Fülle des originalsten Gedankenlebens durch die Inbrunst offenbart, mit welcher er sich gegen sein eigenes altes Selbst wehrt und sich selbst verwundet. Hieraus erklärt sich auch die Leidenschaftlichkeit und Rücksichtslosigkeit der Angriffe, die er gegen Wagner und dessen Ansichten richtet. Niemand ist weniger fähig zu ruhig abwägender Gerechtigkeit als der, welcher seinen Ueberzeugungswechsel gerade vollzieht,--und dies nicht aus rein intellectuellen Gründen, sondern selber aus der Tiefe des »Menschlichen, Allzumenschlichen« seiner eigenen Natur heraus. Keinen Gedanken schleudern wir so weit, so heftig von uns fort, als denjenigen, von dem wir uns soeben erst in schmerzlichem Widerstreit getrennt haben, und vor dem wir noch verletzt und erschüttert, voll geheimer Wunden, die unser Stolz verbirgt, dastehen: es ist Hass darin als ein Nachklang unvergesslicher Liebe.

Durchaus bezeichnend für das Jähe und Innerliche der Wandlung Nietzsches ist es, dass sie auch diesmal ihren Ausgang von einem _persönlichen Verhältniss_ nahm. Wie der bitterste Stachel im Kampf gegen das alte Erkenntnissideal ein Freundschaftsbruch war, so verkörperte sich für Nietzsche auch der neue Erkenntnisstypus wiederum in einer Persönlichkeit. Je leidensvoller die Einsamkeit, in welche der Freundschaftsbruch ihn zurückwarf, desto mehr Innigkeit gewann Nietzsches Beziehung zu Paul Rée, denn »für einen solchen Einsamen ist der Freund ein köstlicherer Gedanke als für die Vielsamen,« wie er Rée einmal schreibt. (31. October 1880, aus Italien.)

War sein Verhältniss zu Richard Wagner durch die Ausschliesslichkeit gekennzeichnet, mit der Nietzsche in ihm aufging und zu ihm aufsah: durch seine _Jüngerschaft_,--so bildet sein Freundschaftsbund mit Rée mehr eine geistige _Genossenschaft_, die selbst dadurch nicht behindert wurde, dass die Freunde fern von einander lebten, und Rée nur zeitweise seinen Wohnsitz in Westpreussen verlassen konnte, um mit Nietzsche an verschiedenen Orten zusammenzutreffen. Schon am 19. November 1877 klagt Nietzsche von Basel aus, wo er noch im Kreise von Gesinnungsgenossen lebte, über diese Entfernung, welche ihn, infolge einer Erkrankung Rées, für längere Zeit vom Freunde getrennt hielt:

»Möge ich bald von Ihnen, mein Freund, hören, dass die bösen Krankheitsgeister ganz von Ihnen gewichen sind; dann bliebe mir für Ihr neues Lebensjahr nichts zu wünschen übrig, als dass Sie bleiben, der Sie sind und dass Sie mir bleiben, der Sie im letzten Jahre waren,-- -- -- -- -- -- -- --ich muss Ihnen doch sagen, dass ich in meinem Leben noch nicht so viel Annehmlichkeiten von der Freundschaft gehabt habe, wie durch Sie in diesem Jahre, gar nicht von dem zu reden, was ich von Ihnen gelernt habe. Wenn ich von Ihren Studien höre, so wässert mir immer der Mund nach Ihrem Umgänge; wir sind geschaffen dafür, uns gut zu verständigen, ich glaube, wir finden uns immer auf dem halben Wege schon, wie gute Nachbarn, die immer zur gleichen Zeit den Einfall haben,

sich zu besuchen, und sich auf der Grenze ihrer Besitzungen einander entgegenzukommen. Vielleicht steht es ein wenig mehr in Ihrer Gewalt, als in meiner, die grosse räumliche Entfernung zu überwinden; darf ich in dieser Beziehung für das neue Jahr hoffen? Ich selber bin gar zu elend und gebrechlich daran, als dass ich nicht um die beste Freude, die es giebt, bitten dürfte, selbst wenn die Bitte unbescheiden ist--ein gutes Gespräch unter uns über menschliche Dinge, ein persönliches Gespräch, nicht ein briefliches, zu dem ich immer untauglicher werde.«-- -- -- -- --

Je mehr Nietzsches körperliches Leiden ihn in die Einsamkeit zwang, je einsiedlerischer, fern von allen Menschen, er leben musste, um dieses Leiden ertragen zu können, desto sehnsüchtiger verlangt er nach dem Freunde, der seine Einsamkeit zur »Zweisamkeit« machen solle: »Zehnmal täglich wünsche ich bei Ihnen, mit Ihnen zu sein.« (Brief aus Basel, December 1878.) »Immer knüpfe ich im Geist meine Zukunft mit der Ihrigen zusammen.« (Aus Genf, Mai 1879.) »Viele Wünsche habe ich aufgeben müssen, aber noch niemals _den_, mit Ihnen zusammenzuleben,--mein »Garten Epikurs.«« (Aus Naumburg, den letzten October 1879.)

Die heftigen Schmerzen und Anfälle, unter denen Nietzsche litt, weckten damals Todesgedanken in ihm, und diese geben einem jeden Wiedersehen eine besonders tief empfundene Bedeutung. »Wie viel Freude haben Sie min gemacht, mein lieber, ausserordentlich lieber Freund!« ruft er nach einem solchen aus. »Also ich habe Sie noch einmal gesehen und so gefunden, wie mein Herz mir die; Erinnerung bewahrt hatte; wie ein beständiger, angenehmer Rausch wars, diese Tage hindurch. Ich gestehe Ihnen, ich hoffe nicht mehr auf ein Wiedersehn, die Erschütterung meiner Gesundheit ist zu tief, die Qual zu anhaltend, was nützt mir alle Selbstüberwindung und Geduld! Ja, in Sorrentiner Zeiten gab es noch zu hoffen, aber das ist vorbei. So preise ich denn, Sie gehabt zu haben, mein herzlich geliebter Freund.«-- -- --

Die beiden Freunde gelangten in diesen Jahren zu um so übereinstimmenderen Ansichten, als ihre Studien vielfach gemeinsame waren. Rée vermittelte Nietzsche meistens die Bücher, deren er bedurfte, las dem Augenleidenden vor und lebte mit ihm in einem ständigen, theils brieflichen, theils persönlichen Verkehr und Gedankenaustausch.

»Mein geliebter Freund!« schreibt Nietzsche nach einer etwas länger währenden Trennung, »Für unser Zusammensein,-- falls ich dieses Glück doch noch erleben sollte, ist viel in mir präparirt. Auch ein Kistchen Bücher steht für jenen Augenblick bereit, Réealia betitelt, es sind gute Sachen darunter, über die Sie sich freuen werden. Können Sie mir ein lehrreiches Buch, womöglich englischer Abkunft,[7] aber ins Deutsche übersetzt und mit mit gutem, grossem Druck zusenden?--Ich lebe ganz ohne Bücher, als Sieben-Achtel-Blinder, aber ich nehme gern die verbotene Frucht aus Ihrer Hand.--Es lebe das Gewissen, weil es nun eine Historie haben wird und mein Freund an ihm zum Historiker geworden ist! Glück und Heil auf Ihren Wegen. Von Herzen Ihnen nahe

Ihr

Friedrich Nietzsche.

So schreibt er dem Freunde immer wieder, in verschiedenen Wendungen: »Bei allem Guten, das Sie thun oder Vorhaben, wird auch für mich der Tisch gedeckt und mein Appetit ist sehr lebendig nach _Réealismus_, das wissen Sie!«

So wurde denn der Réealismus die ursprüngliche Form, in der Nietzsche den philosophischen Realismus in sich aufnahm und den alten Idealismus begrub. Schon das anonym erschienene kleine Erstlingswerk Rées (Berlin, Carl Duncker, 1875), dessen »_Psychologische Beobachtungen_«-- Sentenzen im Geist und Stil La Rochefoucaulds-- schätzte Nietzsche nicht nur, sondern er überschätzte es sogar, wie ein noch jetzt erhaltener Brief an den Verfasser bekundet. Rées Lieblingsautoren wurden nun auch die seinigen: die französischen Aphoristiker, die La Rochefoucauld, La Bruyère, Vauvenargues, Chamfort, beeinflussten um diese Zeit ausserordentlich Nietzsches Stil und Denken. Von den philosophischen Schriftstellern Frankreichs bevorzugte er mit Rée, Pascal und Voltaire, von den Novellisten Stendhal und Mérimée. Von ungleich tieferer Bedeutung war jedoch für ihn Rées zweites Werk »_Der Ursprung der moralischen Empfindungen_« (Chemnitz, Ernst Schmeitzner, 1877)[8], das für die nächste Zeit gewissermassen Nietzsches positivistisches Glaubensbekenntnis bildete. Dadurch wurde er zu den englischen Positivisten gefühlt, an die Rée sich angeschlossen hatte, und die auch Nietzsche bald allen ähnlichen deutschen Werken vorzog. Die Hauptanziehungskraft, die der Positivismus auf ihn ausübte, lag vornehmlich in der Beantwortung jener einen Frage, die Rée in seinem Buch behandelte, der Frage nach der Entstehung des moralischen Phänomens. Für Rée fiel sie zusammen mit der Frage _nach den Gründen der Sanction_ altruistischer Empfindungen; seine Untersuchungen richteten sich hauptsächlich gegen die ethischen Systeme der bisherigen Metaphysik. Da nun die Ethik Wagners und Schopenhauers auf dem Altruismus und dessen metaphysischem Gefühlswerth fusst, so musste Nietzsche gerade in Rées Buch die geeignetesten Waffen zu seinem Kampf

gegen die verlassene Weltanschauung finden. »Der Ursprung der moralischen Empfindungen« wurde der eigentliche Gegenstand seiner Forschung, und man kann sein Erstlingswerk kurz als den Versuch bezeichnen, zur vollen Einsicht in die Nichtigkeit seiner ehemaligen Ideale zu gelangen durch die Einsicht in ihre _Entstehungsgeschichte_. Auf diesem Wege wird sein gesammtes Philosophiren zu einer Analyse und Geschichte menschlicher Vorurtheile und Irrthümer; der Metaphysiker wird zum Psychologen und Historiker und stellt sich auf den Boden eines nüchternen und consequenten Positivismus. Er schloss sich aufs Engste der englischen positivistischen Schule an in ihrer bekannten Zurückführung der moralischen Werthurtheile und Phänomene auf den _Nutzen_, die _Gewohnheit_ und das _Vergessen_ der ursprünglichen Nützlichkeitsgründe; es bedarf daher keiner besonderen Erläuterung seiner Theorien; es genügt auf die Richtung hinzuweisen, welcher er sie entnahm. Man vergleiche Stellen wie die folgende in »Menschliches, Allzumenschliches«: »Die Geschichte der-- -- --moralischen Empfindungen verläuft in folgenden Hauptphasen. Zuerst nennt man einzelne Handlungen gut oder böse ohne alle Rücksicht auf deren Motive, sondern allein der nützlichen oder schädlichen Folgen wegen. Bald aber vergisst man die Herkunft dieser Bezeichnungen und wähnt, dass den Handlungen an sich, ohne Rücksicht auf deren Folgen, die Eigenschaft »gut« oder »böse« innewohne.« (I 39). »Wie wenig moralisch sähe die Welt ohne die Vergesslichkeit aus! Ein Dichter könnte sagen, dass Gott die Vergesslichkeit als Thürhüterin an die Tempelschwelle der Menschenwürde hingelagert habe.« (I 92). Den Weg, auf dem die sogenannte Moralität der Handlungen entstanden ist, kann man mit den Worten bezeichnen:«--_jetzt_ aus Gewohnheit, Vererbung und Anerziehung, _ursprünglich_, weil (es)--_nützlicher_ und _ehrebringender_ ist.« (II 26). Ferner, Der Wanderer und sein Schatten (40): »Die Bedeutung des Vergessens in der moralischen Empfindung: Die selben Handlungen, welche innerhalb der ursprünglichen Gesellschaft zuerst die Absicht auf gemeinsamen Nutzen eingab, sind später von anderen Generationen auf andere Motive hin gethan worden: aus Furcht oder Ehrfurcht vor Denen, die sie forderten und anempfablen, oder aus Gewohnheit, weil man sie von Kindheit an um sich hatte thun sehen, oder aus Wohlwollen, weil ihre Ausübung überall Freude und zustimmende Gesichter schuf, oder aus Eitelkeit, weil sie gelobt wurden. Solche Handlungen, an denen das Grundmotiv, das der Nützlichkeit, _vergessen_ worden ist, heissen dann _moralische_.« »Der Inhalt unseres Gewissens ist Alles, was in den Jahren der Kindheit von uns ohne Grund regelmässig _gefordert_ wurde« (52), indem dem einzelnen Menschen das, was in der Geschichte der Menschheit in der bezeichneten Weise entstanden ist, überliefert wird als eine Summe religiös sanctionirter und festgeprägter Pflichtbegriffe. »Die Sitte respräsentirt die Erfahrungen früherer Menschen über das vermeintlich Nützliche und Schädliche,--aber _das Gefühl für die Sitte_ (Sittlichkeit) bezieht sich nicht auf jene Erfahrungen als solche, sondern auf das Alter, die Heiligkeit, die Indiscutabilität der Sitte.« (Morgenröthe 19).

So zieht sich durch das ganze Werk hindurch, was schon der Titel charakteristisch andeutet: die Gedankenarbeit der Zerstörung, die rücksichtslose Blosslegung der »Allzumenschlichkeit« dessen, was bisher heilig, ewig, übermenschlich hiess. Um zu sehen, mit welcher schroffen Einseitigkeit und Uebertreibung sich Nietzsche hier gegen sich selbst wandte, lohnt es die Mühe, seinen nunmehrigen Anschauungen in Bezug auf diejenigen vier Punkte nachzugehen, die in seiner vorhergehenden philosophischen Periode eine entgegengesetzte Deutung erfahren hatten: in Bezug auf die Bedeutung des »Dionysischen«, des »Dekadenz-Begriffs«, des »Unzeitgemässen«, und des »Geniecultus«. An Stelle des Dionysos steht hier der früher so viel geschmähte Sokrates als Schirmherr und Tempelhüter des neuen Wahrheitstempels da. »Wenn Alles gut geht, wird die Zeit kommen, da man, um sich sittlich-vernünftig zu fördern, lieber die Memorabilien des Sokrates in die Hand nimmt, als die Bibel, und wo Montaigne und Horaz als Vorläufer und Wegweiser zum Verständniss des einfachsten und unvergänglichsten Mittler-Weisen, des Sokrates, benuzt werden. Zu ihm führen die Strassen der verschiedendsten philosophischen Lebensweisen zurück, welche im Grunde die Lebensweisen der verschiedenen Temperamente sind, festgestellt durch Vernunft und Gewohnheit und allesammt mit ihrer Spitze hin nach der Freude am Leben und am eignen Selbst gerichtet.-- -- --« (Der Wanderer und sein Schatten 86). Dieser Sieg des Sokratischen, der Vernunft und weisen Leidenschaftslosigkeit, über das Dionysische, über die Affectsteigerung und den selbstvergessenen Lebensrausch, gipfelt in dem Satz, dass »der wissenschaftliche Mensch die Weiterentwickelung des künstlerischen« (Menschliches, Allzumenschliches I 222), und alles dessen sei, was auf dem Rausch anstatt auf der Einsicht beruht, denn: »an sich ist-- --der Künstler schon ein zurückbleibendes Wesen.« (Menschliches, Allzumenschliches I 159). Daher bedeutete für Griechenland das Aufkommen des sokratischen Geistes einen _ungeheuren Fortschritt_. »Die Formen aus der Fremde entlehnen, nicht schaffen, aber zum schönsten Schein umbilden--das ist griechisch: nachahmen, nicht zum Gebrauch, sondern zur künstlerischen Täuschung,-- -- --ordnen, verschönern, verflachen--so geht es fort von Homer bis zu den Sophisten des dritten und vierten Jahrhunderts der neuen Zeitrechnung, welche ganz Aussenseite, pomphaftes Wort, begeisterte Gebärde sind und sich an lauter ausgehöhlte, schein-, klang- und effect-lüsterne Seelen wenden.--Und nun würdige man die Grösse jener Ausnahme Griechen, welche die _Wissenschaft_ schufen. Wer von ihnen erzählt, erzählt die heldenhafteste Geschichte des menschlichen Geistes!« (Menschliches, Allzumenschliches II 221; Vergleiche auch Morgenröthe 544 über das damalige »Jauchzen über die neue Erfindung des _vernünftigen_ Denkens.») Die _Abkunft alles Gefühlsmässigen_ von _Urtheilen_ und

ursprünglichen Gedankenschlüssen wird deshalb Denen entgegengestellt, die dem Affectleben als dem höchsten Leben das Wort reden. »--Gefühle sind nichts Letztes, Ursprüngliches, hinter den Gefühlen stehen Urtheile und Werthschätzungen, welche in der Form von Gefühlen uns vererbt sind. _Die Inspiration, die aus dem Gefühle stammt, ist das Enkelkind eines Urtheils--und oft eines falschen!--und jedenfalls nicht deines eigenen! Seinem Gefühle vertrauen--das heisst seinem Grossvater und seiner Grossmutter und deren Grosseltern mehr gehöre hen als den Göttern, die in uns sind: unserer Vernunft und unserer Erfahrung._« (Morgenröthe 35). Die »edlen Schwärmer«, welche die Unterordnung des Fühlens unter das vernünftige Denken zu verhindern suchen, verführen dadurch zu einer »_Lasterhaftigkeit des Intellectes._« (Morgenröthe 543). »_Diesen schwärmerischen Trunkenbolden_ verdankt die Menschheit viel Übles:-- -- --Zu alledem pflanzen jene Schwärmer mit allen ihren Kräften den Glauben _an den Rausch als an das Leben im Leben_: einen furchtbaren Glauben! _Wie die Wilden jetzt schnell durch das »Feuerwasser« verdorben werden und zu Grunde gehen, so ist die Menschheit_-- -- --_langsam und gründlich durch die geistigen Feuerwässer trunken machender Gefühle_-- -- --_verdorben worden:_« (Morgenröthe 50).-- -- --daran denken sie nicht, dass die _Erkenntniss_ auch der hässlichsten Wirklichkeit schön ist,-- -- --Das Glück der Erkennenden mehrt die Schönheit der Welt-- -- --;----zwei so grundverschiedene Menschen, wie Plato und Aristoteles, kamen in dem überein, was _das höchste Glück_ ausmache,----: sie fanden es im _Erkennen_, in der Thätigkeit eines wohlgeübten findenden und erfindenden _Verstandes_ (_nicht_ etwa in der »Intuition,« _nicht_ in der Vision, und ebenfalls _nicht_ im Schaffen,--)--« (Morgenröthe 550). Damit fällt der bisherige Genie-Cultus:[9] »Ach, um den wohlfeilen Ruhm des »Genie's«! Wie schnell ist sein Thron errichtet, seine Anbetung zum Brauch geworden! Immer noch liegt man vor der Kraft auf den Knieen--nach alter _Sclaven-Gewohnheit_ --und doch ist, wenn der Grad von _Verehrungswürdigkeit_ festgestellt werden soll, nur _der Grad der Vernunft in der Kraft_ entscheidend. (Morgenröthe 548).--Es ist die Zeit angebrochen für die strengen und schlichten Geister, die übermässige Verherrlichung der künstlerischen Genialität steht der »fortschreitenden Vermännlichung der Menschheit« entgegen. (Menschliches, Allzumenschliches I 147). Scheinbar kämpft das Genie wohl für »die höhere Würde und Bedeutung des Menschen«, es »will sich die glänzenden, tiefsinnigen Deutungen des Lebens durchaus nicht nehmen lassen und wehrt sich gegen nüchterne, schlichte Methoden und Resultate«, anstatt zurückzutreten gegenüber der höherstehenden »wissenschaftlichen Hingebung an das Wahre in jeder Gestalt, erscheine diese auch noch so schlicht«. (Menschliches, Allzumenschliches I 146). Wenn man die sogenannte »Inspiration« untersucht, so zeigt sich, dass nicht so sehr das Wunder einer zeugenden Phantasie, sondern ebenfalls nur die »Urtheilskraft« sichtend, ordnend, wählend, das Kunstwerk erzeugt,--»wie man jetzt aus den Notizbüchern Beethoven's ersieht, dass er die herrlichsten Melodien allmählich zusammengetragen und aus vielfachen Ansätzen gewissermaassen ausgelesen hat.-- -- -- -- --die künstlerische Improvisation steht tief im Verhältniss zum ernst und mühevoll erlesenen Kunstgedanken«. (Menschliches, Allzumenschliches I 155) Daher ist Genie in viel höherem Grade _erlernbar_, als meist angenommen wird: »Redet nur nicht von Begabung, angeborenen Talenten! Es sind grosse Männer aller Art zu nennen, welche wenig begabt waren. Aber sie _bekamen_ Grösse, wurden »Genie's«,-- -- --: sie hatten Alle jenen tüchtigen Handwerker-Ernst, welcher erst lernt, die Theile vollkommen zu bilden, bis er es wagt, ein grosses Ganzes zu machen; sie gaben sich Zeit dazu, weil sie mehr Lust am Gutmachen des Kleinen, Nebensächlichen hatten, als an dem Effecte eines blendenden Ganzen.« (Menschliches, Allzumenschliches I 163). Der Drang, das Wunder der Genialität zu erklären und herabzusetzen, ist hier, wo es in Nietzsches Gedanken dem Wagner-Wunder gilt, ebenso stark, wie später, in seiner letzten Geistesperiode, der Drang, dem Genie--diesmal dem _eigenen_ Genie--das Wort zu sprechen und es auf das höchste zu glorificiren. Hier erscheint ihm sogar jede wahrhafte Grösse als ein Verhängniss, weil sie »_viele schwächere Kräfte_ und _Keime zu erdrücken_« sucht, während es nur gerecht und wünschenswerth sei, dass nicht nur einzelne Grosse leben, sondern dass ebenfalls den »_schwächeren und zarteren Naturen auch Luft und Licht gegönnt_« (Menschliches, Allzumenschliches I 158) werde. »Das Vorurtheil zu Gunsten der Grösse: Die Menschen überschätzen ersichtlich alles Grosse und Hervorstechende.-- -- --Die extremen Naturen erregen viel zu sehr die Aufmerksamkeit; aber es ist auch eine viel geringere Cultur nöthig, um von ihnen sich fesseln zu lassen.« (Menschliches, Allzumenschliches I 260).

Er findet nicht Worte genug, um den Hochmuth derer zu geissein, die sich von der Allgemeinheit ausgenommen wissen wollen: »es ist Phantasterei, von sich zu glauben, dass man eine Meile Wegs voraus sei und dass die gesammte Menschheit _unsere_ Strasse ziehe. Man soll der hochmüthigen Vereinsamung nicht so leicht das Wort reden« (Menschliches, Allzumenschliches I 375). Denn diese Phantasterei beruht meistens auf einer eitlen Selbsttäuschung über die Motive unseres Thuns und Lassens; der wahre Denker weiss, dass eine so starke Betonung der Rangunterschiede unter den Menschen unberechtigt ist, und dass das Menschliche, selbst in seinen edelsten und höchsten Regungen, noch ein »Allzumenschliches« bleibt. Kraft dieser Einsicht ist er imstande, sich mit allen Uebrigen auf Eine Stufe zu stellen und sich gerade dadurch denkend über sein eignes unzulängliches Wesen zu erheben. »Vielleicht, dass es eine Zukunft giebt, wo dieser Muth des Denkens so angewachsen sein wird, dass er als der äusserste Hochmuth sich _über_ den Menschen und Dingen fühlt,--wo der Weise als der am meisten Muthige _sich selber_ und das Dasein am meisten _unter sich_ sieht?« (Morgenröthe 551). Deshalb besitzt der Weise die Neigung, die menschlichen

Handlungen auf ihre Allzumenschlichkeit zu prüfen: »Man wird selten irren, wenn man extreme Handlungen auf Eitelkeit, mittelmässige auf Gewöhnung und kleinliche auf Furcht zurückführt.« (Menschliches, Allzumenschliches 174). Die Bedeutung der Eitelkeit als eines Hauptmotivs der menschlichen Handlungen wird immer neu betont und erwogen,--wie ihr auch in _Rées_ Buch ein besonderes Capitel gewidmet war. »Wer die Eitelkeit bei sich leugnet, besitzt sie gewöhnlich in so brutaler Form, dass er instinctiv vor ihr das Auge schliesst, um sich nicht verachten zu müssen.« (Menschliches, Allzumenschliches II 38). »Wie arm wäre der menschliche Geist ohne die Eitelkeit!« (Menschliches, Allzumenschliches I 79). Die Eitelkeit, das »menschliche Ding an sich.« (Menschliches, Allzumenschliches II 46). »Die ärgste Pest könnte der Menschheit nicht so schaden, als wenn eines Tages die Eitelkeit aus ihr entschwände.« (Der Wanderer und sein Schatten 285). Denn auch das, was wir uns gewöhnt haben, für Kraftgefühl und Machtbewusstsein inneren höchsten Werthes anzusehen, ist meistens nur ein Ausfluss der Eitelkeit, sich hervorzuthun. Der Mensch will für mehr gelten, als er eigentlich seiner Kraft nach zu gelten berechtigt ist. »Er merkt zeitig, dass nicht Das, was er _ist_, sondern Das, was er gilt, ihn trägt oder niederwirft: hier ist der Ursprung der _Eitelkeit_.« (Der Wanderer und sein Schatten 181. »Die Eitelkeit als die grosse Nützlichkeit.«),--wo Nietzsche den _Mächtigen_ gleichsetzt mit dem Eitlen, Listigen, Klugen, der die eigne Furchtsamkeit und Wehrlosigkeit dadurch verbirgt, dass er sich Ansehen verschafft. Die einschlägigen Aussprüche stehen im schärfsten Gegensatz zu seiner spätem Anschauung der Sklaven- und Herrennaturen, sowie der ursprünglichen Gemeinwesen. (Vergl. auch den Aphorismus »Eitelkeit als Nachtrieb des ungesellschaftlichen Zustandes« in Der Wanderer und sein Schatten 31.) Die Eitelkeit schwindet in dem Maasse, als sich der höher stehende Mensch der Gleichheit oder doch der Aehnlichkeit menschlicher Motive bewusst wird und sich selbst in der ihn allen Andern gleichstellenden »Allzumenschlichkeit« seiner Triebe erkennt.

Der einzige wahrhaft werthbestimmende Unterschied zwischen den Menschen liegt ausschliesslich in der Art und dem Grade ihres intellectuellen Vermögens; die Menschen _veredeln_ heisst demnach nichts anderes, als _Einsicht_ unter sie tragen. Selbst das, was vom moralischen Standpunkt aus als _böse_ bezeichnet wird, erweist sich meistens als bedingt durch geistige Verkümmerung und Verrohung. »Viele Handlungen werden böse genannt und sind nur dumm, weil der Grad der Intelligenz, welcher sich für sie entschied, sehr niedrig war.« (Menschliches, Allzumenschliches I 107). Die Unfähigkeit, den Schaden oder das Weh, welches man Andern zufügt, richtig zu taxiren, lässt den sogenannten Verbrecher, den in seiner Geistesentwickelung Zurückgebliebenen, als besonders grausam und herzlos erscheinen. »Ob der Einzelne den Kampf um das Leben so kämpft, dass die Menschen ihn _gut_, oder so, dass sie ihn _böse_ nennen, darüber entscheidet das Maass und die Beschaffenheit seines Intellects.« (Menschliches. Allzumenschliches I 104). »Die Menschen, welche jetzt grausam sind, müssen uns als Stufen _früherer Culturen_ gelten,------. Es sind _zurückgebliebene_ Menschen, deren Gehirn, durch alle möglichen Zufälle im Verlaufe der Vererbung, nicht so zart und vielseitig fortgebildet worden ist.« (Menschliches, Allzumenschliches I 43). Es sind die Menschen des Niedergangs. Je vorgeschrittener aber ein Mensch, desto mehr verfeinert, mildert, ja verdünnt sich gewissermassen die rohe Instinctkraft der ursprünglichen Leidenschaften, aus der noch die Handlungen des Zurückgebliebenen quellen.--»Gute Handlungen sind sublimirte böse; böse Handlungen sind vergröberte, verdummte, gute. -- -- --Die Grade der Urtheilsfähigkeit entscheiden, wohin Jemand sich-- -- --hinziehen lässt.-- -- -- --Ja, in einem bestimmten Sinne sind auch jetzt noch _alle_ Handlungen dumm, denn der höchste Grad von menschlicher Intelligenz-- -- --wird sicherlich noch überboten werden: und dann-- -- --wird der erste Versuch gemacht, ob die Menschheit aus einer moralischen sich in eine _weise Menschheit umwandeln könne_«. (Menschliches, All-zurnenschliches I 107). Ihr Merkzeichen aber wird sein, dass in den Menschen »der gewaltthätige Instinct schwächer«, »die Gerechtigkeit in Allen grösser« wird, »Gewalt und Sclaverei« aufhört. (Menschliches, Allzumenschliches I 452). Beneidenswerth sind Diejenigen, in denen sich durch generationenlange Gewöhnung ein milder, mitleidsvoller und liebevoller Sinn vererbt hat: »_Die Herkunft von guten Ahnen macht den ächten Geburtsadel aus; eine einzige Unterbrechung in jener Kette, Ein böser Vorfallr also hebt den Geburtsadel auf. Man soll Jeden, welcher von seinem Adel redet, fragen: hast du keinen gewaltthätigen, habsüchtigen, ausschweifenden, boshaften, grausamen Menschen unter deinen Vorfahren_? Kann er darauf in gutem Wissen und Gewissen mit Nein antworten, so bewerbe man sich um seine Freundschaft. (Menschliches, Allzumenschliches I 456). »Das beste Mittel, jeden Tag gut zu beginnen, ist: beim Erwachen daran zu denken, ob man nicht wenigstens einem Menschen an diesem Tage eine Freude machen könne. Wenn dies als ein Ersatz für die religiöse Gewöhnung gelten dürfte, so hätten die Menschen einen Vortheil bei dieser Aenderung.« Und diese Verherrlichung der zarten und mitleidigen Regungen auf Kosten nicht nur der brutalen Roheit, sondern auch der begeisterten Leidenschaft des religiösen oder künstlerischen Rausches klingt aus in der schönen Begründung der Religionslosigkeit: »Es ist nicht genug Liebe und Güte in der Welt, um noch davon an eingebildete Wesen wegschenken zu dürfen.« (Menschliches, Allzumenschlichen 1129).[10]

Wir werden später sehen, wie stark sich Nietzsches letzte Philosophie gegen diese Auffassung der Mitleids Moral und der Abschwächung des Instinctlebens richtet, Und wie ihm nur derjenige der höchststehende Mensch heissen wird, der die ganze Fülle

der leidenschaftlichen Triebe und Instincte in sich birgt,--also der »böse« Mensch. Noch ist ihm aber ausserhalb der Güte und Selbstlosigkeit kein Menschenwerth denkbar, weil nur diese die Ueberwindung der thierischen Vergangenheit darstellen.

Deshalb sollte man den Weisen allein zugleich gut nennen, nicht weil er anders geartet ist als der Unweise, sondern weil die ursprüngliche menschliche Beschaffenheit in ihm vergeistigt und dadurch »die Wildheit in seinen Anlagen besänftigt« worden ist (Menschliches, Allzumenschliches I 56). »Die volle Entschiedenheit des Denkens und Forschens, also die Freigeisterei, zur Eigenschaft des Charakters geworden, macht im Handeln massig: denn sie schwächt die Begehrlichkeit« (Ebendaselbst 464). »Dabei verschwindet immer mehr-- -- --die übermässige Erregbarkeit des Gemüthes. Er (der Weise) geht zuletzt wie ein Naturforscher unter Pflanzen, so unter Menschen herum und nimmt sich selber als ein Phänomen wahr, welches nur seinen erkennenden Trieb stark anregt« (Ebendaselbst 254). Alle menschliche Grösse beruht auf einer Verfeinerung des Instinctmässigen; der höchste Mensch entsteht durch das Abstreifen des Thierischen, als ein »Nicht-mehr-Thier«, rein negativ gedacht; er ist als das »dialektische und vernünftige Wesen« das »Ueber-Thier« (Menschliches, Allzumenschliches I 40), in dem sich »eine neue Gewohnheit, die des Begreifens, Nicht-Liebens, Nicht-Hassens, Ueberschauens« allmählich anpflanzen kann (Ebendaselbst 107).

Ein »Ueber-Mensch« hingegen, als ein Wesen von _positiven_ neuen und höheren Eigenschaften, galt Nietzsche damals als vollendete Phantasterei und seine Erfindung als der stärkste Beweis menschlicher Eitelkeit. »Es müsste geistigere Geschöpfe geben, als die Menschen sind, blos um den Humor ganz auszukosten, der darin liegt, dass der Mensch sich für den Zweck des ganzen Weltendaseins ansieht, und die Menschheit sich ernstlich nur mit Aussicht auf eine Welt-Mission zufrieden giebt« (Der Wanderer und sein Schatten 14). »Ehemals suchte man zum Gefühl der Herrlichkeit des Menschen zu kommen, indem man auf seine göttliche _Abkunft_ hinzeigte: diess ist jetzt ein verbotener Weg geworden, denn an seiner Thür steht der Affe, nebst anderem greulichen Gethier, und fletscht verständnissvoll die Zähne, wie um zu sagen: nicht weiter in dieser Richtung! So versucht man es jetzt in der entgegengesetzten Richtung: der Weg, _wohin_ die Menschheit geht, soll zum Beweise ihrer Herrlichkeit-- ---dienen. Ach, auch damit ist es Nichts!-- -- -- -- --Wie hoch die Menschheit sich entwickelt haben möge--und vielleicht wird sie am Ende gar tiefer, als am Anfang stehen!--es giebt für sie keinen Übergang in eine höhere Ordnung, so wenig die Ameise und der Ohrwurm am Ende ihrer »Erdenbahn« zur Gottverwandtschaft und Ewigkeit emporsteigen. Das Werden schleppt das Gewesensein hinter sich her: warum sollte es von diesem ewigen Schauspiele eine Ausnahme geben! Fort mit solchen Sentimentalitäten!« (Morgenröthe 49). Vermöchte ein Mensch das Leben ganz zu erkennen, so müsste er »am Werthe des Lebens verzweifeln; gelänge es ihm, das Gesammtbewusstsein der Menschheit in sich zu fassen und zu empfinden, er würde mit einem Fluche gegen das Dasein zusammenbrechen,--denn die Menschheit hat im Ganzen _keine_ Ziele, folglich kann der Mensch-- ---nicht darin seinen Trost und Halt finden, sondern seine Verzweiflung« (Menschliches, Allzumenschliches I 33). Daher lautet »der erste Grundsatz des neuen Lebens«: »man soll das Leben auf das Sicherste, Beweisbarste hin einrichten: nicht wie bisher auf das Entfernteste, Unbestimmteste, Horizont-Wolkenhafteste hin« (Der Wanderer und sein Schatten 310). Man soll wieder »zum guten Nachbar der nächsten Dinge« (Der Wanderer und sein Schatten 16) werden und, anstatt im »Unzeitgemässen« der fernsten Vergangenheit und Zukunft zu schwelgen, die höchsten Erkenntnissgedanken der eigenen Zeit in sich verkörpern. Denn es ist der Menschheit nunmehr, anstelle all jener phantastischen Ziele, »die Erkenntnis der Wahrheit als das einzige ungeheure Ziel«' (Morgenröthe 45) vor Augen zu stellen. »Dem Lichte zu--deine letzte Bewegung; ein Jauchzen der Erkenntniss--dein letzter Laut« (Menschliches, Allzumenschliches I 292). Es ist möglich, dass ein solcher überhandnehmender Intellectualismus ihr Glück und ihre Lebensfähigkeit beeinträchtigt, dass er also in einem gewissen Sinne ein »Decadenz-Symptom« ist,--aber hier deckt sich der Begriff der Decadenz mit dem der edelsten Grösse: »Vielleicht selbst, dass die Menschheit an dieser Leidenschaft der Erkenntniss zu Grunde geht!-- -- --Sind die Liebe und der Tod nicht Geschwister?-- --wir wollen Alle lieber den Untergang der Menschheit, als den Rückgang der Erkenntniss!« (Morgenröthe 429). Ein solcher »Tragödien-Ausgang der Erkenntniss« (Morgenröthe 45) wäre gerechtfertigt, denn für sie ist kein Opfer zu gross: »Fiat veritas, pereatvita!« Dieses Wort fasste damals Nietzsches Erkenntnissideal zusammen,-- dasselbe Wort, gegen das er sich noch kurz zuvor mit der grössten Erbitterung gewendet hatte, und das er nur wenige Jahre später wieder ebenso heftig bekämpfen sollte, so dass die _Umkehrung_ desselben als die Quintessenz sowohl seiner ursprünglichen als auch seiner späteren Lehre gelten kann. Das _Lebenwollen_ um jeden Preis, auch um den Preis der Lebenserkenntniss, --das ist die »neue Lehre«, die Nietzsche später jener Lebensmüdigkeit entgegenstellte, deren Einsicht in der Werthlosigkeit alles Geschaffenen gipfelt: »In der Reife--des Lebens und des Verstandes überkommt den Menschen das Gefühl, dass sein Vater Unrecht hatte, ihn zu zeugen« (Menschliches, Allzumenschliches I 386); denn »Jeder Glaube an Werth und Würdigkeit des Lebens beruht auf unreinem Denken« (Ebendaselbst 33).

Verfolgt man Nietzsches Gedanken in dieser Gruppe von Werken, so kann man deutlich herausempfinden, unter welchem inneren Zwange er sie zu immer schroffem Consequenzen zuspitzte, und mit welchem Grade von Selbstüberwindung dies jedesmal

geschah. Aber gerade infolge des _Gegensatzes_, in dem diese Erkenntnissrichtung zu seinem innersten Bedürfen und Verlangen stand, wurde die Erkenntniss der Wahrheit für ihn zu einem _Ideal_,--gewann sie für ihn die Bedeutung einer höheren, von ihm selbst unterschiedenen, ihm schlechthin überlegenen Macht. Der Zwang, dem er sich damit unterwarf, befähigte ihn ihr gegenüber zu einem enthusiastischen,--fast _religiösen_ Verhalten und ermöglichte ihm jene 'religiös motivirte _Selbstspaltung_, deren Nietzsche bedurfte,--jene Selbstspaltung, durch die der Erkennende auf sein eigenes Wesen und dessen Regungen und Triebe herabblicken kann wie auf ein _zweites_ Wesen. Indem er sich so gleichsam der Wahrheit als einer Idealmacht _opferte_, gelangte er zu einer Affect-Entladung religiöser Art, die eine viel intensivere Gluth in ihm erzeugen musste, als sie sich jemals an einer warmen, kampflosen Befriedigung seiner innern Wünsche und Neigungen hätte entzünden können. So erscheint in dieser Periode, paradox genug, sein ganzer Kampf _wider den Rausch_, seine ganze Verherrlichung der Affectlosigkeit lediglich als ein Versuch, sich durch diese Selbstvergewaltigung zu berauschen.

Daher vollzog er seine Wandlung in einem äussersten Extrem; ja man könnte sagen: die Energie, mit welcher er sich zu einem lauten, rückhaltlosen »Ja!« der neuen Denkweise gegenüber aufrafft, stelle nur den Gewaltact eines »Nein!« dar, mit dem er seine eigne Natur und ihre tiefsten Bedürfnisse zu unterjochen strebt. Jene »vorurteilslose Kälte und Ruhe des Erkennenden«, sein Ideal in dieser Geistesperiode, begriff für ihn eine Art sublimer Selbstfolterung in sich, und er ertrug sie nur, indem er dabei die Leiden seines Seelenlebens entschlossen als eine Krankheit auffasste, als eine von den »Krankheiten, in denen Eisumschläge noth thun« (Menschliches, Allzumenschliches I 38),--und auch wohl thun,--denn »die scharfe Kälte ist so gut ein Reizmittel als ein hoher Wärmegrad«.

Deshalb tritt seine Uebereinstimmung mit R^es Gedankenrichtung nirgends so vollständig zu Tage als gerade in dem Erstlingswerk »Menschliches, Allzumenschliches«, zu einer Zeit also, wo er am schwersten unter seiner Trennung von Wagner und dessen Metaphysik litt. Daher Hess er sich in seinem übertriebenen Intellectualismus vielfach von der persönlichen Eigenart Rées leiten. Er formte sich auf Grund derselben ein ganz bestimmtes Idealbild, das ihm zur Richtschnur diente: die Ueberlegenheit des Denkers über den Menschen, die Nichtachtung aller Schätzungen, welche dem Affectleben entspringen, die unbedingte und rückhaltlose Hingabe an die wissenschaftliche Forschung erstand vor ihm als ein _neuer und höherer Typus des erkennenden Menschen_ und verlieh seiner Philosophie ihr eigenthümliches Gepräge.

Im Bedürfniss, die rein wissenschaftlichen Gedanken, die er dem Positivismus entnahm, in einer menschlichen Form verkörpert zu denken, verfing er sich im Bild einer einzelnen, ganz bestimmten Persönlichkeit, die ihm selbst durchaus entgegengesetzt war, und marterte sich damit, die Züge dieses Bildes noch zu verschärfen. Dass er immer wieder zu seiner Entwickelung der Selbstverneinung, zu seiner Geistessteigerung der freiwilligen Schmerzen bedurfte, erklärt auch hier den scheinbaren Widerspruch, dass er, um seine Selbständigkeit aus dem Bannkreise Wagners und der Metaphysik zu retten, sich wieder unter fremden Bann stellte, sein Selbst aufzugeben suchte. Denn weder im Charakter der philosophischen Richtung noch in dem des persönlichen Verhältnisses lag eine Veranlassung dazu; die Gründe blieben vielmehr rein innerlicher Natur. Sie allein trieben ihn zum engen Anschluss an einen Andern und dessen Gedanken; sietrieben ihn, gleichsam aus einem »Collectivgeist« (Menschliches, Allzumenschliches I 180) heraus zu denken und zu schaffen. In diesem Sinne konnte er bei Uebersendung seines »Menschlichen, Allzumenschlichen« dem Freunde schreiben: »Ihnen gehört's,--den Andern wird's geschenkt!« und gleich darauf hinzufügen: »Alle meine Freunde sind jetzt einmüthig, dass mein Buch von Ihnen geschrieben sei und herstamme: weshalb ich zu dieser neuen Vaterschaft gratulire! Es lebe der Réealismus!«

Es stellte sich eben zwischen den beiden Freunden eine eigenthümliche Art der Ergänzung heraus, die derjenigen ganz entgegengesetzt war, welche einst zwischen Nietzsche und Wagner bestanden hatte. Für Wagner, als das Kunstgenie, musste Nietzsche der Denker und Erkennende sein, der wissenschaftliche Vermittler der neuen Kunstcultur. Jetzt hingegen war in Rée der Theoetiker gegeben, und Nietzsche ergänzte ihn dadurch, dass er die praktischen Consequenzen der Theorien zog und ihre innere Bedeutung für Cultur und Leben festzustellen suchte. An diesem Punkt, bei der Frage nach dem Werth, schied sich die geistige Eigenart der Freunde. So hörte der Eine da auf, wo der Andere anfing. Rée, als Denker von schroffer Einseitigkeit, liess sich durch solche Fragen nicht beeinflussen; ihm ging der künstlerische, philosophische, religiöse Geistesreichthum Nietzsches ganz ab, dagegen war er von Beiden der schärfere Kopf. Mit Staunen und Interesse sah er, wie seiae fest und sauber gesponaenen Gedankenfäden sich unter Nietzsches Zauberhänden in lebendige frischblühende Ranken verwandelten. Für Nietzsches Werke ist es charakteristisch, dass selbst ihre Irrthümer und Fehler noch eine Fülle von Anregung enthalten, die ihre allgemeine Bedeutung erhöht, selbst wo jene ihren wissenschaftlichen Werth verringern. Im Gegensatz dazu ist es für Rées Schriften bezeichnend, dass sie mehr Mängel als Fehler besitzen; dies drückt wohl am klarsten aus der Schlusssatz des kurzen Vorwortes zum »Ursprung der moralischen Empfindungen«: »In dieser Schrift sind Lücken, aber Lücken sind besser, als Lückenbüsser«! Nietzsches geniale

Vielseitigkeit hingegen erschliesst neue Einblicke gerade in Gebiete, zu denen der Logik der Schlüssel fehlt, in denen diese sich gezwungen sieht, dem Wissen seine Lücken zu lassen.

Während für Nietzsche die leidenschaftliche Verschmelzung des Gedankenlebens mit dem gesammten Innenleben charakteristisch war, bildete einen Grundzug von Rées geistigem Wesen die schroffe und bis zum Aeussersten gehende Scheidung von Denken und Empfinden. Nietzsches Genialität entsprang dem lebensvollen Feuer hinter seinen Gedanken, welches sie in einem so herrlichen Lichte ausstrablen liess, wie sie es auf dem Wege der logischen Einsicht allein nicht hätten gewinnen können; Rées Geistesstärke beruhte auf der kalten Unbeeinflussbarkeit des Logischen durch das Psychische, auf der Schärfe und klaren Strenge seines wissenschaftlichen Denkens. Seine Gefahr lag in der Einseitigkeit und Abgeschlossenheit dieses Denkens, in einem Mangel an jener weitgehenden und feinen Witterung, die mehr Verständniss als Verstand verlangt; Nietzsches Gefahr lag gerade in seiner unbegrenzten Anempfindungsfähigkeit und der Abhängigkeit seiner Verständeseinsichten von allen Regungen und Erregungen seines Gemüths. Selbst da, wo seine jeweilige Denkweise momentan mit geheimen Wünschen und Herzenstrieben in Widerspruch zu gerathen schien, schöpfte er doch seine höchste Erkenntnisskraft aus dem wilden Kampf und Widerstreit mit solchen Wünschen und Trieben. Rées Geistesart hingegen schien selbst dann noch jede Betheiligung des Gemüthslebens an Erkenntnissfragen auszuschliessen, wenn einmal das Erkenntnissresultat seinem individuellen Empfinden entsprach. Denn der Denker in ihm blickte überlegen und fremd auf den Menschen in ihm herab und saugte demselben dadurch gewissermaassen einen Theil seiner Energie aus, und mit der Energie den Egoismus. An dessen Stelle gab es in diesem Charakter nichts als eine tiefe, lautere, unbegrenzte Güte des Wesens, deren Aeusserungen in einem interessanten und ergreifenden Gegensatz standen zu der kalten Nüchternheit und Härte seines Denkens. Nietzsche aber besass umgekehrt jene hochfliegende Selbstliebe, die sich selbst so lange in ihre Erkenntnissideale hinein verlegt, bis sie sich fast mit ihnen verwechselt und der Welt mit der Begeisterung des Apostels und Bekehrers gegenübertritt.

So lag hinter aller theoretischen Uebereinstimmung der Freunde eine um so tiefere Verschiedenheit des Empfindens unter der Gedankenhülle verborgen. Was durchaus der natürliche Ausdruck der geistigen Eigenart des Einen war, war für den Andern der volle Gegensatz der seinigen; aber eben darum Beiden dasselbe Ideal. Nietzsche schätzte und überschätzte an Rée, was ihm selbst am schwersten fiel, weil eben für ihn in einem solchen Selbstzwang wieder die innere Bedeutung seiner Wandlung lag: »Mein lieber Freund und Vollender!« nennt er ihn deshalb in einem Briefe, »wie sollte ich es auch aushalten, ohne von Zeit zu Zeit meine eigene Natur gleichsam in einem gereinigten Metall und in einer erhöhtem Form zu sehen,--ich, der ich selber Bruchstück---- --bin und durch selten, selten gute Minuten in das bessere Land hinausschaue, wo die ganzen und vollständigen Naturen wandeln!«

Aber diese von sich selbst absehende Hingebung ist nur der Weg, auf dem er sich innerhalb einer neuen Weltanschauung zu einem eigenen neuen Selbst durchringt; es ist nur der leidende Zustand, in dem er den aufgenommenen fremden Geistessamen zu seinem eignen lebensvollen Originalgeist umschafft und ausgestaltet. Es sind wie immer die Geburtswehen, die seine neue Schöpfung begleiten und es ihm verbürgen, dass er sich mit; seinem ganzen Wesen und allen seinen Kräften in ihr; ausleben und erneuern wird.

Die Geschichte also, wie Nietzsche sich in dieser Wandlung entwickelt und sie wieder verlässt, ist wesentlich eine Geschichte seines innern Erlebens, seiner Seelenkämpfe. In den hierhergehörigen Werken,--von seinem Erstgeborenen und Schmerzenskinde »Menschliches, Allzumenschliches« an, bis hinein in die tiefbewegte freudige Stimmung der »Fröhlichen Wissenschaft«, die gewissermassen schon der folgenden Geistesperiode angehört, liegt diese Entwicklung vor uns ausgebreitet. In ihnen allen hat er in einer Reihe von Aphorismensammlungen das »Bild und Ideal des Freigeistes« aufrichten wollen, des freien Geistes in seinen Gedanken über alle Gebiete des Wissens und des Lebens und noch mehr in der Fülle seiner Gedankenerlebnisse selbst. Die Grundstimmung, aus der ein jedes dieser Bücher hervorgegangen ist, prägt sich jedesmal als das eigentlich Charakteristische an demselben schon im Titel aus. Niemals sind Nietzsches Titel zufällig, indifferent oder abstractem Stoff entnommen, sie sind ganz und gar Bilder innerer Vorgänge, ganz und gar Symbole. So fasste er auch den Grundinhalt seiner einsamen Denkerexistenz am Schluss der Siebzigerjahre in wenigen Worten zusammen, als er auf das Titelblatt des zweiten Werkes schrieb: »Der Wanderer und sein Schatten« (Chemnitz 1880, Ernst Schmeitzner). Aus der Hitze der ersten, leidenschaftlichen Kämpfe ist er hier in die Einsamkeit seiner selbst eingekehrt; aus dem Krieger wurde ein Wanderer, der statt feindseliger Angriffe auf die verlassene Geistesheimath nunmehr das Land seiner freiwilligen Verbannung danach durchforscht, ob der steinige Boden sich nicht anbauen lasse, ob nicht auch er irgendwo seine fette Erdkrume besitze. Der laute Zwiespalt mit dem Gegner hat sich in die Stille eines Zwiegesprächs mit sich selbst aufgelöst: der Einsame hört seinen eigenen Gedanken zu wie einer mehrstimmigen Unterhaltung, er lebt in ihrer Gesellschaft wie unter ihrem ihn überall hin begleitenden Schatten. Noch

erscheinen sie ihm düster, einförmig und gespenstisch, ja, so hoch und drohend emporgewachsen, wie es Schattengebilde nur sind, wenn die Sonne im Untergang steht. Aber nicht lange mehr, denn seine Nähe streift ihnen allmählich alles Schattenhafte ab: was Gedanke war und farblose Theorie, das erhält Klang und Blick, Gestalt und Leben. Ist dies doch der innere Process seiner Aneignung und Umschaffung des Neuen und Ungewohnten: dass er ihm Leben einhaucht, dass er ihm zu voller Lebensfülle verhilft. Man möchte sagen: Nietzsche wählt sich die düstersten Gedankenschatten aus, um sie mit seinem eigenen Blut zu nähren, um sie, sei es auch unter Wunden und Verlusten, zuletzt dennoch zu seinem eigenen lebendigen Selbst verwandelt zu sehen, zu seinem Doppel-Selbst.

In dem Maasse als die Gedanken, mit denen er sich umgiebt, von dem ganzen Reichthum seines Wesens in sich aufnehmen, in dem Maasse als sie sich langsam mit der ganzen wunderbaren Kraft und Gluth desselben sättigen, wird die Stimmung immer gehobener und getroster. Man fühlt: hier geht Nietzsche Schritt um Schritt den Weg zu sich selbst, beginnt heimisch zu werden in seiner neuen »Haut«, beginnt sich in seiner Eigenart auszuleben, ihm ist wie einem Wanderer, der nach harter Mühsal endlich nach Hause kommt. Er will nicht mehr dasselbe Ziel des Denkens erreichen, wie sein Genosse Paul Rée, er will _das Seine_: dies hört man sogar schon aus Briefen heraus, in denen er immer noch den Theoretiker bewundert: »Immer mehr bewundere ich übrigens, wie gut gewappnet Ihre Darstellung nach der logischen Seite ist. Ja, so etwas kann ich nicht machen; höchstens ein bischen seufzen oder singen,--aber beweisen, dass es Einem wohl im Kopfe wird, das können Sie, und daran ist hundertmal mehr gelegen.«

In solchem »Singen und Seufzen« hatte sich gerade die eigene Genialität seinem Bewusstsein aufgedrängt, als die Gabe zu den herrlichsten Klagegesängen und Siegeshymnen, die jemals eine Gedankenschlacht begleiteten, als die Schöpfergabe, auch noch den nüchternsten, den hässlichsten Gedanken in innere Musik umzusetzen. Lebte doch der Musiker in ihm sich nicht mehr auf eigene Kosten aus, er ging mit auf, ein Einzelton, in der neuen grossen Melodie des Ganzen.

Und dies giebt in der That seinen Werken und Gedanken zu dieser Zeit noch eine ganz besondere Bedeutung: die neue Einheitlichkeit, die sein Wesen dadurch gewonnen hat, dass alle seine Triebe und Talente allmählich dem einen grossen Ziele des Erkennens dienstbar gemacht worden sind. Der Künstler, der Dichter, der Musiker Nietzsche, anfangs gewaltsam zurückgedrängt und unterdrückt, beginnt wieder sich Gehör zu verschaffen, aber unterthan dem Denker in ihm und dessen Zielen;-- --dies hat ihn dazu befähigt, von seinen neuen Wahrheiten in einer Weise zu »singen und zu seufzen« die ihn zum ersten Stilisten der Gegenwart erhoben haben.[11] Seinen Stil auf Ursachen und Bedingungen hin prüfen ist daher mehr, als die blosse Ausdrucksform seiner Gedanken untersuchen: es bedeutet, Nietzsche in seinem innersten Grundwesen belauschen. Denn der Stil dieser Werke ist entstanden durch die opferwillige und begeisterte Verschwendung grosser künstlerischer Talente zu Gunsten des strengen Erkennens,--durch das Bestreben, _nur_ dieses strenge Erkennen und nichts als dieses auszusprechen, aber nicht in abstracter Allgemeinheit, sondern in individualisirtester Nüancirung,--so wie es sich in allen Regungen einer ergriffenen und erschütterten Seele wiederspiegelt. Die lebendigste Innerlichkeit und Fülle hatte Nietzsche schon in den Werken seiner ersten Geistesperiode in vollendete Form zu giessen verstanden,--aber erst jetzt lernte er, sie mit der Schärfe und Kälte nüchternen Denkens zu verbinden: wie ein goldener Ring umschliesst dieses die Lebensfülle in einem jeden seiner Aphorismen und verleiht ihnen gerade hierdurch ihren eigenthümlichen Zauber. So schuf Nietzsche gewissermaassen einen _neuen Stil_ in der Philosophie, die bis dahin nur den Ton des Wissenschafters oder die dichterische Rede des Enthusiasten vernommen hatte: er schuf den Stil des _Charakteristischen_, der den Gedanken nicht nur als solchen, sondern mit dem ganzen Stimmungsreichthum seiner seelischen Resonanz ausspricht, mit all den feinen und geheimen Gefühlsbeziehungen, die ein Wort, ein Gedanke weckt. Durch diese Eigenart meistert Nietzsche nicht nur die Sprache, sondern hebt zugleich über die Grenze sprachlicher Unzulänglichkeit hinaus, indem er durch die Stimmung miterklingen lässt, was sonst im Worte stumm bleibt.

In keines Andern Geist aber konnte das bloss Gedachte so völlig zu etwas wirklich Erlebtem werden, wie in Nietzsches Geist, denn keines Andern Leben ging je so völlig darin auf, mit dem ganzen innern Menschen am Denken schöpferisch zu werden. Seine Gedanken hoben sich nicht, wie es gewöhnlich der Fall ist, vom wirklichen Leben und dessen Ereignissen _ab_: sie _machten_ vielmehr das eigentliche und einzige Lebensereigniss dieses Einsamen _aus_. Und dem gegenüber erschien ihm auch der lebensvollste Ausdruck, den er für sie fand, noch blass und leblos: »Ach, was seid ihr doch, ihr meine geschriebenen und gemalten Gedanken!« so klagt er in dem schönen Schluss-Aphorismus von »Jenseits von Gut und Böse« (296). »Es ist nicht lange her, da wart ihr noch so bunt, jung und boshaft, voller Stacheln und geheimer Würzen, dass ihr mich niesen und lachen machtet--und jetzt?-- -- --Welche Sachen schreiben und malen wir denn ab, wir Mandarinen mit chinesischem Pinsel, wir Verewiger der Dinge, welche sich schreiben _lassen_, was vermögen wir denn allein abzumalen? Ach, immer nur Das, was eben welk werden will und anfängt, sich zu verriechen! Ach, immer nur abziehende und erschöpfte Gewitter und gelbe späte Gefühle! Ach, immer nur Vogel,

die sich müde flogen und verflogen und sich nun mit der Hand haschen lassen,--mit _unserer_ Hand!--Und nur euer _Nachmittag_ ist es, ihr meine geschriebenen und gemalten Gedanken, für den allein ich Farben habe, viel Farben vielleicht, viel bunte Zärtlichkeiten und fünfzig Gelbs und Brauns und Grüns und Roths:--aber Niemand erräth mir daraus, wie ihr in eurem Morgen aussahet, ihr plötzlichen Funken und Wunder meiner Einsamkeit, ihr meine alten, geliebten-- -- --_schlimmen_ Gedanken!«

Es gehört ganz wesentlich dazu, dass man sich Nietzsche bei seinen stillen und einsamen Wanderungen vorstelle, ein paar Aphorismen mit sich herumtragend als das Resultat langer stummer Selbstunterhaltung,--nicht über den Schreibtisch gebückt, nicht mit der Feder in der Hand:

»Ich schreib nicht mit der Hand allein: Der Fuss will stets mit Schreiber sein.«

singt er in der Fröhlichen Wissenschaft (Scherz, List und Rache 52). Gebirge und Meer umgeben ihn bei seinen Gedanken-Wandelungen als der wirkungsvolle Hintergrund für die Gestalt dieses Einsamen. Am Hafen von Genua träumte er seine Träume, sah eine neue Welt am verhüllten Horizont empordämmern in der Morgenröthe und fand das Wort seines Zarathustra (II 5): »-- --aus dem Überflüsse heraus ist es schön hinaus zu blicken auf ferne Meere.« Im Engadiner Gebirge aber erkannte er sich selbst wie in einer Wiederspiegelung von Kälte und Gluth, aus deren Mischung alle seine Kämpfe und Wandlungen hervorgegangen waren. »In mancher Natur-Gegend entdecken wir uns selber wieder, mit angenehmem Grausen; es ist die schönste Doppelgängerei,« sagt er davon (Der Wanderer und sein Schatten 338), »-- -- --in dem gesammten-- -- --Charakter dieser Hochebene, welche sich ohne Furcht neben die Schrecknisse des ewigen Schnees hingelagert hat, hier, wo Italien und Finnland zum Bunde zusammengekommen sind und die Heimath aller silbernen Farbentöne der Natur zu sein scheint: Von diesem Ort mit seinen »kleinen, abgelegenen Seen,« aus denen ihn »die Einsamkeit selber mit ihren Augen anzusehen schien,« sagt er auch in einem Briefe: »Seine Natur ist der meinigen verwandt, wir wundem uns nicht über einander, sondern sind vertraulich zusammen.«

Aeusserlich betrachtet, hatte ihn allerdings sein Kopf- und Augenleiden gezwungen, rein aphoristisch zu arbeiten, aber auch seiner geistigen Eigenart entsprach es immer mehr, seine Gedanken nicht in der fortlaufenden Kette vor sich zu sehen, wie man sie, systematisch arbeitend, auf dem Papier fixirt, sondern ihnen zuzuhören wie in einem Gespräch zu Zweien, einem immer wieder abgebrochenen und immer wieder aufgenommenen, von Einzelheiten ausgehenden Dialog,--der seinen »Ohren für Unerhörtes« (Also sprach Zarathustra I 25), vernehmbar wurde gleich gesprochenem Wort.

»Schreiben kann ich nicht, obschon ich es herzlich gern thun möchte,« schreibt er auf einer Postkarte (Januar 1881 aus Italien). »Ach, die _Augen_! Ich weiss mir damit gar nicht mehr zu helfen, sie halten mich förmlich _mit Gewalt ferne_ von der Wissenschaft--und was habe ich ausserdem! Nun, die Ohren! könnte man sagen.« Aber mit diesem Lauschen und Horchen nahm er es sehr genau, und es giebt keinen Satz in seinen Büchern, auf den nicht Anwendung findet, was er einmal in einem seiner Briefe schreibt: »Ich bin immer von sehr feinen Sprachdingen occupirt; die letzte Entscheidung über den Text zwingt zum scrupulösesten »Hören« von Wort und Satz. Die Bildhauer nennen diese letzte Arbeit: ad unguem.«

Als Nietzsche im Jahre 1881 sein drittes Werk auf positivistischer Grundlage, die »_Morgenröthe_« (Chemnitz 1881, Ernst Schmeitzner), vollendete, da war in ihm der Process einer Verlebendigung und Individualisirung der aufgenommenen Theorien schon vollkommen zum Abschluss gelangt Dieses Werk und in ebenso hohem Grade das nächstfolgende erscheinen mir daher als die bedeutendsten und gehaltvollsten seiner mittleren Geistesperiode. Denn in ihnen ist es ihm gelungen, praktisch den übertriebenen Intellektualismus zu überwinden, dem er sich in »Menschliches, Allzumenschliches« noch ohne Weiteres in freiwilliger Selbstmarterung unterworfen hatte,-- es ist ihm gelungen, denselben innerlich und individuell zu ergänzen und menschlich zu vertiefen, ohne die wissenschaftliche Grundlage, auf die er sich gestellt hatte, unter den Füssen zu verlieren,--ohne die Strenge der Erkenntnissmethode zu lockern, mit der er seinen Problemen nachging. Nietzsches eigene Natur hatte ihm geholfen, die Einseitigkeiten und Härten seiner praktischen Philosophie zu widerlegen, und einen lebensvolleren Typus des Erkennenden aus den Gedankenkämpfen der letzten Jahre herauszugestalten. Denn die Unterordnung des Affektlebens unter das Denken hatte sich, wie wir sahen, in Nietzsche vermöge einer so gewaltigen inneren Hingebung an das Wahrheitsideal vollzogen, dass gerade dadurch ihm die _Bedeutung des Affectlebens für das Denken aufgehen musste_. Unmerklich verschob sich ihm damit der Hauptaccent von dem rein intellectuellen Vorgang auf die Macht des Gefühls, die sich in den Dienst auch noch der nüchternsten und hässlichsten Wahrheiten zu stellen vermag, bloss weil sie _Wahrheiten_ sind. So beginnt denn schon wieder an Stelle der Verstandeskraft die Seelenkraft zu dem zu werden, was den Rang des Denkers als Menschen bestimmt. Und es ist leicht zu sehen, wie auf diesem Wege allmählich der Werth einer ganz neuen Denkweise Nietzsche aufgehen musste,--einer allem Verstandesmässigen überhaupt abholden Philosophie.

In keinem seiner Bücher lassen sich so sehr wie in der »Morgenröthe« die feinen Uebergänge und Gedankenverbindungen nachweisen, die von seiner positivistischen Geistesperiode in die darauf folgende einer mystischen Willensphilosophie hinüberleiten. Der _Uebergang_ von einem Alten zu einem Neuen macht, ähnlich wie im »Menschlichen, Allzumenschlichen«, den hohen Reiz und Werth des Buches aus. Aber in ganz entgegengesetzter Weise wie dort, wo wir _theoretisch_ der vollendeten Thatsache eines Gesinnungswechsels gegenüberstehen, in den sich das leidende Gefühl erst allmählich hineinzufinden sucht. Hier dagegen wird jede Möglichkeit einer _Theorien-Aenderung_ noch mit Heftigkeit zurückgewiesen als »Versuchungen des wissenschaftlichen Menschen«, während die Seele schon begehrlich und tastend ihre Fühlhörner immer wieder nach dem Verbotenen ausstreckt, wie sehr der Verstand es ihr auch verwehrt. So sind es Aeusserungen leisen Schwankens, einzelne Ausbrüche tief erregten Seelenlebens, denen wir ahnungsvoll das Zukünftige entnehmen, weil sie in diesem Gemüthszustand eine ungewollte Naivetät und Unmittelbarkeit besitzen, die Nietzsche sonst vollständig abgeht. Hier _verräth_ er sich fortwährend, ohne es zu ahnen, indem er den Anlass zu jeder »Versuchung« prüft und tadelt,--er entblösst das Geheime und Verborgene seines Innenlebens, sodass wir zu sehen glauben, wie sein vergangenes und sein zukünftiges Selbst mit einander hinter dem Rücken der scheinbar unangetasteten Verstandesphilosophie das Bekenntniss heimlichen Höffens und Verlangens austauschen. In der Auflehnung gegen dieses heimliche Hoffen und Verlangen ruft er sich in dem Aphorismus »Nicht die Leidenschaft zum Argument der Wahrheit machen!« (Morgenröthe 543) die Worte zu: »Oh, ihr-- -- --edlen Schwärmer, ich kenne euch!-- -- -- -- --Bis zum Hass gegen die Kritik, die Wissenschaft, die Vernunft treibt ihr es!-- -- --Farbige Bilder, wo Vernunftgründe noth thäten! Gluth und Macht der Ausdrücke!-- -- --Ihr versteht euch darauf, zu beleuchten und zu verdunkeln, und mit Licht zu verdunkeln!-- -- -- -- --Wie dürstet ihr darnach, Menschen in diesem Zustande --es ist der der Lasterhaftigkeit des Intellectes --zu finden und an ihrem Brande eure Flammen zu entzünden!-- -- --« Erst in Nietzsches letzter Philosophie begreift man ganz, wie sehr er selbst es ist, an den er die Mahnung richtet: »Nichts wäre verkehrter, als abwarten wollen, was die Wissenschaft über die ersten und letzten Dinge einmal endgültig feststellen wird,-- -- --Der Trieb, auf diesem Gebiete durchaus _nur Sicherheiten_ haben zu wollen, ist ein _religiöser Nachtrieb_, nichts Besseres,--« (Der Wanderer und sein Schatten 16).

Aber inmitten zahlreicher derartiger Auflehnungen gegen sich selbst, bricht dann auch vereinzelt der Ueberdruss durch an der strengen Selbstbescheidung des Verstandes-Erkennens und an--»der Tyrannei des Wahren«:--»ich wüsste nicht, warum die Alleinherrschaft und Allmacht der Wahrheit zu wünschen wäre;-- -- -- --man muss sich von ihr im Unwahren ab und zu _erholen_ können,--sonst wird sie uns langweilig,--« (Morgenröthe 507). Und sehnsüchtig ruft er sogar den von ihm geschmähten Künstlern zu: »Oh, wollten doch die Dichter wieder werden, was sie einstmals gewesen sein sollen:--_Seher_, die uns Etwas von dem _Möglichen_ erzählen! Wollten sie uns von den _zukünftigen Tugenden_ Etwas vorausempfinden lassen! Oder von Tugenden, die nie auf Erden sein werden, obschon sie irgendwo in der Welt sein könnten,--von purpurnglühenden Sternbildern und ganzen Milchstrassen des Schönen! Wo seid ihr, ihr Astronomen des Ideals?« (Morgenröthe 551).

So sehen wir in der »Morgenröthe« nicht nur, wie er gegen die heimlich in ihm aufsteigenden Gelüste ankämpft, sondern wie er ihnen auch schon nachgiebt, in der hingegebenen Sehnsucht nach etwas Neuem, in der Ahnung eines vor ihm aufsteigenden Erkerintnisszieles. Beides ist in charakteristischer Weise mit einander vermischt, insofern ja die höchste Gluth der Seele, die Nietzsche für ein Erkenntnissideal aufwendet, bei ihm stets den bereits beginnenden Niedergang desselben Ideals anzeigt, dem er sich zur Zeit der Unbeirrtesten Ueberzeugung von dessen Wahrheit und Nothwendigkeit nur mit Widerstreben gefügt hatte. Dies ist die »Sonnenbahn der Idee«, wie er sie selbst auf Grund eigener Erfahrung geschildert hat: »Wenn eine Idee am Horizonte eben aufgeht, ist gewöhnlich die Temperatur der Seele dabei sehr kalt. Erst allmählich entwickelt die Idee ihre Wärme, und am heissesten ist diese-- --, wenn der Glaube an die Idee schon wieder im Sinken ist.« (Der Wanderer und sein Schatten 207.) Sich selbst aber charakterisirt er in derselben Schrift (331) mit den Worten: »Jene Personen, welche langsam beginnen und schwer in einer Sache heimisch werden, haben nachher mitunter die Eigenschaft der stätigen Beschleunigung,--sodass zuletzt Niemand weiss, wohin der Strom sie noch reissen kann.«

Die Macht der langsam und schwer, aber um so verhängnissvoller und unwiderstehlicher entzündeten Innerlichkeit,-- diese überschäumende Fülle, musste ihn schliesslich dem Positivismus entfremden und zu neuen Gedankenfernen führen. Schon sieht er im vollsten Gegensatz zur früher verherrlichten »Affectlosigkeit« sein Ideal darin, dass der Erkennende »der Mensch Eines hohen Gefühls, die Verkörperung einer einzigen grossen Stimmung« sei; es soll ihm »eben Das der gewöhnliche Zustand« sein, »was bisher als die mit Schauder empfundene Ausnahme hier und da einmal in unseren Seelen eintrat: eine fortwährende Bewegung zwischen hoch und tief und das Gefühl von hoch und tief, ein beständiges Wie-auf-Treppen-steigen und zugleich Wie-auf-Wolken-ruhen«. (Fröhliche Wissenschaft 288.) Vor einem solchen »Erkennenden« steht jetzt als Lockung" was ihm ehemals als Gefahr galt: »Einmal den Boden verlieren! Schweben! Irren! Toll sein!« (Fröhliche Wissenschaft 46.) Und in der

»Morgenröthe« (271) heisst es unter der Ueberschrift »Feststimmung«: »Gerade für jene Menschen, welche am hitzigsten nach Macht streben, ist es unbeschreiblich angenehm, sich _überwältigt_ zu fühlen! Plötzlich und tief in ein Gefühl, wie in einen Strudel hinabzusinken! Sich die Zügel aus der Hand reissen zu lassen, und einer Bewegung wer weiss wohin? zuzusehen!«

In einer solchen Feststimmung des Ueberflusses und Ueberschusses, langsam aus den nüchternsten Erkenntnissen herausgeschöpft und angesammelt,--in einem solchen Zauber der Ausspannung und Erholung nach langem Arbeitstag, gleitet Nietzsche in eine Welt der Mystik hinein. In einer solchen Selbstüberwältigung besiegt der eigene Sieg den Sieger. Es ist das »_Glück des Gegensatzes_«, das er darin sucht, des Gegensatzes zum Kühlen, Strengen, Verstandesmässigen der positivistischen Denkweise: die Erkenntniss neu gegründet auf die begeisterten Eingebungen des Gefühls, des Affectlebens, und unterthan gemacht dem Schaffensdrang des Willens.

Diese »Morgenröthe« ist kein blasses, kaltes, rückwärts leuchtendes Aufklärungslicht mehr,--hinter ihr erhebt sich schon eine wärmende, lebenzeugende Sonne, und während er selbst noch im grauen Zwielicht der Dämmerung dasteht, sind seine Augen schon sehnsüchtig auf diesen hellen verheissenden Schein am Horizont gerichtet. »Es gibt so viele Morgenröthen, die noch nicht geleuchtet haben!« schrieb er mit den Worten des Rig-veda als Motto auf das Titelblatt, ohne dass er noch zu glauben wagte, er selbst sei berufen, ein solches Leuchten am Himmel der Erkenntniss zu entzünden, Das Buch enthält »Gedanken über die moralischen Vorurtheile«, wie dem Titel ergänzend beigefügt ist, und damit will es scheinbar noch dem zersetzenden, negirenden Geiste der vorhergehenden Werke angehören; aber darüber schwebt schon ein träumender, hoffender Geist, der zwar nur hier und da vollen Ausdruck findet, aber schweigend sinnt, wie es zu ermöglichen wäre, aus allen _Vorurtheilen_ heraus zu neuen _Werthurtheilen_ zu gelangen, wie es möglich wäre, zum Schöpfer neuer Werthe zu werden. »Wenn endlich auch alle Bräuche und Sitten vernichtet sind, auf welche die Macht der Götter, der Priester und Erlöser sich stützt, wenn also die Moral im alten Sinne gestorben sein wird: dann kommt--ja was kommt dann?« (Morgenröthe 96.)

Der Sturz, der Abbruch des Alten ist eben kein Ende mehr, vielmehr ein Ausblick, ein Anfang und ein Appell an alle besten Geisteskräfte. »Es kommt eben noch etwas,--die Hauptsache kommt noch!« verspricht die Morgenröthe und wird immer heller und röther.

Ein Jahr nach Veröffentlichung der »Morgenröthe« schrieb Nietzsche denn auch zum ersten Mal wieder über neue philosophische Hoffnungen und Fempläne:

-- »Nun, liebste Freundin, Sie haben immer für mich ein gutes Wort in Bereitschaft, es macht mir grosse Freude, Ihnen zu gefallen. Die fürchterliche Existenz der Entsagung, welche ich führen muss und welche so hart ist, wie je eine asketische Lebenseinschnürung, hat einige Trostmittel, die mir das Leben immer noch schätzenswerter machen als das Nichtsein. Einige grosse Perspectiven des geistig sittlichen Horizonts sind meine mächtigste Lebensquelle. Ich bin so froh darüber, dass gerade auf diesem Boden unsere Freundschaft ihre Wurzeln und Hoffnungen treibt. Niemand kann so von Herzen sich über Alles freuen, was von Ihnen gethan und geplant wird!

Treulich Ihr Freund

F. N.«

Und kurz darauf ruft er am Schlüsse eines anderen Briefes aus:

»Auch ich habe jetzt Morgenröthen um mich, und keine gedruckten! Was ich nie mehr glaubte,-- -- -- --das erscheint mir jetzt als möglich,--als die goldene Morgenröthe am Horizonte all' meines zukünftigen Lebens-- -- --.«

Diese Stimmung, die mit der Gewalt der Sehnsucht eine neue Geisteswelt fern am Horizont heraufbeschwor, damit sie Ersatz böte für alles, was Zweifel und Kritik zerstört hatten, klingt am deutlichsten durch in den Schlussworten der »Morgenröthe«, in denen Nietzsche seine kritische und negirende Denkrichtung selber als einen _Wegweiser_ zu neuen Idealen aufzufassen sucht:

»Warum doch gerade in dieser Richtung, dorthin, wo bisher alle Sonnen der Menschheit _untergegangen_ sind? Wird man vielleicht uns einstmals nachsagen, dass auch wir, _nach Westen steuernd, ein Indien zu erreichen hofften_,--dass aber unser Loos war, an der Unendlichkeit zu scheitern? Oder, meine Brüder? Oder--? (Morgenröthe, Schluss.)

Als Nietzsche im Jahre 1882 seine »Fröhliche Wissenschaft« vollendete, da war ihm sein Indien bereits zur Gewissheit geworden: er glaubte gelandet zu sein an den Küsten einer fremden, noch namenlosen, ungeheuren Welt, von der nichts anderes bekannt sei,

als dass sie jenseits alles dessen liegen müsse, was von Gedanken angefochten, von Gedanken zerstört werden kann. Ein weites, scheinbar uferloses Meer zwischen ihm und jeder Möglichkeit einer erneuten begrifflichen Kritik,--jenseits aller Kritik meinte er festen Boden gefasst zu haben.

Der übermüthige Jubel dieser Gewissheit klingt in den Versen wieder, die er in das Widmungs-Exemplar seiner »Fröhlichen Wissenschaft« schrieb:

»Freundin, sprach Columbus, traue Keinem Genuesen mehr! Immer starrt er in das Blaue Fernstes zieht ihn allzusehr! Wen er liebt, den lockt er gerne Weit hinaus in Raum und Zeit,-- Üeber uns glänzt Stern bei Sterne Um uns braust die Ewigkeit.«

Aber er irrte sich in Bezug auf die völlige Neuheit und Jenseitigkeit des Landes,--es war der umgekehrte Irrthum des Columbus, der, das Alte suchend, das Neue fand. Denn Nietzsche war in der That, ohne es zu bemerken, nach einer Weltumseglung von der entgegengesetzten Seite an die Küste eben desjenigen Landes zurückgelangt, von welchem er ursprünglich ausgegangen, und welches er für immer im Rücken gelassen zu haben glaubte, als er sich von der Metaphysik abwandte. Wir werden es an allen Werken seiner letzten Geistesperiode erkennen, in wiefern sie wieder aus jenem alten Boden hervorgewachsen sind, wenn auch in ihrem Wachsthum und ihrer Eigenart beeinflusst durch die Erfahrungen der letzten Jahre. Unstreitig hatte ein Hauptwerth der positivistischen Denkrichtung für Nietzsche darin gelegen, dass sie ihm wenigstens innerhalb gewisser Grenzen wirklich Spielraum für alle diese Stimmungs-Uebergänge und Gefühlsschwankungen zu bieten vermochte und ihn dadurch eine Zeit lang festhielt. Sie schlug ihn nicht in Fesseln, wie es die Metaphysik nothwendig gethan hatte, sondern wies ihm nur eine Wegerichtung; sie bürdete ihm nicht ein Erkenntnisssystem auf, sondern gab ihm im wesentlichen nur eine neue Erkenntnissmethode an die Hand. Darum war auch seine Emancipation von ihr keine so gewaltsame und plötzliche wie seine Wagnerwandlung, sie war, anstatt eines Fesselsprengens, ein allmähliches Sich-Verfliegen und Sich-Verlaufen,--»all mein Wandern und Bergsteigen: eine Noth war's nur und ein Behelf des Unbeholfenen:--_fliegen_ allein will mein ganzer Wille!« (Also sprach Zarathustra III 19.) »Ich habe gehen gelernt: seitdem lasse ich mich laufen!« (I 54.) Aber wohl vollzog sie sich ebenso unaufhaltsam und unwiderruflich, wie die vorhergehende Wandlung. Denn über die rein empiristische Betrachtungsweise seiner Probleme, über die principielle Beschränkung auf das Erfahrungsgebiet, musste Nietzsche irgend wann einmal wieder hinaus; einer Philosophie der »letzten und höchsten Dinge« in irgend einer Form konnte er, der ganzen Art seines Geistes nach, nicht dauernd entsagen. Es konnte sich im Grunde nur darum handeln, auf welchem stillen. Seitenweg er sich wieder dorthin zurückschleichen würde,--wo die Götter und die Uebermenschen hausen.

Nietzsche schreibt einmal an Rée:

»Ach, liebster, guter Freund, mit dem schmerzlichsten Bedauern lese ich-- -- --die Nachricht Ihres Krankseins. Was soll aus uns werden, wenn wir in unseren besten Jahren so elend dahinwelken?-- -- --_Will uns das Schicksal ein schönes Greisenalter aufsparen, weil unsere Denkweise diesem am natürlichsten, wie eine gesunde Haut, anliegt?_ Aber müssten wir da nicht zu lange warten? Die Gefahr wäre, dass wir die Geduld verlören--.«

Er verlor sie völlig. »Schon krümmt und bricht sich mir die Haut!« sang er gleich darauf in einem schlechten Versehen der »Fröhlichen Wissenschaft«, und unter der »Greisenhaut« des »affectlosen Erkennenden« regte sich machtvoll jener Verjüngungsdrang, aus welchem heraus Nietzsche noch in seinem Untergange eine Apotheose des Lebens, des ewigen Lebens, schrieb.

Das Schicksal brauchte ihm kein Greisenalter auf-zusparen--.

Aber als die Basis der neuen Lehre, die er verkünden wollte, als das einzige zuverlässige Fundament, auf dem sie errichtet werden könnte, dachte sich Nietzsche damals doch noch eine wissenschaftliche Begründung. Gerade in dieser Zeit des Ueberganges sehen wir ihn daher von dem lebhaftesten Verlangen ergriffen, sich grossen zusammenhängenden Forschungen widmen zu dürfen, denen er seit langen Jahren hatte entsagen müssen. Mit nimmermüdem Interesse und Antheil verfolgte er die Studien, welche Rée seit 1878 unternommen hatte, um durch sie die Grundgedanken seines ersten moralphilosophischen Buches zu erweitern und zu erhärten. Als dieser 1881 Nietzsche mittheilte, dass er sein neues Werk noch vor Ablauf des Jahres zu vollenden hoffe, empfing er die beglückte Antwort: »Dieses selbe Jahr soll nun auch das Werk ans Licht bringen, an dem ich im Bilde des Zusammenhanges und der goldenen Kette meine arme, stückweise Philosophie vergessen darf! Welches herrliche Jahr 1881!«

Die in Frage stehende Schrift: »Die Entstehung des Gewissens« (Berlin 1885) wurde jedoch erst vier Jahre später völlig beendigt, nachdem Nietzsche inzwischen längst den letzten Rest seiner »Freigeisterei« von sich abgestreift und die abgelegte Haut auch

schon mit der gewöhnlichen Energie verbrannt hatte. Aber durch den regen Antheil, den er so lange an Rées Studien zu jenem Buche genommen, hat es eine bestimmte Bedeutung für sein Gedankenleben gewonnen. Doch stützt er sich jetzt nicht in demselben Sinne auf »Die Entstehung des Gewissens«, wie er sich einst in »Menschliches, Allzumenschliches« auf den »Ursprung der moralischen Empfindungen« gestützt hatte. Darauf beruht überhaupt ein Unterschied zwischen der letzten Geistesperiode Nietzsches und der vorhergehenden positivistischen, dass er sich nicht mehr darauf beschränkt, einzelne gegebene Theorien in ihrer inneren Bedeutsamkeit zum Ausdruck zu bringen, sondern dass er sich der kühnsten Entwickelung eines eigenen Systems hingiebt, dass er aus dem Aphoristischen, Vereinzelten hinausstrebt. Hatte die »freigeisterische« Richtung ihn dazu angetrieben, ihre Erkenntnisse in tiefstem Erleben und Empfinden zu verinnerlichen, so drängte nun die leidenschaftliche Gewalt dieses inneren Erlebens ihrerseits nach Entlastung in bestimmten Gedanken und Theorien; sie drängte danach, sich in neue geschlossene Weltbilder umzusetzen.

Im Sommer 1882 wurde Nietzsche dadurch zu dem Entschlüsse geführt, sich während einer Reihe von Jahren demjenigen Studium zu widmen, das ihm für den systematischen Ausbau seiner »Zukunftsphilosophie« unentbehrlich zu sein schien, dem Studium der Naturwissenschaften. Er wollte zu diesem Zwecke sein Leben im Süden aufgeben, um in Paris, Wien oder München Vorlesungen zu hören. Zehn Jahre lang sollte jede schriftstellerische Thätigkeit eingestellt werden, bis das Neue in ihm nicht nur völlig ausgereift, sondern auch auf wissenschaftlichem Wege als richtig erwiesen wäre.

Etwas später als Nietzsche fühlte auch Rée das Bedürfniss, sich mit den Naturwissenschaften auseinanderzusetzen, die ihnen Beiden bisher fremd geblieben waren. Er jedoch wünschte sie nicht als Material zum Ausbau eigener philosophischer Hypothesen heranzuziehen, sondern hatte, nach Vollendung seines Buches, das Verlangen, neue Gedanken frei auf sich wirken zu lassen und völlig aus seinem engeren Specialgebiete herauszutreten. So wandte er sich denn der Medicin zu, studirte noch einmal, und machte sein Staatsexamen als praktischer Arzt, mit der Absicht, sich längere Zeit der Psychiatrie zu widmen und auf diesem Umwege zu den Geisteswissenschaften zurückzukehren, Niemals standen sich die Freunde geistig ferner als damals, wo sie scheinbar noch einmal Dasselbe zu erstreben schienen: sie waren an den einander entgegengesetzten Polen ihres Wesens und Geistes angelangt.[12] Das spricht sich bezeichnend auch darin aus, dass die geplanten zehn Jahre des Schweigens für Nietzsche gerade diejenigen seiner grössten Productivität wurden, während Rée bis jetzt den Punkt noch nicht erreicht hat, auf dem sein altes Schaffen und sein neues Wissen in Eins verschmelzen und ihn zu neuer erhöhter Selbstthätigkeit anregen müssen.

Nietzsche war durch sein Kopfleiden an der Ausführung seiner Entschlüsse gehindert worden; schon der anbrechende Winter 1882 fand ihn wieder in seiner Einsiedlerklause zu Genua. Doch auch bei besserer Gesundheit wäre das Vorhaben nicht ausführbar gewesen. Denn Nietzsche befand sich nicht mehr in jenem abwartenden Zustande, in welchem der Geist noch Fremdes aufnehmen, sich störenden Einsichten willig unterordnen kann; er war schon viel zu stark productiv erregt, um noch von irgend etwas berührt zu werden, das ihn in seinem Drange zu schaffen hätte aufhalten können. Während er zur Entfesselung seiner Schaffenskraft einer ersten Befruchtung von aussen her bedurfte, sei es selbst unter Schmerzen und Selbstüberwindung, während er sich einer solchen fremden Erkenntniss gegenüber hingebend verhielt, in der Inbrunst der Verschmelzung mit ihr sein Selbst preisgab, erscheint er--einmal befruchtet--um so unzugänglicher und unbeeinflussbarer. Er ist ganz benommen vom eigenen Zustand und von Dem, was Leben in ihm gewinnen will. Richtet sich aber seine Aufmerksamkeit nach aussen, so geschieht es nur noch, um für das Leben, das aus ihm geboren werden soll, um jeden Preis Raum zu schaffen, keineswegs aber, um seine Existenzbedingungen noch einmal zu prüfen und in Frage zu stellen.

Der ihm durch seinen körperlichen Zustand zum zweiten Mal aufgezwungene Verzicht auf umfassende wissenschaftliche Studien führte dieses Mal zu dem entgegengesetzten Resultat wie zur Zeit seines Wagnerbruches und seiner positivistischen Periode. Damals war er die Veranlassung, dass Nietzsche, anstatt neue Theorien zu begründen, die von Anderen aufgenommenen innerlich auszuschöpfen und in ihren Seelenwirkungen festzustellen suchte. Jetzt hingegen wird er dadurch verleitet, die ihm fehlende theoretische Grundlage gewissermassen hinzuzudichten. Hierin liegt geradezu ein Grundzug der letzten Philosophie Nietzsches: das Bedürfniss, sich systematisch auszubreiten, als gelte es, den verschiedensten Wissensgebieten die Beweise für die Richtigkeit seines schöpferischen Gedankens zu entnehmen, in Wahrheit jedoch nur ein gewaltsames Raumschaffen für denselben: ein so souveränes Ausleben seiner Innerlichkeit, dass sich ihm unwillkürlich das ganze Weltbild zu einer Wiege seiner Schöpfung umgestaltet.

Dementsprechend gewinnen von jetzt an alle seine Lehren, so paradox dies klingen mag, einen um so persönlicheren Charakter, je allgemeiner gefasst sie erscheinen, je allgemeingiltigere Bedeutung sie beanspruchen. Zuletzt verbirgt sich ihr Hauptkern unter so vielen Schalen, ihr letzter Geheimsinn unter so vielen Masken, dass die Theorien, in denen er zum Ausdruck kommt, fast nur noch Bilder und Symbole inneren Erlebens sind. Endlich fehlt jeder Wille zur Uebereinstimmung und zur Verständigung mit

Anderen,--»Mein Urtheil ist mein Urtheil: dazu hat nicht leicht auch ein Anderer das Recht« (Jenseits von Gut und Böse 43)--und doch wird gleichzeitig dieses Urtheil zum Weltgesetz decretirt, zu einem Befehl an die ganze Menschheit. Denn so vollständig verschmilzt für Nietzsche zum Schlüsse innere Eingebung und Aussen-Offenbarung, dass er in seinem Innenleben das Weltganze zu umfassen wähnt, und sein Geist in mystischer Weise den Inbegriff des Seienden in sich zu enthalten, aus sich zu gebären glaubt.« Für mich--wie gäbe es ein Ausser-mir? Es gibt kein Aussen!« (Also sprach Zarathustra III 95.)

Entsprechend dem Umstande, dass Nietzsches letzte Schaffensperiode ganz und gar in der philosophischen Ausdeutung seines eigenen Seelenlebens besteht, nennt er »Die fröhliche Wissenschaft«, das Werk, welches sie einleitet, in einem seiner Briefe »das Persönlichste unter meinen Büchern«, und klagt noch kurz vor dem Druck der »Fröhlichen Wissenschaft« in einem anderen Briefe: »Das Manuscript erweist sich seltsamer Weise als unedirbar. Das kommt vom Princip des mihi ipsi scribo!«

In der That hat er wohl niemals so völlig für sich selbst geschrieben, als zu jener Zeit, wo er im Begriffe stand, seiner ganzen Weltbetrachtung sein eigenes Selbst unterzulegen, Alles aus seinem eigenen Selbst heraus zu erklären. So ist die Mystik der neuen Grundlehren Nietzsches wohl schon hier enthalten, aber noch verborgen im rein persönlichen Element, aus dem sie hervorging. In Folge dessen bilden diese Aphorismen Monologe, monologischer gemeint als sonst irgend etwas in Nietzsches Werken, gleichsam halblaute >Zwischenreden«, ja oft nur gedacht als ein stummes geistiges Mienenspiel, das weit mehr verstecken als verrathen soll. Die Gedanken der »Zukunftsphilosophie« reden schon daraus zu uns, aber sie umgeben uns noch gleich verschleierten Gestalten, deren Blick dunkel und räthselhaft auf uns ruht, und dies nicht, weil sie, wie in der »Morgenröthe«, nur Ahnungen zum Ausdrücke bringen und noch der festen Züge und sicheren Umrisse entbehren, sondern weil ihnen mit Absicht ein Schleier übergeworfen und Schweigsamkeit anbefohlen wurde. Mit dem Finger an der Lippe scheint Nietzsche hier vor uns zu stehen, und gerade daraus entnehmen wir, dass er uns Viel, dass er uns Alles zu bekennen wünscht.

Aber es wird ihm schwer, ohne Rückhalt davon zu sprechen, weil auch in diesem Falle sein Selbstbekenntniss zugleich wieder ein Schmerzensbekenntniss ist. Und in einem viel tieferen, viel schmerzvolleren Sinn als bisher führt uns diesmal die Philosophie Nietzsches hinein in die verborgenen Leiden und Qualen seines Erlebens, sodass, im Vergleiche hierzu, selbst die harten Kämpfe und Entsagungen seiner positivistischen Periode uns harmlos und gefahrlos Vorkommen werden. Auf den ersten Blick erscheint dies als ein Widerspruch, da Nietzsches letzte Philosophie gerade aus dem Drange he'rvorgegangen ist, an Stelle der ihm widerstrebenden positivistischen Theorien eine Weltanschauung aufzubauen, die seinem innersten Verlangen völlig entspräche. Insofern beginnt er in der That seine letzte Wandlung unter Jauchzen und Frohlocken. Aber man darf nicht vergessen, dass diese äusserste Selbsteinkehr, dieser Versuch, das Weltbild aus seinem Eigenbild zu construiren, Nietzsches_ Leiden an sich selbst zu Tage_ treten lässt, aus dem sein tiefster Wesensgrund besteht. Bisher hat er in seinen Erkenntnisswandlungen diesem Leiden an sich selbst dadurch zu entrinnen gesucht, dass er den einen Theil seines Selbst durch den anderen quälte und tyrannisirte, aber bei allen Wandlungen des theoretischen Menschen blieb unverwandelt und sich ewig gleich der praktische Mensch mit seinen inneren Nöthen. Jetzt erst, wo Nietzsche sich nicht mehr zwingt und kasteit, jetzt erst, wo er seiner Sehnsucht freie Worte giebt, begreift man ganz, in welcher Qual er lebte, hört man endlich den Schrei nach _Erlösung von sich selbst_,--nach seinem _Wesens-Gegensatz_, nach vollständiger und endgiltiger Verwandlung, Umwandlung,-- nicht einzelner Erkenntnisse nur, sondern des ganzen, des innersten Menschen. Man sieht förmlich, wie er hier, in Verzweiflung, aus sich selbst heraus und nach aussen greift, nach einem erlösenden Ideal, welches er aus einem solchen Wesens-Gegensatz zu formen sucht. Daher liess sich voraussehen: sobald Nietzsche seinen Seeleninhalt frei zum Weltinhalt umschuf, sobald er seinem intimsten Erleben die Weltgesetze entnahm, musste seine Philosophie ein tragisches Weltbild zeichnen: die Menschheit musste von ihm aufgefasst werden als eine an sich selbst leidende, an ihrer eigenen Entwicklung hoffnungslos krankende Zwittergattung, deren Daseinsberechtigung gar nicht in ihr selbst, sondern in einer schlechthin anderen, höheren, Uebermenschen-Gattung liege, zu der sie nur eine Brücke bilden solle. Das Endziel der Menschheit sei Untergang und Selbstaufopferung zu Gunsten dieses ihr entgegengesetzten Ideals.

Erst am Eingang zu Nietzsches letzter Philosophie wird daher völlig klar, bis zu welchem Grade es der religiöse Grundtrieb ist, der sein Wesen und Erkennen stets beherrschte. Seine verschiedenen Philosophien sind ihm ebensoviele Gott-Surrogate, die ihm helfen sollen, ein mystisches Gott-Ideal ausser seiner selbst entbehren zu können. Seine letzten Lehren enthalten nun das Eingeständniss, dass er dies nicht vermag. Und gerade deshalb stossen wir in seinen letzten Werken wieder auf eine so leidenschaftliche Bekämpfung der Religion, des Gottesglaubens und des Erlösungsbedürfnisses, weil er sich ihnen so gefährlich nähert. Hier spricht aus ihm ein Hass der Angst und der Liebe, mit dem er sich seine eigene Gottesstärke einreden, seine menschliche Hilflosigkeit ausreden möchte. Denn wir werden sehen, kraft welcher Selbsttäuschung und geheimen List Nietzsche endlich den tragischen Conflict seines Lebens löst,--den Conflict, des Gottes zu bedürfen und dennoch den Gott leugnen zu

müssen. Zuerst gestaltet er mit sehnsuchtstrunkener Phantasie, in Träumen und Verzückungen, visionengleich, das mystische Uebermenschen-Ideal, und dann, um sich vor sich selbst zu retten, sucht er, mit einem ungeheuren Sprung, sich mit demselben zu identificiren. So wird er zuletzt zu einer Doppelgestalt, halb kranker, leidender Mensch, halb erlöster, lachender Uebermensch. Das Eine ist er als Geschöpf, das Andere als Schöpfer, das Eine als Wirklichkeit, das Andere als mystisch gedachte Ueberwirklichkeit. Oft aber, während man seinen Reden darüber zuhört, empfindet man mit Grauen, dass er als Gegenstand der Anbetung hinstellt, was in Wahrheit auch für ihn nicht vorhanden ist, und man gedenkt seines Wortes, »-- -- --wer weiss, ob sich nicht bisher in allen grossen Fällen eben das Gleiche begab: dass die Menge einen Gott anbetete,--und dass der »Gott« nur ein armes Opferthier war!« (Jenseits von Gut und Böse 269.)

»Das Opferthier als Gott« ist wahrlich ein Titel, der über der letzten Philosophie Nietzsches stehen könnte und am deutlichsten den inneren Widerspruch enthüllt, der in ihr liegt,--jene Exaltation von Schmerz und Wonne, in der beide ununterscheidbar in einander fliessen. Wir haben vorher gesehen, inwiefern es eine Feststimmung war, in der Nietzsche in seine letzte Geisteswandlung hinüberglitt,-- eine Feierstimmung träumenden Rausches und Ueberflusses: wir sehen jetzt den Punkt, an welchem die Gewalt der inneren Erregung in den Schmerz überschlägt. Er war in jener ganzen Zeit, selbst in seinem Alltagsleben, erfüllt von einer Stimmung äusserster seelischer Ueberwältigung, in der man sogar der Ausgelassenheit fähig ist, aber nur weil alle Nerven beben, in der man leicht bis zum Scherzen und Lachen gelangt, aber nur mit zitternden Lippen. Bedurfte es doch jedesmal für Nietzsche einer solchen Verschlingung von Wonne und Weh, von Begeisterung und Leiden, um ihn einer geistigen Wiedergeburt entgegenzuführen. Sein Glück musste erst zum »Ueberglück«, und in diesem Uebermass zum eigenen Gegner und Gegensatz geworden sein; Frieden und Heimatgefühl, wo er sie einmal innerhalb eines gewonnenen Erkenntnissgebietes mühsam errungen hatte, mussten ihn erst zu Selbstverwundung und Selbstvertreibung gereizt haben, damit sein Geist in sich selber schwelgen und sich in neuen Schöpfungen entlasten konnte.

Es ist dafür bezeichnend, dass er sein Werk, im Jauchzen seines Herzens, die frohe Botschaft, »Die fröhliche Wissenschaft« nannte, zugleich aber über den Schluss-Aphorismus desselben die düsteren Räthselworte setzte: »Incipit tragoedia!«

Dieser Verbindung von tiefer Erschütterung und spielendem Uebermuth, von Tragik und Heiterkeit, welche für die ganze Gruppe der letzten Werke charakteristisch ist, entspricht es auch, dass die »Fröhliche Wissenschaft«, im schärfsten Gegensatz zu dem dunkeln Geheimniss der Schlussworte, ein »Vorspiel« in Versen besitzt: »Scherz, List und Rache.« Hier begegnen uns zum ersten Mal Verse in Nietzsches Schriften,--sie mehren sich aber in dem Maasse, als er seinem persönlichen Untergang zuzuschreiten glaubt. In Gesängen klingt sein Geist aus. Die Verse sind überraschend verschieden an Werth, zum Theil vollendet: Gedanken, die an ihrer eigenen Schönheit und Fülle sich zu Gedichten wandelten;--zum Theil von einer so wunderlichen Unvollkommenheit, wie sie nur die Laune des Muthwillens vom Zaune bricht. Ueber ihnen allen aber ruht etwas seltsam Ergreifendes: Sind es doch Blumen, die sich ein Einsamer auf den Leidensweg streut, der seiner harrt, um den Schein zu erwecken, dass es ein Freudenweg sei. Frisch gebrochenen Rosen gleichen sie, auf die sein Fuss treten will, während er schon beschäftigt ist, in seinen leidvollsten Erkenntnissen seinem Haupte die Dornenkrone zu flechten.

Sie klingen wie ein Präludium zu dem erschütternden Schauspiel seiner höchsten Erhebung und seines Unterganges. Von diesem Schauspiel hebt auch die Philosophie Nietzsches den Vorhang nicht ganz. Was sie uns zeigt, ist nur, gleich einem Bilde auf diesem Vorhang, ein buntes Blumengewinde, aus dem, halb versteckt, die Worte gross und traurig hervorleuchten:

»Incipit tragoedia!«

[1] Die philologischen Arbeiten Nietzsches sind: _Zur Geschichte der Theognideischen Spruchsammlung_, im Rheinischen Museum, Bd. 22; _Beiträge zur Kritik der griechischen Lyriker, I. Der Danae Klage von Simonides_, im Rhein. Mus., Bd. 23; _De Laertii Diogenis Fontibus_, im Rhein. Mus., Bd. 23 und 24; _Analecta Laertiana_, im Rhein. Mus., Bd. 25; _Beiträge zur Quellenkunde und Kritik des Laertius Diogenes_, Gratulationsschrift des Pädagogiums zu Basel. Basel 1870.--_Certamen quod dicitur Homeri et Hesiodi e codice Florentino post H. Stephanum denuo_ ed. F. N., in den Acta societatis philologae Lipsiensis ed. Fr. Ritschl, Vol. I; dazu der florentinische Tractat über _Homer und Hesiod_, ihr Geschlecht und ihren Wettkampf, im Rhein. Mus, Bd. 25 und 28. Auch rührt das »Registerheft« zu den ersten 24 Bänden des Rheinischen Museums (1842-1869) von ihm her, das er nach Ritschls Disposition zusammenstellte.

[2] Er hat so gelesen, wie er es einmal »gut lesen« nennt: »--das heisst langsam, tief, vor- und rücksichtig, mit Hintergedanken, mit offen gelassenen Thüren, mit zarten Fingern und Augen lesen--« (Einführende Vorrede zur neuen Ausgabe der Morgenröthe 11.)

[3] Dieses Buch erregte bei seinem Erscheinen das lebhafteste Missfallen der philologischen Zunft; hatte der Verfasser es doch gewagt, seinen Ausführungen nicht nur die Lehren des verpönten Philosophen Arthur Schopenhauer, sondern auch die künstlerischen Anschauungen des damals noch ebenso geschmähten »Zukunftsmusikers« Richard Wagner zu Grunde zu legen. Ein junger philologischer Heisssporn, Ulrich v. Wilamowitz-Möllendorf, der jetzt zu den hervorragenden Vertretern der classischen Philologie in Deutschland gehört, machte sich in nicht besonders glücklicher und geschmackvoller Weise zum Sprachrohr zünftiger Einseitigkeit. Ohne der Eigenart des Nietzscheschen Buches irgendwie gerecht zu werden, griff er es in der Broschüre »Zukunftsphilologie! eine erwidrung auf F. N.'s »gebürt der tragödie«, Berlin 1872, von einem beschränkt philologischen Standpunkte auf das heftigste an. Für den Angegriffenen traten in die Schranken derjenige, an den vor Allen das Buch gerichtet war, Richard Wagner, der Künstler, in einem in der »Norddeutschen Allgemeinen Zeitung« vom 23. Juni 1872 abgedruckten offenen Briefe an Friedrich Nietzsche, und Erwin Rohde, der bereits damals von seiner tiefen Kenntnis des griechischen Alterthums die vollgiltigsten Proben abgelegt hatte. In der ausgezeichnet geschriebenen Streitschrift: »Afterphilologie. Sendschreiben eines Philologen an Richard Wagner«, Leipzig 1872, stellte er sich auf den von dem Gegner gewählten Boden und wies die von diesem gemachten Einwände und Beschuldigungen zurück, worauf v. Wilamowitz dann noch mit einer Duplik, »Zukunftsphilologie! Zweites Stück, eine erwidrung auf die rettungsversuche für F. N.'s »gebürt der tragödie«, Berlin 1873, antwortete.

[4] Vergleiche die einführende Vorrede zur Neuen Ausgabe des zweiten Bandes von Menschliches, Allzumenschliches, wo es IV heisst: »--was ich gegen die »historische Krankheit« gesagt habe, das sagte ich als Einer, der von ihr langsam, mühsam genesen lernte-- -- --.

[5] Vorwort V: »Auch soll-- --nicht verschwiegen werden,-- -- -- --dass ich nur, sofern ich Zögling älterer Zeiten, zumal der griechischen bin, über mich als ein Kind dieser jetzigen Zeit zu so unzeitgemässen Erfahrungen komme.«

[6] Vgl. Schopenhauer als Erzieher 19: »ich ahnte, in ihm jenen Erzieher und Philosophen gefunden zu haben, den ich so lange suchte. Zwar nur als Buch: und das war ein grosser Mangel. Um so mehr strengte ich mich an, durch das Buch hindurch zu sehen und mir den lebendigen Menschen vorzustellen, dessen grosses Testament ich zu lesen hatte, und der nur solche zu seinen Erben zu machen verhiess, welche mehr sein wollten und konnten als nur seine Leser: nämlich seine Söhne und Zöglinge.

[7] Nietzsche lebte damals in einer Bewunderung der englischen Gelehrten und Philosophen, die später in ihr Gegentheil umschlug; in Menschliches, Allzumenschliches II 184 nennt er sie noch die »ganzen, vollen und füllenden Naturen«, und in einem Briefe an Rée nennt er die englischen Philosophen der Gegenwart, »den einzig gut philosophischen Umgang, den es jetzt giebt«. Dementsprechend ist das Einzige, was er in dieser Periode an seinem ehemaligen Meister Schopenhauer noch hochschätzt: »sein harter Thatsachen-Sinn, sein guter Wille zu Helligkeit und Vernunft, der ihn oft so englisch--erscheinen lässt.« (Fröhliche Wissenschaft 99.)

[8] Erwähnt wird es von Nietzsche in »Menschliches, Allzumenschliches« I 37.

[9] Vergleiche Menschliches, Allzumenschliches die Aphorismen über »Cultus des Genius' aus Eitelkeit« (162) und »Gefahr und Gewinn im Cultus des Genius'.« (164).

[10] Dieser Besitz von »Liebe und Güte« als der heilsamsten Kräuter und Kräfte im Verkehre der Menschen (Menschliches, Allzumenschliches I 48) ist noch mehr werth als die gepriesene grosse einzelne Aufopferung; noch »mächtiger an der Cultur gebaut«, hat jenes immerwährende freundliche Wohlwollen, das des Lebens »_Behagen_« schafft. (Menschliches, Allzumenschliches I 49)

[11] Vergleiche die folgenden Aphorismen, die Nietzsche mir einmal aufschrieb:

Zur Lehre vom Stil.

1.

Das Erste, was noth thut, ist Leben: der Stil soll _leben_.

2.

Der Stil soll _dir_ angemessen sein in Hinsicht auf eine ganz bestimmte Person, der du dich mittheilen willst. (Gesetz der _doppelten Relation_.)

3.

Man muss erst genau wissen: »so und so würde ich das sprechen und _vortragen_«--bevor man schreiben darf. Schreiben muss eine Nachahmung sein.

4.

Weil dem Schreibenden viele _Mittel_ des Vortragenden _fehlen_, so muss er im Allgemeinen eine _sehr ausdrucksvolle_ Art von Vortrag zum Vorbild haben: das Abbild davon, das Geschriebene, wird schon nothwendig viel blässer ausfallen.

5.

Der Reichthum an Leben verräth sich durch _Reichthum an Gebärden_. Man muss alles, Länge und Kürze der Sätze, die Interpunctionen, die Wahl der Worte, die Pausen, die Reihenfolge der Argumente--als Gebärden empfinden _lernen_.

6.

Vorsicht vor der Periode! Zur Periode haben nur die Menschen ein Recht, die einen langen Athem auch im Sprechen haben. Bei den meisten ist die Periode eine Affectation.

7.

Der Stil soll beweisen, dass man an seine Gedanken _glaubt_, und sie nicht nur denkt, sondern _empfindet_.

8.

Je abstracter die Wahrheit ist, die man lehren will, um so mehr muss man erst die _Sinne_ zu ihr verführen.

9.

Der Tact des guten Prosaikers in der Wahl seiner Mittel besteht darin, dicht an die Poesie heranzutreten, aber _niemals_ zu ihr überzutreten.

10.

Es ist nicht artig und klug, seinem Leser die leichteren Einwände vorwegzunehmen. Es ist sehr artig und _sehr klug_, seinem Leser zu überlassen, die letzte Quintessenz unserer Weisheit _selber auszusprechen_.

[12] Siehe in der »Fröhlichen Wissenschaft« (279) unter der Ueberschrift »Sternen-Freundschaft« die schönen Worte, mit denen Nietzsche damals von dieser geistigen Genossenschaft Abschied nahm.

III. ABSCHNITT.

DAS "SYSTEM NIETZSCHE"

MOTTO:

»Schaffen wollt ihr noch die Welt, vor der ihr knien könnt.«

(Also sprach Zarathustra II. 47).

Geist? Was ist mir Geist! Was ist mir Erkenntniss! Ich schätze nichts als _Antriebe_,--und ich möchte schwören, dass wir darin unser Gemeinsames haben. Sehen Sie doch durch diese Phase _hindurch_, in der ich seit einigen Jahren gelebt habe,--sehen Sie _dahinter_! Lassen _Sie_ sich nicht über mich täuschen--glauben doch nicht, dass »der Freigeist« mein Ideal ist!! _Ich bin_-- ----Verzeihung! Liebste Lou!

F. N.

In dieser geheimnissvollen Weise bricht der vorstehende Brief Nietzsches ab, den er in der Zeit zwischen der Veröffentlichung der »Fröhlichen Wissenschaft« und derjenigen seiner mystischen Dichtung »Also sprach Zarathustra« geschrieben hat. In den wenigen Zeilen sind bereits die wesentlichsten Züge der letzten Philosophie Nietzsches angedeutet: auf dem Gebiet der Logik die principielle Abkehr von dem bisherigen reinlogischen Erkenntnissideal, von der theoretischen Strenge der verstandesmassigen

»Freigeisterei«; auf dem Gebiet der Ethik, anstatt der bisherigen negirenden Kritik, die Verlegung der Wahrheitsbegründung in die Welt der seelischen Antriebe, als der Quelle einer neuen Werthung und Abschätzung aller Dinge; ferner eine Art von _Rückkehr_ zu Nietzsches erster philosophischer Entwicklungsphase, die vor seinem positivistischen Freigeisterthum liegt,--nämlich zur Metaphysik der Wagner-Schopenhauerischen _Aesthetik_ und ihrer Lehre vom übermenschlichen Genie. Und hierauf endlich gründet sich, als auf den Kempunkt der neuen Zukunftsphilosophie, _das Mysterium einer ungeheuren Selbst-Apotheose_, das er in dem zögernden Wort »Ich bin«--sich noch scheut auszusprechen.

Nietzsches letzte Geistesperiode umfasst fünf Werke: Die vierbändige Dichtung »_Also sprach Zarathustra_« (I und II 1883; III 1884, Chemnitz, Ernst Schmeitzner; IV 1891, Leipzig, C. G. Naumann); _Jenseits von Gut und Böse_, Vorspiel einer Philosophie der Zukunft (1886, Leipzig, C. G. Naumann; 2. Auflage 1891); _Zur Genealogie der Moral_, eine Streitschrift (1887, Leipzig, C. G. Naumann); _Der Fall Wagner_, ein Musikanten-Problem (1888, Leipzig, C. G. Naumann); endlich die kleine Aphorismen-Sammlung _Götzen-Dämmerung_ oder _Wie man mit dem Hammer philosophirt_ (1889, Leipzig, C. G. Naumann). Wir können hier aber nicht dem Gange seines philosophischen Denkens Schritt für Schritt an der Hand jener Werke folgen, da sie nicht, wie die der vorhergehenden Periode, ebensoviele Entwicklungsstufen seines Gedankens darstellen, sondern zum ersten Mal alle dazu bestimmt sind, der Darlegung eines _Systems_ zu dienen, wenn auch nur eines Systems, das mehr auf ihrer Gesammtstimmung als auf der klaren Einheitlichkeit begrifflicher Deduction beruht. Der aphoristische Charakter, den seine Bücher auch hier bewahren, erscheint daher in diesem Fall als ein unleugbarer Mangel der Form seiner Darstellung, nicht, wie bisher, als ein eigenthümlicher Vorzug derselben. Was Nietzsche durch seine vollendete Meisterschaft in der aphoristischen Form gelang: einen jeden Gedanken in seiner seelischen Bedeutsamkeit voll auszuschöpfen und mit allen seinen feinen inneren Nebenbeziehungen wiederzugeben, das reicht nicht aus für die systematische Begründung eigener Theorien, sondern löst sie hier und da in ein geistreiches Spiel mit blendenden Hypothesen auf. Nietzsche wurde sowohl durch sein Augenleiden als auch durch seine Gewöhnung an sprunghaftes Denken dazu gezwungen, im Allgemeinen an seiner alten Schreibweise festzuhalten, aber immer wieder macht er,--sowohl in Jenseits von Gut und Böse, als auch in der Genealogie der Moral,--den Versuch, über das Rein--Aphoristische hinauszukommen, seine Gedanken systematisch zu ordnen und vorzutragen, weil das, was ihm vorschwebt, ein einheitliches Ganzes geworden ist.

Daher finden wir auch hier zum ersten Mal bei ihm eine Art von _Erkenntnisstheorie_, einen Ansatz dazu, sich mit den erkenntnisstheoretischen Problemen auseinanderzusetzen, nachdem er ihnen bisher immer aus dem Wege gegangen war, wie er überhaupt gern jedes Problem mied, dem sich nur auf rein begrifflichem Wege beikommen lässt. Jetzt erst bleibt er nicht mehr ohne Weiteres bei der praktischen Philosophie stehen, sondern hält es für nothwendig, auf die Mittel hinzuweisen, mit denen er sich das erkenntnisstheoretische Pförtchen aufgebrochen habe, durch das er zu seinen Hypothesen gelangt. Ziemlich ausführliche Bemerkungen darüber finden sich an den verschiedensten Stellen seiner Werke zerstreut. Es erscheint aber höchst charakteristisch, dass sie sich erst jetzt finden, wo er der Welt des Abstrakt-Logischen principielle Feindschaft erklärt und fest entschlossen ist, alle schwierigen Begriffsknoten, auf die er stossen könnte, mit einem Schwerthieb zu zerhauen: er befasst sich mit der Erkenntnisstheorie eben nur, um sie über den Haufen zu werfen.

Zur Zeit seines Wagnerthums war Nietzsche als Jünger Schopenhauers diesem seinem Meister in der bekannten Interpretirung und Modificirung Kants gefolgt, laut welcher die Fragen nach den höchsten und letzten Dingen ihre Beantwortung finden, zwar nicht durch den Verstand, sondern durch die höchsten Eingebungen und Erleuchtungen des Willenslebens. Später stimmte Nietzsche, unter heftigem Protest gegen diese Annahme der Schopenhauerischen Metaphysik, der strengen Selbstbescheidung der Erfahrungswissenschaft zu, welche sich mit dem Verstandeserkennen auf den ihm zugänglichen Gebieten begnügt. Aber Nietzsche hielt diese Zustimmung nur so lange aufrecht, als er mit Hilfe eines fanatischen Intellektualismus sich aus dem bescheidenen Verstandeserkennen ein ihn begeisterndes Wahrheitsideal zu schaffen vermochte, dem sich sein Wille und Seelenleben blind unterwarf. Sobald sein Fanatismus sich erschöpft hatte, sobald seine Begeisterung die intellektuellen Ziele und Werthe nicht mehr in so über-schwänglich-idealer Beleuchtung sah, wurde er derselben überhaupt überdrüssig und verlangte nach neuen Idealen. In diesem Verlangen ging ihm nun innerhalb des Positivismus eine Einsicht auf, die er bisher nicht beachtet hatte: nämlich die Einsicht in die Relativität alles Denkens, die Zurückführung alles Verstandeserkennens auf die rein praktische Grundlage des menschlichen Trieblebens, dem es entstammt und von dem es dauernd abhängig ist.

Diesem Wege, der ihm von seinen eigenen philosophischen Genossen vorgezeichnet war, brauchte er nur mit gewohnter Exaltation zu folgen, um schliesslich zu seiner ursprünglichen Schätzung der Affekte zürückzugelangen. Denn was für die Andern nur eine natürliche Consequenz war, welche die moderne Erkenntnisstheorie zieht, und welche die Methode und die Resultate der Erfahrungswissenschaft als solche gar nicht berührt, daraus entnahm Nietzsche den Anstoss zu einem völligen

Gesinnungswechsel. Mit derselben äussersten Uebertreibung und demselben Fanatismus, mit denen er das streng begriffliche Denken als höchstes Wahrheitsideal angebetet hatte, verhöhnt er es jetzt als etwas Geringes und Niedriges gegenüber den Trieben, die es in Wahrheit regieren.

Was sich inzwischen verändert hat, ist zwar nur seine _Stimmung_, nur seine _Gefühlsauffassung_ der Sachlage, aber eben dies besagt für Nietzsche Alles: es veisst ihn allmählich fort zu immer weitergehenden Folgerungen und wird so schliesslich zum Ausgangspunkt für eine neue Weltanschauung.

Dieser Verlauf ist typisch für die Entstehung aller Grundgedanken in Nietzsches »Zukunftsphifosophie-«; ihm werden wir in seiner Erkenntnisstheorie wie in seiner Morallehre, in seiner Äesthetik wie in seiner letzten Mystik wieder begegnen und stets dieselben drei Entwicklungsstufen daran wahrnehmen: zuerst das Anknüpfen an einzelne letzte Consequenzen der modernen Erfahrungswissenschaft, dann ein Umschlagen seiner Gemüthsstimmung in der Auffassung solcher Ergebnisse, ihre Zuspitzung und Uebertreibung bis aufs Aeusserste, und endlich, daraus fliessend, seine eigenen, neuen Theorien.

Hinsichtlich dieser sind aber zwei Seiten zu unterscheiden, einestheils ihr thatsächlicher philosophischer Gehalt, anderntheils Nietzsches rein seelische Wieder-Spiegelung in ihnen, indem er sich in seinen Gedanken den Ausdruck für sein tiefstes Wesen schafft. Diese Selbstwiederspiegelung führt uns zu dem Bilde Nietzsches zurück, wie es im ersten Theile dieser Arbeit entworfen ist. Der Gedankengehalt aber der neuen Lehre erweist sich als eine kunstvolle Verbindung der beiden philosophischen Phasen in Nietzsches Geistesentwicklung,--als ein Muster von zwei verschiedenen mit genialer Hand ineinandergeflochtenen Geweben: der Schopenhauerischen Willenslehre und der Entwicklungslehre der Positivistem

Für Nietzsches Erkenntnisstheorie, mit ihrer Bekämpfung der Bedeutung des Logischen und ihrer Zurückführung desselben auf das schlechthin Unlogische, kommt am meisten in Betracht sein Buch »Jenseits von Gut und Böse«, das in einzelnen Abschnitten ebensogut heissen könnte: »Jenseits von Wahr und Falsch«. Denn hier erörtert er am ausführlichsten die _Unberechtigung der Werthgegensätze_ »wahr und unwahr«, die mit der Einsicht in ihren Ursprung nicht minder hinfällig werden, wie die Werthgegensätze »gut und böse«. »Das Problem vom Werthe der Wahrheit trat vor uns hin,-- -- --Was in uns will eigentlich »»zur Wahrheit««?-- -- --Gesetzt, wir wollen Wahrheit: _warum nicht lieber Unwahrheit?_-- --« (1.) »Ja, was zwingt uns überhaupt zur Annahme, dass es einen wesenhaften Gegensatz von »wahr« und »falsch« giebt? Genügt es nicht, Stufen der Scheinbark eit anzunehmen-- --?« (34.) »In welcher seltsamen Vereinfachung und Fälschung lebt der Mensch!-- -- -- erst auf diesem nunmehr festen und granitnen Grunde von Unwissenheit durfte sich--die Wissenschaft erheben, der Wille zum Wissen auf dem Grunde eines viel gewaltigeren Willens, des Willens zum Nicht-wissen, zum Ungewissen, zum Unwahren! Nicht als sein Gegensatz, sondern--als seine Verfeinerung«! (24.) Das »Bewusstsein« ist nicht »in irgend einem entscheidenden Sinne dem Instinktiven _entgegengesetzt_,--das meiste bewusste Denken eines Philosophen ist durch seine Instinkte heimlich geführt und in bestimmte Bahnen gezwungen.« (3.) Alle Logik ist letzten Endes nichts anderes als eine blosse »Zeichen-Convention« (Götzen-Dämmerung III 3), alles Denken eine Art von »Zeichensprache der Affekte«, da »wir zu keiner anderen »Realität« hinab oder hinauf können als gerade zur Realität unserer Triebe--denn Denken ist nur ein Verhalten dieser Triebe zu einander.« (Jenseits von Gut und Böse 36). Und daraus folgt denn schon: »-- --_je mehr_ Affekte wir über eine Sache zu Worte kommen lassen, _je mehr_ Augen, verschiedne Augen wir uns für dieselbe Sache einzusetzen wissen, um so vollständiger wird unser »Begriff« dieser Sache, unsre »Objektivität« sein. Den Willen aber überhaupt eliminiren, die Affekte sammt und sonders aushängen, gesetzt, dass wir dies vermöchten: wie? hiesse das nicht den Intellekt _castriren_?... (Zur Genealogie der Moral III 12).

Hier ist der Punkt, an welchem Nietzsches Auffassung plötzlich von seiner ehemaligen abweicht und ihn zu der entgegengesetzten führt. Hat er früher davor gewarnt, irgend einem Affekt zu trauen, weil derselbe doch nur das »Enkelkind« alter vergessener und wahrscheinlich irrthümlicher Urtheilsschlüsse sei, so beruft er sich jetzt auf die uralte Gefühlsgrundlage, der alle Urtheilsschlüsse entstammen, und degradirt diese so zu unselbständigen, abhängigen »Enkelkindern« des Gefühls. Für beide Auffassungen findet er die gesuchte Begründung noch in der positivistischen Weltanschauung, aber was dort friedlich neben einander besteht,--die Relativität des Denkens und diejenige des Affektlebens,-- --das trennt sich für ihn in zwei unversöhnliche Gegensätze: auf der einen Seite steht der bis auf die Spitze getriebene Intellektualismus, dem er sich bis dahin hingegeben, und durch den er alles Leben dem Denken, alles Gemüth dem Verstände unterthan machen wollte,--auf der anderen Seite eine ebenfalls auf das Höchste gesteigerte Gefühlsexaltation, die sich für ihre lange Unterdrückung rächt und in ihrem Lebensüberschwang sich nur genug thun kann in einem fanatischen: »fiat vita, pereat veritas!«

Darum heisst es weiter: »Die Falschheit eines Urtheils ist uns noch kein Einwand gegen ein Urtheil;-- --Die Frage ist, wie weit es lebenfördernd, lebenerhaltend -- --ist;-- -- --Verzichtleisten auf falsche Urtheile (wäre) ein Verzichtleisten auf Leben, eine

Verneinung des Lebens.« (Jenseits von Gut und Böse 4.) »Bei allem Werthe, der dem Wahren, dem Wahrhaftigen,-- --zukommen mag: es wäre möglich, dass dem Scheine, dem Willen zur Täuschung, und der Begierde ein für alles Leben höherer und grundsätzlicherer Werth zugeschrieben werden müsste. Es wäre sogar noch möglich, dass, _was_ den Werth jener guten und verehrten Dinge ausmacht, gerade darin bestünde, mit jenen schlimmen, scheinbar entgegengesetzten Dingen auf verfängliche Weise verwandt, verknüpft, verhäkelt, vielleicht gar wesensgleich zu sein.« (Jenseits von Gut und Böse 2.) »-- -- --wir sind von Grund aus, von Alters her--_ans Lügen gewöhnt_. Oder, um es tugendhafter und heuchlerischer, kurz angenehmer auszudrücken: man ist viel mehr Künstler als man weiss.« (Ebendaselbst 192.) Und das Lebenerhaltendere der Lüge ist es, das den Künstler hoch über den wissenschaftlichen Menschen und dessen Wahrheitsforschung stellt. »--die Kunst, in der gerade die Lüge sich heiligt, der Wille zur Täuschung das gute Gewissen zur Seite hat,« (Zur Genealogie der Moral III 25), ist es auch, um derentwillen jetzt plötzlich wieder die ehemals so geschmähten Metaphysiker weit vornehmer und schätzenswerther erscheinen, als die »Wirklichkeits-Philosophaster«, mit ihrer Genügsamkeit und »Lappenhaftigkeit«. (Jenseits von Gut und Böse 10.)

An dieser erneuten Verherrlichung des Künstlerthums und selbst der Metaphysik erkennt man, wie weit Nietzsche schon zu einem neuen, entgegengesetzten Typus des Erkennenden durchgedrungen ist, und wie weit er sich bereits von den positivistischen »Wirklichkeits-Philosophastern« entfernt hat. Denn was diese als eine unvermeidliche _Zugabe_ zum erkennenden Denken betrachten und im Erkenntnissakt nach Möglichkeit zu _reduciren_ suchen: die Abhängig-keitdes Denkens vom menschlichen Triebleben,--das gerade bedarf, nach Nietzsche der höchstmöglichen Steigerung. Die Einsicht in die Relativität alles Denkens, in die engen Grenzen, die der Wahrheitserkenntniss gezogen sind, dien! ihm ausschliesslich zur Proklamirung einer neuen Grenzenlosigkeit des Erkennens, die demselben den absoluten Charakter wiedergeben soll. Weil Nietzsche der absoluten Ideale bedurfte, um sie anbeten und an ihnen seine Hingebung ausleben zu können, suchte er, sobald sein logisches Wahrheitsideal allzu bescheiden zusammenschrumpfte, Abhilfe in dessen Gegensatz, im Maasslosen des gesteigerten Affektlebens. Ist er vorher davon ausgegangen, das Wahrheitsstreben von einer letzten Illusion zu befreien, indem er es als relativ auffasste, so öffnet er sich nun einen neuen Zugang zu neuen Illusionen: durch Verlegung des Erkenntnissgebietes in das der Gefühlserregungen und Willenseingebungen. Damit sind alle zurückhaltenden, einschränkenden Dämme niedergerissen und rückhaltlos darf das Affektleben darüber hinfluthen. Nirgends Gewissheit oder überall Gewissheit, das kommt hier beinahe auf dasselbe hinaus; wo der Gedanke alle selbständigen Erkenntnissrechte eingebüsst hat, da schweift er, als Spielzeug und Werkzeug der ihn regierenden verborgenen Triebe bis in die fernsten Fernen, bis in die tiefsten Tiefen. Ist Nietzsche ursprünglich aus dem geheimnissvoll schimmernden Zaubergarten der Metaphysik in die nüchterne Verstandeswelt empirischer Forschung eingetreten, so verliert er sich jetzt in den Irrgarten einer Wildniss, die, ungelichtet und undurchdringlich, diese Verstandeswelt umgiebt. Gerade der Umstand, dass in ihr noch keine Wege gebahnt sind, dem Denken noch keine Richtung gewiesen ist,--dass Alles in ihr noch herrenlos und gesetzlos ist, und der Willensmachtspruch Raum hat für jegliches Schaffen,--gerade dies Abenteuerlich-Gefährliche ist ihm Bürgschaft für den richtigen Weg, denn es erscheint als die Richtung mitten ins Innere des Lebens, mitten in seine Urkräfte hinein. »Räthsel-Trunkene, Zwielicht-Frohe« nennt daher Zarathustra seine Jünger, »deren Seele mit Flöten zu jedem Irr-Schlunde gelockt wird:--denn nicht wollt ihr mit _feiger Hand einem Faden nachtasten_; und, wo ihr _errathen_ könnt, da hasst ihr es, zu _erschliessen_.« (Also sprach Zarathustra III 6 f.) »Auch im Erkennen fühle ich nur meines Willens Zunge und Werde-Lust (Ebendaselbst II 8); »Werk- und Spielzeuge sind Sinn und Geist!« (Ebendaselbst I 43), denn das Leben spricht: »Auch du, Erkennender, bist nur ein Pfad und Fusstapfen meines Willens: wahrlich, mein Wille zur Macht wandelt auch auf den Füssen deines Willens zur Wahrheit!« (Ebendaselbst II 50)

Nietzsche, der so lange Zeit hindurch, zur Beschwichtigung und Zügelung seyier tieferregten Innerlichkeit und ihres Affektlebens, eine kalte und nüchterne Denkweise benutzt hatte, erfuhr nun an sich selber, was er früher einmal vorahnend und warnend, in »Menschliches, Allzumenschliches (II 275), geschildert: »Hat man seinen Geist verwendet, um über die Maasslosigkeit der Affekte Herr zu werden, so geschieht es vielleicht mit dem leidigen Erfolge, dass man die Maasslosigkeit auf den Geist überträgt und fürderhin im Denken und Erkennenwollen ausschweift.[1] In einem solchen Verlangen wild auszuschweifen, schafft er sich einen neuen Wahlspruch:»Nichts ist wahr, Alles ist erlaubt!« (Zur Genealogie der Moral III. 24.) und preist den Werth der Täuschung, der willkürlichen Fiktion, des Unlogischen und »Unwahren«, als der im Grunde lebenfördernden, willensteigernden Mächte. In der Vorstellung, dass ja in dem gesammten Weltbilde, so wie wir es um uns aufgebaut haben, wir selbst als die Schöpfer mit unserer psychischen Eigenart drinstecken, und dass unser Erkennen letzten Endes doch nichts ist als eine »Anmenschlichung der Dinge«, schwelgt er so lange, bis das Weltganze sich ihm zu einem Traumbilde verflüchtigt, das sich der Einzelne willkürlich ersonnen hat. »Warum dürfte die Welt, _die uns etwas angeht_--, nicht eine Fiktion sein?« fragt er sich (Jenseits von Gut und Böse 34), mit dem Hintergedanken: _und also durch einen Gewaltakt umzuschaffen sein_?

Hierauf bezieht sich ein kurzes interessantes Kapitel in der »Götzen-Dämmerung« (IV), dessen Absicht aber nur im Zusammenhang mit den übrigen zerstreuten Bemerkungen Nietzsches über diesen Gegenstand ganz verständlich wird. Es ist überschrieben: »Wie die »wahre Welt« endlich zur Fabel wurde. Geschichte eines Irrthums.« und enthält eine Skizzirung des philosophischen Entwicklungsganges von den Alten bis zu uns. Die alte Philosophie fasste schon, wenn auch erst in naiver Weise, den Erkennenden und sein Weltbild, die Person und die Wahrheit, als identisch; sie gipfelte in der Umschreibung des Satzes: »ich, Plato, _bin_ die Wahrheit.« »Die wahre Welt«, im Gegensatz zur unwahren, scheinbaren, in der die Unweisen leben, ist, »erreichbar für den Weisen,--lebt in ihr, _er ist sie_.« Im Christenthum trennt sich die Idee der »wahren Welt« fortschreitend von der Persönlichkeit, indem sie sich entmenschlicht und sublimirt, als Zukunftsverheissung, als Versprechen über den Menschen auffliegt. Endlich, durch eine Reihe von metaphysischen Systemen hindurch, verblasst sie bei Kant zu einem blossen Schatten, »unerreichbar, unbeweisbar, unversprechbar,«--bis sie sich, mit der endgiltigen Abkehr von aller Metaphysik, völlig zu Nichts verflüchtigt: »Grauer Morgen. Erstes Gähnen der Vernunft. Hahnenschrei des Positivismus.« Damit steigt die bisher, als scheinbar und unwahr gescholtene Welt im Preise, weil sie die einzig übrigbleibende ist: »Heller Tag; Frühstück; Rückkehr des bon sens und der Heiterkeit; Schamröthe Plato's; Teufelslärm aller freien Geister.« Aber mit der Einsicht in die Entstehung der Fabel von der »wahren Welt« haben wir zugleich die Entstehungsweise des Weltbildes unserer Erkenntniss überhaupt eingesehen. Jetzt, wo der Glaube an eine mystische »wahre« Welt hinter der scheinbaren, durch Täuschung und Irrthum entstandenen, uns nicht mehr tröstet, was bleibt uns noch übrig? »Mit der wahren Welt haben wir auch die scheinbare abgeschafft,« die ja nur als deren Gegensatz möglich war. Wieder ist der Mensch auf sich selbst zurückgeworfen als auf den _Selbstschöpfer aller Dinge_. Wieder ist die alte Fassung: »Ich, Plato, bin die Welt,« möglich geworden und steht als letzte Weisheit am Anfang aller Philosophie, nun aber nicht mehr in der naiven, noch ungebrochenen Identificirung von Person und Wahrheit, von Subjekt und Objekt, sondern als klar bewusste und gewollte Schöpferthat Dessen, der sich selbst als den Weltenträger erkannt hat. »Ich, Nietzsche-Zarathustra, bin die Welt, sie ist, weil ich bin, sie ist, wie ich will.« Dieses Ergebniss wird nur angedeutet in den geheimnissvollen Schlussworten: »_Mittag; Augenblick des kürzesten Schattens; Ende des längsten Irrthums. Höhepunkt der Menschheit; Incipit Zarathustra_.«

Hier lässt es sich schon deutlich verfolgen, wie sich neue und ins Mystische überschlagende Gedanken Nietzsches mit Elementen mischen und verknüpfen, die er noch der modernen Erkenntnisstheorie entnimmt. Und damit ist bereits der Punkt erreicht, von dem aus sich seine neue Lehre aufbaut, und bei dem es sich nicht mehr um eine blosse Gefühlsübertreibung gewisser allgemeingiltiger Einsichten handelt. Denn aus der Thatsache der Begrenztheit und Relativität alles menschlichen Erkennens, und aus der der Priorität des menschlichen Trieblebens gegenüber demselben formt sich ihm unvermerkt der neue Typus des Philosophen: das überlebensgrosse Bild eines Einzelnen, dessen Gewaltwille über wahr und unahr entscheidet, und in dessen Hand das Verstandeserkennen der Menschen ein blosses Spielzeug ist. Man könnte sagen: dasjenige, was den Geist zu strenger Selbstbescheidung zwingt, was ihn von allen Seiten bedingt und beeinflusst, das personificirt sich Nietzsche unter dem Bilde einer zügellosen Allmacht, die er auf einen übermenschlichen Einzelnen überträgt. Ja, in ihm sollen alle Triebe und Kräfte alles Menschenthums dermaassen entfesselt und gesteigert gedacht werden, dass die Quintessenz des Lebens, der Kraft-Extract des Ganzen, in ihm gleichsam Person geworden ist, sodass er auch die Erkenntnissnormen umzuprägen und zu verrücken im Stande wäre. Doch geschieht dies nicht in einem Act der Contemplation, sondern in einer schöpferischen That, als Handlung und Befehl, der an die Welt ergeht. »--_Die eigentlichen Philosophen aber sind Befehlende und Gesetzgeber_: sie sagen »_so soll_ es sein!« sie bestimmen erst das Wohin? und Wozu? des Menschen-- --,--sie greifen mit schöpferischer Hand nach der Zukunft-- --. Ihr »Erkennen« ist _Schaffen_, ihr Schaffen ist eine Gesetzgebung, ihr Wille zur Wahrheit ist--_Wille zur Macht_.« (Jenseits von Gut und Böse 211.) Ihre Philosophie »schafft immer die Welt nach ihrem Bilde, sie kann nicht anders; Philosophie ist dieser tyrannische Trieb selbst, der geistigste Wille zur Macht, zur »Schaffung der Welt«, zur causa prima« (Ebendaselbst 9). Die »cäsarischen Züchter und Gewaltmenschen der Cultur« (Ebendaselbst 207) sind es, mit deren Erläuterung und Beschreibung sich Nietzsches ganze Zukunftsphilosophie beschäftigt, ja, in deren Bilde ihr gesammter Inhalt besteht. In seiner Erkenntnisstheorie wird ihnen nur der Boden bereitet, in seiner Ethik und Aesthetik wachsen sie aus diesem Boden immer höher hinauf in eine religiöse Mystik, in der Gott, Welt und Mensch zu einem einzigen ungeheuren Ueberwesen verschmelzen.

Es ist leicht zu sehen, inwiefern sich Nietzsche mit dem Bilde dieses Schöpfer-Philosophen seinen ehemaligen metaphysischen Anschauungen nähert, wie er aber dieselben zugleich durch seine späteren wissenschaftlichen Theorien zu modificiren sucht. Die »idealen« Wahrheiten der Metaphysik mit ihren erhebenden und tröstenden Deutungen des Welträthsels nimmt er nicht wieder auf, aber indem er überhaupt mit der Möglichkeit einer »Wahrheit« aufräumt, indem er die Skepsis in das Gebiet des Erkennens hineinträgt und sich auf den Standpunkt »Alles ist unwahr« stellt, schafft er sich Raum, um einen _Ersatz_ für jene verlorenen idealen Wahrheiten und Trostgründe herzustellen. Durch einen Machtspruch, durch einen Willensakt wird in die Dinge die Bedeutung hineingelegt, die sie an sich selbst nicht haben; aus dem Wahrheits-_Entdecker_, als welcher der Philosoph bisher galt,

ist er gewissermassen zum Wahrheits-_Erfinder_ geworden, zu einem »Überreichen des Willens« (Jenseits von Gut und Böse 212), der zwar Unwahrheiten und Täuschungen ausspricht, aber dessen schöpferischer Wille sie wahr, d. h. zu überzeugenden Wirklichkeiten, zu machen weiss. »Wer seinen Willen nicht in die Dinge zu legen weiss, der legt wenigstens einen _Sinn_ noch hinein« (Götzen-Dämmerung, Sprüche und Pfeile 18). Damit kehrt er sich gegen die Metaphysiker, aber wie sie nimmt er sich das Recht zu einer Umdeutung und Umschaffung der Dinge auf Grund der über die blosse Verstandeskraft hinausgehenden Eingebungen des Gemüths.

In dieser persönlich gedachten Ueberlegenheit des Affektlebens über das Verstandesleben, in welcher schliesslich der Wahrheitsgehalt einer Erkenntniss als unwesentlich erachtet wird gegenüber ihrem Willens- und Gefühlsgehalt, spiegelt sich rückhaltlos Nietzsches Geistesart, sein innerstes Wesen und Sehnen wieder. Nach dem langen Zwang im Dienste des strengen Wahrheitserkennens war dies eine Reaktion, deren Seligkeit ihn in einen Taumel der Mystik hineinriss. Seine eigene Seele gibt er jenem übermenschengrossen Schöpfer-Philosophen, in dem des Lebens Fülle und Ueberfülle sich drängt und schöpferisch nach Entlastung durch den Gedanken verlangt,--es ist der »tropische« Mensch, auf den die Worte passen, die wir bereits im ersten Theile dieses Buches auf Nietzsches tieferregtes Innenleben angewendet haben: »die umfänglichste Seele, welche am weitesten in sich laufen und irren und schweifen kann;-- -- --die sich selber fliehende, die sich selber im weitesten Kreise einholt; die weiseste Seele, welcher die Narrheit am süssesten zuredet: die sich selber bebendste, in der alle Dinge ihr Strömen und Wiederströmen und Ebbe und Fluth haben« (Also sprach Zarathustra III 82).

Aber noch weiter geht diese unwillkürliche und gewaltsame Reaktion gegen die vorhergehende Geistesperiode, und geht die unbewusste Selbstwiderspiegelung in den Theorien, bis hinein in das persönlichste Empfinden Nietzsches. Denn in ihnen treffen wir auch auf jenen unheimlichen Zug in Nietzsches Seelenleben, wonach er sich nur in der Selbstopferung und Selbstvergewaltigung befriedigte und seiner Exaltation genug that. Wie er sich zuvor zur Unterwerfung unter die Forderungen eines strengen Intellektualismus gezwungen hatte, so zwingt er jetzt umgekehrt den Verstand, den Trieb zu rein intellektuellem Erkennen, unter den Machtwillen der Affekte. Hatte er zuvor seinen seelischen Menschen vergewaltigt, so vergewaltigt er jetzt den erkennenden Menschen in sich. Er ruht nicht eher, als bis der Triumph des entfesselten Lebenswillens zu einer Selbstverhöhnung des Verstandes wird: in unheimlicher Weise resultirt schliesslich die höchste Erkenntniss aus einer Selbstpreisgebung alles logischen Erkennens,--der Denker wird »heimlich durch seine Grausamkeit gelockt und vorwärts gedrängt, durch jene gefährlichen Schauder der _gegen sich selbst_ gewendeten Grausamkeit«.--er muss als »Künstler und Verklärer der Grausamkeit« walten (Jenseits von Gut und Böse 229). Der menschliche Geist taucht zuletzt freiwillig hinab in seine Vernichtung, denn nur so empfängt er die höchste Offenbarung,--er taucht hinab ins Grenzenlose, Maasslose, das über ihm zusammenschlägt, denn nur so erfüllt er sein Ziel. Wir werden in der ganzen letzten Philosophie Nietzsches, in der Ethik wie in der Aesthetik, den durchgehenden Grundgedanken wiederfinden: _dass der Untergang durch das Uebermass_ die Bedingung einer höchsten Neuschöpfung sei, und daher mündet auch Nietzsches Erkenntnisstheorie in eine Art schauerlich--persönlicher Mystik aus, in der die Begriffe Wahn und Wahrheit unlöslich verkettet sind, und das »Uebermenschliche« daher kommt als ein Blitz, der den Geist treffen und tödten, als ein Wahnsinn, mit dem sein Wahrheitssinn geimpft werden soll: »Wollte ich doch, sie hätten einen Wahnsinn, an dem sie zu Grunde gingen!-- -- --Wahrlich ich wollte, ihr Wahnsinn hiesse Wahrheit!-- --Und des Geistes Glück ist diess: gesalbt zu sein und durch Thränen geweiht zum Opferthier,--wusstet ihr das schon? Und die Blindheit des Blinden und sein Suchen und Tappen soll noch von der Macht der Sonne zeugen, in die er schaute,--wusstet ihr das schon?« (Also sprach Zarathustra II 33).

Aber dieses letzte Mysterium kann uns, wie das ganze Bild des Schöpfer-Philosophen überhaupt, nur fortschreitend, in der Ethik und Aesthetik Nietzsches, völlig deutlich werden, indem es, von den abstrakten Grundlinien aus, stets körperhaftere Züge gewinnt, bis es endlich, als eine mystische Wesensverklärung Nietzsches selber, in seiner persönlichen Einzelgestalt vor unseren Augen steht.

Dass erst die Ethik der Erkenntnisstheorie ihre rechte Erläuterung und Begründung giebt, erhellt schon aus dem Charakter des Erkennenden als des wahren Trägers des Lebenswillens,--des Erkennenden als des Handelnden und Schaffenden. Es gilt daher im höchsten Grade von Nietzsches Philosophie, was er von den Systemen der Philosophen überhaupt aussagt: »dass die moralischen-- --Absichten-- --den eigentlichen Lebenskeim ausmachten, aus dem jedesmal die ganze Pflanze gewachsen ist« (Jenseits von Gut und Böse 6). Dieser enge Zusammenhang des Philosophen mit dem Leben als solchem und mit dessen menschlichsten und persönlichsten Zwecken soll ihn am entschiedensten von allen Denen trennen, die das Leben anfeinden oder pessimistisch ansehen. Er soll der geborene Lebens-Apologet sein und seine Philosophie eo ipso eine Lebens-Apotheose, denn zu sich selbst kann das Leben nur immer wieder »Ja« sagen. In Wirklichkeit jedoch ist fast immer das Gegentheil der Fall gewesen (Götzen-Dämmerung II I). »Über das Leben haben zu allen Zeiten die Weisesten gleich geurtheilt: _es taugt nichts_.... Immer und

überall hat man aus ihrem Munde denselben Klang gehört,--einen Klang voll Zweifel, voll Schwermuth, voll Müdigkeit am Leben, voll Widerstand gegen das Leben.« War doch dieser geschwächte Lebenswille eine Folge der Verfeinerung und Sublimirung ihres menschlich-thierischen Wesens, der intellektuellen und beschaulichen Eigenart ihrer Natur,--war es doch, nach Nietzsches ehemaliger Auffassung, gewissermaassen zugleich ihr _Adelszeichen_, das sie von den geistig rohen Menschen, vom _Pöbel_, unterschied und zu ihrer Führerrolle berechtigte. Hier hat sich nun die Auffassung dahin verändert, dass nicht mehr auf die Lebensdurchgeistigung, sondern auf die Lebensschwächung der Nachdruck gelegt wird. Die Menschen des Geistes erscheinen nunmehr als die Kranken und Entnervten, als die _Niedergangstypen_ eines jeden Zeitalters. Der von Nietzsche so geliebte und verherrlichte Philosoph, der bei den Griechen die Lehre von der Herrschaft der Vernunft über die Naturinstinkte vertrat, Sokrates, wandelt sich ihm damit wieder zu der gefährlichen und geschmähten Versucher-Gestalt, die er für Nietzsche zur Zeit der Schopenhauerischen Periode war. Sokrates, der Hässliche, Missgestaltete unter den vornehmen, wohlgebildeten Griechen, trat unter ihnen auf als der erste grosse Decadent, er corrumpirte und verschnitt den ursprünglichen hellenischen Lebensinstinkt, indem er ihn der Vernunftlehre unterwarf (Vergleiche Götzen-Dämmerung II »Das Problem des Sokrates«). Darin ist er das Urbild aller Denker, die das Leben durch das Denken meistern wollen, aber wie sie Alle beweist er damit Nichts gegen das Leben, sondern nur Etwas gegen das Denken. Denn wenn auch bisher alle Philosophen zur Missachtung des Daseins, zur Erschlaffung der lebenerhaltenden Instinkte beigetragen haben, so spricht sich darin nicht eine Wahrheit hinsichtlich des also geringgeschätzten Lebens aus, sondern nur der Widerspruch, in den sie mit sich selber gerathen sind, als das charakteristische Symptom eines Krankheitszustandes. Es lehrt nur, dass die Menschen des überwiegenden Intellekts sich von der Lebensquelle, die auch ihrem Intellekt erst Nahrung zuführt, abgekehrt haben, dass sie Abgelebte, Müde, Spätlinge niedergehender Culturen sind, dass sie in sich nicht mehr die sieghafte, heilende, umformende Kraft besitzen, welche über die Schäden und Lücken des Daseins triumphirt und dasselbe zu höherer Entwicklung weiterführt. Ihnen allen gilt daher die argwöhnische Frage: »Waren sie vielleicht allesammt auf den Beinen nicht mehr fest? spät? wackelig? ddcadents? Erschiene die Weisheit vielleicht auf Erden als Rabe, den ein kleiner Geruch von Aas begeistert?...« (Götzen-Dämmerung II 1.)

Aber nicht nur ihnen gilt diese Frage, denn sie repräsentiren nur die äusserste Spitze dessen, worin die ganze Entwicklung der Menschheit gipfelt. Der stumpfen und dumpfen Einheitlichkeit seines ursprünglichen Thierbewusstseins entrissen, ist der Mensch durch die Weiterbildung seiner Geistesfähigkeiten in Zwiespalt mit dem Naturgrund gerathen, in dem seine Kraft wurzelt. Er ist damit zu einer Halbheit, zu einem Zwitterding geworden, das ersichtlich seine Erklärung und Daseinsberechtigung nicht aus sich selber schöpfen kann,--? er ist der verkörperte Uebergang zu Etwas, das noch nicht entdeckt, noch nicht geschaffen ist, und als ein solcher Uebergang ist der Mensch das krankhafteste,--»das noch nicht _festgestellte_ Thier.« (Jenseits von Gut und Böse 62). So haftet der Decadenz-Charakter dem Menschenthum als solchem an und nicht nur einer einzelnen Form, einem einzelnen Gebiet desselben.

Wir finden demnach die ersten Anfänge der Decadenz, des Niederganges ungebrochenen Lebens, schon im Entstehen aller Cultur,--da wo sich die wilde Bestie Mensch, das »menschliche Raubthier«, durch den ersten socialen Zwang in seiner ungezügelten Freiheit beengt fühlt. »Jene furchtbaren Bollwerke, mit denen sich die staatliche Organisation gegen die alten Instinkte der Freiheit schützte-- -- --brachten zu Wege, dass alle jene Instinkte des wilden freien schweifenden Menschen sich rückwärts, sich _gegen den Menschen selbst_ wandten.« »Alle Instinkte, welche sich nicht nach Aussen entladen, _wenden sich nach Innen_-- ist das, was ich die _Verinnerlichung_ des Menschen nenne: damit wächst erst das an den Menschen heran, was man später seine »Seele« nennt. Die ganze innere Welt, ursprünglich dünn wie zwischen zwei Häute eingespannt, hat Tiefe, Breite, Höhe bekommen, als die Entladung des Menschen _nach Aussen_ gehemmt worden ist.« »Der Mensch, der sich, aus Mangel an äusseren Feinden und Widerständen, eingezwängt in eine drückende Enge und Regelmässigkeit der Sitte, ungeduldig selbst zerriss, verfolgte, annagte, aufstörte, misshandelte, dies an den Gitterstangen seines Käfigs sich wund stossende Thier,-- -- --. Mit ihm aber war die grösste und unheimlichste Erkrankung eingeleitet, von welcher die Menschheit bis heute nicht genesen ist, das Leiden des Menschen--_an sich_: als die Folge einer gewaltsamen Abtrennung von der thierischen Vergangenheit, einer Kriegserklärung gegen die alten Instinkte, auf denen bis dahin seine Kraft, Lust und Furchtbarkeit beruhte.« (Zur Genealogie der Moral II 16.)

Wenn dementsprechend die Krankhaftigkeit des Menschen gewissermaassen sein Normalzustand, seine specifisch menschliche Natur selbst ist, und die Begriffe Erkrankung und Entwicklung als nahezu identisch gefasst werden, so müssen wir natürlich auch am _Ausgang_ einer langen culturellen Entwicklung wieder der nämlichen Decadenz als Resultat begegnen. Sie hat nur das Aussehen verändert. Es sind die Zeiten langer friedlicher Gewöhnung, in denen sie in ihrer neuen Form auftritt, Zeiten, in denen das strenge Zusammenhalten, die harte Zucht und Unterordnung der Einzelnen nicht mehr als nothwendig erscheinen, sondern die Mittel zu einer sorgloseren und volleren Selbstauslebung reichlich vorhanden sind. Die starre Gleichförmigkeit, zu der durch eine

Jahrhunderte währende Schulung Alle herangezüchtet worden sind, beginnt sich aufzulösen und dem Spiel des Individuellen Platz zu machen. »Die Variation, sei es als Abartung (in's Höhere, Feinere, Seltnere), sei es als Entartung und Monstrosität, ist plötzlich in der grössten Fülle und Pracht auf dem Schauplatz, der Einzelne wagt einzeln zu sein und sich abzuheben.« »Lauter neue Wozu's, lauter neue Womit's, keine gemeinsamen Formeln mehr, Missverständniss und Missachtung mit einander im Bunde, der Verfall, Verderb und die höchsten Begierden schauerlich verknotet, das Genie der Rasse aus allen Füllhörnern des Guten und Schlimmen überquellend, ein verhängnissvolles Zugleich von Frühling und Herbst.« (Jenseits von Gut und Böse 262.)

Wenn in der zuerst geschilderten ursprünglichen Decadenzform die Leidenschaften des Menschen sich gegen ihn selbst wenden, ihn bedrohen und zerfleischen, weil er sich nicht nach Aussen hin entladen, nicht wehren kann,--so gerathen sie jetzt aus dem entgegengesetzten Grunde in einen gleichen Innenkrieg miteinander, weil keine Verhältnisse mehr vorhanden sind, gegen die der Mensch sich zu wehren hätte, nichts, was seine Kriegskraft nach Aussen hin abzuziehen vermöchte. Im zahmen Frieden des geordneten Lebens hat der inzwischen so stark verinnerlichte Mensch nur noch sich selbst zum Kampfplatz seiner ungeberdigen Triebe. Sobald diese sich zu regen anfangen, beginnt er wiederum, an sich zu leiden, »Dank den wild gegeneinander gewendeten, gleichsam explodirenden Egoismen«, die sein überaus complicirt gewordenes Wesen in sich begreift, und durch die es allmälig alle Geschlossenheit der Persönlichkeit wieder einbüsst. In diesem Stadium bildet der Mensch das Endglied einer einzigen ungeheuer langen Entwicklungskette, deren einzelne Ringe ihm alle einverleibt sind, als die Summe der gesammten allmälig angezüchteten intellektuellen, moralischen und socialen »Menschlichkeit« nebst sämmtlichen nur allzu lebendigen Instinkterinnerungen an die zurückliegende Thierheit.

Aber wenn diese beiden Formen der Decadenz mit Nothwendigkeit der menschlichen Natur entspringen und unumgängliche Durchgangsphasen für deren Weiterbildung zu etwas Höherem sind, so gibt es daneben noch eine dritte Art der Decadenz, welche die geschilderten Krankheitszustände unheilbar zu machen und die Möglichkeit einer Wiedergenesung zu verhindern droht. Das ist die falsche Weltdeutung, die unrichtige Lebensauffassung, die durch jenes Leiden und jene Krankheit gezeitigt wird. Es ist die Aufforderung zur Askese in gleichviel welcher Form, zur Abkehr vom Leben und seinen Schmerzen, zur Hingebung an die Müdigkeit, die als Folge des immerwährenden »Krieges der man ist« auftritt. Ein solches asketisches Ideal predigen nicht nur alle Religionen und Moralen, sondern auch jeder Intellektualismus, der das Denken auf Kosten des Lebens unterstützt und das Ideal der »Wahrheit« dem Ideal einer möglichsten Lebenssteigerung entgegensetzt. Das wahre Heilmittel für diese um sich greifende Corruption bestände gerade in der vollen Hinwendung zum Leben, damit aus dem chaotischen Reichthum durcheinander ringender Gegensätze eine neue höhere Gesundheit geboren werde.

»Man ist nur _fruchtbar_ um den Preis, an Gegensätzen reich zu sein (Götzen-Dämmerung V 3), vorausgesetzt, dass noch genügende Kraft da ist, sie zu tragen, sie zu _ertragen_. Dann ist scheinbare Auflösung und Decadenz, dann ist alle sogenannte Corruption »nur ein Schimpfname für die Herbstzeiten«,--d. h. für die Zeiten der abfallenden Blätter, aber auch der reifenden Früchte. Insofern kann Decadenz und Fortschritt ein und dasselbe bedeuten: den Fortschritt dem nothwendigen Ende zu,--»Es hilft nichts: man muss vorwärts, will sagen _Schritt für Schritt weiter in der décadence_.-- -- --Man kann diese Entwicklung _hemmen_ und, durch Hemmung, die Entartung selber stauen, aufsammeln, vehementer und _plötzlicher_ machen: mehr kann man nicht.« (Götzen-Dämmerung IX 43.) Ein solches Ende, eine solche tragische Verknüpfung von vorwärts und niederwärts wird dadurch erklärt, dass der Mensch nicht in sich selbst seine Erfüllung findet, sondern über sich selbst hinaus drängt nach etwas Höherem, als er ist. Es ist »mit der Thatsache einer gegen sich selbst gekehrten, -- --Thierseele auf Erden etwas so Neues, Tiefes,-- --Widerspruchsvolles und _Zukunftsvolles_ gegeben«,--dass daraus die Zuversicht auf eine mögliche, neue Über-Art des Menschlichen geschöpft werden kann. Es ist, als ob sich damit »Etwas ankündige, Etwas vorbereite, als ob der Mensch kein Ziel, sondern nur ein Weg, ein Zwischenfall, eine Brücke, ein grosses Versprechen sei.« (Zur Genealogie der Moral II 16.) »Der Mensch ist ein Seil, geknüpft zwischen Thier und Übermensch,--ein Seil über einem Abgrunde.-- --Was gross ist am Menschen, das ist, dass er eine Brücke und kein Zweck ist: was geliebt werden kann am Menschen, das ist, dass er ein _Übergang_ und ein _Untergang_ ist.« (Also sprach Zarathustra I 12.) Die Decadenzerscheinungen können daher der Menschheit zu Zeiten des hereinbrechenden Unterganges und der sich ankündigenden Neugeburt ebenso wenig erspart bleiben als »einem schwangeren Weibe die Widerlichkeiten und Wunderlichkeiten der Schwangerschaft: »-- -- --als welche man vergessen muss, um sich des Kindes zu freuen.«

Die Einsicht in die durchgängige »Allzumenschlichkeit« der Triebe, die Nietzsche früher so stark betont hatte, wird hier also nicht aufgegeben, sondern noch möglichst _verschärft_ und zum Ausgangspunkt seiner neuen Menschheitstheorie genommen. Aus einer verstandeskalten Einsicht hat sie sich ihm zu einem _Gemüthsaffekt_ gesteigert, und als solcher gewinnt sie eine so ungeheure Bedeutung, dass sie alle seine Seelen- und Gedankenkräfte aufwühlt, bis ihm in Zorn, Gram und Entsetzen neue

»Flügel und quellenahnende Kräfte« (Also sprach Zarathustra III 77) wachsen, mit denen er sich über sie erhebt. Aus dem _Accent_, den er auf seine ehemalige Einsicht legt, aus den äussersten Consequenzen, die er aus ihr zieht, quillt ihm die übermächtige Sehnsucht nach seiner neuen Theorie, nach dem Gedanken einer Selbstopferung des Allzumenschlichen für das Uebermenschliche.

Wie sich in dem erkenntnisstheoretischen Theile von Nietzsches neuer Lehre die Abhängigkeit des Logischen vom Seelischen, des Gedankenlebens vom Gemüthsleben wiederspiegelt, so tritt uns in jenem Menschheitsbilde einer leidenden Ueberfülle zum Zweck einer Neugeburt die Erklärung seines eigenen Wesens entgegen: die Selbstopferung durcheinanderringender Triebe zur Entbindung höchster Schaffenskraft. Aus dem tiefen, ihm stets gegenwärtigen Gefühl eigener Krankhaftigkeit, eigenen Leidens ist seine Decadenzlehre hervorgegangen. Auch von ihr gilt, was von allen Theorien seiner letzten Philosophie gilt: die schmerzlichen psychischen Vorgänge, die bei ihm bisher die _Ursache_ und _Begleiterscheinung_ der verschiedenen Erkenntnissprocesse waren, werden nunmehr zum _Erkenntniss_-inhalt selbst.

Der Gedanke einer überreich gewordenen, sich opfernden Menschheit ist es denn auch, von dem aus Nietzsche, zurückblickend, den ganzen Gang der Menschheits-Entwicklung begreift. Um desswillen allein war jene lange und peinvolle Zähmung ursprünglicher Thierwildheit nöthig, obgleich sie den Menschen zum Decadenten heranzüchtet, und er ihr schliesslich doch wieder entwächst. Ihr Sinn ist es gewesen, ihn mit der ganzen Fülle seiner Innerlichkeit zu bereichern und ihn dann zum Herrn dieses Reichthums und seiner selbst zu machen. Das konnte nur durch einen langen harten Zwang geschehen, in dem sein Wille, als, der eines noch Unmündigen, gleichsam unter Schlägen und Strafen zur Mündigkeit erzogen wurde. So lernte der Mensch einen _längeren_ und _tieferen_ Willen haben, als das vergessliche, vom Augenblick beherrschte, dem Augenblicksimpulse unterworfene Thier. Er lernte für sein Wollen einstehen--er wurde »das Thier, das _versprechen darf_«. Alle Menschheitserziehung ist im Grunde eine Art von _Mnemotechnik_: sie löst das Problem, wie dem unberechenbaren Willen ein _Gedächtniss einzuverleiben_ sei. »Für sich gut sagen dürfen und mit Stolz, also auch zu sich _Ja sagen dürfen_--das ist--- eine _späte_ Frucht:--wie lange musste diese Frucht herb und sauer am Baume hängen! Stellen wir uns--ans Ende des ungeheuren Prozesses, dorthin, wo der Baum endlich seine Früchte zeitigt, wo die Societät und ihre Sittlichkeit der Sitte endlich zu Tage bringt, _wozu_ sie nur das Mittel war: so finden wir als reifste Frucht-- --das souveraine _Individuum_, das nur sich selbst gleiche,-- --, kurz den Menschen des eignen unabhängigen langen Willens, der _versprechen darf_.« (Zur Genealogie der Moral II I ff.) Dieser Selbstgewissheit des freigewordenen, herrgewordenen Individuums entspricht eine neue Art von _Gewissen_, nachdem der Mensch den Moral Vorstellungen und Idealbegriffen des Herkommens--seinen strengen, nunmehr überflüssig gewordenen Erziehern--entwachsen ist, und damit das alte Gewissen seine Wurzel und Berechtigung in ihm verloren hat.

Auch die Willenstheorie Nietzsches weist eine Verschmelzung seiner ehemaligen metaphysischen Anschauungen mit einem wissenschaftlichen Determinismus auf. Als Jünger Schopenhauers unterschied Nietzsche gleich diesem zwischen dem mysteriösen Willen »an sich«, der die Grundlage der Schopenhauerischen Metaphysik ausmacht, und dem Willen, wie er für unsere menschliche Wahrnehmung in die Erscheinung tritt. Er nannte ihn also frei, insofern die letzten Gründe seines Seins und Wesens jenseits unserer gesammten Erfahrungswelt liegen, jenseits des für diese geltenden Causalitätsgesetzes; unfrei, insofern die einzelne Willenserscheinung uns nur wahrnehmbar wird innerhalb des unzerreissbaren Netzes des allgemeinen Causalzusammenhangs. Nachdem Nietzsche dann mehrere Jahre einem consequenten Determinismus gehuldigt hatte, hält er auch jetzt noch an der Ansicht fest, dass der »Wille« sich am Gängelbande der ihn bestimmenden Einflüsse sozusagen erst seinen Namen verdiene. Aber was er als Determinist hinsichtlich der mysteriösen _Herkunft_ und Abstammung des Willens leugnet, das versucht er dafür an das _Ziel_ und _Ende_ der Willensentwicklung zu stellen. Ist nämlich in Folge der von ihm geschilderten langen Willenszüchtung durch Zwang und äussere Beeinflussung ein reifer, selbstgewisser, dem Augenblick entwachsener und das Leben beherrschender Wille allmählich _geschaffen worden_, so ist er damit in einem Sinne frei geworden, dem gegenüber die Deterministen Unrecht bekommen: denn nun lassen sich seine Handlungen nicht länger aus einer bestimmten Zeit und Umgebung ableiten, nun wird er durch nichts mehr als durch sich selbst, d. h. durch seine _gewaltig angewachsene und rücksichtslos explodirende Stärke_ bestimmt,--er ist reines, von der Zeit gelöstes Machtbewusstsein. Allerdings ist dieses sein Wesen nicht mehr _metaphysischer_ Natur, denn es ist geworden, es ist das _Resultat_ einer Entwicklungsreihe, und die erreichte Freiheit des Willens ist die Tochter der Nothwendigkeit und strengsten Bedingtheit des Willens. Aber es ist dennoch etwas Mystisches um diese Freiheit, denn sie wendet sich nunmehr als eine _unbedingte_ Macht umgestaltend und umschaffend _gegen_ eben die natürlichen Bedingungen, denen sie entsprungen. Die Welt der Wirklichkeit in ihrer uns allein zugänglichen und begreiflichen Entwicklung hatte Nietzsche in seiner positivistischen Zeit als das Werthvollste schätzen gelernt, indem er sich gegen die andersgesinnten Metaphysiker mit dem Wort kehrte: »Alles Fertige, Vollkommene wird angestaunt, alles Werdende unterschätzt,« (Menschliches, Allzumenschliches I 162)--blos weil man die Entstehungsursachen des ersteren nicht mehr

nachprüfen, nicht mehr durchschauen kann. Nun gelangt er zu dem gleichen Anstaunen des Fertiggewordenen und scheinbar Vollkommenen; und alles Werdende erscheint ihm nur noch schätzenswerth, insofern es der Weg dazu ist. Die Bedingtheit aller Dinge wird von ihm auch jetzt zugestanden, aber nur, weil aus ihr heraus irgend wann einmal eine über alle Bedingtheit und Erfahrung hinausgehende mystische Bedeutsamkeit aller Dinge sich offenbaren soll. Von der Machtstärke des freigewordenen Willens hängt diese Bedeutsamkeit ab, denn von ihm wird sie in die Dinge hineinerschaffen; darum will Nietzsche an Stelle des »freien« und »unfreien« Willens der Deterministen den Ausdruck »_starker_ und _schwacher_ Wille« gesetzt sehen (Jenseits von Gut und Böse 21) und die gesammte Psychologie aufgefasst wissen als »Morphologie und _Entwicklungslehre des Willens zur Macht_«. (Ebendas. 23.)

Der Willensmächtige ist also jederzeit der im höchsten Grade »Unzeitgemässe«, er ist Derjenige, in dem _Genie_ geworden ist, was sich durch lange Zeit hindurch in der Menschheit vorbereitet hat. Im Genie strömt frei aus, was von der Menschheit in Unfreiheit und Knechtschaft erlernt wurde. Genies sind wie »Explosivstoffe, in denen eine ungeheure Kraft aufgehäuft ist; ihre Voraussetzung ist immer, historisch und physiologisch, dass lange auf sie hin gesammelt, gehäuft, gespart und bewahrt worden ist,-- -- --die Zeit, in der sie erscheinen, ist zufällig; dass sie fast immer über dieselbe Herr werden, liegt nur darin, dass sie stärker, dass sie _älter_ sind, dass länger auf sie hin gesammelt worden ist;-- -- --die Zeit ist relativ immer viel jünger, dünner, unmündiger, unsicherer, kindischer.«-- -- --»Der grosse Mensch ist ein Ende;-- -- --Das Genie--in Werk, in That-- ist nothwendig ein Verschwender: _dass es sich ausgiebt_, ist seine Grösse.... Der Instinkt der Selbsterhaltung ist gleichsam ausgehängt; der übergewaltige Druck der ausströmenden Kräfte verbietet ihm jede solche Obhut und Vorsicht.« (Götzen-Dämmerung IX 44.)

Im Genie tritt also, wenigstens nach einer bestimmten Richtung, in ausserordentlichem Grade das zu Tage was den Menschen befähigen soll, von seiner Art zu einer Ueber-Art fortzuschreiten, eine Selbstvergeudung zu Gunsten einer Neuschöpfung, ein verschwenderischer Reichthum, in dessen Gaben sich die ganze Vergangenheit abgelagert hat, und in dem sie zugleich ganz und gar Fruchtbarkeit geworden ist,--Zukunftsbefruchtung. Denke man sich nun ein Genie, das nicht, gleich anderen Genies, seine Genialität nur auf einem oder einigen Gebieten besitzt, sondern in Bezug auf das gesammte Menschheitsbewusstsein,--so etwa, dass in ihm wirksam und lebendig ausströmt, was je in demselben gelebt und gewirkt: ein solches Genie wäre das Bild des Menschen, aus dem der Uebermensch geboren wird. Es würde in sich die ganze Vergangenheit überschauen und zusammenfassen, ja, es enthielte in sich »die ganze Linie Mensch, bis zu ihm selbst hin noch«, und deshalb müsste sich in ihm plötzlich Weg und Ziel der Menschheitszukunft offenbaren. Zum ersten Mal erhielte durch den Machtwillen eines solchen Offenbarers die Menschheitsentwicklung Richtung, Ziel und Zukunft, alle Dinge eine innere und endgiltige Bedeutsamkeit:--mit einem Wort, zum ersten Mal erstände der Philosoph als der Schaffende, wie Nietzsche ihn sich denkt: als der Willensmächtige, der Menschheitsgenius, der das Leben in sich Begreifende, an dem offenbar wird, was Nietzsche vom Denken überhaupt sagt: es sei »in der That viel weniger ein Entdecken, als ein Wiedererkennen, Wiedererinnern, eine Rück- und Heimkehr in einen fernen uralten Gesammt-Haushalt der Seele, aus dem jene Begriffe einstmals herausgewachsen sind:--Philosophien ist insofern eine Art von Atavismus höchsten Ranges.« (Jenseits von Gut und Böse 20.) Alles Höchste eine Art von Atavismus,--darin liegt der wunderlich _reaktionäre_ Charakter der ganzen letzten Philosophie Nietzsches, der sie am schärfsten von der seiner vorhergehenden Periode unterscheidet. Es ist ein Versuch, an Stelle der metaphysischen Verherrlichung bestimmter Dinge und Begriffe die ihres Alters und ihrer weit zurückliegenden Herkunft zu setzen. Er nimmt das »Wiedererinnern« und »Wiedererkennen« nur deshalb nicht im Sinne Platos, weil er meint, es durch die ungeheuer lange Zeitstrecke des Bestehens alles Denkens ebenso bedeutsam und übermenschlich fassen zu können. Deshalb gilt ihm, dass von allem Hochgearteten nur das Aelteste das Zukunftbestimmende sei,[2] dass Werth und Vornehmheit der Dinge ausschliesslich an das Alter gebunden seien: erst am Ende angelangt, weisen sie ihren Schatz auf, weisen sie sich als Macht, Freiheit und unabhängig gewordene Kraft aus. »Wer (die guten Dinge) _hat_, ist ein Andrer, als wer sie erwirbt. Alles Gute ist Erbschaft: was nicht ererbt ist, ist unvollkommen, ist Anfang ... « (Götzen-Dämmerung IX 47), vornehm ist: »was sich nicht improvisiren lässt.« Nichts ist mithin pöbelhafter, unvornehmer, als das Werdende und der Bringer des Werdenden und Neuen: der moderne Mensch und der moderne Geist, der von seiner Zeit ganz und gar bedingt und daher ganz und gar Sklavengeist ist. Herrengeist kann er erst werden, nachdem ihm Jahrhunderte und Jahrtausende einverleibt sind, und er dadurch selbst ein »Unzeitgemässer«, »zeitlose Genialität« geworden ist.

»Demokratismus war jeder Zeit die Niedergangs-Form der organisirenden Kraft:-- -- --Damit es Institutionen giebt, muss es-- --Wille, Instinkt, Imperativ geben, antiliberal bis zur Bosheit: den Willen zur Tradition, zur Autorität, zur Verantwortlichkeit auf Jahrhunderte hinaus, zur _Solidarität_ von Geschlechter-Ketten vorwärts und rückwärts in infinitum.« (Götzen-Dämmerung IX 39.) Es ist interessant, durch Vergleichung der entsprechenden Stellen in Nietzsches vorhergehenden Werken zu sehen, welche Wandlung in der Auffassung einer Theorie der blosse Gefühlsumschlag bei ihm hervorzurufen vermag, und wie unversöhnlich sich dadurch die Gegensätze sofort zuspitzen. Jetzt geisselt er die »pöbelhafte[3] Gleichmacherei« aller Menschen und die zahmen

Friedenszustände, in denen keine rohen Barbarengewalten mehr aufkommen können, welche die gesunde Kraft alter Zeiten in die ermattete und entkräftete Gegenwart hinübertragen würden. Barbaren sind »die _ganzeren_ Menschen (was auf jeder Stufe auch so viel mit bedeutet, als »die ganzeren Bestien«--).« (Jenseits von Gut und Böse 257.) Diese ganzeren Menschen und ganzeren Bestien erscheinen in einem solchen Gesellschaftszustand als böse und gefährlich, sie werden zu Verbrechern gestempelt und demgemäss behandelt,-- ja, sie _sind_ kraft ihrer stärkeren Naturtriebe die geborenen Verbrecher und Biecher der bestehenden Ordnung. »Der Verbrecher-Typus, das ist der Typus des starken Menschen unter ungünstigen Bedingungen,-- -- --Ihm fehlt die Wildniss, eine gewisse freiere und gefährlichere Natur und Daseinsform, in der Alles, was Waffe und Wehr im Instinkt des starken Menschen ist, _zu Recht besteht_. Seine _Tugenden_ sind von der Gesellschaft in Bann gethan.« (Götzen-Dämmerung IX 45.) Das Freiheitsideal, wonach einem _Jeden_ eine gewisse Freiheit zukommt, das also auch den Schwächsten und Geringsten zur Freiheit der Bewegung gelangen lässt, steht dem seinen gerade entgegen: seine rücksichtslose Auslebung fordert immer die Vergewaltigung Anderer, seine Stärke äussert sich unwillkürlich und nothwendig in einem Zertreten jeder ihn umgebenden Schwäche. Der Grund aber dieser in ihm ausbrechenden Stärke der Instinkte ist, dass er sozusagen von einer älteren Kultur-stufe herkommt, ein älteres Stück Menschenthum darstellt: dass er, mit einem Wort, gleich dem Willensmächtigen und dem Genie, im höchsten Grade atavistisch veranlagt ist. Mag diese ihm von Alters her innewohnende Instinktmacht an sich noch so unedler Natur sein, edel ist sie schon dadurch, dass sie einen Durchbruch lang angesammelter Fülle, einen starken Explosivstoff darstellt, mit welchem die Vergangenheit die Zukunft befruchtet. Wo der Verbrecher sehr stark, wo er also zugleich ein Genie seiner Art und ein »Willensfreier« ist, da gelingt es ihm manchmal, die herrschende Zeitrichtung seiner atavistischen Sonderart entsprechend zu leiten und das ihm widerstrebende Zeitalter unter seinen Tyrannenwillen zu beugen. Ein Beispiel hierfür ist Napoleon, den Nietzsche ähnlich auffasst wie Taine. Auch ihm erscheint es von der grössten Bedeutsamkeit, dass Napoleon ein Nachkomme der Tyrannen-Genies der Renaissance-Zeit ist, der, nach Corsica verpflanzt, in der Wildheit und Ursprünglichkeit der dortigen Sitten das Erbe seiner Vorfahren unangetastet in sich bewahren konnte, um endlich mit der Gewalt desselben das moderne Europa zu unterjochen, das ihm einen ganz anderen Spielraum der Kraftentladung bot, als einst Italien seinen Ahnen geboten hatte. Nietzsches Bewunderung für den grossen Corsen gehört seiner letzten Geistesperiode an, wie er auch die italienische Renaissance früher wesentlich anders auffasste.[4]

In der Urgesundheit seiner gewaltthätigen Instinktkraft und seines rückhaltlosen Egoismus wurde Napoleon nun für Nietzsche das Idealbild der geborenen Herrennatur, wie sie sein soll, und wie wir sie auch heute noch brauchen, um Alles auszurotten, was durch die Sklavennatur der modernen Menschen an moralischen Rücksichten und weichlichen Regungen grossgezogen worden ist. Wir kommen damit zu Nietzsches viel besprochener und vielfach überschätzter Unterscheidung zwischen Herren-Moral und Sklaven-Moral. Anfangs ging Nietzsche auch hier von positivistischen Anregungen aus. Wie schon erwähnt, gab Rées damals im Werden begriffenes Werk »Die Entstehung des Gewissens« den Anlass, mit dem Freunde das ganze Material, dessen dieser für seine eigenen Zwecke bedurfte, durchzusprechen,--namentlich auch den etymologischen und historischen Zusammenhang der Begriffe vornehm-stark-gut, niedrig-schwach-schlecht in der ältesten Moral oder auf der sozusagen vormoralischen Culturstufe. Die Art, wie diese Gespräche und gemeinsamen Studien noch einmal von den beiden Freunden aufgenommen wurden, war charakteristisch für die Beziehung, in der Nietzsche auch jetzt noch zu den positivistischen Anschauungen stand: er hörte den Gedanken derselben noch einmal geduldig zu, entnahm ihnen hie und da die Anregung oder das Material zu eigenem Denken, wandte sich aber hierbei bereits feindlich gegen seine ehemaligen Genossen.

In Rées Werk wurde die historische Verschiebung des Urtheils zu Gunsten aller wohlwollenden, gleichmachenden Regungen als ein natürlicher und allmählicher Uebergang zu höher entwickelten Gesellschaftsformen aufgefasst: die anfängliche Verherrlichung der raubthierhaften Kraft und Selbstsucht weicht immer mehr der Einführung milderer Sitten und Gesetze, bis endlich in der christlichen Moral das Mitleid und die Nächstenliebe als höchstes Gebot religiös sanktionirt erscheint. In seiner persönlichen Abschätzung des moralischen Phänomens war Rée indessen weit davon entfernt, sich auf die Seite der englischen Utilitarier zu stellen, denen er in seinen wissenschaftlichen Anschauungen sonst am nächsten kommt. Für Nietzsche hingegen spitzte sich, in Folge seiner veränderten persönlichen Auffassung des Moralischen, der geschichtlich gegebene Unterschied zwischen den beiden verschiedenen Verthbestimmungen dessen, was »gut« heisst, zu zwei unversöhnlichen Gegensätzen zu: zu einem Kampf zwischen Herren-Moral und Sklaven-Moral, der ungeschlichtet bis in unsere Tage hineinreicht. Die ungemein grosse Bedeutung, die alles Willensmächtige und Instinktstarke für ihn gewonnen hatte, verleitete ihn, darin die einzig mögliche Quelle aller gesunden Moral zu erblicken, in der Sanktionirung wohlwollender Regungen hingegen ein tödtliches Uebel, an dem die ganze Menschheit bis heute kranke. Seine bisherige Zurückführung aller moralischen Werthurtheile auf den Nutzen, die Gewohnheit und das Vergessen der ursprünglichen Nützlichkeitsgründe erschien ihm nunmehr als unrichtig: eine solche Entstehung konnte sich höchstens für die Sklaven-Moral schicken, für die andere musste ein vornehmerer Ursprung gefunden werden. Denn vornehm ist es, ein Ding ohne

Rücksicht auf den Nutzen gut oder schlecht zu nennen, und so verfährt die Herrennatur: sie empfindet sich selbst in ihrem Wesen und allen ihren Regungen als »gut« und sieht auf Alles, was diesen nicht entspricht, also auf alles Schwache, Abhängige, Furchtsame, mit unwillkürlicher und halb unbewusster Geringschätzung als auf das »Schlechte« herab. Ganz anders entsteht die Sklaven-Moral dieser Geringgeschätzten, dieser »Schlechten«: sie entsteht nicht spontan und von sich selbst aus, sondern auf dem Boden des Ressentiment als eine Art Racheakt: sie nennt alles »böse«, hassenswerth, was den herrschenden Ständen angehört, und erst von da aus erfindet sie, als etwas Abgeleitetes, _ihren_ Begriff »gut« für sämmtliche jenen _entgegengesetzte_ Eigenschaften,--also für das Schwache, Unterdrückte, Leidende. Auf der einen Seite steht mithin das »unschuldbewusste Raubthier«, das starke, »frohlockende Ungeheuer«, das sogar die schlimmsten Thaten, wenn es sie selbst begeht, mit einem »Übermuthe und seelischen Gleichgewichte« vollbringt, wie »einen Studentenstreich« (Zur Genealogie der Moral I 11), auf der anderen Seite der Unterdrückte, Hassgeübte, dessen Seele ohnmächtig nach Rache dürstet, während er die Moral des Mitleids und der erbarmenden Nächstenliebe zu predigen scheint. Zu einem vollkommenen Idealbild ist dieser letztere Typus im Christenthum ausgearbeitet worden, das Nietzsche ohne Weiteres als einen ungeheuren Racheakt des Judenthums an der selbstherrlichen antiken Welt auffasst. Dass die Juden den Stifter des Christenthums gekreuzigt und seine Religion verleugnet haben, soll die eigentliche Feinheit dieses Racheplanes gewesen sein, damit die anderen Völker unbedenklich »an diesem Köder anbeissen«.[5] Es ist aber nicht nothwendig, Nietzsche in allen seinen Erklärungen und seiner bisweilen gewagten Geschichts-Interpretation nachzugehen, weil die eigentliche _Bedeutsamkeit_ dieser Anschauung für seine Philosophie an anderer Stelle liegt, als wo man sie gemeinhin sucht. Im Bedürfniss, Alles möglichst zu verallgemeinern und wissenschaftlich zu begründen, hat Nietzsche versucht, Etwas, dessen Bedeutung für ihn innerhalb eines verborgenen seelischen Problems lag, aus der Menschheitsgeschichte zu entwickeln und in sie hineinzulegen. Deshalb ist es zu bedauern, wenn das Eigenartige in Nietzsches Gedankengang verwischt wird, indem man daran die falsche Seite über Gebühr betont: die der Wissenschaftlichkeit. Auch von diesen Hypothesen Nietzsches gilt es, und ganz besonders von diesen, dass man sie nicht theoretisch nehmen darf, um den originellen Kern aus ihnen herauszuschälen. Nicht was die Seelengeschichte der Menschheit sei, sondern wie seine eigene Seelengeschichte als diejenige der ganzen Menschheit aufzufassen sei, das war für ihn die Grundfrage. Im schärfsten Gegensatz zu der philologischen Genauigkeit, mit der er anfänglich und im Wesentlichen auch in der vorhergehenden Periode Geschichte und Philosophie interpretirt hatte, spielt jetzt die exakte wissenschaftliche Forschung keine Rolle mehr neben seinen genialen Einfällen und Ideen,--und sie konnte auch keine mehr spielen, weil Nietzsche verhindert war, wissenschaftlich zu arbeiten.

Von allen Studien, die er jetzt noch streifen mochte, gelten daher seine Worte aus der »Fröhlichen Wissenschaft« (166)--dass wir »_Immer in unserer Gesellschaft« bleiben_, auch wo wir wähnen, Fremdes aufzunehmen: »Alles, was meiner Art ist, in Natur und Geschichte, redet zu mir, lobt mich, treibt mich vorwärts, tröstet mich--: das Andere höre ich nicht oder vergesse es gleich.« »_Grenze unseres Hörsinns_: Man hört nur die Fragen, auf welche man im Stande ist, eine Antwort zu finden.« (Ebendaselbst 196.) »Wie gross auch die Habsucht meiner Erkenntniss ist: ich kann aus den Dingen nichts Anderes herausnehmen, als was mir schon gehört,-- das Besitzthum Anderer bleibt in den Dingen zurück.« (Ebendaselbst 242.)

Bei einer so willkürlichen Behandlung des Materials zu Gunsten seiner philosophischen Hypothesen entfernte er sich viel weiter von sachlicher Beobachtung und Begründung, wurde er viel subjektiver bestimmt in seinen Schlüssen und Folgerungen, als in den Jahren, wo er sich noch bewusst auf das innerlich Erlebte beschränkte. Jetzt wurde aus dem innerlich Bedeutsamen das nach Aussen hin Bestimmende und Gesetzgebende und er selber der »grosse Gewalt-Herr«, der »gewitzte Unhold, der mit seiner Gnade und Ungnade alles Vergangene zwänge und zwängte: bis es ihm Brücke würde und Vorzeichen und Herold und Hahnenschrei.« (Also sprach Zarathustra III 74.)

Für Nietzsches seelisches Problem handelt es sich von vornherein weniger darum, den Gegensatz zwischen Herren-Moral und Sklaven-Moral geschichtlich richtig zu fixiren, als um Feststellung der Thatsache, dass der Mensch, so wie er bis heute von unten herauf geworden ist, _beide_ Gegensätze in sich trägt, dass er das leidende Resultat einer solchen Instinkt-Widersprüchlichkeit, einer solchen Einverleibung von Doppel-Werthungen ist. Wenn wir uns Nietzsches Decadenz-Schilderung entsinnen, so finden wir in ihr den Menschen als geborene Herren-Natur, d. h. in ursprünglich ungezähmter Kraft und Wildheit, aber geknechtet und zum gehorchenden Sklaven gemacht durch den socialen Zwang, durch die Thatsache der beginnenden Kultur selbst. Alle Kultur als solche beruht für Nietzsche auf einem solchen Krankmachen, Sklavischmachen des Menschen, und ausdrücklich bemerkt er, dass ohne diesen Vorgang, ohne gewaltsam gegen sich selbst gekehrt zu werden, die menschliche Seele »flach« und »dünn« geblieben wäre. Seine ursprüngliche Herren-Natur ist noch nichts als ein herrliches Thier-Exemplar und zur Weiterentwickelung erst befähigt durch die _Wunden_, die ihrer Kraft beigebracht werden,--denn in der Qual dieser Wunden muss sie lernen, sich selbst zu zerfleischen, sich an sich selbst zu rächen, ihre Ohnmacht in nach Innen gekehrten Leidenschaften auszulassen: _alles dies ausschliesslich auf dem Boden des sklavischen Ressentiment_. »Das Wesentliche,-- -- --wie es scheint, ist, nochmals gesagt, dass

lange und in Einer Richtung _gehorcht_ werde: dabei kommt-- --auf die Dauer immer Etwas heraus, dessentwillen es sich lohnt, auf Erden zu leben.« (Jenseits von Gut und Böse 188.) Nun gilt dieser Decadenz-Zustand Nietzsche allerdings nicht nur als überwindbar, sondern geradezu als die nothwendige Voraussetzung für den daraus zu züchtenden willenslangen, affektstarken, selbstsicheren Menschen, aber man beachte wohl: Dieser vollendete Mensch mit seiner vertieften und individualisirten Herren-Natur soli keineswegs seinem naiven Egoismus leben, nicht die Vorurtheile und Sklavenketten abstreifen, um sich Selbstzweck zu sein, sondern er soll zum Erstling einer höheren Menschengattung werden und für ihre Neugeburt sich opfern, denn, wie wir gesehen, stellte ja für Nietzsche der Gipfel der Entwickelung den Untergang der Menschheit dar, indem diese nur der Uebergang zu etwas Höherem, eine Brücke, ein Mittel ist. Je grösser daher ein Mensch ist, je mehr Genie, je mehr Gipfel in einem jeden Sinne, um so mehr ist er auch ein Ende, eine Selbstvergeudung, ein Ausströmen letzter Kräfte,--»zum Vernichten bereit im Siegen!« (Also sprach Zarathustra III 91.) Er soll »etwas Vollkommenes, zu-Ende-Gerathenes, Glückliches, Mächtiges, Triumphirendes«, nur werden, damit er »zu Neuem, zu noch Schwererem, Fernerem bereit« sei, »wie ein Bogen, den alle Noth immer nur noch straffer anzieht«, (Zur Genealogie der Moral I 12) ein Bogen, dessen Pfeil nach dem Uebermenschen zielt. So wird er denn zu einem Kampfplatze widerstrebender und einander bekriegender Triebe, aus deren schmerzlicher Fülle allein alle Entwickelung hervorgeht; es zeigt sich in ihm wieder jenes Durcheinander von Herrschenwollen und Dienen müssen, von Vergewaltigung des Einen durch den Andren,--woraus einst alle Kultur geworden, und woraus nun eine Ueber-Kultur als letzte und höchste Schöpfung entstehen soll. Er ist kein Friedvoller und sich selbst Geniessender, sondern ein Kämpfender und Selbst-Untergang. Er wiederholt also _in sich_ und auf Grund seiner vollkommen individualisirten und geistesfreien Persönlichkeit genau dasselbe, was einst auf die Menschheit _von Aussen her_, durch Knechtung, als ein aufgezwungenes Erziehungsmittel wirkte,--wir finden in ihm wieder »diese heimliche Selbst-Vergewaltigung, diese Künstler-Grausamkeit, diese Lust, sich selbst als einem schweren widerstrebenden leidenden Stoffe eine Form zu geben, einen Willen, eine Kritik, einen Widerspruch, eine Verachtung, ein Nein einzubrennen, diese unheimliche und entsetzlich-lustvolle Arbeit einer mit sich selbst willig-zwiespältigen Seele, welche sich leiden macht, aus Lust am Leidenmachen. (Zur Genealogie der Moral II 18.) Denn gerade die vollendetste und umfassendste Seele muss am klarsten und unwid erruf lichsten das Grundgesetz des Lebens in sich zum Ausdruck bringen, welches heisst: »Ich bin das, _was sich immer selber überwinden muss_«. (Also sprach Zarathustra II 49.)

Es ist nicht zu verkennen, wie sehr Nietzsche seinen eignen Seelenzustand diesen Theorien untergelegt, wie stark er sein eignes Wesen in ihnen wiedergespiegelt, und wie er endlich dem tiefsten Bedürfniss desselben das Grundgesetz des Lebens selbst entnommen hat. Seine leidvolle »Seelen-Vielspältigkeit«, seine gewaltsame »Zweispaltung« in einen sich opfernden, anbetenden und in einen beherrschenden, vergöttlichten Wesenstheil liegt seinem gesammten Bilde der Menschheitsentwickelung zu Grunde. Ueberall, wo er von Herren- und Sklaven-Naturen spricht, muss man dessen eingedenk bleiben, dass er von sich selbst spricht, getrieben von der Sehnsucht einer leidenden und unharmonischen Natur nach ihrem Wesens-Gegensatz und von dem Verlangen, zu einem solchen als zu seinem Gott aufblicken zu können. Sein eigenes Ich schildert er, wenn er vom Sklaven sagt: »sein Geist liebt Schlupfwinkel, Schleichwege und Hinterthüren, alles Versteckte muthet ihn an als _seine_ Welt, _seine_ Sicherheit, _sein_ Labsal«; (Zur Genealogie der Moral I 10)--und er beschreibt sein Gegenbild in der handelnden, frohen, instinktsicheren, unbekümmerten Herren-Natur, dem ursprünglichen Thatenmenschen. Aber indem er das Eine die Voraussetzung des Andren sein lässt, indem er die Menschen-Natur als solche zu dem Schauplatz macht, auf dem sich diese beiden Gegensätze immer wieder treffen, um sich gegenseitig zu überwinden, fasst er sie als _Entwickelungsstufen innerhalb desselben Wesens_, die, historisch betrachtet, Gegensätze bleiben, sich aber im Einzelwesen, psychologisch betrachtet, als eine _Wesenstheilung innerhalb des entwickelungsfähigen Menschen erweisen_. Daher ist seine Auffassung des geschichtlichen Kampfes zwischen Herren- und Sklaven-Naturen in seiner ganzen Bedeutung nichts als eine vergröberte Illustration dessen, was im höchsten Einzelmenschen vorgeht, des grausamen Seelenprozesses, durch den dieser sich in Opfergott und Opferthier spalten muss.

Erst jetzt lässt sich feststellen, was eigentlich Nietzsches »Umwerthung aller Werthe«, aller bisherigen Moralund Idealauffassungen bedeutet, und wie sie sich zum _asketischen Ideal_ verhält, in dem jetzt alle religiösen und moralischen Ideale für Nietzsche zusammengefasst sind. Diese Umwerthung aller Werthe beginnt allerdings damit, dass sie jeglicher Askese den Krieg erklärt,--beginnt mit einer Heiligsprechung des »Allzumenschlichen« im Menschen, das bisher geschmäht und unterdrückt wurde, weil das Natürliche und Sinnliche dem Ueber-natürlichen und Uebersinnlichen im Wege stand, an das man als an eine unumstösslich gegebene Thatsache glaubte. Nietzsches Zukunftsphilosoph aber glaubt nicht langer, dass irgend ein Uebermenschenthum _gegeben_ sei, es müsste denn erst _geschaffen_ werden durch den Menschen selbst, und dazu verfügt er ja über kein andres Material als über die elementare Lebenskraft der Natur, wie sie ist. Es gilt also nicht mehr, das Diesseits in ein höheres Jenseits möglichst restlos zu verflüchtigen, sondern die ganze Fülle eines reichen, ungeahnt herrlichen Jenseits mitten aus dem Diesseits hervorzulocken.[6] Daher giebt er den verachteten, gefürchteten, misshandelten Trieben, den Leidenschaften

des »natürlichen« noch von keiner Moral zurechtgestutzten Menschen ihr Existenzrecht wieder. Mit der Ueberzeugung, dass es nicht auf eine Scheidung von guten und bösen Kräften ankomme, sondern auf eine Stärkung und äusserste Steigerung der Lebenskraft überhaupt, damit das Leben aus sich selbst heraus seinen höchsten Zweck verwirklichen könne, ist es gegeben, »dass dem Menschen sein Bösestes nöthig ist zu seinem Besten,--dass alles Böseste seine beste _Kraft_ ist und der härteste Stein dem höchsten Schaffenden; und dass der Mensch besser _und_ böser werden muss«. (Also sprach Zarathustra III 97.)

Als ein Fürsprecher des Lebens soll der Mensch sich in seiner Tugend ausgeben, preisgeben, verschwenden; aber indem er sein eigenes Selbst zu seiner Tugend umtauft, soll er sie zu einer Machtfülle in sich steigern, die ihn endlich zersprengt gleich einem zu engen Gefäss: er soll sie nur besitzen, um von ihr besessen zu werden. Zu einem so kraftquellenden Uebermaass anwachsend, verschlingt sie endlich ihn und seinen Einzelwillen in der Gluth und Empfindung des Ganzen,--wandelt sie sich ihm zur Brücke, auf welcher er dem Untergange zuschreitet: »Der Mensch ist Etwas, das überwunden werden muss: und darum sollst du deine Tugenden lieben,--denn du wirst an ihnen zu Grunde gehen«. (Ebendaselbst I 47.) »Ich liebe Den, dessen Seele übervoll ist, so dass er sich selber vergisst, und alle Dinge in ihm sind: so werden alle Dinge sein Untergang.« (Ebendaselbst I 14.)

So gleichbedeutend hiernach _egoistische Kraftauslebung_ und _Tugend_ im ersten Augenblick erscheinen mögen, so tief bleiben sie doch in Wahrheit von einander geschieden. Wohl ist der Werthunterschied zwischen den menschlichen Kräften und Eigenschaften, den alle Moral als einen qualitativen auffasst, im Grunde völlig ins Quantitative verlegt, aber die willige und begeisterte Hingabe an diese das Selbst zerstörende Kraftsteigerung begreift darum nicht minder einen Werthunterschied der Gesinnung in sich. Die Verwerflichkeit der Gesinnung wird betont, wenn es heisst, dass nicht das Böse der Menschengrösse schlimmster Feind sei, sondern -dass sein Bösestes so gar klein ist! Ach dass sein Bestes so gar klein ist!« (Ebendaselbst III 97.) Das _Uebermaass_ ist der Weg _zum Uebermenschlichen_, deshalb geht diesem der Ruf voran: »Wo ist doch der Blitz, der euch mit seiner Zunge lecke? Wo ist der Wahnsinn, mit dem ihr geimpft werden müsstet?--Seht, ich lehre euch den Übermenschen: der ist dieser Blitz, der ist dieser Wahnsinn!--« (Ebendaselbst I 11.)

Daher darf man den Weg, den Nietzsche zur Erreichung seines Idealzieles wählt, nicht mit diesem Ziele selbst verwechseln; er betrachtet die Herrschaft der »furchtbaren Instinkte« nur als ein Mittel, dessen er für den höchsten Endzweck bedarf. Ganz mit Unrecht und in grobem Missverständniss ist ihm vorgeworfen worden, sein »Uebermensch« trage statt der Züge eines Jesus die eines Cesare Borgia, oder sonst eines lasterhaften Unmenschen. In Wahrheit ist der »Unmensch« dem »Uebermenschen« nicht Vorbild, sondern nur Sockel; er stellt sozusagen den unbehauenen Granitblock dar, der gefordert wird, um auf demselben eine Götterstatue aufzurichten. Und diese Götterstatue des Uebermenschen-Ideals ist in Art und Wesen nicht nur von ihm verschieden, sondern ihm geradezu entgegengesetzt. Dabei wird der Gegensatz so tief und scharf gefasst, wie es selbst in der asketischesten Moral nicht der Fall ist. Alle Moral strebt nur eine Verbesserung und Verschönerung des Menschlichen an, während Nietzsche davon ausgeht, dass eine ganz neue Species, eine Ueberart, geschaffen werden müsse. Was bisher als ein Uebergang von Niederem zu Höherem galt, unter Beibehaltung des charakteristisch Menschlichen im Idealbilde, das fasst Nietzsche als einen vollständigen Bruch, als den Kampf sich befehdender Gegensätze auf; was bisher nur ein Gradesunterschied zwischen dem »natürlichen« und dem »moralischen« Menschen innerhalb des beiden gemeinsamen Menschsems war, das wird bei Nietzsche zu einem absoluten Wesensgegensatz zwischen dem Naturmenschen und dem Uebeimenschen. Deshalb kann man sagen: Betrachtet man den _Moral-Weg_, den Nietzsche einschlägt, so ist für denselben allerdings das Anti-Asketische bezeichnend, indem er nicht dem steilen und steinigen Pfade der Selbstentsagung gleicht, sondern mitten in eine tropische Wildniss unbekümmerten Selbstgenusses führt. Fasst man hingegen Nietzsches _Moral-Ziel_ genauer ins Auge, so erweist es sich als völlig asketischer Natur, indem es den Menschen nicht nur erheben, sondern vollständig über ihn hinausgehen, ihn nicht nur läutern, sondern ihn vollständig aufheben will. Einerseits also bekämpft Nietzsche die übliche Moral wegen ihres asketischen Grund Charakters, wegen ihrer Geringachtung und Verdammung der untermenschlichen Begierden, denen er, als der Kraftquelle im Menschen, so hohen Werth zuspricht; "andrerseits aber bekämpft er die herrschende Moral nicht minder heftig in dem, worin sie ihm nicht asketisch genug ist. Er wendet sich grundsätzlich gegen ihren optimistischen Glauben, als ob auf dem Wege einer bestimmten Läuterung der Mensch einem Idealziele nahegebracht werden könne; denn der Mensch ist nach Nietzsches Meinung unfähig hierzu, und daher beruht alle sogenannte Veredelung auf einer blossen Schwächung der elementaren Lebenskraft. »Nackt hatte ich einst Beide gesehn, den grössten Menschen und den kleinsten Menschen: allzuähnlich einander,--allzumenschlich auch den Grössten noch!« (Also sprach Zarathustra III 98.) Der Versuch aller Moral, das Menschenwesen einem Idealwesen anzuähneln, ergiebt nur eine unwirkliche Nachahmung auf Kosten der wirklichen Kraft, und alle moralische Umwandlung ist deshalb nur eine Art von ästhetischer Verschleierung des geschwächten, aber sonst völlig unveränderten menschlichen Wesens. »Wie? Ein grosser Mann? Ich sehe immer nur den Schauspieler seines eignen Ideals.« (Jenseits von Gut und Böse 97.) »Ich suchte nach grossen Menschen, ich fand immer nur die _Affen_ ihres Ideals.« (Götzen-Dämmerung I 39.)

Aus dieser pessimistischen Auffassung des Menschlichen entspringt der extrem-asketische Grundzug, den das Idealziel in Nietzsches Philosophie erhält; dasselbe ist nur erreichbar durch den Untergang des Menschen. Und dieser Grundzug tritt in der Folge um so extremer hervor, je prinzipieller Nietzsche alles Asketische zu verleugnen und auszumerzen bemüht ist. Je ausschliesslicher am Anfang die Steigerung der egoistischen Kraft gefordert wird, desto ungeheurer erscheint am Ende der Entwickelung die Forderung, das eigene Selbst aufzugeben, damit Raum für den Uebermenschen geschafft werde. Hiess es zuerst: Der Mensch ist Etwas, das böse, wild und grausam werden muss, so heisst es schliesslich: »Der Mensch ist Etwas, das überwunden werden muss«,--alle erlangte Grausamkeit und Wildheit ist letzten Endes nur dazu da, um sich gegen den Menschen selbst zu kehren und ihn zu vernichten.

So unversöhnlich fallen die beiden Seiten von Nietzsches Ethik auseinander, die er in ein und demselben Gebot zusammenfasst,--in dem ersten und einzigen Moralgesetz, das in die neuen Werthtafeln eingegraben wird: »Werdet hart!« (Also sprach Zarathustra III 90 = Götzen-Dämmerung, Schluss.) Aus dem Wort: »Werdet hart!« blickt in der That deutlich das Doppelantlitz der Nietzsche-Moral, mit seinen Zügen voll tyrannischer Grausamkeit und asketischer Entsagung. Denn hart werden bedeutet einmal die Widerstandskraft gegen alle weichen und wohlwollenden Regungen, die Versteinerung im egoistischen Selbstgenuss, kurz: Härte gegen Andere, guten Willen zur Ausübung herrischer Macht; das andere Mal aber bedeutet es die Härte gegen sich selbst, als den Untergehenden, der zermalmt werden muss,--es bedeutet: Euch adelt die Härte in demselben Sinne, wie sie den Stein adelt, den der Künst Author: Frank Frost Abbott

Prefatory Note

This book, like the volume on "Society and Politics in Ancient Rome," deals with the life of the common people, with their language and literature, their occupations and amusements, and with their social, political, and economic conditions. We are interested in the common people of Rome because they made the Roman Empire what it was. They carried the Roman standards to the Euphrates and the Atlantic; they lived abroad as traders, farmers, and soldiers to hold and Romanize the provinces, or they stayed at home,

working as carpenters, masons, or bakers, to supply the daily needs of the capital.

The other side of the subject which has engaged the attention of the author in studying these topics has been the many points of similarity which arise between ancient and modern conditions, and between the problems which the Roman faced and those which confront us. What policy shall the government adopt toward corporations? How can the cost of living be kept down? What effect have private benefactions on the character of a people? Shall a nation try to introduce its own language into the territory of a subject people, or shall it allow the native language to be used, and, if it seeks to introduce its own tongue, how can it best accomplish its object? The Roman attacked all these questions, solved some of them admirably, and failed with others egregiously. His successes and his failures are perhaps equally illuminating, and the fact that his attempts to improve social and economic conditions run through a period of a thousand years should make the study of them of the greater interest and value to us.

Of the chapters which this book contains, the article on "The Origin of the Realistic Romance among the Romans" appeared originally in _Classical Philology_, and the author is indebted to the editors of that periodical for permission to reprint it here. The other papers are now published for the first time.

It has not seemed advisable to refer to the sources to substantiate every opinion which has been expressed, but a few references have been given in the foot-notes mainly for the sake of the reader who may wish to follow some subject farther than has been possible in these brief chapters. The proofs had to be corrected while the author was away from his own books, so that he was unable to make a final verification of two or three of the citations, but he trusts that they, as well as the others, are accurate. He takes this opportunity to acknowledge his indebtedness to Dr. Donald Blythe Durham, of Princeton University, for the preparation of the index.

The Common People of Ancient Rome

How Latin Became the Language of the World

How the armies of Rome mastered the nations of the world is known to every reader of history, but the story of the conquest by Latin of the languages of the world is vague in the minds of most of us. If we should ask ourselves how it came about, we should probably think of the world-wide supremacy of Latin as a natural result of the world-wide supremacy of the Roman legions or of Roman law. But in making this assumption we should be shutting our eyes to the history of our own times. A conquered people does not necessarily accept, perhaps it has not commonly accepted, the tongue of its master. In his "Ancient and Modern Imperialism" Lord Cromer states that in India only one hundred people in every ten thousand can read and write English, and this condition exists after an occupation of one hundred and fifty years or more. He adds: "There does not appear the least prospect of French supplanting Arabic in Algeria." In comparing the results of ancient and modern methods perhaps he should have taken into account the fact that India and Algeria have literatures of their own, which most of the outlying peoples subdued by Rome did not have, and these literatures may have strengthened the resistance which the tongue of the conquered people has offered to that of the conqueror, but, even when allowance is made for this fact, the difference in resultant conditions is surprising. From its narrow confines, within a little district on the banks of the Tiber, covering, at the close of the fifth century B.C., less than a hundred square miles, Latin spread through Italy and the islands of the Mediterranean, through France, Spain, England, northern Africa, and the Danubian provinces, triumphing over all the other tongues of those regions more completely than Roman arms triumphed over the peoples using them.

In tracing the story we must keep in our mind's eye the linguistic geography of Italy, just as we must remember the political geography of the peninsula in following Rome's territorial expansion. Let us think at the outset, then, of a little strip of flat country on the Tiber, dotted here and there with hills crowned with villages. Such hill towns were Rome, Tusculum, and Præneste, for instance. Each of them was the stronghold and market-place of the country immediately about it, and therefore had a life of its own, so that although Latin was spoken in all of them it varied from one to the other. This is shown clearly enough by the inscriptions which have been found on the sites of these ancient towns,[1] and as late as the close of the third century before our era, Plautus pokes fun in his comedies at the provincialism of Præneste.

The towns which we have mentioned were only a few miles from Rome. Beyond them, and occupying central Italy and a large part of southern Italy, were people who spoke Oscan and the other Italic dialects, which were related to Latin, and yet quite distinct from it. In the seaports of the south Greek was spoken, while the Messapians and Iapygians occupied Calabria. To the north of Rome were the mysterious Etruscans and the almost equally puzzling Venetians and Ligurians. When we follow the Roman legions across the Alps into Switzerland, France, England, Spain, and Africa, we enter a jungle, as it were, of languages and dialects. A mere reading of the list of tongues with which Latin was brought into contact, if such a list could be drawn up, would bring weariness to the flesh. In the part of Gaul conquered by Cæsar, for instance, he tells us that there were three independent languages, and sixty distinct states, whose peoples doubtless differed from one another in their speech. If we look at a map of the Roman world under Augustus, with the Atlantic to bound it on the west, the Euphrates on the east, the desert of Sahara on the south, and the Rhine and Danube on the north, and recall the fact that the linguistic conditions which Cæsar found in Gaul in 58 B.C. were typical of what confronted Latin in a great many of the western, southern, and northern provinces, the fact that Latin subdued all these different tongues, and became the every-day speech of these different peoples, will be recognized as one of the marvels of history. In fact, so firmly did it establish itself, that it withstood the assaults of the invading Gothic, Lombardic, Frankish, and Burgundian, and has continued to hold to our own day a very large part of the territory which it acquired some two thousand years ago.

That Latin was the common speech of the western world is attested not only by the fact that the languages of France, Spain, Roumania, and the other Romance countries descend from it, but it is also clearly shown by the thousands of Latin inscriptions composed by freeman and freedman, by carpenter, baker, and soldier, which we find all over the Roman world.

How did this extraordinary result come about? It was not the conquest of the world by the common language of Italy, because in Italy in early days at least nine different languages were spoken, but its subjugation by the tongue spoken in the city of Rome. The traditional narrative of Rome, as Livy and others relate it, tells us of a struggle with the neighboring Latin hill towns in the early days of the Republic, and the ultimate formation of an alliance between them and Rome. The favorable position of the city on the Tiber for trade and defence gave it a great advantage over its rivals, and it soon became the commercial and political centre of the neighboring territory. The most important of these villages, Tusculum, Præneste, and Lanuvium, were not more than twenty miles distant, and the people in them must have come constantly to Rome to attend the markets, and in later days to vote, to hear political speeches, and to listen to plays in the theatre. Some of them probably heard the jests at the expense of their dialectal peculiarities which Plautus introduced into his comedies. The younger generations became ashamed of their provincialisms; they imitated the Latin spoken in the metropolis, and by the second century of our era, when the Latin grammarians have occasion to cite dialectal peculiarities from Latium outside Rome, they quote at second-hand from Varro of the first century B.C., either because they will not take the trouble to use their own ears or because the differences which were noted in earlier days had ceased to exist. The first stage in the conquest of the world by the Latin of Rome comes to an end, then, with the extension of that form of speech throughout Latium.

Beyond the limits of Latium it came into contact with Oscan and the other Italic dialects, which were related to Latin, but of course were much farther removed from it than the Latin of Tusculum or Lanuvium had been,[2] so that the adoption of Latin was not so simple a matter as the acceptance of Roman Latin by the villages of Latium near Rome had been.

The conflict which went on between Latin and its Italic kinsmen is revealed to us now and then by a Latin inscription, into which Oscan or Umbrian forms have crept.[3] The struggle had come to an end by the beginning of our era. A few Oscan inscriptions are found scratched on the walls of Pompeii after the first earthquake, in 63 A.D., but they are late survivals, and no Umbrian inscriptions are known of a date subsequent to the first century B.C.

The Social War of 90-88 B.C., between Rome and the Italians, was a turning-point in the struggle between Latin and the Italic dialects, because it marks a change in the political treatment of Rome's dependencies in Italy. Up to this time she had followed the

policy of isolating all her Italian conquered communities from one another. She was anxious to prevent them from conspiring against her. Thus, with this object in view, she made differences in the rights and privileges granted to neighboring communities, in order that, not being subject to the same limitations, and therefore not having the same grievances, they might not have a common basis for joint action against her. It would naturally be a part of that policy to allow or to encourage the retention by the several communities of their own dialects. The common use of Latin would have enabled them to combine against her with greater ease. With the conclusion of the Social War this policy gave way before the new conception of political unity for the people of Italian stock, and with political unity came the introduction of Latin as the common tongue in all official transactions of a local as well as of a federal character. The immediate results of the war, and the policy which Rome carried out at its close of sending out colonies and building roads in Italy, contributed still more to the larger use of Latin throughout the central and southern parts of the peninsula. Samnium, Lucania, and the territory of the Bruttii suffered severely from depopulation; many colonies were sent into all these districts, so that, although the old dialects must have persisted for a time in some of the mountain towns to the north of Rome, the years following the conclusion of the Social War mark the rapid disappearance of them and the substitution of Latin in their place. Campania took little part in the war, and was therefore left untouched. This fact accounts probably for the occurrence of a few Oscan inscriptions on the walls of Pompeii as late as 63 A.D.

We need not follow here the story of the subjugation of the Greek seaports in southern Italy and of the peoples to the north who spoke non-Italic languages. In all these cases Latin was brought into conflict with languages not related to itself, and the situation contains slightly different elements from those which present themselves in the struggle between Latin and the Italic dialects. The latter were nearly enough related to Latin to furnish some support for the theory that Latin was modified by contact with them, and this theory has found advocates,[4] but there is no sufficient reason for believing that it was materially influenced. An interesting illustration of the influence of Greek on the Latin of every-day life is furnished by the realistic novel which Petronius wrote in the middle of the first century of our era. The characters in his story are Greeks, and the language which they speak is Latin, but they introduce into it a great many Greek words, and now and then a Greek idiom or construction.

The Romans, as is well known, used two agencies with great effect in Romanizing their newly acquired territory, viz., colonies and roads. The policy of sending out colonists to hold the new districts was definitely entered upon in the early part of the fourth century, when citizens were sent to Antium, Tarracina, and other points in Latium. Within this century fifteen or twenty colonies were established at various points in central Italy. Strategic considerations determined their location, and the choice was made with great wisdom. Sutrium and Nepete, on the borders of the Ciminian forest, were "the gates of Etruria"; Fregellæ and Interamna commanded the passage of the river Liris; Tarentum and Rhegium were important ports of entry, while Alba Fucens and Carsioli guarded the line of the Valerian road.

This road and the other great highways which were constructed in Italy brought not only all the colonies, but all parts of the peninsula, into easy communication with the capital. The earliest of them was built to Capua, as we know, by the great censor Appius Claudius, in 312 B.C., and when one looks at a map of Italy at the close of the third century before our era, and sees the central and southern parts of the peninsula dotted with colonies, the Appian Way running from Rome south-east to Brundisium, the Popillian Way to Rhegium, the Flaminian Way north-east to Ariminum, with an extension to Cremona, with the Cassian and Aurelian ways along the western coast, the rapidity and the completeness with which the Latin language overspread Italy ceases to be a mystery. A map of Spain or of France under the Empire, with its network of roads, is equally illuminating.

The missionaries who carried Roman law, Roman dress, Roman ideas, and the Latin language first through central, southern, and northern Italy, and then to the East and the West, were the colonist, the merchant, the soldier, and the federal official. The central government exempted the Roman citizen who settled in a provincial town from the local taxes. As these were very heavy, his advantage over the native was correspondingly great, and in almost all the large towns in the Empire we find evidence of the existence of large guilds of Roman traders, tax-collectors, bankers, and land-owners.[5] When Trajan in his romantic eastern campaign had penetrated to Ctesiphon, the capital of Parthia, he found Roman merchants already settled there. Besides the merchants and capitalists who were engaged in business on their own account in the provinces, there were thousands of agents for the great Roman corporations scattered through the Empire. Rome was the money centre of the world, and the great stock companies organized to lend money, construct public works, collect taxes, and engage in the shipping trade had their central offices in the capital whence they sent out their representatives to all parts of the world.

The soldier played as important a part as the merchant in extending the use of Latin. Tacitus tells us that in the reign of Augustus there were twenty-five legions stationed in the provinces. If we allow 6,000 men to a legion, we should have a total of 150,000 Roman soldiers scattered through the provinces. To these must be added the auxiliary troops which were made up of natives who,

at the close of their term of service, were probably able to speak Latin, and when they settled among their own people again, would carry a knowledge of it into ever-widening circles. We have no exact knowledge of the number of the auxiliary troops, but they probably came to be as numerous as the legionaries.[6] Soldiers stationed on the frontiers frequently married native women at the end of their term of service, passed the rest of their lives in the provinces, and their children learned Latin.

The direct influence of the government was no small factor in developing the use of Latin, which was of course the official language of the Empire. All court proceedings were carried on in Latin. It was the language of the governor, the petty official, and the tax-gatherer. It was used in laws and proclamations, and no native could aspire to a post in the civil service unless he had mastered it. It was regarded sometimes at least as a _sine qua non_ of the much-coveted Roman citizenship. The Emperor Claudius, for instance, cancelled the Roman citizenship of a Greek, because he had addressed a letter to him in Latin which he could not understand. The tradition that Latin was the official language of the world was taken up by the Christian church. Even when Constantine presided over the Council at Nicæa in the East, he addressed the assembly in Latin.

The two last-mentioned agencies, the Latin of the Roman official and the Latin of the church, were the influences which made the language spoken throughout the Empire essentially uniform in its character. Had the Latin which the colonist, the merchant, and the soldier carried through Italy and into the provinces been allowed to develop in different localities without any external unifying influence, probably new dialects would have grown up all over the world, or, to put it in another way, probably the Romance languages would have come into existence several centuries before they actually appeared. That unifying influence was the Latin used by the officials sent out from Rome, which all classes eagerly strove to imitate. Naturally the language of the provinces did not conform in all respects to the Roman standard. Apuleius, for instance, is aware of the fact that his African style and diction are likely to offend his Roman readers, and in the introduction to his _Metamorphoses_ he begs for their indulgence. The elder Seneca in his _Controversiae_ remarks of a Spanish fellow-countryman "that he could never unlearn that well-known style which is brusque and rustic and characteristic of Spain," and Spartianus in his Life of Hadrian tells us that when Hadrian addressed the senate on a certain occasion, his rustic pronunciation excited the laughter of the senators. But the peculiarities in the diction of Apuleius and Hadrian seem to have been those which only a cultivated man of the world would notice. They do not appear to have been fundamental. In a similar way the careful studies which have been made of the thousands of inscriptions found in the West[7], dedicatory inscriptions, guild records, and epitaphs show us that the language of the common people in the provinces did not differ materially from that spoken in Italy. It was the language of the Roman soldier, colonist, and trader, with common characteristics in the way of diction, form, phraseology, and syntax, dropping into some slight local peculiarities, but kept essentially a unit by the desire which each community felt to imitate its officials and its upper classes.

The one part of the Roman world in which Latin did not gain an undisputed pre-eminence was the Greek East. The Romans freely recognized the peculiar position which Greek was destined to hold in that part of the Empire, and styled it the _altera lingua_. Even in Greek lands, however, Latin gained a strong hold, and exerted considerable influence on Greek[8].

In a very thoughtful paper on "Language-Rivalry and Speech-Differentiation in the Case of Race-Mixture,"[9] Professor Hempl has discussed the conditions under which language-rivalry takes place, and states the results that follow. His conclusions have an interesting bearing on the question which we are discussing here, how and why it was that Latin supplanted the other languages with which it was brought into contact.

He observes that when two languages are brought into conflict, there is rarely a compromise or fusion, but one of the two is driven out of the field altogether by the other. On analyzing the circumstances in which such a struggle for supremacy between languages springs up, he finds four characteristic cases. Sometimes the armies of one nation, though comparatively small in numbers, conquer another country. They seize the government of the conquered land; their ruler becomes its king, and they become the aristocracy. They constitute a minority, however; they identify their interests with those of the conquered people, and the language of the subject people becomes the language of all classes. The second case arises when a country is conquered by a foreign people who pour into it with their wives and children through a long period and settle permanently there. The speech of the natives in these circumstances disappears. In the third case a more powerful people conquers a country, establishes a dependent government in it, sends out merchants, colonists, and officials, and establishes new towns. If such a province is held long enough, the language of the conqueror prevails. In the fourth and last case peaceful bands of immigrants enter a country to follow the humbler callings. They are scattered among the natives, and succeed in proportion as they learn the language of their adopted country. For their children and grandchildren this language becomes their mother tongue, and the speech of the invaded nation holds its ground.

The first typical case is illustrated by the history of Norman-French in England, the second by that of the European colonists in America; the Latinization of Spain, Gaul, and other Roman provinces furnishes an instance of the third, and our own experience with European immigrants is a case of the fourth characteristic situation. The third typical case of language-conflict is the one with which we are concerned here, and the analysis which we have made of the practices followed by the Romans in occupying newly acquired territory, both in Italy and outside the peninsula, shows us how closely they conform to the typical situation. With the exception of Dacia, all the provinces were held by the Romans for several centuries, so that their history under Roman rule satisfies the condition of long occupation which Professor Hempl lays down as a necessary one. Dacia which lay north of the Danube, and was thus far removed from the centres of Roman influence, was erected into a province in 107 A.D., and abandoned in 270. Notwithstanding its remoteness and the comparatively short period during which it was occupied, the Latin language has continued in use in that region to the present day. It furnishes therefore a striking illustration of the effective methods which the Romans used in Latinizing conquered territory.[10]

We have already had occasion to notice that a fusion between Latin and the languages with which it was brought into contact, such a fusion, for instance, as we find in Pidgin-English, did not occur. These languages influenced Latin only by way of making additions to its vocabulary. A great many Greek scientific and technical terms were adopted by the learned during the period of Roman supremacy. Of this one is clearly aware, for instance, in reading the philosophical and rhetorical works of Cicero. A few words, like rufus, crept into the language from the Italic dialects. Now and then the Keltic or Iberian names of Gallic or Spanish articles were taken up, but the inflectional system and the syntax of Latin retained their integrity. In the post-Roman period additions to the vocabulary are more significant. It is said that about three hundred Germanic words have found their way into all the Romance languages.[11] The language of the province of Gaul was most affected since some four hundred and fifty Gothic, Lombardic, and Burgundian words are found in French alone, such words as boulevard, homard, and blesser. Each of the provinces of course, when the Empire broke up, was subjected to influences peculiar to itself. The residence of the Moors in Spain, for seven hundred years, for instance, has left a deep impress on the Spanish vocabulary, while the geographic position of Roumanian has exposed it to the influence of Slavic, Albanian, Greek, Magyar, and Turkish.[12] A sketch of the history of Latin after the breaking up of the Empire carries us beyond the limits of the question which we set ourselves at the beginning and out of the domain of the Latinist, but it may not be out of place to gather together here a few of the facts which the Romance philologist has contributed to its later history, because the life of Latin has been continuous from the foundation of the city of Rome to the present day.

In this later period the question of paramount interest is, why did Latin in one part of the world develop into French, in another part into Italian, in another into Spanish? One answer to this question has been based on chronological grounds.[13] The Roman soldiers and traders who went out to garrison and to settle in a newly acquired territory, introduced that form of Latin which was in use in Italy at the time of their departure from the peninsula. The form of speech thus planted there developed along lines peculiar to itself, became the dialect of that province, and ultimately the (Romance) language spoken in that part of Europe. Sardinia was conquered in 241 B.C., and Sardinian therefore is a development of the Latin spoken in Italy in the middle of the third century B.C., that is of the Latin of Livius Andronicus. Spain was brought under Roman rule in 197 B.C., and consequently Spanish is a natural outgrowth of popular Latin of the time of Plautus. In a similar way, by noticing the date at which the several provinces were established down to the acquisition of Dacia in 107 A.D., we shall understand how it was that the several Romance languages developed out of Latin. So long as the Empire held together the unifying influence of official Latin, and the constant intercommunication between the provinces, preserved the essential unity of Latin throughout the world, but when the bonds were broken, the naturally divergent tendencies which had existed from the beginning, but had been held in check, made themselves felt, and the speech of the several sections of the Old World developed into the languages which we find in them to-day.

This theory is suggestive, and leads to several important results, but it is open to serious criticism, and does not furnish a sufficient explanation. It does not seem to take into account the steady stream of emigrants from Italy to the provinces, and the constant transfer of troops from one part of the world to another of which we become aware when we study the history of any single province or legion. Spain was acquired, it is true, in 197 B.C., and the Latin which was first introduced into it was the Latin of Plautus, but the subjugation of the country occupied more than sixty years, and during this period fresh troops were steadily poured into the peninsula, and later on there was frequently an interchange of legions between Spain and the other provinces. Furthermore, new communities of Roman citizens were established there even down into the Empire, and traders were steadily moving into the province. In this way it would seem that the Latin of the early second century which was originally carried into Spain must have been constantly undergoing modification, and, so far as this influence goes, made approximately like the Latin spoken elsewhere in the Empire.

A more satisfactory explanation seems to be that first clearly propounded by the Italian philologist, Ascoli. His reasoning is that when we acquire a foreign language we find it very difficult, and often impossible, to master some of the new sounds. Our ears do not catch them exactly, or we unconsciously substitute for the foreign sound some sound from our own language. Our vocal organs, too, do not adapt themselves readily to the reproduction of the strange sounds in another tongue, as we know from the difficulty which we have in pronouncing the French nasal or the German guttural. Similarly English differs somewhat as it is spoken by a Frenchman, a German, and an Italian. The Frenchman has a tendency to import the nasal into it, and he is also inclined to pronounce it like his own language, while the German favors the guttural. In a paper on the teaching of modern languages in our schools, Professor Grandgent says:[14] "Usually there is no attempt made to teach any French sounds but _u_ and the four nasal vowels; all the rest are unquestioningly replaced by the English vowels and consonants that most nearly resemble them." The substitution of sounds from one's own language in speaking a foreign tongue, and the changes in voice-inflection, are more numerous and more marked if the man who learns the new language is uneducated and acquires it in casual intercourse from an uneducated man who speaks carelessly.

This was the state of things in the Roman provinces of southern Europe when the Goths, Lombards, and other peoples from the North gradually crossed the frontier and settled in the territory of Latin-speaking peoples. In the sixth century, for instance, the Lombards in Italy, the Franks in France, and the Visigoths in Spain would each give to the Latin which they spoke a twist peculiar to themselves, and out of the one Latin came Italian, out of the second, the language of France, and out of the third, Spanish. This initial impulse toward the development of Latin along different lines in Italy, France, and Spain was, of course, reinforced by differences in climate, in the temperaments of the three peoples, in their modes of life, and in their political and social experiences. These centrifugal forces, so to speak, became effective because the political and social bonds which had held Italy, France, and Spain together were now loosened, and consequently communication between the provinces was less frequent, and the standardizing influence of the official Latin of Rome ceased to keep Latin a uniform thing throughout the Empire.

One naturally asks why Latin survived at all, why the languages of the victorious Germanic peoples gave way to it. In reply to this question it is commonly said that the fittest survived, that the superiority of Roman civilization and of the Latin language gave Latin the victory. So far as this factor is to be taken into account, I should prefer to say that it was not so much the superiority of Latin, although that may be freely recognized, as it was the sentimental respect which the Germans and their leaders had for the Empire and for all its institutions. This is shown clearly enough, for instance, in the pride which the Visigothic and Frankish kings showed in holding their commissions from Rome, long after Rome had lost the power to enforce its claims upon them; it is shown in their use of Latin as the language of the court and of the official world. Under the influence of this sentiment Germanic rulers and their peoples imitated the Romans, and, among other things, took over their language. The church probably exerted considerable influence in this direction. Many of the Germans had been converted to Christianity before they entered the Empire, and had heard Latin used in the church services and in the hymns. Among cultivated people of different countries, it was the only medium of communication, and was accepted as the lingua franca of the political and ecclesiastical world, and the traditional medium of expression for literary and legal purposes.

Perhaps, however, one element in the situation should be given more weight than any of the facts just mentioned. Many of the barbarians had been allowed to settle in a more or less peaceful fashion in Roman territory, so that a large part of the western world came into their possession by way of gradual occupation rather than by conquest.[15] They became peasant proprietors, manual laborers, and soldiers in the Roman army. Perhaps, therefore, their occupation of central and southern Europe bears some resemblance to the peaceful invasion of this country by immigrants from Europe, and they may have adopted Latin just as the German or Scandinavian adopts English.

This brings us to the last important point in our inquiry. What is the date before which we shall call the language of the Western Empire Latin, and after which it is better to speak of French, Spanish, and Italian? Such a line of division cannot be sharply drawn, and will in a measure be artificial, because, as we shall attempt to show in the chapter which follows on the "Latin of the Common People," Latin survives in the Romance languages, and has had a continuous life up to the present day. But on practical grounds it is convenient to have such a line of demarcation in mind, and two attempts have been made to fix it. One attempt has been based on linguistic grounds, the other follows political changes more closely. Up to 700 A.D. certain common sound-changes take place in all parts of the western world.[16] After that date, roughly speaking, this is not the case. Consequently at that time we may say that unity ceased. The other method of approaching the subject leads to essentially the same conclusion, and shows us why unity ceased to exist.[17] In the sixth century the Eastern Emperor Justinian conceived the idea of reuniting the Roman world, and actually recovered and held for a short time Italy, southern Spain, and Africa. This attempt on his part aroused a national spirit

among the peoples of these lands, and developed in them a sense of their national independence and individuality. They threw off the foreign yoke and became separate peoples, and developed, each of them, a language of its own. Naturally this sentiment became effective at somewhat different periods in different countries. For France the point may be fixed in the sixth century, for Spain and Italy, in the seventh, and at these dates Latin may be said to take the form of French, Spanish, and Italian.

The Latin of the Common People

Unless one is a professional philologist he feels little interest in the language of the common people. Its peculiarities in pronunciation, syntax, phraseology, and the use of words we are inclined to avoid in our own speech, because they mark a lack of cultivation. We test them by the standards of polite society, and ignore them, or condemn them, or laugh at them as abnormal or illogical or indicative of ignorance. So far as literature goes, the speech of the common people has little interest for us because it is not the recognized literary medium. These two reasons have prevented the average man of cultivated tastes from giving much attention to the way in which the masses speak, and only the professional student has occupied himself with their language. This is unfortunate because the speech of the common people has many points of interest, and, instead of being illogical, is usually much more rigid in its adherence to its own accepted principles than formal speech is, which is likely to be influenced by convention or conventional associations. To take an illustration of what I have in mind, the ending _-s_ is the common mark in English of a plural form. For instance, "caps," "maps," "lines," and "places" are plurals, and the corresponding singular forms are "cap," "map," "line," and "place." Consequently, granted the underlying premise, it is a perfectly logical and eminently scientific process from the forms "relapse" (pronounced, of course, "relaps") and "species" to postulate a corresponding singular, and speak of "a relap" and "a specie," as a negro of my acquaintance regularly does. "Scrope" and "lept," as preterites of "scrape" and "leap," are correctly formed on the analogy of "broke" and "crept," but are not used in polite society.

So far as English, German, or French go, a certain degree of general interest has been stimulated lately in the form which they take in every-day life by two very different agencies, by the popular articles of students of language, and by realistic and dialect novels. But for our knowledge of the Latin of the common people we lack these two all-important sources of information. It occurred to only two Roman writers, Petronius and Apuleius, to amuse their countrymen by writing realistic stories, or stories with realistic features, and the Roman grammarian felt an even greater contempt for popular Latin or a greater indifference to it than we feel to-day. This feeling was shared, as we know, by the great humanists of the fourteenth and fifteenth centuries, when the revival of interest in the Greek and Latin languages and literatures begins. Petrarch, Poggio Bracciolini, and the other great leaders in the movement were concerned with the literary aspects of the classics, and the scholars of succeeding generations, so far as they studied the language, confined their attention to that of the great Latin stylists. The first student to conceive of the existence of popular Latin as a form of speech which differed from formal literary Latin, seems to have been the French scholar, Henri Étienne. In a little pamphlet on the language and style of Plautus, written toward the end of the sixteenth century, he noted the likeness between French and the language of the Latin dramatist, without, however, clearly perceiving that the reason for this similarity lay in the fact that the comedies of Plautus reflect the spoken language of his time, and that French and the other Romance languages have developed out of this, rather than from literary Latin. Not until the middle of the eighteenth century was this truth clearly recognized, and then almost simultaneously on both sides of the Rhine.

It was left for the nineteenth century, however, to furnish scientific proof of the correctness of this hypothesis, and it was a fitting thing that the existence of an unbroken line of connection between popular Latin of the third century before our era, and the Romance languages of the nineteenth century, should have been established at the same time by a Latinist engaged in the study of Plautus, and a Romance philologist working upward toward Latin. The Latin scholar was Ritschl, who showed that the deviations from the formal standard which one finds in Plautus are not anomalies or mistakes, but specimens of colloquial Latin which can be traced down into the later period. The Romance philologist was Diez, who found that certain forms and words, especially those from the vocabulary of every-day life, which are common to many of the Romance languages, are not to be found in serious Latin literature at all, but occur only in those compositions, like comedy, satire, or the realistic romance, which reflect the speech of the every-day man. This discovery made it clear that the Romance languages are related to folk Latin, not to literary Latin. It is sixty years since the study of vulgar Latin was put on a scientific basis by the investigations of these two men, and during that period the Latinist and the Romance philologist have joined hands in extending our knowledge of it. From the Latin side a great impetus was given to the work by the foundation in 1884 of Wölfflin's _Archiv für lateinische Lexikographie und Grammatik_. This periodical, as is well known, was intended to prepare the way for the publication of the Latin _Thesaurus_, which the five German Academies are now bringing out.

One of its primary purposes, as its title indicates, was to investigate the history of Latin words, and in its first number the editor called attention to the importance of knowing the pieces of literature in which each Latin word or locution occurred. The results have been very illuminating. Some words or constructions or phrases are to be found, for instance, only in comedy, satire, and the romance. They are evidently peculiar to vulgar Latin. Others are freely used in these types of literature, but sparingly employed in historical or rhetorical works. Here again a shade of difference is noticeable between formal and familiar usage. The method of the Latinist then is essentially one of comparison and contrast. When, for instance, he finds the word _equus_ regularly used by serious writers for "horse," but _caballus_ employed in that sense in the colloquial compositions of Lucilius, Horace, and Petronius, he comes to the conclusion that _caballus_ belongs to the vocabulary of every-day life, that it is our "nag."

The line of reasoning which the Romance philologist follows in his study of vulgar Latin is equally convincing. The existence of a large number of words and idioms in French, Spanish, Italian, and the other Romance languages can be explained only in one of three ways. All these different languages may have hit on the same word or phrase to express an idea, or these words and idioms may have been borrowed from one language by the others, or they may come from a common origin. The first hypothesis is unthinkable. The second is almost as impossible. Undoubtedly French, for instance, borrowed some words from Spanish, and Spanish from Portuguese. It would be conceivable that a few words originating in Spain should pass into France, and thence into Italy, but it is quite beyond belief that the large element which the languages from Spain to Roumania have in common should have passed by borrowing over such a wide territory. It is clear that this common element is inherited from Latin, out of which all the Romance languages are derived. Out of the words, endings, idioms, and constructions which French, Spanish, Italian, and the other tongues of southern Europe have in common, it would be possible, within certain limits, to reconstruct the parent speech, but fortunately we are not limited to this material alone. At this point the Latinist and the Romance philologist join hands. To take up again the illustration already used, the student of the Romance languages finds the word for "horse" in Italian is cavallo, in Spanish caballo, in French cheval, in Roumanian cal, and so on. Evidently all these forms have come from caballus, which the Latinist finds belongs to the vocabulary of vulgar, not of formal, Latin. This one illustration out of many not only discloses the fact that the Romance languages are to be connected with colloquial rather than with literary Latin, but it also shows how the line of investigation opened by Diez, and that followed by Wölfflin and his school, supplement each other. By the use of the methods which these two scholars introduced, a large amount of material bearing on the subject under discussion has been collected and classified, and the characteristic features of the Latin of the common people have been determined. It has been found that five or six different and independent kinds of evidence may be used in reconstructing this form of speech.

We naturally think first of the direct statements made by Latin writers. These are to be found in the writings of Cicero, Quintilian, Seneca the Rhetorician, Petronius, Aulus Gellius, Vitruvius, and the Latin grammarians. The professional teacher Quintilian is shocked at the illiterate speech of the spectators in the theatres and circus. Similarly a character in Petronius utters a warning against the words such people use. Cicero openly delights in using every-day Latin in his familiar letters, while the architect Vitruvius expresses the anxious fear that he may not be following the accepted rules of grammar. As we have noticed above, a great deal of material showing the differences between formal and colloquial Latin which these writers have in mind, may be obtained by comparing, for instance, the Letters of Cicero with his rhetorical works, or Seneca's satirical skit on the Emperor Claudius with his philosophical writings. Now and then, too, a serious writer has occasion to use a bit of popular Latin, but he conveniently labels it for us with an apologetic phrase. Thus even St. Jerome, in his commentary on the Epistle to the Ephesians, says: "Don't look a gift horse in the mouth, as the vulgar proverb has it." To the ancient grammarians the "mistakes" and vulgarisms of popular speech were abhorrent, and they have fortunately branded lists of words and expressions which are not to be used by cultivated people. The evidence which may be had from the Romance languages, supplemented by Latin, not only contributes to our knowledge of the vocabulary of vulgar Latin, but it also shows us many common idioms and constructions which that form of speech had. Thus, "I will sing" in Italian is canterò (=cantar[e]-ho), in Spanish, cantaré (=cantar-he), in French, chanterai (=chanter-ai), and similar forms occur in some of the other Romance languages. These forms are evidently made up of the Latin infinitive cantare, depending on habeo ("I have to sing"). But the future in literary Latin was cantabo, formed by adding an ending, as we know, and with that the Romance future can have no connection. However, as a writer in the _Archiv_ has pointed out,[18] just such analytical tense forms as are used in the Romance languages to-day are to be found in the popular Latin sermons of St. Jerome. From these idioms, common to Italian, French, and Spanish, then, we can reconstruct a Latin formation current among the common people. Finally a knowledge of the tendencies and practices of spoken English helps us to identify similar usages when we come upon them in our reading of Latin. When, for instance, the slave in a play of Plautus says: "Do you catch on" (tenes?), "I'll touch the old man for a loan" (tangam senem, etc.), or "I put it over him" (ei os sublevi) we recognize specimens of Latin slang, because all of the metaphors involved are in current use to-day. When one of the freedmen in Petronius remarks: "You ought not to

do a good turn to nobody" (neminem nihil boni facere oportet) we see the same use of the double negative to which we are accustomed in illiterate English. The rapid survey which we have just made of the evidence bearing on the subject establishes beyond doubt the existence of a form of speech among the Romans which cannot be identified with literary Latin, but it has been held by some writers that the material for the study of it is scanty. However, an impartial examination of the facts ought not to lead one to this conclusion. On the Latin side the material includes the comedies of Plautus and Terence, and the comic fragments, the familiar odes of Catullus, the satires of Lucilius, Horace, and Seneca, and here and there of Persius and Juvenal, the familiar letters of Cicero, the romance of Petronius and that of Apuleius in part, the Vulgate and some of the Christian fathers, the Journey to Jerusalem of St. Ætheria, the glossaries, some technical books like Vitruvius and the veterinary treatise of Chiron, and the private inscriptions, notably epitaphs, the wall inscriptions of Pompeii, and the leaden tablets found buried in the ground on which illiterate people wrote curses upon their enemies.

It is clear that there has been preserved for the study of colloquial Latin a very large body of material, coming from a great variety of sources and running in point of time from Plautus in the third century B.C. to St. Ætheria in the latter part of the fourth century or later. It includes books by trained writers, like Horace and Petronius, who consciously adopt the Latin of every-day life, and productions by uneducated people, like St. Ætheria and the writers of epitaphs, who have unwittingly used it.

St. Jerome says somewhere of spoken Latin that "it changes constantly as you pass from one district to another, and from one period to another" (et ipsa Latinitas et regionibus cotidie mutatur et tempore). If he had added that it varies with circumstances also, he would have included the three factors which have most to do in influencing the development of any spoken language. We are made aware of the changes which time has brought about in colloquial English when we compare the conversations in Fielding with those in a present-day novel. When a spoken language is judged by the standard of the corresponding literary medium, in some of its aspects it proves to be conservative, in others progressive. It shows its conservative tendency by retaining many words and phrases which have passed out of literary use. The English of the Biglow Papers, when compared with the literary speech of the time, abundantly illustrates this fact. This conservative tendency is especially noticeable in districts remote from literary centres, and those of us who are familiar with the vernacular in Vermont or Maine will recall in it many quaint words and expressions which literature abandoned long ago. In Virginia locutions may be heard which have scarcely been current in literature since Shakespeare's time. Now, literary and colloquial Latin were probably drawn farther apart than the two corresponding forms of speech in English, because Latin writers tried to make the literary tongue as much like Greek in its form as possible, so that literary Latin would naturally have diverged more rapidly and more widely from conversational Latin than formal English has drawn away from colloquial English.

But a spoken language in its development is progressive as well as conservative. To certain modifying influences it is especially sensitive. It is fond of the concrete, picturesque, and novel, and has a high appreciation of humor. These tendencies lead it to invent many new words and expressions which must wait months, years, perhaps a generation, before they are accepted in literature. Sometimes they are never accepted. The history of such words as buncombe, dude, Mugwump, gerrymander, and joy-ride illustrate for English the fact that words of a certain kind meet a more hospitable reception in the spoken language than they do in literature. The writer of comedy or farce, the humorist, and the man in the street do not feel the constraint which the canons of good usage put on the serious writer. They coin new words or use old words in a new way or use new constructions without much hesitation. The extraordinary material progress of the modern world during the last century has undoubtedly stimulated this tendency in a remarkable way, but it would seem as if the Latin of the common people from the time of Plautus to that of Cicero must have been subjected to still more innovating influences than modern conversational English has. During this period the newly conquered territories in Spain, northern Africa, Greece, and Asia poured their slaves and traders into Italy, and added a great many words to the vocabulary of every-day life. The large admixture of Greek words and idioms in the language of Petronius in the first century of our era furnishes proof of this fact. A still greater influence must have been felt within the language itself by the stimulus to the imagination which the coming of these foreigners brought, with their new ideas, and their new ways of looking at things, their strange costumes, manners, and religions.

The second important factor which affects the spoken language is a difference in culture and training. The speech of the gentleman differs from that of the rustic. The conversational language of Terence, for instance, is on a higher plane than that of Plautus, while the characters in Plautus use better Latin than the freedmen in Petronius. The illiterate freedmen in Petronius speak very differently from the freemen in his story. Sometimes a particular occupation materially affects the speech of those who pursue it. All of us know something of the linguistic eccentricities of the London cabman, the Parisian thief, or the American hobo. This particular influence cannot be estimated so well for Latin because we lack sufficient material, but some progress has been made in detecting

the peculiarities of Latin of the nursery, the camp, and the sea.

Of course a spoken language is never uniform throughout a given area. Dialectal differences are sure to develop. A man from Indiana and another from Maine will be sure to notice each other's peculiarities. Even the railway, the newspaper, and the public school will never entirely obliterate the old differences or prevent new ones from springing up. Without these agencies which do so much to promote uniformity to-day, Italy and the rest of the Empire must have shown greater dialectal differences than we observe in American English or in British English even.

For the sake of bringing out clearly some of the points of difference between vulgar and formal Latin we have used certain illustrations, like _caballus_, where the two forms of speech were radically opposed to each other, but of course they did not constitute two different languages, and that which they had in common was far greater than the element peculiar to each, or, to put it in another way, they in large measure overlapped each other. Perhaps we are in a position now to characterize colloquial Latin and to define it as the language which was used in conversation throughout the Empire with the innumerable variations which time and place gave it, which in its most highly refined form, as spoken in literary circles at Rome in the classical period, approached indefinitely near its ideal, literary Latin, which in its most unconventional phase was the rude speech of the rabble, or the "sermo inconditus" of the ancients. The facts which have just been mentioned may be illustrated by the accompanying diagrams.

[Illustration: Fig. I]

[Illustration: Fig. II]

[Illustration: Fig. III]

[Illustration: Fig. IV]

In Fig. I the heavy-lined ellipse represents the formal diction of Cicero, the dotted line ellipse his conversational vocabulary. They overlap each other through a great part of their extent, but there are certain literary locutions which would rarely be used by him in conversation, and certain colloquial words and phrases which he would not use in formal writing. Therefore the two ellipses would not be coterminous. In Fig. II the heavy ellipse has the same meaning as in Fig. I, while the space enclosed by the dotted line represents the vocabulary of an uneducated Roman, which would be much smaller than that of Cicero and would show a greater degree of difference from the literary vocabulary than Cicero's conversational stock of words does. The relation of the uncultivated Roman's conversational vocabulary to that of Cicero is illustrated in Fig. III, while Fig. IV shows how the Latin of the average man in Rome would compare, for instance, with that of a resident of Lugudunum, in Gaul.

This naturally brings us to consider the historical relations of literary and colloquial Latin. In explaining them it has often been assumed that colloquial Latin is a degenerate form of literary Latin, or that the latter is a refined type of the former. Both these theories are equally false. Neither is derived from the other. The true state of the case has never been better put than by Schuchardt, who says: "Vulgar Latin stands with reference to formal Latin in no derivative relation, in no paternal relation, but they stand side by side. It is true that vulgar Latin came from a Latin with fuller and freer forms, but it did not come from formal Latin. It is true that formal Latin came from a Latin of a more popular and a cruder character, but it did not come from vulgar Latin. In the original speech of the people, preliterary Latin (the prisca Latinitas), is to be found the origin of both; they were twin brothers."

Of this preliterary Latin we have no record. The best we can do is to infer what its characteristics were from the earliest fragments of the language which have come down to us, from the laws of the Twelve Tables, for instance, from the religious and legal formulæ preserved to us by Varro, Cicero, Livy, and others, from proverbs and popular sayings. It would take us too far afield to analyze these documents here, but it may be observed that we notice in them, among other characteristics, an indifference to strict grammatical structure, not that subordination of clauses to a main clause which comes only from an appreciation of the logical relation of ideas to one another, but a co-ordination of clauses, the heaping up of synonymous words, a tendency to use the analytical rather than the synthetical form of expression, and a lack of fixity in the forms of words and in inflectional endings. To illustrate some of these traits in a single example, an early law reads "if [he] shall have committed a theft by night, if [he] shall have killed him, let him be regarded as put to death legally" (si nox furtum faxsit, si im occisit, iure caesus esto).[19] We pass without warning from one subject, the thief, in the first clause to another, the householder, in the second, and back to the thief again in the third. Cato in his book on Agriculture writes of the cattle: "let them feed; it will be better" (pascantur; satius erit), instead of saying: "it will be better for them to feed" (or "that they feed"). In an early law one reads: "on the tablet, on the white surface" (in tabula, in albo), instead of "on the white tablet" (in alba tabula). Perhaps we may sum up the general characteristics of this preliterary Latin

out of which both the spoken and written language developed by saying that it showed a tendency to analysis rather than synthesis, a loose and variable grammatical structure, and a lack of logic in expression.

Livius Andronicus, Nævius, and Plautus in the third century before our era show the language as first used for literary purposes, and with them the breach between the spoken and written tongues begins. So far as Livius Andronicus, the Father of Latin literature, is concerned, allowance should be made without doubt for his lack of poetic inspiration and skill, and for the fact that his principal work was a translation, but even making this allowance the crude character of his Latin is apparent, and it is very clear that literary Latin underwent a complete transformation between his time and that of Horace and Virgil. Now, the significant thing in this connection is the fact that this transformation was largely brought about under an external influence, which affected the Latin of the common people only indirectly and in small measure. Perhaps the circumstances in which literary Latin was placed have never been repeated in history. At the very outset it was brought under the sway of a highly developed literary tongue, and all the writers who subsequently used it earnestly strove to model it after Greek. Livius Andronicus, Ennius, Accius, and Pacuvius were all of Greek origin and familiar with Greek. They, as well as Plautus and Terence, translated and adapted Greek epics, tragedies, and comedies. Several of the early writers, like Accius and Lucilius, interested themselves in grammatical subjects, and did their best to introduce system and regularity into their literary medium. Now, Greek was a highly inflected, synthetical, regular, and logical medium of literary expression, and it was inevitable that these qualities should be introduced into Latin. But this influence affected the spoken language very little, as we have already noticed. Its effect upon the speech of the common people would be slight, because of the absence of the common school which does so much to-day to hold together the spoken and written languages.

The development then of preliterary Latin under the influence of this systematizing, synthetical influence gave rise to literary Latin, while its independent growth more nearly in accordance with its original genius produced colloquial Latin. Consequently, we are not surprised to find that the people's speech retained in a larger measure than literary Latin did those qualities which we noticed in preliterary Latin. Those characteristics are, in fact, to be expected in conversation. When a man sets down his thoughts on paper he expresses himself with care and with a certain reserve in his statements, and he usually has in mind exactly what he wants to say. But in speaking he is not under this constraint. He is likely to express himself in a tautological, careless, or even illogical fashion. He rarely thinks out to the end what he has in mind, but loosely adds clauses or sentences, as new ideas occur to him.

We have just been thinking mainly about the relation of words to one another in a sentence. In the treatment of individual words, written and spoken Latin developed along different lines. In English we make little distinction between the quantity of vowels, but in Latin of course a given vowel was either long or short, and literary tradition became so fixed in this matter that the professional poets of the Augustan age do not tolerate any deviation from it. There are indications, however, that the common people did not observe the rules of quantity in their integrity. We can readily understand why that may have been the case. The comparative carelessness, which is characteristic of conversation, affects our pronunciation of words. When there is a stress accent, as there was in Latin, this is especially liable to be the case. We know in English how much the unaccented syllables suffer in a long word like "laboratory." In Latin the long unaccented vowels and the final syllable, which was never protected by the accent, were peculiarly likely to lose their full value. As a result, in conversational Latin certain final consonants tended to drop away, and probably the long vowel following a short one was regularly shortened when the accent fell on the short syllable, or on the syllable which followed the long one. Some scholars go so far as to maintain that in course of time all distinction in quantity in the unaccented vowels was lost in popular Latin. Sometimes the influence of the accent led to the excision of the vowel in the syllable which followed it. Probus, a grammarian of the fourth century of our era, in what we might call a "Guide to Good Usage"[20] or "One Hundred Words Mispronounced," warns his readers against masclus and anglus for masculus and angulus. This is the same popular tendency which we see illustrated in "lab'ratory."

The quality of vowels as well as their quantity changed. The obscuring of certain vowel sounds in ordinary or careless conversation in this country in such words as "Latun" and "Amurican" is a phenomenon which is familiar enough. In fact a large number of our vowel sounds seem to have degenerated into a grunt. Latin was affected in a somewhat similar way, although not to the same extent as present-day English. Both the ancient grammarians in their warnings and the Romance languages bear evidence to this effect.

We noticed above that the final consonant was exposed to danger by the fact that the syllable containing it was never protected by the accent. It is also true that there was a tendency to do away with any difficult combination of consonants. We recall in English the current pronunciations, "February," and "Calwell" for Caldwell. The average Roman in the same way was inclined to follow the line of least resistance. Sometimes, as in the two English examples just given, he avoided a difficult combination of consonants by dropping one of them. This method he followed in saying santus for sanctus, and scriserunt for scripserunt, just as in vulgar English

one now and then hears "slep" and "kep" for the more difficult "slept" and "kept." Sometimes he lightened the pronunciation by metathesis, as he did when he pronounced interpretor as interpertor. A third device was to insert a vowel, as illiterate English-speaking people do in the pronunciations "ellum" and "Henery." In this way, for instance, the Roman avoided the difficult combinations -mn- and -chn- by saying mina and techina for the historically correct mna and techna. Another method of surmounting the difficulty was to assimilate one of the two consonants to the other. This is a favorite practice of the shop-girl, over which the newspapers make merry in their phonetical reproductions of supposed conversations heard from behind the counter. Adopting the same easy way of speaking, the uneducated Roman sometimes said isse for ipse, and scritus for scriptus. To pass to another point of difference, the laws determining the incidence of the accent were very firmly established in literary Latin. The accent must fall on the penult, if it was long, otherwise on the antepenult of the word. But in popular Latin there were certain classes of words in whose case these principles were not observed.

The very nature of the accent probably differed in the two forms of speech. In preliterary Latin the stress was undoubtedly a marked feature of the accent, and this continued to be the case in the popular speech throughout the entire history of the language, but, as I have tried to prove in another paper,[21] in formal Latin the stress became very slight, and the pitch grew to be the characteristic feature of the accent. Consequently, when Virgil read a passage of the _Æneid_ to Augustus and Livia the effect on the ear of the comparatively unstressed language, with the rhythmical rise and fall of the pitch, would have been very different from that made by the conversation of the average man, with the accented syllables more clearly marked by a stress.

In this brief chapter we cannot attempt to go into details, and in speaking of the morphology of vulgar Latin we must content ourselves with sketching its general characteristics and tendencies, as we have done in the case of its phonology. In English our inflectional forms have been reduced to a minimum, and consequently there is little scope for differences in this respect between the written and spoken languages. From the analogy of other forms the illiterate man occasionally says: "I swum," or, "I clumb," or "he don't," but there is little chance of making a mistake. However, with three genders, five declensions for nouns, a fixed method of comparison for adjectives and adverbs, an elaborate system of pronouns, with active and deponent, regular and irregular verbs, four conjugations, and a complex synthetical method of forming the moods and tenses, the pitfalls for the unwary Roman were without number, as the present-day student of Latin can testify to his sorrow. That the man in the street, who had no newspaper to standardize his Latin, and little chance to learn it in school, did not make more mistakes is surprising. In a way many of the errors which he did make were historically not errors at all. This fact will readily appear from an illustration or two. In our survey of preliterary Latin we had occasion to notice that one of its characteristics was a lack of fixity in the use of forms or constructions. In the third century before our era, a Roman could say audibo or audiam, contemplor or contemplo, senatus consultum or senati consultum. Thanks to the efforts of the scientific grammarian, and to the systematizing influence which Greek exerted upon literary Latin, most verbs were made deponent or active once for all, a given noun was permanently assigned to a particular declension, a verb to one conjugation, and the slight tendency which the language had to the analytical method of forming the moods and tenses was summarily checked. Of course the common people tried to imitate their betters in all these matters, but the old variable usages persisted to some extent, and the average man failed to grasp the niceties of the new grammar at many points. His failures were especially noticeable where the accepted literary form did not seem to follow the principles of analogy. When these principles are involved, the common people are sticklers for consistency. The educated man conjugates: "I don't," "you don't," "he doesn't," "we don't," "they don't"; but the anomalous form "he doesn't" has to give way in the speech of the average man to "he don't." To take only one illustration in Latin of the effect of the same influence, the present infinitive active of almost all verbs ends in -re, e.g., amare, monere, and regere. Consequently the irregular infinitive of the verb "to be able," posse, could not stand its ground, and ultimately became potere in vulgar Latin. In one respect in the inflectional forms of the verb, the purist was unexpectedly successful. In comedy of the third and second centuries B.C., we find sporadic evidence of a tendency to use auxiliary verbs in forming certain tenses, as we do in English when we say: "I will go," "I have gone," or "I had gone." This movement was thoroughly stamped out for the time, and does not reappear until comparatively late.

In Latin there are three genders, and the grammatical gender of a noun is not necessarily identical with its natural gender. For inanimate objects it is often determined simply by the form of the noun. Sella, seat, of the first declension, is feminine, because almost all nouns ending in -a are feminine; hortus, garden, is masculine, because nouns in -us of its declension are mostly masculine, and so on. From such a system as this two results are reasonably sure to follow. Where the gender of a noun in literary Latin did not conform to these rules, in popular Latin it would be brought into harmony with others of its class. Thus stigma, one of the few neuter nouns in -a, and consequently assigned to the third declension, was brought in popular speech into line with sella and the long list of similar words in -a, was made feminine, and put in the first declension. In the case of another class of words, analogy was supplemented by a mechanical influence. We have noticed already that the tendency of the stressed syllable in a

word to absorb effort and attention led to the obscuration of certain final consonants, because the final syllable was never protected by the accent. Thus hortus in some parts of the Empire became hortu in ordinary pronunciation, and the neuter caelum, heaven, became caelu. The consequent identity in the ending led to a confusion in the gender, and to the ultimate treatment of the word for "heaven" as a masculine. These influences and others caused many changes in the gender of nouns in popular speech, and in course of time brought about the elimination of the neuter gender from the neo-Latin languages.

Something has been said already of the vocabulary of the common people. It was naturally much smaller than that of cultivated people. Its poverty made their style monotonous when they had occasion to express themselves in writing, as one can see in reading St. Ætheria's account of her journey to the Holy Land, and of course this impression of monotony is heightened by such a writer's inability to vary the form of expression. Even within its small range it differs from the vocabulary of formal Latin in three or four important respects. It has no occasion, or little occasion, to use certain words which a formal writer employs, or it uses substitutes for them. So testa was used in part for caput, and bucca for os. On the other hand, it employs certain words and phrases, for instance vulgar words and expletives, which are not admitted into literature.

In its choice of words it shows a marked preference for certain suffixes and prefixes. It would furnish an interesting excursion into folk psychology to speculate on the reasons for this preference in one case and another. Sometimes it is possible to make out the influence at work. In reading a piece of popular Latin one is very likely to be impressed with the large number of diminutives which are used, sometimes in the strict sense of the primitive word. The frequency of this usage reminds one in turn of the fact that not infrequently in the Romance languages the corresponding words are diminutive forms in their origin, so that evidently the diminutive in these cases crowded out the primitive word in popular use, and has continued to our own day. The reason why the diminutive ending was favored does not seem far to seek. That suffix properly indicates that the object in question is smaller than the average of its kind. Smallness in a child stimulates our affection, in a dwarf, pity or aversion. Now we give expression to our emotion more readily in the intercourse of every-day life than we do in writing, and the emotions of the masses are perhaps nearer the surface and more readily stirred than are those of the classes, and many things excite them which would leave unruffled the feelings of those who are more conventional. The stirring of these emotions finds expression in the use of the diminutive ending, which indirectly, as we have seen, suggests sympathy, affection, pity, or contempt. The ending -osus for adjectives was favored because of its sonorous character. Certain prefixes, like de-, dis-, and ex-, were freely used with verbs, because they strengthened the meaning of the verb, and popular speech is inclined to emphasize its ideas unduly.

To speak further of derivation, in the matter of compounds and crystallized word groups there are usually differences between a spoken and written language. The written language is apt to establish certain canons which the people do not observe. For instance, we avoid hybrid compounds of Greek and Latin elements in the serious writing of English. In formal Latin we notice the same objection to Greco-Latin words, and yet in Plautus, and in other colloquial writers, such compounds are freely used for comic effect. In a somewhat similar category belong the combinations of two adverbs or prepositions, which one finds in the later popular Latin, some of which have survived in the Romance languages. A case in point is ab ante, which has come down to us in the Italian avanti and the French avant. Such word-groups are of course debarred from formal speech.

In examining the vocabulary of colloquial Latin, we have noticed its comparative poverty, its need of certain words which are not required in formal Latin, its preference for certain prefixes and suffixes, and its willingness to violate certain rules, in forming compounds and word-groups, which the written language scrupulously observes. It remains for us to consider a third, and perhaps the most important, element of difference between the vocabularies of the two forms of speech. I mean the use of a word in vulgar Latin with another meaning from that which it has in formal Latin. We are familiar enough with the different senses which a word often has in conversational and in literary English. "Funny," for instance, means "amusing" in formal English, but it is often the synonym of "strange" in conversation. The sense of a word may be extended, or be restricted, or there may be a transfer of meaning. In the colloquial use of "funny" we have an extension of its literary sense. The same is true of "splendid," "jolly," "lovely," and "awfully," and of such Latin words as "lepidus," "probe," and "pulchre." When we speak of "a splendid sun," we are using splendid in its proper sense of shining or bright, but when we say, "a splendid fellow," the adjective is used as a general epithet expressing admiration. On the other hand, when a man of a certain class refers to his "woman," he is employing the word in the restricted sense of "wife." Perhaps we should put in a third category that very large colloquial use of words in a transferred or figurative sense, which is illustrated by "to touch" or "to strike" when applied to success in getting money from a person. Our current slang is characterized by the free use of words in this figurative way.

Under the head of syntax we must content ourselves with speaking of only two changes, but these were far-reaching. We have already noticed the analytical tendency of preliterary Latin. This tendency was held in check, as we have just observed, so far as

verb forms were concerned, but in the comparison of adjectives and in the use of the cases it steadily made headway, and ultimately triumphed over the synthetical principle. The method adopted by literary Latin of indicating the comparative and the superlative degrees of an adjective, by adding the endings -ior and -issimus respectively, succumbed in the end to the practice of prefixing plus or magis and maxime to the positive form. To take another illustration of the same characteristic of popular Latin, as early as the time of Plautus, we see a tendency to adopt our modern method of indicating the relation which a substantive bears to some other word in the sentence by means of a preposition rather than by simply using a case form. The careless Roman was inclined to say, for instance, magna pars de exercitu, rather than to use the genitive case of the word for army, magna pars exercitus. Perhaps it seemed to him to bring out the relation a little more clearly or forcibly.

The use of a preposition to show the relation became almost a necessity when certain final consonants became silent, because with their disappearance, and the reduction of the vowels to a uniform quantity, it was often difficult to distinguish between the cases. Since final -m was lost in pronunciation, _Asia_ might be nominative, accusative, or ablative. If you wished to say that something happened in Asia, it would not suffice to use the simple ablative, because that form would have the same pronunciation as the nominative or the accusative, Asia(m), but the preposition must be prefixed, _in Asia_. Another factor cooperated with those which have already been mentioned in bringing about the confusion of the cases. Certain prepositions were used with the accusative to indicate one relation, and with the ablative to suggest another. _In Asia_, for instance, meant "in Asia," _in Asiam_, "into Asia." When the two case forms became identical in pronunciation, the meaning of the phrase would be determined by the verb in the sentence, so that with a verb of going the preposition would mean "into," while with a verb of rest it would mean "in." In other words the idea of motion or rest is disassociated from the case forms. From the analogy of _in_ it was very easy to pass to other prepositions like _per_, which in literary Latin took the accusative only, and to use these prepositions also with cases which, historically speaking, were ablatives.

In his heart of hearts the school-boy regards the periodic sentences which Cicero hurled at Catiline, and which Livy used in telling the story of Rome as unnatural and perverse. All the specious arguments which his teacher urges upon him, to prove that the periodic form of expression was just as natural to the Roman as the direct method is to us, fail to convince him that he is not right in his feeling--and he _is_ right. Of course in English, as a rule, the subject must precede the verb, the object must follow it, and the adverb and attribute adjective must stand before the words to which they belong. In the sentence: "Octavianus wished Cicero to be saved," not a single change may be made in the order without changing the sense, but in a language like Latin, where relations are largely expressed by inflectional forms, almost any order is possible, so that a writer may vary his arrangement and grouping of words to suit the thought which he wishes to convey. But this is a different matter from the construction of a period with its main subject at the beginning, its main verb at the end, and all sorts of subordinate and modifying clauses locked in by these two words. This was not the way in which the Romans talked with one another. We can see that plainly enough from the conversations in Plautus and Terence. In fact the Latin period is an artificial product, brought to perfection by many generations of literary workers, and the nearer we get to the Latin of the common people the more natural the order and style seem to the English-speaking person. The speech of the uneducated freedmen in the romance of Petronius is interesting in this connection. They not only fail to use the period, but they rarely subordinate one idea to another. Instead of saying "I saw him when he was an ædile," they are likely to say "I saw him; he was an ædile then."

When we were analyzing preliterary Latin, we noticed that the co-ordination of ideas was one of its characteristics, so that this trait evidently persisted in popular speech, while literary Latin became more logical and complex.

In the preceding pages we have tried to find out the main features of popular Latin. In doing so we have constantly thought of literary Latin as the foil or standard of comparison. Now, strangely enough, no sooner had the literary medium of expression slowly and painfully disassociated itself from the language of the common people than influences which it could not resist brought it down again to the level of its humbler brother. Its integrity depended of course upon the acceptance of certain recognized standards. But when flourishing schools of literature sprang up in Spain, in Africa, and in Gaul, the paramount authority of Rome and the common standard for the Latin world which she had set were lost. When some men tried to imitate Cicero and Quintilian, and others, Seneca, there ceased to be a common model of excellence. Similarly a careful distinction between the diction of prose and verse was gradually obliterated. There was a loss of interest in literature, and professional writers gave less attention to their diction and style. The appearance of Christianity, too, exercised a profound influence on literary Latin. Christian writers and preachers made their appeal to the common people rather than to the literary world. They, therefore, expressed themselves in language which would be readily understood by the average man, as St. Jerome frankly tells us his purpose was. The result of these influences, and of others, acting on literary Latin, was to destroy its unity and its carefully developed scientific system, and to bring it nearer

and nearer in its genius to popular Latin, or, to put it in another way, the literary medium comes to show many of the characteristics of the spoken language. Gregory of Tours, writing in the sixth century, laments the fact that he is unfamiliar with grammatical principles, and with this century literary Latin may be said to disappear.

As for popular Latin, it has never ceased to exist. It is the language of France, Spain, Italy, Roumania, and all the Romance countries to-day. Its history has been unbroken from the founding of Rome to the present time. Various scholars have tried to determine the date before which we shall call the popular speech vulgar Latin, and after which it may better be styled French or Spanish or Italian, as the case may be. Some would fix the dividing line in the early part of the eighth century A.D., when phonetic changes common to all parts of the Roman world would cease to occur. Others would fix it at different periods between the middle of the sixth to the middle of the seventh century, according as each section of the old Roman world passed definitely under the control of its Germanic invaders. The historical relations of literary and colloquial Latin would be roughly indicated by the accompanying diagram, in which preliterary Latin divides, on the appearance of literature in the third century B.C., into popular Latin and literary Latin. These two forms of speech develop along independent lines until, in the sixth century, literary Latin is merged in popular Latin and disappears. The unity for the Latin tongue thus secured was short lived, because within a century the differentiation begins which gives rise to the present-day Romance languages.

It may interest some of the readers of this chapter to look over a few specimens of vulgar Latin from the various periods of its history.

(a) The first one is an extract from the Laws of the Twelve Tables. The original document goes back to the middle of the fifth century B.C., and shows us some of the characteristics of preliterary Latin. The non-periodic form, the omission of pronouns, and the change of subject without warning are especially noticeable.

"Si in ius vocat, ito. Ni it, antestamino, igitur em (=eum) capito. Si calvitur pedemve struit, manum endo iacito (=inicito). Si morbus aevitasve (=aetasve) vitium escit, iumentum dato: si nolet, arceram ne sternito."

[Illustration:

1 Preliterary Latin. 2 Vulgar Latin 3 Literary Latin 4-8 The Romance languages.

]

(b) This passage from one of Cicero's letters to his brother (_ad Q. fr._ 2, 3, 2) may illustrate the familiar conversational style of a gentleman in the first century B.C. It describes an harangue made by the politician Clodius to his partisans.

"Ille furens et exsanguis interrogabat suos in clamore ipso quis esset qui plebem fame necaret. Respondebant operae: 'Pompeius.' Quem ire vellent. Respondebant: 'Crassum.' Is aderat tum Miloni animo non amico. Hora fere nona quasi signo dato Clodiani nostros consputare coeperunt. Exarsit dolor. Vrgere illi ut loco nos moverent."

(c) In the following passage, Petronius, 57, one of the freedmen at Trimalchio's dinner flames out in anger at a fellow-guest whose bearing seems to him supercilious. It shows a great many of the characteristics of vulgar Latin which have been mentioned in this paper. The similarity of its style to that of the preliterary specimen is worth observing. The great number of proverbs and bits of popular wisdom are also noticeable.

"Et nunc spero me sic vivere, ut nemini iocus sim. Homo inter homines sum, capite aperto ambulo; assem aerarium nemini debeo; constitutum habui nunquam; nemo mihi in foro dixit 'redde, quod debes.' Glebulas emi, lamelullas paravi; viginti ventres pasco et canem; contubernalem meam redemi, ne quis in sinu illius manus tergeret; mille denarios pro capite solvi; sevir gratis factus sum; spero, sic moriar, ut mortuus non erubescam."

(d) This short inscription from Pompeii shows some of the peculiarities of popular pronunciation. In ortu we see the same difficulty in knowing when to sound the aspirate which the cockney Englishman has. The silence of the final -m, and the reduction of ae to e are also interesting. Presta mi sinceru (=sincerum): si te amet que (=quae) custodit ortu (=hortum) Venus.

(e) Here follow some of the vulgar forms against which a grammarian, probably of the fourth century, warns his readers. We notice that the popular "mistakes" to which he calls attention are in (1) syncopation and assimilation, in (2) the use of the diminutive for the primitive, and pronouncing au as o, in (3) the same reduction of ct to t (or tt) which we find in such Romance forms as Ottobre, in (4) the aspirate falsely added, in (5) syncopation and the confusion of v and b, and in (6) the silence of final -m.

(1) frigida non fricda (2) auris non oricla (3) auctoritas non autoritas (4) ostiae non hostiae (5) vapulo non baplo (6) passim non passi

(f) The following passages are taken from Brunot's "Histoire de la langue Fraçaise," p. 144. In the third column the opening sentence of the famous Oath of Strasburg of 842 A.D. is given. In the other columns the form which it would have taken at different periods is set down. These passages bring out clearly the unbroken line of descent from Latin to modern French.

The Oath of Strasburg of 842

Classic Latin

Per Dei amorem et per christiani populi et nostram communem salutem, ab hac die, quantum Deus scire et posse mini dat, servabo hunc meum fratrem Carolum

Spoken Latin, Seventh Cent.

For deo amore et por chrestyano pob(o)lo et nostro comune salvamento de esto die en avante en quanto Deos sabere et podere me donat, sic salvarayo eo eccesto meon fradre Karlo

Actual Text

Pro deo amur et pro christian poblo et nostro commun salvament, d'ist di en avant, in quant Deus savir et podir me dunat, si salvarai eo cist meon fradre Karlo

French, Eleventh Cent.

Por dieu amor et por del crestüen poeple et nostre comun salvement, de cest jorn en avant, quant que Dieus saveir et podeir me donet, si salverai jo cest mien fredre Charlon

French, Fifteenth Cent.

Pour l'amour Dieu et pour le sauvement du chrestien peuple et le nostre commun, de cest jour en avant, quant que Dieu savoir et pouvoir me done, si sauverai je cest mien frere Charle

Modern French

Pour l'amour de Dieu et pour le salut commun du peuple chrétien et le nôtre, à partir de ce jour, autant que Dieu m'en donne le savoir et le pouvoir, je soutiendrai mon frère Charles

The Poetry of the Common People of Rome

I. Their Metrical Epitaphs

The old village churchyard on a summer afternoon is a favorite spot with many of us. The absence of movement, contrasted with the life just outside its walls, the drowsy humming of the bees in the flowers which grow at will, the restful gray of the stones and the green of the moss give one a feeling of peace and quiet, while the ancient dates and quaint lettering in the inscriptions carry us far from the hurry and bustle and trivial interests of present-day life. No sense of sadness touches us. The stories which the stones tell are so far removed from us in point of time that even those who grieved at the loss of the departed have long since followed their friends, and when we read the bits of life history on the crumbling monuments, we feel only that pleasurable emotion which, as Cicero says in one of his letters, comes from our reading in history of the little tragedies of men of the past. But the epitaph deals with the common people, whom history is apt to forget, and gives us a glimpse of their character, their doings, their beliefs, and their views of life and death. They furnish us a simple and direct record of the life and the aspirations of the average man, the record of a life not interpreted for us by the biographer, historian, or novelist, but set down in all its simplicity by one of the common people themselves.

These facts lend to the ancient Roman epitaphs their peculiar interest and charm. They give us a glimpse into the every-day life of the people which a Cicero, or a Virgil, or even a Horace cannot offer us. They must have exerted an influence, too, on Roman

character, which we with our changed conditions can scarcely appreciate. We shall understand this fact if we call to mind the differences between the ancient practices in the matter of burial and our own. The village churchyard is with us a thing of the past. Whether on sanitary grounds, or for the sake of quiet and seclusion, in the interest of economy, or not to obtrude the thought of death upon us, the modern cemetery is put outside of our towns, and the memorials in it are rarely read by any of us. Our fathers did otherwise. The churchyard of old England and of New England was in the middle of the village, and "short cuts" from one part of the village to another led through its enclosure. Perhaps it was this fact which tempted our ancestors to set forth their life histories more fully than we do, who know that few, if any, will come to read them. Or is the world getting more reserved and sophisticated? Are we coming to put a greater restraint upon the expression of our emotions? Do we hesitate more than our fathers did to talk about ourselves? The ancient Romans were like our fathers in their willingness or desire to tell us of themselves. Perhaps the differences in their burial practices, which were mentioned above, tempted them to be communicative, and sometimes even garrulous. They put their tombstones in a spot still more frequented than the churchyard. They placed them by the side of the highways, just outside the city walls, where people were coming or going constantly. Along the Street of Tombs, as one goes out of Pompeii, or along the great Appian Way, which runs from Rome to Capua, Southern Italy and Brundisium, the port of departure for Greece and the Orient, they stand on both sides of the roadway and make their mute appeals for our attention. We know their like in the enclosure about old Trinity in New York, in the burial ground in New Haven, or in the churchyards across the water. They tell us not merely the date of birth and death of the deceased, but they let us know enough of his life to invest it with a certain individuality, and to give it a flavor of its own.

Some 40,000 of them have come down to us, and nearly 2,000 of the inscriptions upon them are metrical. This particular group is of special interest to us, because the use of verse seems to tempt the engraver to go beyond a bare statement of facts and to philosophize a bit about the present and the future. Those who lie beneath the stones still claim some recognition from the living, for they often call upon the passer-by to halt and read their epitaphs, and as the Roman walked along the Appian Way two thousand years ago, or as we stroll along the same highway to-day, it is in silent converse with the dead. Sometimes the stone itself addresses us, as does that of Olus Granius:[22] "This mute stone begs thee to stop, stranger, until it has disclosed its mission and told thee whose shade it covers. Here lie the bones of a man, modest, honest, and trusty--the crier, Olus Granius. That is all. It wanted thee not to be unaware of this. Fare thee well." This craving for the attention of the passer-by leads the composer of one epitaph to use somewhat the same device which our advertisers employ in the street-cars when they say: "Do not look at this spot," for he writes: "Turn not your eyes this way and wish not to learn our fate," but two lines later, relenting, he adds: "Now stop, traveller...within this narrow resting-place,"[23] and then we get the whole story. Sometimes a dramatic, lifelike touch is given by putting the inscription into the form of a dialogue between the dead and those who are left behind. Upon a stone found near Rome runs the inscription:[24] "Hail, name dear to us, Stephanus,...thy Moschis and thy Diodorus salute thee." To which the dead man replies: "Hail chaste wife, hail Diodorus, my friend, my brother." The dead man often begs for a pleasant word from the passer-by. The Romans, for instance, who left Ostia by the highway, read upon a stone the sentiment:[25] "May it go well with you who lie within and, as for you who go your way and read these lines, 'the earth rest lightly on thee' say." This pious salutation loses some of the flavor of spontaneity in our eyes when we find that it had become so much of a convention as to be indicated by the initial letters of the several words: S(it) t(ibi) t(erra) l(evis). The traveller and the departed exchange good wishes on a stone found near Velitræ:[26]

"May it go well with you who read and you who pass this way, The like to mine and me who on this spot my tomb have built."

One class of passers-by was dreaded by the dweller beneath the stone--the man with a paint-brush who was looking for a conspicuous spot on which to paint the name of his favorite political candidate. To such an one the hope is expressed "that his ambition may be realized, provided he instructs his slave not to paint this stone."[27]

These wayside epitaphs must have left an impress on the mind and character of the Roman which we can scarcely appreciate. The peasant read them as he trudged homeward on market days, the gentleman, as he drove to his villa on the countryside, and the traveller who came from the South, the East, or the North. In them the history of his country was set forth in the achievements of her great men, her prætors and consuls, her generals who had conquered and her governors who had ruled Gaul, Spain, Africa, and Asia. In them the public services, and the deeds of charity of the rich and powerful were recorded and the homely virtues and self-sacrifices of the humbler man and woman found expression there. Check by jowl with the tomb of some great leader upon whom the people or the emperor had showered all the titles and honors in their power might stand the stone of the poor physician, Dionysius,[28] of whom it is said "to all the sick who came to him he gave his services free of charge; he set forth in his deeds what he taught in his precepts."

But perhaps more of the inscriptions in verse, and with them we are here concerned, are in praise of women than of men. They make clear to us the place which women held in Roman life, the state of society, and the feminine qualities which were held in most esteem. The world which they portray is quite another from that of Ovid and Juvenal. The common people still hold to the old standards of morality and duty. The degeneracy of smart society has made little progress here. The marriage tie is held sacred; the wife and husband, the parent and child are held close to each other in bonds of affection. The virtues of women are those which Martinianus records on the stone of his wife Sofroniola:[29]

"Purity, loyalty, affection, a sense of duty, a yielding nature, and whatever qualities God has implanted in women."

(Castitas fides earitas pietas obsequium Et quaecumque deus faemenis inesse praecepit.)

Upon a stone near Turin,[30] Valerius wrote in memory of his wife the simple line:

"Pure in heart, modest, of seemly bearing, discreet, noble-minded, and held in high esteem."

(Casta pudica decens sapiens Generosa probata.)

Only one discordant note is struck in this chorus of praise. This fierce invective stands upon an altar at Rome:[31] "Here for all time has been set down in writing the shameful record of the freedwoman Acte, of poisoned mind, and treacherous, cunning, and hard-hearted. Oh! for a nail, and a hempen rope to choke her, and flaming pitch to burn up her wicked heart."

A double tribute is paid to a certain Statilia in this naïve inscription:[32] "Thou who wert beautiful beyond measure and true to thy husbands, didst twice enter the bonds of wedlock...and he who came first, had he been able to withstand the fates, would have set up this stone to thee, while I, alas! who have been blessed by thy pure heart and love for thee for sixteen years, lo! now I have lost thee." Still greater sticklers for the truth at the expense of convention are two fond husbands who borrowed a pretty couplet composed in memory of some woman "of tender age," and then substituted upon the monuments of their wives the more truthful phrase "of middle age,"[33] and another man warns women, from the fate of his wife, to shun the excessive use of jewels.[34]

It was only natural that when men came to the end of life they should ask themselves its meaning, should speculate upon the state after death, and should turn their thoughts to the powers which controlled their destiny. We have been accustomed to form our conceptions of the religion of the Romans from what their philosophers and moralists and poets have written about it. But a great chasm lies between the teachings of these men and the beliefs of the common people. Only from a study of the epitaphs do we know what the average Roman thought and felt on this subject. A few years ago Professor Harkness, in an admirable article on "The Scepticism and Fatalism of the Common People of Rome," showed that "the common people placed no faith in the gods who occupy so prominent a place in Roman literature, and that their nearest approach to belief in a divinity was their recognition of fate," which "seldom appears as a fixed law of nature...but rather as a blind necessity, depending on chance and not on law." The gods are mentioned by name in the poetic epitaphs only, and for poetic purposes, and even here only one in fifty of the metrical inscriptions contains a direct reference to any supernatural power. For none of these deities, save for Mother Earth, does the writer of an epitaph show any affection. This feeling one may see in the couplet which reads:[35] "Mother Earth, to thee have we committed the bones of Fortunata, to thee who dost come near to thy children as a mother," and Professor Harkness thoughtfully remarks in this connection that "the love of nature and appreciation of its beauties, which form a distinguishing characteristic of Roman literature in contrast to all the other literatures of antiquity, are the outgrowth of this feeling of kinship which the Italians entertained for mother earth."

It is a little surprising, to us on first thought, that the Roman did not interpose some concrete personalities between himself and this vague conception of fate, some personal agencies, at least, to carry out the decrees of destiny. But it will not seem so strange after all when we recall the fact that the deities of the early Italians were without form or substance. The anthropomorphic teachings of Greek literature, art, and religion found an echo in the Jupiter and Juno, the Hercules and Pan of Virgil and Horace, but made no impress on the faith of the common people, who, with that regard for tradition which characterized the Romans, followed the fathers in their way of thinking.

A disbelief in personal gods hardly accords with faith in a life after death, but most of the Romans believed in an existence of some sort in the world beyond. A Dutch scholar has lately established this fact beyond reasonable doubt, by a careful study of the epitaphs in verse.[36] One tombstone reads:[37]

"Into nothing from nothing how quickly we go,"

and another:[38]

"Once we were not, now we are as we were,"

and the sentiment, "I was not, I was, I am not, I care not" (non fui, fui, non sum, non euro) was so freely used that it is indicated now and then merely by the initial letters N.f.f.n.s.n.c., but compared with the great number of inscriptions in which belief in a life after death finds expression such utterances are few. But how and where that life was to be passed the Romans were in doubt. We have noticed above how little the common people accepted the belief of the poets in Jupiter and Pluto and the other gods, or rather how little their theology had been influenced by Greek art and literature. In their conception of the place of abode after death, it is otherwise. Many of them believe with Virgil that it lies below the earth. As one of them says in his epitaph:[39]

"No sorrow to the world below I bring."

Or with other poets the departed are thought of as dwelling in the Elysian fields or the Isles of the Blessed. As one stone cries out to the passer-by:[40] "May you live who shall have said. 'She lives in Elysium,'" and of a little girl it is said:[41] "May thy shade flower in fields Elysian." Sometimes the soul goes to the sky or the stars: "Here lies the body of the bard Laberius, for his spirit has gone to the place from which it came;"[42] "The tomb holds my limbs, my soul shall pass to the stars of heaven."[43] But more frequently the departed dwell in the tomb. As one of them expresses it: "This is my eternal home; here have I been placed; here shall I be for aye." This belief that the shade hovers about the tomb accounts for the salutations addressed to it which we have noticed above, and for the food and flowers which are brought to satisfy its appetites and tastes. These tributes to the dead do not seem to accord with the current Roman belief that the body was dissolved to dust, and that the soul was clothed with some incorporeal form, but the Romans were no more consistent in their eschatology than many of us are.

Perhaps it was this vague conception of the state after death which deprived the Roman of that exultant joy in anticipation of the world beyond which the devout Christian, a hundred years or more ago, expressed in his epitaphs, with the Golden City so clearly pictured to his eye, and by way of compensation the Roman was saved from the dread of death, for no judgment-seat confronted him in the other world. The end of life was awaited with reasonable composure. Sometimes death was welcomed because it brought rest. As a citizen of Lambsesis expresses it:[44] "Here is my home forever; here is a rest from toil;" and upon a woman's stone we read:[45]

"Whither hast thou gone, dear soul, seeking rest from troubles, For what else than trouble hast thou had throughout thy life?"

But this pessimistic view of life rarely appears on the monuments. Not infrequently the departed expresses a certain satisfaction with his life's record, as does a citizen of Beneventum, who remarks:[46] "No man have I wronged, to many have I rendered services," or he tells us of the pleasure which he has found in the good things of life, and advises us to enjoy them. A Spanish epitaph reads:[47] "Eat, drink, enjoy thyself, follow me" (es bibe lude veni). In a lighter or more garrulous vein another says:[48] "Come, friends, let us enjoy the happy time of life; let us dine merrily, while short life lasts, mellow with wine, in jocund intercourse. All these about us did the same while they were living. They gave, received, and enjoyed good things while they lived. And let us imitate the practices of the fathers. Live while you live, and begrudge nothing to the dear soul which Heaven has given you." This philosophy of life is expressed very succinctly in: "What I have eaten and drunk I have with me; what I have foregone I have lost,"[49] and still more concretely in:

"Wine and amours and baths weaken our bodily health, Yet life is made up of wine and amours and baths."[50]

Under the statue of a man reclining and holding a cup in his hand, Flavius Agricola writes:[51] "Tibur was my native place; I was called Agricola, Flavius too.... I who lie here as you see me. And in the world above in the years which the fates granted, I cherished my dear soul, nor did the god of wine e'er fail me.... Ye friends who read this, I bid you mix your wine, and before death comes, crown your temples with flowers, and drink.... All the rest the earth and fire consume after death." Probably we should be wrong in tracing to the teachings of Epicurus, even in their vulgarized popular form, the theory that the value of life is to be estimated by the material pleasure it has to offer. A man's theory of life is largely a matter of temperament or constitution. He may find support for it in the teachings of philosophy, but he is apt to choose a philosophy which suits his way of thinking rather than to let his views of life be determined by abstract philosophic teachings. The men whose epitaphs we have just read would probably have been hedonists if Epicurus had never lived. It is interesting to note in passing that holding this conception of life naturally presupposes the acceptance of one of the notions of death which we considered above--that it ends all.

In another connection, a year or two ago, I had occasion to speak of the literary merit of some of these metrical epitaphs,[52] of their interest for us as specimens of the literary compositions of the common people, and of their value in indicating the æsthetic taste of the average Roman. It may not be without interest here to speak of the literary form of some of them a little more at length than was possible in that connection. Latin has always been, and continues to be among modern peoples, a favored language for epitaphs and dedications. The reasons why it holds its favored position are not far to seek. It is vigorous and concise. Then again in English and in most modern languages the order which words may take in a given sentence is in most cases inexorably fixed by grammatical necessity. It was not so with Latin. Its highly inflected character made it possible, as we know, to arrange the words which convey an idea in various orders, and these different groupings of the same words gave different shades of meaning to the sentence, and different emotional effects are secured by changing the sequence in which the minor conceptions are presented. By putting contrasted words side by side, or at corresponding points in the sentence, the impression is heightened. When a composition takes the form of verse the possibilities in the way of contrast are largely increased. The high degree of perfection to which Horace brought the balancing and interlocking of ideas in some of his Odes, illustrates the great advantage which the Latin poet had over the English writer because of the flexibility of the medium of expression which he used. This advantage was the Roman's birthright, and lends a certain distinction even to the verses of the people, which we are discussing here. Certain other stylistic qualities of these metrical epitaphs, which are intended to produce somewhat the same effects, will not seem to us so admirable. I mean alliteration, play upon words, the acrostic arrangement, and epigrammatic effects. These literary tricks find little place in our serious verse, and the finer Latin poets rarely indulge in them. They seem to be especially out of place in an epitaph, which should avoid studied effects and meretricious devices. But writers in the early stages of a literature and common people of all periods find a pleasure in them. Alliteration, onomatopœia, the pun, and the play on words are to be found in all the early Latin poets, and they are especially frequent with literary men like Plautus and Terence, Pacuvius and Accius, who wrote for the stage, and therefore for the common people. One or two illustrations of the use of these literary devices may be sufficient. A little girl at Rome, who died when five years old, bore the strange name of Mater, or Mother, and on her tombstone stands the sentiment:[53] "Mater I was by name, mater I shall not be by law." "Sepulcrum hau pulcrum pulcrai feminae" of the famous Claudia inscription,[54] Professor Lane cleverly rendered "Site not sightly of a sightly dame." Quite beyond my power of translating into English, so as to reproduce its complicated play on words, is the appropriate epitaph of the rhetorician, Romanius Iovinus:[55]

"Docta loqui doctus quique loqui docuit."

A great variety of verses is used in the epitaphs, but the dactylic hexameter and the elegiac are the favorites. The stately character of the hexameter makes it a suitable medium in which to express a serious sentiment, while the sudden break in the second verse of the elegiac couplet suggests the emotion of the writer. The verses are constructed with considerable regard for technique. Now and then there is a false quantity, an unpleasant sequence, or a heavy effect, but such blemishes are comparatively infrequent. There is much that is trivial, commonplace, and prosaic in these productions of the common people, but now and then one comes upon a phrase, a verse, or a whole poem which shows strength or grace or pathos. An orator of the late period, not without vigor, writes upon his tombstone:[56] "I have lived blessed by the gods, by friends, by letters."

(Vixi beatus dis, amicis, literis.)

A rather pretty, though not unusual, sentiment occurs in an elegiac couplet to a young girl,[57] in which the word amoena is the adjective, meaning "pleasant to see," in the first, while in the second verse it is the girl's name: "As a rose is amoena when it blooms in the early spring time, so was I Amoena to those who saw me."

(Ut rosa amoena homini est quom primo tempore floret. Quei me viderunt, seic Amoena fui.)

There is a touch of pathos in the inscription which a mother put on the stone of her son:[58] "A sorrowing mother has set up this monument to a son who has never caused her any sorrow, except that he is no more," and in this tribute of a husband:[59] "Out of my slender means now that the end has come, my wife, all that I could do, this gift, a small small one for thy deserts, have I made." The epitaph of a little girl, named Felicia, or Kitty, has this sentiment in graceful verse:[60] "Rest lightly upon thee the earth, and over thy grave the fragrant balsam grow, and roses sweet entwine thy buried bones." Upon the stone of a little girl who bore the name of Xanthippe, and the nickname Iaia, is an inscription with one of two pretty conceits and phrases. With it we may properly bring to an end our brief survey of these verses of the common people of Rome. In a somewhat free rendering it reads in part:[61] "Whether the thought of death distress thee or of life, read to the end. Xanthippe by name, yclept also Iaia by way of jest, escapes from sorrow since her soul from the body flies. She rests here in the soft cradle of the earth,... comely, charming, keen of mind, gay in discourse. If there be aught of compassion in the gods above, bear her to the sun and light."

II. Their Dedicatory and Ephemeral Verses

In the last paper we took up for consideration some of the Roman metrical epitaphs. These compositions, however, do not include all the productions in verse of the common people of Rome. On temples, altars, bridges, statues, and house walls, now and then, we find bits of verse. Most of the extant dedicatory lines are in honor of Hercules, Silvanus, Priapus, and the Cæsars. Whether the two famous inscriptions to Hercules by the sons of Vertuleius and by Mummius belong here or not it is hard to say. At all events, they were probably composed by amateurs, and have a peculiar interest for us because they belong to the second century B.C., and therefore stand near the beginning of Latin letters; they show us the language before it had been perfected and adapted to literary purposes by an Ennius, a Virgil, and a Horace, and they are written in the old native Saturnian verse, into which Livius Andronicus, "the Father of Latin literature," translated the Odyssey. Consequently they show us the language before it had gained in polish and lost in vigor under the influence of the Greeks. The second of these two little poems is a finger-post, in fact, at the parting of the ways for Roman civilization. It was upon a tablet let into the wall of the temple of Hercules, and commemorates the triumphant return to Rome of Mummius, the conqueror of Corinth. It points back to the good old days of Roman contempt for Greek art, and ignorance of it, for Mummius, in his stupid indifference to the beautiful monuments of Corinth, made himself the typical Philistine for all time. It points forward to the new Greco-Roman civilization of Italy, because the works of art which Mummius is said to have brought back with him, and the Greeks who probably followed in his train, augmented that stream of Greek influence which in the next century or two swept through the peninsula.

In the same primitive metre as these dedications is the Song of the Arval Brothers, which was found engraved on a stone in the grove of the goddess Dea Dia, a few miles outside of Rome. This hymn the priests sang at the May festival of the goddess, when the farmers brought them the first fruits of the earth. It has no intrinsic literary merit, but it carries us back beyond the great wars with Carthage for supremacy in the western Mediterranean, beyond the contest with Pyrrhus for overlordship in Southern Italy, beyond the struggle for life with the Samnites in Central Italy, beyond even the founding of the city on the Tiber, to a people who lived by tilling the soil and tending their flocks and herds.

But we have turned away from the dedicatory verses. On the bridges which span our streams we sometimes record the names of the commissioners or the engineers, or the bridge builders responsible for the structure. Perhaps we are wise in thinking these prosaic inscriptions suitable for our ugly iron bridges. Their more picturesque stone structures tempted the Romans now and then to drop into verse, and to go beyond a bare statement of the facts of construction. Over the Anio in Italy, on a bridge which Narses, the great general of Justinian, restored, the Roman, as he passed, read in graceful verse:[62] "We go on our way with the swift-moving waters of the torrent beneath our feet, and we delight on hearing the roar of the angry water. Go then joyfully at your ease, Quirites, and let the echoing murmur of the stream sing ever of Narses. He who could subdue the unyielding spirit of the Goths has taught the rivers to bear a stern yoke."

It is an interesting thing to find that the prettiest of the dedicatory poems are in honor of the forest-god Silvanus. One of these poems, Titus Pomponius Victor, the agent of the Cæsars, left inscribed upon a tablet[63] high up in the Grecian Alps. It reads: "Silvanus, half-enclosed in the sacred ash-tree, guardian mighty art thou of this pleasaunce in the heights. To thee we consecrate in verse these thanks, because across the fields and Alpine tops, and through thy guests in sweetly smelling groves, while justice I dispense and the concerns of Cæsar serve, with thy protecting care thou guidest us. Bring me and mine to Rome once more, and grant that we may till Italian fields with thee as guardian. In guerdon therefor will I give a thousand mighty trees." It is a pretty picture. This deputy of Cæsar has finished his long and perilous journeys through the wilds of the North in the performance of his duties. His face is now turned toward Italy, and his thoughts are fixed on Rome. In this "little garden spot," as he calls it, in the mountains he pours out his gratitude to the forest-god, who has carried him safely through dangers and brought him thus far on his homeward way, and he vows a thousand trees to his protector. It is too bad that we do not know how the vow was to be paid--not by cutting down the trees, we feel sure. One line of Victor's little poem is worth quoting in the original. He thanks Silvanus for conducting him in safety "through the mountain heights, and through Tuique luci suave olentis hospites." Who are the _hospites_? The wild beasts of the forests, we suppose. Now _hospites_ may, of course, mean either "guests" or "hosts," and it is a pretty conceit of Victor's to think of the wolves and bears as the guests of the forest-god, as we have ventured to render the phrase in the translation given above. Or, are they Victor's hosts, whose characters have been so changed by Silvanus that Victor has had friendly help rather than fierce attacks from them?

A very modern practice is revealed by a stone found near the famous temple of Æsculapius, the god of healing, at Epidaurus in Argolis, upon which two ears are shown in relief, and below them the Latin couplet:[64] "Long ago Cutius Gallus had vowed these

ears to thee, scion of Phœbus, and now he has put them here, for thou hast healed his ears." It is an ancient ex-voto, and calls to mind on the one hand the cult of Æsculapius, which Walter Pater has so charmingly portrayed in Marius the Epicurean, and on the other hand it shows us that the practice of setting up ex-votos, of which one sees so many at shrines and in churches across the water to-day, has been borrowed from the pagans. A pretty bit of sentiment is suggested by an inscription[65] found near the ancient village of Ucetia in Southern France: "This shrine to the Nymphs have I built, because many times and oft have I used this spring when an old man as well as a youth."

All of the verses which we have been considering up to this point have come down to us more or less carefully engraved upon stone, in honor of some god, to record some achievement of importance, or in memory of a departed friend. But besides these formal records of the past, we find a great many hastily scratched or painted sentiments or notices, which have a peculiar interest for us because they are the careless effusions or unstudied productions of the moment, and give us the atmosphere of antiquity as nothing else can do. The stuccoed walls of the houses, and the sharp-pointed stylus which was used in writing on wax tablets offered too strong a temptation for the lounger or passer-by to resist. To people of this class, and to merchants advertising their wares, we owe the three thousand or more graffiti found at Pompeii. The ephemeral inscriptions which were intended for practical purposes, such as the election notices, the announcements of gladiatorial contests, of houses to rent, of articles lost and for sale, are in prose, but the lovelorn lounger inscribed his sentiments frequently in verse, and these verses deserve a passing notice here. One man of this class in his erotic ecstasy writes on the wall of a Pompeian basilica:[66] "May I perish if I'd wish to be a god without thee." That hope sprang eternal in the breast of the Pompeian lover is illustrated by the last two lines of this tragic declaration:[67]

"If you can and won't, Give me hope no more. Hope you foster and you ever Bid me come again to-morrow. Force me then to die Whom you force to live A life apart from you. Death will be a boon, Not to be tormented. Yet what hope has snatched away To the lover hope gives back."

This effusion has led another passer-by to write beneath it the Delphic sentiment: "May the man who shall read this never read anything else." The symptoms of the ailment in its most acute form are described by some Roman lover in the verses which he has left us on the wall of Caligula's palace, on the Palatine:[68]

"No courage in my heart, No sleep to close my eyes, A tide of surging love Throughout the day and night."

This seems to come from one who looks upon the lover with a sympathetic eye, but who is himself fancy free:

"Whoever loves, good health to him, And perish he who knows not how, But doubly ruined may he be Who will not yield to love's appeal."[69]

The first verse of this little poem,

"Quisquis amat valeat, pereat qui nescit amare,"

represented by the first couplet of the English rendering, calls to mind the swinging refrain which we find a century or two later in the _Pervigilium Veneris_, that last lyrical outburst of the pagan world, written for the eve of the spring festival of Venus:

"Cras amet qui nunquam amavit quique amavit eras amet."

(To-morrow he shall love who ne'er has loved And who has loved, to-morrow he shall love.)

An interesting study might be made of the favorite types of feminine beauty in the Roman poets. Horace sings of the "golden-haired" Pyrrhas, and Phyllises, and Chloes, and seems to have had an admiration for blondes, but a poet of the common people, who has recorded his opinion on this subject in the atrium of a Pompeian house, shows a more catholic taste, although his freedom of judgment is held in some constraint:

"My fair girl has taught me to hate Brunettes with their tresses of black. I will hate if I can, but if not, 'Gainst my will I must love them also."[70]

On the other hand, one Pompeian had such an inborn dread of brunettes that, whenever he met one, he found it necessary to take an appropriate antidote, or prophylactic:

"Whoever loves a maiden dark By charcoal dark is he consumed. When maiden dark I light upon I eat the saving blackberry."[71]

These amateur poets do not rely entirely upon their own Muse, but borrow from Ovid, Propertius, or Virgil, when they recall sentiments in those writers which express their feelings. Sometimes it is a tag, or a line, or a couplet which is taken, but the borrowings are woven into the context with some skill. The poet above who is under compulsion from his blonde sweetheart, has taken the second half of his production verbatim from Ovid, and for the first half of it has modified a line of Propertius. Other writers have set down their sentiments in verse on more prosaic subjects. A traveller on his way to the capital has scribbled these lines on the wall, perhaps of a wine-shop where he stopped for refreshment:[72]

"Hither have we come in safety. Now I hasten on my way, That once more it may be mine To behold our Lares, Rome."

At one point in a Pompeian street, the eye of a straggler would catch this notice in doggerel verse:[73]

"Here's no place for loafers. Lounger, move along!"

On the wall of a wine-shop a barmaid has thus advertised her wares:[74]

"Here for a cent is a drink, Two cents brings something still better. Four cents in all, if you pay, Wine of Falernum is yours."

It must have been a lineal descendant of one of the parasites of Plautus who wrote:[75]

"A barbarian he is to me At whose house I'm not asked to dine."

Here is a sentiment which sounds very modern:

"The common opinion is this: That property should be divided."[76]

This touch of modernity reminds one of another group of verses which brings antiquity into the closest possible touch with some present-day practices. The Romans, like ourselves, were great travellers and sightseers, and the marvels of Egypt in particular appealed to them, as they do to us, with irresistible force. Above all, the great statue of Memnon, which gave forth a strange sound when it was struck by the first rays of the rising sun, drew travellers from far and near. Those of us who know the Mammoth Cave, Niagara Falls, the Garden of the Gods, or some other of our natural wonders, will recall how fond a certain class of visitors are of immortalizing themselves by scratching their names or a sentiment on the walls or the rocks which form these marvels. Such inscriptions We find on the temple walls in Egypt--three of them appear on the statue of Memnon, recording in verse the fact that the writers had visited the statue and heard the voice of the god at sunrise. One of these Egyptian travellers, a certain Roman lady journeying up the Nile, has scratched these verses on a wall of the temple at Memphis:[77]

"The pyramids without thee have I seen, My brother sweet, and yet, as tribute sad, The bitter tears have poured adown my cheek, And sadly mindful of thy absence now I chisel here this melancholy note."

Then follow the name and titles of the absent brother, who is better known to posterity from these scribbled lines of a Cook's tourist than from any official records which have come down to us. All of these pieces of popular poetry which we have been discussing thus far were engraved on stone, bronze, stucco, or on some other durable material. A very few bits of this kind of verse, from one to a half dozen lines in length, have come down to us in literature. They have the unique distinction, too, of being specimens of Roman folk poetry, and some of them are found in the most unlikely places. Two of them are preserved by a learned commentator on the Epistles of Horace. They carry us back to our school-boy days. When we read

"The plague take him who's last to reach me,"[78]

we can see the Roman urchin standing in the market-place, chanting the magic formula, and opposite him the row of youngsters on tiptoe, each one waiting for the signal to run across the intervening space and be the first to touch their comrade. What visions of early days come back to us--days when we clasped hands in a circle and danced about one or two children placed in the centre of the ring, and chanted in unison some refrain, upon reading in the same commentator to Horace a ditty which runs:[79]

"King shall you be If you do well. If you do ill You shall not be."

The other bits of Roman folk poetry which we have are most of them preserved by Suetonius, the gossipy biographer of the Cæsars. They recall very different scenes. Cæsar has returned in triumph to Rome, bringing in his train the trousered Gauls, to mingle on the street with the toga-clad Romans. He has even had the audacity to enroll some of these strange peoples in the Roman senate, that ancient body of dignity and convention, and the people chant in the streets the ditty:[80]

"Cæsar leads the Gauls in triumph, In the senate too he puts them. Now they've donned the broad-striped toga And have laid aside their breeches."

Such acts as these on Cæsar's part led some political versifier to write on Cæsar's statue a couplet which contrasted his conduct with that of the first great republican, Lucius Brutus:

"Brutus drove the kings from Rome, And first consul thus became. This man drove the consuls out, And at last became the king."[81]

We may fancy that these verses played no small part in spurring on Marcus Brutus to emulate his ancestor and join the conspiracy against the tyrant. With one more bit of folk poetry, quoted by Suetonius, we may bring our sketch to an end. Germanicus Cæsar, the flower of the imperial family, the brilliant general and idol of the people, is suddenly stricken with a mortal illness. The crowds throng the streets to hear the latest news from the sick-chamber of their hero. Suddenly the rumor flies through the streets that the crisis is past, that Germanicus will live, and the crowds surge through the public squares chanting:

"Saved now is Rome, Saved too the land, Saved our Germanicus."[82]

The Origin of the Realistic Romance among the Romans

One of the most fascinating and tantalizing problems of literary history concerns the origin of prose fiction among the Romans. We can trace the growth of the epic from its infancy in the third century before Christ as it develops in strength in the poems of Nævius, Ennius, and Cicero until it reaches its full stature in the _Æneid_, and then we can see the decline of its vigor in the _Pharsalia_, the _Punica_, the _Thebais_, and _Achilleis_, until it practically dies a natural death in the mythological and historical poems of Claudian. The way also in which tragedy, comedy, lyric poetry, history, biography, and the other types of literature in prose and verse came into existence and developed among the Romans can be followed with reasonable success. But the origin and early history of the novel is involved in obscurity. The great realistic romance of Petronius of the first century of our era is without a legally recognized ancestor and has no direct descendant. The situation is the more surprising when we recall its probable size in its original form. Of course only a part of it has come down to us, some one hundred and ten pages in all. Its great size probably proved fatal to its preservation in its complete form, or at least contributed to that end, for it has been estimated that it ran from six hundred to nine hundred pages, being longer, therefore, than the average novel of Dickens and Scott. Consequently we are not dealing with a bit of ephemeral literature, but with an elaborate composition of a high degree of excellence, behind which we should expect to find a long line of development. We are puzzled not so much by the utter absence of anything in the way of prose fiction before the time of Petronius as by the difficulty of establishing any satisfactory logical connection between these pieces of literature and the romance of Petronius. We are bewildered, in fact, by the various possibilities which the situation presents. The work shows points of similarity with several antecedent forms of composition, but the gaps which lie in any assumed line of descent are so great as to make us question its correctness.

If we call to mind the present condition of this romance and those characteristic features of it which are pertinent to the question at issue, the nature of the problem and its difficulty also will be apparent at once. Out of the original work, in a rather fragmentary form, only four or five main episodes are extant, one of which is the brilliant story of the Dinner of Trimalchio. The action takes place for the most part in Southern Italy, and the principal characters are freedmen who have made their fortunes and degenerate freemen who are picking up a precarious living by their wits. The freemen, who are the central figures in the novel, are involved in a great variety of experiences, most of them of a disgraceful sort, and the story is a story of low life. Women play an important rôle in the narrative, more important perhaps than they do in any other kind of ancient literature--at least their individuality is more marked. The efficient motif is erotic. I say the efficient, because the conventional motif which seems to account for all the misadventures of the anti-hero Encolpius is the wrath of an offended deity. A great part of the book has an atmosphere of satire about it which piques our curiosity and baffles us at the same time, because it is hard to say how much of this element is inherent in the subject itself, and how much of it lies in the intention of the author. It is the characteristic of parvenu society to imitate smart society to the best of its ability, and its social functions are a parody of the like events in the upper set. The story of a dinner party, for instance, given by such a _nouveau riche_ as Trimalchio, would constantly remind us by its likeness and its unlikeness, by its sins of omission and commission, of a similar event in correct society. In other words, it would be a parody on a proper dinner, even if the man who described the event knew nothing about the usages of good society, and with no ulterior motive in mind set down accurately the doings of his upstart characters. For instance, when Trimalchio's chef has three white pigs driven into the dining-room for the ostensible purpose of allowing the guests to pick one out for the next course, with the memory of our own monkey breakfasts and

horseback dinners in mind, we may feel that this is a not improbable attempt on the part of a Roman parvenu to imitate his betters in giving a dinner somewhat out of the ordinary. Members of the smart set at Rome try to impress their guests by the value and weight of their silver plate. Why shouldn't the host of our story adopt the more direct and effective way of accomplishing the same object by having the weight of silver engraved on each article? He does so. It is a very natural thing for him to do. In good society they talk of literature and art. Why isn't it natural for Trimalchio to turn the conversation into the same channels, even if he does make Hannibal take Troy and does confuse the epic heroes and some late champions of the gladiatorial ring?

In other words, much of that which is satirical in Petronius is so only because we are setting up in our minds a comparison between the doings of his rich freedmen and the requirements of good taste and moderation. But it seems possible to detect a satirical or a cynical purpose on the part of the author carried farther than is involved in the choice of his subject and the realistic presentation of his characters. Petronius seems to delight in putting his most admirable sentiments in the mouths of contemptible characters. Some of the best literary criticism we have of the period, he presents through the medium of the parasite rhetorician Agamemnon. That happy phrase characterizing Horace's style, "curiosa felicitas," which has perhaps never been equalled in its brevity and appositeness, is coined by the incorrigible poetaster Eumolpus. It is he too who composes and recites the two rather brilliant epic poems incorporated into the _Satirae_, one of which is received with a shower of stones by the bystanders. The impassioned eulogy of the careers of Democritus, Chrysippus, Lysippus, and Myron, who had endured hunger, pain, and weariness of body and mind for the sake of science, art, and the good of their fellow-men, and the diatribe against the pursuit of comfort and pleasure which characterized the people of his own time, are put in the mouth of the same _roué_ Eumolpus.

These situations have the true Horatian humor about them. The most serious and systematic discourse which Horace has given us, in his Satires, on the art of living, comes from the crack-brained Damasippus, who has made a failure of his own life. In another of his poems, after having set forth at great length the weaknesses of his fellow-mortals, Horace himself is convicted of being inconsistent, a slave to his passions, and a victim of hot temper by his own slave Davus. We are reminded again of the literary method of Horace in his Satires when we read the dramatic description of the shipwreck in Petronius. The blackness of night descends upon the water; the little bark which contains the hero and his friends is at the mercy of the sea; Lichas, the master of the vessel, is swept from the deck by a wave, Encolpius and his comrade Giton prepare to die in each other's embrace, but the tragic scene ends with a ridiculous picture of Eumolpus bellowing out above the roar of the storm a new poem which he is setting down upon a huge piece of parchment. Evidently Petronius has the same dread of being taken too seriously which Horace shows so often in his Satires. The cynical, or at least unmoral, attitude of Petronius is brought out in a still more marked way at the close of this same passage. Of those upon the ill-fated ship the degenerates Encolpius, Giton, and Eumolpus, who have wronged Lichas irreparably, escape, while the pious Lichas meets a horrible death. All this seems to make it clear that not only does the subject which Petronius has treated inevitably involve a satire upon contemporary society, but that the author takes a satirical or cynical attitude toward life.

Another characteristic of the story is its realism. There are no marvellous adventures, and in fact no improbable incidents in it. The author never obtrudes his own personality upon us, as his successor Apuleius sometimes does, or as Thackeray has done. We know what the people in the story are like, not from the author's description of them, but from their actions, from the subjects about which they talk, and from the way in which they talk. Agamemnon converses as a rhetorician might talk, Habinnas like a millionnaire stone-cutter, and Echion like a rag-dealer, and their language and style are what we should expect from men of their standing in society and of their occupations. The conversations of Trimalchio and his freedmen guests are not witty, and their jests are not clever. This adherence to the true principles of realism is the more noteworthy in the case of so brilliant a writer as Petronius, and those of us who recall some of the preternaturally clever conversations in the pages of Henry James and other contemporary novelists may feel that in this respect he is a truer artist than they are.

The novel of Petronius has one other characteristic which is significant, if we attempt to trace the origin of this type of literature. It is cast in the prose-poetic form, that is, passages in verse are inserted here and there in the narrative. In a few cases they are quoted, but for the most part they are the original compositions of the novelist. They range in length from couplets to poems of three hundred lines. Sometimes they form an integral part of the narrative, or again they illustrate a point, elaborate an idea in poetry, or are exercises in verse.

We have tried to bring out the characteristic features of this romance in order that we may see what the essential elements are of the problem which faces one in attempting to explain the origin of the type of literature represented by the work of Petronius. What was there in antecedent literature which will help us to understand the appearance on Italian soil in the first century of our era of a long erotic story of adventure, dealing in a realistic way with every-day life, marked by a satirical tone and with a leaning toward the

prose-poetic form? This is the question raised by the analysis, which we have made above, of the characteristics of the story. We have no ambitious hope of solving it, yet the mere statement of a puzzling but interesting problem is stimulating to the imagination and the intellect, and I am tempted to take up the subject because the discovery of certain papyri in Egypt within recent years has led to the formulation of a new theory of the origin of the romance of perilous adventure, and may, therefore, throw some light on the source of our realistic novel of every-day life. My purpose, then, is to speak briefly of the different genres of literature of the earlier period with which the story of Petronius may stand in some direct relation, or from which the suggestion may have come to Petronius for his work. Several of these lines of possible descent have been skilfully traced by others. In their views here and there I have made some modifications, and I have called attention to one or two types of literature, belonging to the earlier period and heretofore unnoticed in this connection, which may help us to understand the appearance of the realistic novel.

It seems a far cry from this story of sordid motives and vulgar action to the heroic episodes of epic poetry, and yet the _Satirae_ contain not a few more or less direct suggestions of epic situations and characters. The conventional motif of the story of Petronius is the wrath of an offended deity. The narrative in the _Odyssey_ and the _Æneid_ rests on the same basis. The ship of their enemy Lichas on which Encolpius and his companions are cooped up reminds them of the cave of the Cyclops; Giton hiding from the town-crier under a mattress is compared to Ulysses underneath the sheep and clinging to its wool to escape the eye of the Cyclops, while the woman whose charms engage the attention of Encolpius at Croton bears the name of Circe. It seems to be clear from these reminiscences that Petronius had the epic in mind when he wrote his story, and his novel may well be a direct or an indirect parody of an epic narrative. Rohde in his analysis of the serious Greek romance of the centuries subsequent to Petronius has postulated the following development for that form of story: Travellers returning from remote parts of the world told remarkable stories of their experiences. Some of these stories took a literary form in the _Odyssey_ and the Tales of the Argonauts. They appeared in prose, too, in narratives like the story of Sinbad the Sailor, of a much later date. A more definite plot and a greater dramatic intensity were given to these tales of adventure by the addition of an erotic element which often took the form of two separated lovers. Some use is made of this element, for instance, in the relations of Odysseus and Penelope, perhaps in the episode of Æneas and Dido, and in the story of Jason and Medea. The intrusion of the love motif into the stories told of demigods and heroes, so that the whole narrative turns upon it, is illustrated by such tales in the Metamorphoses of Ovid as those of Pyramus and Thisbe, Pluto and Proserpina, or Meleager and Atalanta. The love element, which may have been developed in this way out of its slight use in the epic, and the element of adventure form the basis of the serious Greek romances of Antonius Diogenes, Achilles Tatius, and the other writers of the centuries which follow Petronius.

Before trying to connect the _Satirae_ with a serious romance of the type just mentioned, let us follow another line of descent which leads us to the same objective point, viz., the appearance of the serious story in prose. We have been led to consider the possible connection of this kind of prose fiction with the epic by the presence in both of them of the love element and that of adventure. But the Greek novel has another rather marked feature. It is rhetorical, and this quality has suggested that it may have come, not from the epic, but from the rhetorical exercise. Support has been given to this theory within recent years by the discovery in Egypt of two fragments of the Ninos romance. The first of these fragments reveals Ninos, the hero, pleading with his aunt Derkeia, the mother of his sweetheart, for permission to marry his cousin. All the arguments in support of his plea and against it are put forward and balanced one against the other in a very systematic way. He wins over Derkeia. Later in the same fragment the girl pleads in a somewhat similar fashion with Thambe, the mother of Ninos. The second fragment is mainly concerned with the campaigns of Ninos. Here we have the two lovers, probably separated by the departure of Ninos for the wars, while the hero, at least, is exposed to the danger of the campaign.

The point was made after the text of this find had been published that the large part taken in the tale by the carefully balanced arguments indicated that the story grew out of exercises in argumentation in the rhetorical schools.[83] The elder Seneca has preserved for us in his _Controversiae_ specimens of the themes which were set for students in these schools. The student was asked to imagine himself in a supposed dilemma and then to discuss the considerations which would lead him to adopt the one or the other line of conduct. Some of these situations suggest excellent dramatic possibilities, conditions of life, for instance, where suicide seemed justifiable, misadventures with pirates, or a turn of affairs which threatened a woman's virtue. Before the student reached the point of arguing the case, the story must be told, and out of these narratives of adventure, told at the outset to develop the dilemma, may have grown the romance of adventure, written for its own sake. The story of Ninos has a peculiar interest in connection with this theory, because it was probably very short, and consequently may give us the connecting link between the rhetorical exercise and the long novel of the later period, and because it is the earliest known serious romance. On the back of the papyrus which contains it are some farm accounts of the year 101 A.D. Evidently by that time the roll had become waste paper, and the story itself may have been composed a century or even two centuries earlier. So far as this second theory is concerned, we

may raise the question in passing whether we have any other instance of a genre of literature growing out of a school-boy exercise. Usually the teacher adapts to his purpose some form of creative literature already in existence.

Leaving this objection out of account for the moment, the romance of love and perilous adventure may possibly be then a lineal descendant either of the epic or of the rhetorical exercise. Whichever of these two views is the correct one, the discovery of the Ninos romance fills in a gap in one theory of the origin of the realistic romance of Petronius, and with that we are here concerned. Before the story of Ninos was found, no serious romance and no title of such a romance anterior to the time of Petronius was known. This story, as we have seen, may well go back to the first century before Christ, or at least to the beginning of our era. It is conceivable that stories like it, but now lost, existed even at an earlier date. Now in the century, more or less, which elapsed between the assumed date of the appearance of these Greek narratives and the time of Petronius, the extraordinary commercial development of Rome had created a new aristocracy--the aristocracy of wealth. In harmony with this social change the military chieftain and the political leader who had been the heroes of the old fiction gave way to the substantial man of affairs of the new, just as Thaddeus of Warsaw has yielded his place in our present-day novels to Silas Lapham, and the bourgeois erotic story of adventure resulted, as we find it in the extant Greek novels of the second and third centuries of our era. If we can assume that this stage of development was reached before the time of Petronius we can think of his novel as a parody of such a romance. If, however, the bourgeois romance had not appeared before 50 A.D., then, if we regard his story as a parody of a prose narrative, it must be a parody of such an heroic romance as that of Ninos, or a parody of the longer heroic romances which developed out of the rhetorical narrative. If excavations in Egypt or at Herculaneum should bring to light a serious bourgeois story of adventure, they would furnish us the missing link. Until, or unless, such a discovery is made the chain of evidence is incomplete.

The two theories of the realistic romance which we have been discussing assume that it is a parody of some anterior form of literature, and that this fact accounts for the appearance of the satirical or cynical element in it. Other students of literary history, however, think that this characteristic was brought over directly from the Milesian tale[84] or the Menippean satire.[85] To how many different kinds of stories the term "Milesian tale" was applied by the ancients is a matter of dispute, but the existence of the short story before the time of Petronius is beyond question. Indeed we find specimens of it. In its commonest form it presented a single episode of every-day life. It brought out some human weakness or foible. Very often it was a story of illicit love. Its philosophy of life was: No man's honesty and no woman's virtue are unassailable. In all these respects, save in the fact that it presents one episode only, it resembles the _Satirae_ of Petronius. At least two stories of this type are to be found in the extant fragments of the novel of Petronius. One of them is related as a well-known tale by the poet Eumolpus, and the other is told by him as a personal experience. More than a dozen of them are imbedded in the novel of Apuleius, the _Metamorphoses_, and modern specimens of them are to be seen in Boccaccio and in Chaucer. In fact they are popular from the twelfth century down to the eighteenth. Long before the time of Petronius they occur sporadically in literature. A good specimen, for instance, is found in a letter commonly attributed to Æschines in the fourth century B.C. As early as the first century before Christ collections of them had been made and translated into Latin. This development suggests an interesting possible origin of the realistic romance. In such collections as those just mentioned of the first century B.C., the central figures were different in the different stories, as is the case, for instance, in the Canterbury Tales. Such an original writer as Petronius was may well have thought of connecting these different episodes by making them the experiences of a single individual. The Encolpius of Petronius would in that case be in a way an ancient Don Juan. If we compare the Arabian Nights with one of the groups of stories found in the Romances of the Round Table, we can see what this step forward would mean. The tales which bear the title of the Arabian Nights all have the same general setting and the same general treatment, and they are put in the mouth of the same story-teller. The Lancelot group of Round Table stories, however, shows a nearer approach to unity since the stories in it concern the same person, and have a common ultimate purpose, even if it is vague. When this point had been reached the realistic romance would have made its appearance. We have been thinking of the realistic novel as being made up of a series of Milesian tales. We may conceive of it, however, as an expanded Milesian tale, just as scholars are coming to think of the epic as growing out of a single hero-song, rather than as resulting from the union of several such songs.

To pass to another possibility, it is very tempting to see a connection between the _Satirae_ of Petronius and the prologue of comedy. Plautus thought it necessary to prefix to many of his plays an account of the incidents which preceded the action of the play. In some cases he went so far as to outline in the prologue the action of the play itself in order that the spectators might follow it intelligently. This introductory narrative runs up to seventy-six lines in the _Menaechmi_, to eighty-two in the _Rudens_, and to one hundred and fifty-two in the _Amphitruo_. In this way it becomes a short realistic story of every-day people, involving frequently a love intrigue, and told in the iambic senarius, the simplest form of verse. Following it is the more extended narrative of the comedy itself, with its incidents and dialogue. This combination of the condensed narrative in the story form, presented usually as a

monologue in simple verse, and the expanded narrative in the dramatic form, with its conversational element, may well have suggested the writing of a realistic novel in prose. A slight, though not a fatal, objection to this theory lies in the fact that the prologues to comedy subsequent to Plautus changed in their character, and contain little narrative. This is not a serious objection, for the plays of Plautus were still known to the cultivated in the later period.

The mime gives us still more numerous points of contact with the work of Petronius than comedy does.[86] It is unfortunate, both for our understanding of Roman life and for our solution of the question before us, that only fragments of this form of dramatic composition have come down to us. Even from them, however, it is clear that the mime dealt with every-day life in a very frank, realistic way. The new comedy has its conventions in the matter of situations and language. The matron, for instance, must not be presented in a questionable light, and the language is the conversational speech of the better classes. The mime recognizes no such restrictions in its portrayal of life. The married woman, her stupid husband, and her lover are common figures in this form of the drama, and if we may draw an inference from the lately discovered fragments of Greek mimes, the speech was that of the common people. Again, the new comedy has its limited list of stock characters--the old man, the tricky slave, the parasite, and the others which we know so well in Plautus and Terence, but as for the mime, any figure to be seen on the street may find a place in it--the rhetorician, the soldier, the legacy-hunter, the inn-keeper, or the town-crier. The doings of kings and heroes were parodied. We are even told that a comic Hector and Achilles were put on the stage, and the gods did not come off unscathed. All of these characteristic features of the mime remind us in a striking way of the novel of Petronius. His work, like the mime, is a realistic picture of low life which presents a great variety of characters and shows no regard for conventional morals. It is especially interesting to notice the element of parody, which we have already observed in Petronius, in both kinds of literary productions. The theory that Petronius may have had the composition of his _Satirae_ suggested to him by plays of this type is greatly strengthened by the fact that the mime reached its highest point of popularity at the court in the time of Nero, in whose reign Petronius lived. In point of fact Petronius refers to the mime frequently. One of these passages is of peculiar significance in this connection. Encolpius and his comrades are entering the town of Croton and are considering what device they shall adopt so as to live without working. At last a happy idea occurs to Eumolpus, and he says: "Why don't we construct a mime?" and the mime is played, with Eumolpus as a fabulously rich man at the point of death, and the others as his attendants. The rôle makes a great hit, and all the vagabonds in the company play their assumed parts in their daily life at Croton with such skill that the legacy-hunters of the place load them with attentions and shower them with presents. This whole episode, in fact, may be thought of as a mime cast in the narrative form, and the same conception may be applied with great plausibility to the entire story of Encolpius.

We have thus far been attacking the question with which we are concerned from the side of the subject-matter and tone of the story of Petronius. Another method of approach is suggested by the Menippean satire,[87] the best specimens of which have come down to us in the fragments of Varro, one of Cicero's contemporaries. These satires are an _olla podrida_, dealing with all sorts of subjects in a satirical manner, sometimes put in the dialogue form and cast in a _mélange_ of prose and verse. It is this last characteristic which is of special interest to us in this connection, because in the prose of Petronius verses are freely used. Sometimes, as we have observed above, they form an integral part of the narrative, and again they merely illustrate or expand a point touched on in the prose. If it were not aside from our immediate purpose it would be interesting to follow the history of this prose-poetical form from the time of Petronius on. After him it does not seem to have been used very much until the third and fourth centuries of our era. However, Martial in the first century prefixed a prose prologue to five books of his Epigrams, and one of these prologues ends with a poem of four lines. The several books of the _Silvae_ of Statius are also preceded by prose letters of dedication. That strange imitation of the _Aulularia_ of Plautus, of the fourth century, the _Querolus_, is in a form half prose and half verse. A sentence begins in prose and runs off into verse, as some of the epitaphs also do. The Epistles of Ausonius of the same century are compounded of prose and a great variety of verse. By the fifth and sixth centuries, a _mélange_ of verse or a combination of prose and verse is very common, as one can see in the writings of Martianus Capella, Sidonius Apollinaris, Ennodius, and Boethius. It recurs again in modern times, for instance in Dante's _La Vita Nuova_, in Boccaccio, _Aucassin et Nicolette_, the _Heptameron_, the _Celtic Ballads_, the _Arabian Nights_, and in _Alice in Wonderland_.

A little thought suggests that the prose-poetic form is a natural medium of expression. A change from prose to verse, or from one form of verse to another, suggests a change in the emotional condition of a speaker or writer. We see that clearly enough illustrated in tragedy or comedy. In the thrilling scene in the _Captives of Plautus_, for example, where Tyndarus is in mortal terror lest the trick which he has played on his master, Hegio, may be discovered, and he be consigned to work in chains in the quarries, the verse is the trochaic septenarius. As soon as the suspense is over, it drops to the iambic senarius. If we should arrange the commoner Latin verses in a sequence according to the emotional effects which they produce, at the bottom of the series would stand the iambic senarius. Above that would come trochaic verse, and we should rise to higher planes of exaltation as we read the

anapæstic, or cretic, or bacchiac. The greater part of life is commonplace. Consequently the common medium for conversation or for the narrative in a composition like comedy made up entirely of verse is the senarius. Now this form of verse in its simple, almost natural, quantitative arrangement is very close to prose, and it would be a short step to substitute prose for it as the basis of the story, interspersing verse here and there to secure variety, or when the emotions were called into play, just as lyric verses are interpolated in the iambic narrative. In this way the combination of different kinds of verse in the drama, and the prosimetrum of the Menippean satire and of Petronius, may be explained, and we see a possible line of descent from comedy and this form of satire to the _Satirae_.

These various theories of the origin of the romance of Petronius--that it may be related to the epic, to the serious heroic romance, to the bourgeois story of adventure developed out of the rhetorical exercise, to the Milesian tale, to the prologue of comedy, to the _verse-mélange_ of comedy or the mime, or to the prose-poetical Menippean satire--are not, of necessity, it seems to me, mutually exclusive. His novel may well be thought of as a parody of the serious romance, with frequent reminiscences of the epic, a parody suggested to him by comedy and its prologue, by the mime, or by the short cynical Milesian tale, and cast in the form of the Menippean satire; or, so far as subject-matter and realistic treatment are concerned, the suggestion may have come directly from the mime, and if we can accept the theory of some scholars who have lately studied the mime, that it sometimes contained both prose and verse, we may be inclined to regard this type of literature as the immediate progenitor of the novel, even in the matter of external form, and leave the Menippean satire out of the line of descent. Whether the one or the other of these explanations of its origin recommends itself to us as probable, it is interesting to note, as we leave the subject, that, so far as our present information goes, the realistic romance seems to have been the invention of Petronius.

Diocletian's Edict and the High Cost of Living

The history of the growth of paternalism in the Roman Empire is still to be written. It would be a fascinating and instructive record. In it the changes in the character of the Romans and in their social and economic conditions would come out clearly. It would disclose a strange mixture of worthy and unworthy motives in their statesmen and politicians, who were actuated sometimes by sympathy for the poor, sometimes by a desire for popular favor, by an honest wish to check extravagance or immorality, or by the fear that the discontent of the masses might drive them into revolution. We should find the Roman people, recognizing the menace to their simple, frugal way of living which lay in the inroads of Greek civilization, and turning in their helplessness to their officials, the censors, to protect them from a demoralization which, by their own efforts, they could not withstand. We should find the same officials preaching against race suicide, extravagant living, and evasion of public duties, and imposing penalties and restrictions in the most autocratic fashion on men of high and low degree alike who failed to adopt the official standards of conduct. We should read of laws enacted in the same spirit, laws restricting the number of guests that might be entertained on a single occasion, and prescribing penalties for guests and host alike, if the cost of a dinner exceeded the statutory limit. All this belongs to the early stage of paternal government. The motives were praiseworthy, even if the results were futile.

With the advent of the Gracchi, toward the close of the second century before our era, moral considerations become less noticeable, and paternalism takes on a more philanthropic and political character. We see this change reflected in the land laws and the corn laws. To take up first the free distribution of land by the state, in the early days of the Republic colonies of citizens were founded in the newly conquered districts of Italy to serve as garrisons on the frontier. It was a fair bargain between the citizen and the state. He received land, the state, protection. But with Tiberius Gracchus a change comes in. His colonists were to be settled in peaceful sections of Italy; they were to receive land solely because of their poverty. This was socialism or state philanthropy. Like the agrarian bill of Tiberius, the corn law of Gaius Gracchus, which provided for the sale of grain below the market price, was a paternal measure inspired in part by sympathy for the needy. The political element is clear in both cases also. The people who were thus favored by assignments of land and of food naturally supported the leaders who assisted them. Perhaps the extensive building of roads which Gaius Gracchus carried on should be mentioned in this connection. The ostensible purpose of these great highways, perhaps their primary purpose, was to develop Italy and to facilitate communication between different parts of the peninsula, but a large number of men was required for their construction, and Gaius Gracchus may well have taken the matter up, partly for the purpose of furnishing work to the unemployed. Out of these small beginnings developed the socialistic policy of later times. By the middle of the first century B.C., it is said that there were three hundred and twenty thousand persons receiving doles of corn from the state, and, if the people could look to the government for the necessities of life, why might they not hope to have it supply their less pressing needs? Or, to put it in another way, if one politician won their support by giving them corn, why might not another increase his popularity by providing them with amusement and with the comforts of life? Presents of oil and

clothing naturally follow, the giving of games and theatrical performances at the expense of the state, and the building of porticos and public baths. As the government and wealthy citizens assumed a larger measure of responsibility for the welfare of the citizens, the people became more and more dependent upon them and less capable of managing their own affairs. An indication of this change we see in the decline of local self-government and the assumption by the central administration of responsibility for the conduct of public business in the towns of Italy. This last consideration suggests another phase of Roman history which a study of paternalism would bring out--I mean the effect of its introduction on the character of the Roman people.

The history of paternalism in Rome, when it is written, might approach the subject from several different points. If the writer were inclined to interpret history on the economic side, he might find the explanation of the change in the policy of the government toward its citizens in the introduction of slave labor which, under the Republic, drove the free laborer to the wall and made him look to the state for help, in the decline of agriculture, and the growth of capitalism. The sociologist would notice the drift of the people toward the cities and the sudden massing there of large numbers of persons who could not provide for themselves and in their discontent might overturn society. The historian who concerns himself with political changes mainly, would notice the socialistic legislation of the Gracchi and their political successors and would connect the growth of paternalism with the development of democracy. In all these explanations there would be a certain measure of truth.

But I am not planning here to write a history of paternalism among the Romans. That is one of the projects which I had been reserving for the day when the Carnegie Foundation should present me with a wooden sword and allow me to retire from the arena of academic life. But, alas! the trustees of that beneficent institution, by the revision which they have lately made of the conditions under which a university professor may withdraw from active service, have in their wisdom put off that day of academic leisure to the Greek Kalends, and my dream vanishes into the distance with it.

Here I wish to present only an episode in this history which we have been discussing, an episode which is unique, however, in ancient and, so far as I know, in modern history. Our knowledge of the incident comes from an edict of the Emperor Diocletian, and this document has a direct bearing on a subject of present-day discussion, because it contains a diatribe against the high cost of living and records the heroic attempt which the Roman government made to reduce it. In his effort to bring prices down to what he considered a normal level, Diocletian did not content himself with such half-measures as we are trying in our attempts to suppress combinations in restraint of trade, but he boldly fixed the maximum prices at which beef, grain, eggs, clothing, and other articles could be sold, and prescribed the penalty of death for any one who disposed of his wares at a higher figure. His edict is a very comprehensive document, and specifies prices for seven hundred or eight hundred different articles. This systematic attempt to regulate trade was very much in keeping with the character of Diocletian and his theory of government. Perhaps no Roman emperor, with the possible exception of Hadrian, showed such extraordinary administrative ability and proposed so many sweeping social reforms as Diocletian did. His systematic attempt to suppress Christianity is a case in point, and in the last twenty years of his reign he completely reorganized the government. He frankly introduced the monarchical principle, fixed upon a method of succession to the throne, redivided the provinces, established a carefully graded system of officials, concerned himself with court etiquette and dress, and reorganized the coinage and the system of taxation. We are not surprised therefore that he had the courage to attack this difficult question of high prices, and that his plan covered almost all the articles which his subjects would have occasion to buy.

It is almost exactly two centuries since the first fragments of the edict dealing with the subject were brought to light. They were discovered in Caria, in 1709, by William Sherard, the English consul at Smyrna. Since then, from time to time, other fragments of tablets containing parts of the edict have been found in Egypt, Asia Minor, and Greece. At present portions of twenty-nine copies of it are known. Fourteen of them are in Latin and fifteen in Greek. The Greek versions differ from one another, while the Latin texts are identical, except for the stone-cutters' mistakes here and there. These facts make it clear that the original document was in Latin, and was translated into Greek by the local officials of each town where the tablets were set up. We have already noticed that specimens of the edict have not been found outside of Egypt, Greece, and Asia Minor, and this was the part of the Roman world where Diocletian ruled. Scholars have also observed that almost all the manufactured articles which are mentioned come from Eastern points. From these facts it has been inferred that the edict was to apply to the East only, or perhaps more probably that Diocletian drew it up for his part of the Roman world, and that before it could be applied to the West it was repealed.

From the pieces which were then known, a very satisfactory reconstruction of the document was made by Mommsen and published in the _Corpus of Latin Inscriptions_.[88]

The work of restoration was like putting together the parts of a picture puzzle where some of the pieces are lacking. Fragments are still coming to light, and possibly we may have the complete text some day. As it is, the introduction is complete, and perhaps four-fifths of the list of articles with prices attached are extant. The introduction opens with a stately list of the titles of the two Augusti and the two Cæsars, which fixes the date of the proclamation as 301 A.D. Then follows a long recital of the circumstances which have led the government to adopt this drastic method of controlling prices. This introduction is one of the most extraordinary pieces of bombast, mixed metaphors, loose syntax, and incoherent expressions that Latin literature possesses. One is tempted to infer from its style that it was the product of Diocletian's own pen. He was a man of humble origin, and would not live in Rome for fear of being laughed at on account of his plebeian training. The florid and awkward style of these introductory pages is exactly what we should expect from a man of such antecedents.

It is very difficult to translate them into intelligible English, but some conception of their style and contents may be had from one or two extracts. In explaining the situation which confronts the world, the Emperor writes: "For, if the raging avarice ... which, without regard for mankind, increases and develops by leaps and bounds, we will not say from year to year, month to month, or day to day, but almost from hour to hour, and even from minute to minute, could be held in check by some regard for moderation, or if the welfare of the people could calmly tolerate this mad license from which, in a situation like this, it suffers in the worst possible fashion from day to day, some ground would appear, perhaps, for concealing the truth and saying nothing; ... but inasmuch as there is only seen a mad desire without control, to pay no heed to the needs of the many, ... it seems good to us, as we look into the future, to us who are the fathers of the people, that justice intervene to settle matters impartially, in order that that which, long hoped for, humanity itself could not bring about may be secured for the common government of all by the remedies which our care affords.... Who is of so hardened a heart and so untouched by a feeling for humanity that he can be unaware, nay that he has not noticed, that in the sale of wares which are exchanged in the market, or dealt with in the daily business of the cities, an exorbitant tendency in prices has spread to such an extent that the unbridled desire of plundering is held in check neither by abundance nor by seasons of plenty!"

If we did not know that this was found on tablets sixteen centuries old, we might think that we were reading a newspaper diatribe against the cold-storage plant or the beef trust. What the Emperor has decided to do to remedy the situation he sets forth toward the end of the introduction. He says: "It is our pleasure, therefore, that those prices which the subjoined written summary specifies, be held in observance throughout all our domain, that all may know that license to go above the same has been cut off.... It is our pleasure (also) that if any man shall have boldly come into conflict with this formal statute, he shall put his life in peril.... In the same peril also shall he be placed who, drawn along by avarice in his desire to buy, shall have conspired against these statutes. Nor shall he be esteemed innocent of the same crime who, having articles necessary for daily life and use, shall have decided hereafter that they can be held back, since the punishment ought to be even heavier for him who causes need than for him who violates the laws."

The lists which follow are arranged in three columns which give respectively the article, the unit of measure, and the price.[89]

Frumenti K■M■ Hordei K■M■ unum ■■ c(entum) Centenum sive sicale " " " ■■ sexa(ginta) Mili pisti " " " ■■ centu(m) Mili integri " " ■■ quinquaginta'

The first item (frumentum) is wheat, which is sold by the K■M■ (kastrensis modius=18½ quarts), but the price is lacking. Barley is sold by the kastrensis modius at ■■ centum (centum denarii = 43 cents) and so on.

Usually a price list is not of engrossing interest, but the tables of Diocletian furnish us a picture of material conditions throughout the Empire in his time which cannot be had from any other source, and for that reason deserve some attention. This consideration emboldens me to set down some extracts in the following pages from the body of the edict:

Extracts from Diocletian's List of Maximum Prices

I

In the tables given here the Latin and Greek names of the articles listed have been turned into English. The present-day accepted measure of quantity--for instance, the bushel or the quart--has been substituted for the ancient unit, and the corresponding price for the modern unit of measure is given. Thus barley was to be sold by the kastrensis modius (=18½ quarts) at 100 denarii (=43.5 cents). At this rate a bushel of barley would have brought 74.5 cents. For convenience in reference the numbers of the chapters and of the items adopted in the text of Mommsen are used here. Only selected articles are given.

(Unit of Measure, the Bushel)

1 Wheat 2 Barley 74.5 cents 3 Rye 45 " 4 Millet, ground 74.5 " 6 Millet, whole 37 " 7 Spelt, hulled 74.5 " 8 Spelt, not hulled 22.5 " 9 Beans, ground 74.5 " 10 Beans, not ground 45 " 11 Lentils 74.5 " 12-16 Peas, various sorts 45-74.5 " 17 Oats 22.5 " 31 Poppy seeds $1.12 34 Mustard $1.12 35 Prepared mustard, quart 6 "

II

(Unit of Measure, the Quart)

1a Wine from Picenum 22.5 cents 2 Wine from Tibur 22.5 " 7 Wine from Falernum 22.5 " 10 Wine of the country 6 " 11-12 Beer 1.5-3 "

III

(Unit of Measure, the Quart)

1a Oil, first quality 30.3 cents 2 Oil, second quality 18 " 5 Vinegar 4.3 " 8 Salt, bushel 74.5 " 10 Honey, best 30.3 " 11 Honey, second quality 15 "

IV

(Unit, Unless Otherwise Noted, Pound Avoirdupois)

XXX

1 Pure gold in bars or in coined pieces, per pound 50,000 denarii 3 Artificers, working in metal, per pound $21.76 4 Gold-beaters, per pound $13.06

Throughout the lists, as one may see, articles are grouped in a systematic way. First we find grain and vegetables; then wine, oil, vinegar, salt, honey, meat, fish, cheese, salads, and nuts. After these articles, in chapter VII, we pass rather unexpectedly to the wages of the field laborer, the carpenter, the painter, and of other skilled and unskilled workmen. Then follow leather, shoes, saddles, and other kinds of raw material and manufactured wares until we reach a total of more than eight hundred articles. As we have said, the classification is in the main systematic, but there are some strange deviations from a systematic arrangement. Eggs, for instance, are in table VI with salads, vegetables, and fruits. Bücher, who has discussed some phases of this price list, has acutely surmised that perhaps the tables in whole, or in part, were drawn up by the directors of imperial factories and magazines. The government levied tribute "in kind," and it must have provided depots throughout the provinces for the reception of contributions from its subjects. Consequently in making out these tables it would very likely call upon the directors of these magazines for assistance, and each of them in making his report would naturally follow to some extent the list of articles which the imperial depot controlled by him, carried in stock. At all events, we see evidence of an expert hand in the list of linens, which includes one hundred and thirty-nine articles of different qualities.

As we have noticed in the passage quoted from the introduction, it is unlawful for a person to charge more for any of his wares than the amount specified in the law. Consequently, the prices are not normal, but maximum prices. However, since the imperial lawgivers evidently believed that the necessities of life were being sold at exorbitant rates, the maximum which they fixed was very likely no greater than the prevailing market price. Here and there, as in the nineteenth chapter of the document, the text is given in tablets from two or more places. In such cases the prices are the same, so that apparently no allowance was made for the cost of carriage, although with some articles, like oysters and sea-fish, this item must have had an appreciable value, and it certainly should have been taken into account in fixing the prices of "British mantles" or "Gallic soldiers' cloaks" of chapter XIX. The quantities for which prices are given are so small--a pint of wine, a pair of fowls, twenty snails, ten apples, a bunch of asparagus--that evidently Diocletian had the "ultimate consumer" in mind, and fixed the retail price in his edict. This is fortunate for us, because it helps us to get at the cost of living in the early part of the fourth century. There is good reason for believing that the system of barter prevailed much more generally at that time than it does to-day. Probably the farmer often exchanged his grain, vegetables, and eggs for shoes and cloth, without receiving or paying out money, so that the money prices fixed for his products would not affect him in every transaction as they would affect the present-day farmer. The unit of money which is used throughout the edict is the copper denarius, and fortunately the value of a pound of fine gold is given as 50,000 denarii. This fixes the value of the denarius as .4352 cent, or approximately four-tenths of a cent. It is implied in the introduction that the purpose of the law is to

protect the people, and especially the soldiers, from extortion, but possibly, as Bücher has surmised, the emperor may have wished to maintain or to raise the value of the denarius, which had been steadily declining because of the addition of alloy to the coin. If this was the emperor's object, possibly the value of the denarius is set somewhat too high, but it probably does not materially exceed its exchange value, and in any case, the relative values of articles given in the tables are not affected.

The tables bring out a number of points of passing interest. From chapter II it seems to follow that Italian wines retained their ancient pre-eminence, even in the fourth century. They alone are quoted among the foreign wines. Table VI gives us a picture of the village market. On market days the farmer brings his artichokes, lettuce, cabbages, turnips, and other fresh vegetables into the market town and exposes them for sale in the public square, as the country people in Italy do to-day. The seventh chapter, in which wages are given, is perhaps of liveliest interest. In this connection we should bear in mind the fact that slavery existed in the Roman Empire, that owners of slaves trained them to various occupations and hired them out by the day or job, and that, consequently the prices paid for slave labor fixed the scale of wages. However, there was a steady decline under the Empire in the number of slaves, and competition with them in the fourth century did not materially affect the wages of the free laborer. It is interesting, in this chapter, to notice that the teacher and the advocate (Nos. 66-73) are classed with the carpenter and tailor. It is a pleasant passing reflection for the teacher of Greek and Latin to find that his predecessors were near the top of their profession, if we may draw this inference from their remuneration when compared with that of other teachers. It is worth observing also that the close association between the classics and mathematics, and their acceptance as the corner-stone of the higher training, to which we have been accustomed for centuries, seems to be recognized (VII, 70) even at this early date. We expect to find the physician mentioned with the teacher and advocate, but probably it was too much even for Diocletian's skill, in reducing things to a system, to estimate the comparative value of a physician's services in a case of measles and typhoid fever.

The bricklayer, the joiner, and the carpenter (VII, 2-3a), inasmuch as they work on the premises of their employer, receive their "keep" as well as a fixed wage, while the knife-grinder and the tailor (VII, 33, 42) work in their own shops, and naturally have their meals at home. The silk-weaver (XX, 9) and the linen-weaver (XXI, 5) have their "keep" also, which seems to indicate that private houses had their own looms, which is quite in harmony with the practices of our fathers. The carpenter and joiner are paid by the day, the teacher by the month, the knife-grinder, the tailor, the barber (VII, 22) by the piece, and the coppersmith (VII, 24a-27) according to the amount of metal which he uses. Whether the difference between the prices of shoes for the patrician, the senator, and the knight (IX, 7-9) represents a difference in the cost of making the three kinds, or is a tax put on the different orders of nobility, cannot be determined. The high prices set on silk and wool dyed with purple (XXIV) correspond to the pre-eminent position of that imperial color in ancient times. The tables which the edict contains call our attention to certain striking differences between ancient and modern industrial and economic conditions. Of course the list of wage-earners is incomplete. The inscriptions which the trades guilds have left us record many occupations which are not mentioned here, but in them and in these lists we miss any reference to large groups of men who hold a prominent place in our modern industrial reports--I mean men working in printing-offices, factories, foundries, and machine-shops, and employed by transportation companies. Nothing in the document suggests the application of power to the manufacture of articles, the assembling of men in a common workshop, or the use of any other machine than the hand loom and the mill for the grinding of corn. In the way of articles offered for sale, we miss certain items which find a place in every price-list of household necessities, such articles as sugar, molasses, potatoes, cotton cloth, tobacco, coffee, and tea. The list of stimulants (II) is, in fact, very brief, including as it does only a few kinds of wine and beer.

At the present moment, when the high cost of living is a subject which engages the attention of the economist, politician, and householder, as it did that of Diocletian and his contemporaries, the curious reader will wish to know how wages and the prices of food in 301 A.D. compare with those of to-day. In the two tables which follow, such a comparison is attempted for some of the more important articles and occupations.

Articles of Food[90]

Price in 301 A.D. Price in 1906 A.D.

Wheat, per bushel 33.6 cents $1.19[91] Rye, per bushel 45 " 79 cents[91] Beans, per bushel 45 " $3.20 Barley, per bushel 74.5 " 55 cents[91] Vinegar, per quart 4.3 " 5-7 " Fresh pork, per pound 7.3 " 14-16 " Beef, per pound 4.9 " { 9-12 " {15-18 " Mutton, per pound 4.9 " 13-16 " Ham, per pound 12 " 18-25 " Fowls, per pair 26 " Fowls, per pound 14-18 " Butter, per pound 9.8 " 26-32 " Fish, river, fresh, per pound 7.3 " 12-15 " Fish, sea, fresh, per pound 9-14 " 8-14 cents Fish, salt, per pound 8.3 " 8-15 " Cheese, per pound 7.3 " 17-20 " Eggs, per dozen 5.1 " 25-30 " Milk, cow's, per quart 6-8 " Milk, sheep's, per quart 6 "

Wages Per Day

Unskilled workman 10.8 cents (k)[92] $1.20-2.24[93] Bricklayer 21.6 " (k) 4.50-6.50 Carpenter 21.6 " (k) 2.50-4.00 Stone-mason 21.6 " (k) 3.70-4.90 Painter 32.4 " (k) 2.75-4.00 Blacksmith 21.6 " (k) 2.15-3.20 Ship-builder 21-26 " (k) 2.15-3.50

We are not so much concerned in knowing the prices of meat, fish, eggs, and flour in 301 and 1911 A.D. as we are in finding out whether the Roman or the American workman could buy more of these commodities with the returns for his labor. A starting point for such an estimate is furnished by the Eighteenth Annual Report of the Commissioner of Labor, on the "Cost of Living and Retail Prices of Food" (1903), and by Bulletin No. 77 of the Bureau of Labor (1908). In the first of these documents (pp. 582, 583) the expenditure for rent, fuel, food, and other necessities of life in 11,156 normal American families whose incomes range from $200 to $1,200 per year is given. In the other report (p. 344 _f._) similar statistics are given for 1,944 English urban families. In the first case the average amount spent per year was $617, of which $266, or a little less than a half of the entire income, was used in the purchase of food. The statistics for England show a somewhat larger relative amount spent for food. Almost exactly one-third of this expenditure for the normal American family was for meat and fish.[94] Now, if we take the wages of the Roman carpenter, for instance, as 21 cents per day, and add one-fourth or one-third for his "keep," those of the same American workman as $2.50 to $4.00, it is clear that the former received only a ninth or a fifteenth as much as the latter, while the average price of pork, beef, mutton, and ham (7.3 cents) in 301 A.D. was about a third of the average (19.6 cents) of the same articles to-day. The relative averages of wheat, rye, and barley make a still worse showing for ancient times while fresh fish was nearly as high in Diocletian's time as it is in our own day. The ancient and modern prices of butter and eggs stand at the ratio of one to three and one to six respectively. For the urban workman, then, in the fourth century, conditions of life must have been almost intolerable, and it is hard to understand how he managed to keep soul and body together, when almost all the nutritious articles of food were beyond his means. The taste of meat, fish, butter, and eggs must have been almost unknown to him, and probably even the coarse bread and vegetables on which he lived were limited in amount. The peasant proprietor who could raise his own cattle and grain would not find the burden so hard to bear.

Only one question remains for us to answer. Did Diocletian succeed in his bold attempt to reduce the cost of living? Fortunately the answer is given us by Lactantius in the book which he wrote in 313-314 A.D., "On the Deaths of Those Who Persecuted (the Christians)." The title of Lactantius's work would not lead us to expect a very sympathetic treatment of Diocletian, the arch-persecutor, but his account of the actual outcome of the incident is hardly open to question. In Chapter VII of his treatise, after setting forth the iniquities of the Emperor in constantly imposing new burdens on the people, he writes: "And when he had brought on a state of exceeding high prices by his different acts of injustice, he tried to fix by law the prices of articles offered for sale. Thereupon, for the veriest trifles much blood was shed, and out of fear nothing was offered for sale, and the scarcity grew much worse, until, after the death of many persons, the law was repealed from mere necessity." Thus came to an end this early effort to reduce the high cost of living. Sixty years later the Emperor Julian made a similar attempt on a small scale. He fixed the price of corn for the people of Antioch by an edict. The holders of grain hoarded their stock. The Emperor brought supplies of it into the city from Egypt and elsewhere and sold it at the legal price. It was bought up by speculators, and in the end Julian, like Diocletian, had to acknowledge his inability to cope with an economic law.

Private Benefactions and Their Effect on the Municipal Life of the Romans

In the early days the authority of the Roman father over his wife, his sons, and his daughters was absolute. He did what seemed to him good for his children. His oversight and care extended to all the affairs of their lives. The state was modelled on the family and took over the autocratic power of the paterfamilias. It is natural to think of it, therefore, as a paternal government, and the readiness with which the Roman subordinated his own will and sacrificed his personal interests to those of the community seems to show his acceptance of this theory of his relation to the government. But this conception is correct in part only. A paternal government seeks to foster all the common interests of its people and to provide for their common needs. This the Roman state did not try to do, and if we think of it as a paternal government, in the ordinary meaning of that term, we lose sight of the partnership between state supervision and individual enterprise in ministering to the common needs and desires, which was one of the marked features of Roman life. In fact, the gratification of the individual citizen's desire for those things which he could not secure for himself depended in the Roman Empire, as it depends in this country, not solely on state support, but in part on state aid, and in part on private generosity. We see the truth of this very clearly in studying the history of the Roman city. The phase of Roman life which we have just noted may not fit into the ideas of Roman society which we have hitherto held, but we can understand it as no other people can, because in the United States and in England we are accustomed to the co-operation of private initiative and state action in the

establishment and maintenance of universities, libraries, museums, and all sorts of charitable institutions.

If we look at the growth of private munificence under the Republic, we shall see that citizens showed their generosity particularly in the construction of public buildings, partly or entirely at their own expense. In this way some of the basilicas in Rome and elsewhere which served as courts of justice and halls of exchange were constructed. The great Basilica Æmilia, for instance, whose remains may be seen in the Forum to-day, was constructed by an Æmilius in the second century before our era, and was accepted as a charge by his descendants to be kept in condition and improved at the expense of the Æmilian family. Under somewhat similar conditions Pompey built the great theatre which bore his name, the first permanent theatre to be built in Rome, and always considered one of the wonders of the city. The cost of this structure was probably covered by the treasure which he brought back from his campaigns in the East. In using the spoils of a successful war to construct buildings or memorials in Rome, he was following the example of Mummius, the conqueror of Corinth, and other great generals who had preceded him. The purely philanthropic motive does not bulk largely in these gifts to the citizens, because the people whose armies had won the victories were part owners at least of the spoils, and because the victorious leader who built the structure was actuated more by the hope of transmitting the memory of his achievements to posterity in some conspicuous and imperishable monument than by a desire to benefit his fellow citizens.

These two motives, the one egoistic and the other altruistic, actuated all the Roman emperors in varying degrees. The activity of Augustus in such matters comes out clearly in the record of his reign, which he has left us in his own words. This remarkable bit of autobiography, known as the "Deeds of the Deified Augustus," the Emperor had engraved on bronze tablets, placed in front of his mausoleum. The original has disappeared, but fortunately a copy of it has been found on the walls of a ruined temple at Ancyra, in Asia Minor, and furnishes us abundant proof of the great improvements which he made in the city of Rome. We are told in it that from booty he paid for the construction of the Forum of Augustus, which was some four hundred feet long, three hundred wide, and was surrounded by a wall one hundred and twenty feet high, covered on the inside with marble and stucco. Enclosed within it and built with funds coming from the same source was the magnificent temple of Mars the Avenger, which had as its principal trophies the Roman standards recovered from the Parthians. This forum and temple are only two items in the long list of public improvements which Augustus records in his imperial epitaph, for, as he proudly writes: "In my sixth consulship, acting under a decree of the senate, I restored eighty-two temples in the city, neglecting no temple which needed repair at the time." Besides the temples, he mentions a large number of theatres, porticos, basilicas, aqueducts, roads, and bridges which he built in Rome or in Italy outside the city.

But the Roman people had come to look for acts of generosity from their political as well as from their military leaders, and this factor, too, must be taken into account in the case of Augustus. In the closing years of the Republic, candidates for office and men elected to office saw that one of the most effective ways of winning and holding their popularity was to give public entertainments, and they vied with one another in the costliness of the games and pageants which they gave the people. The well-known case of Cæsar will be recalled, who, during his term as ædile, or commissioner of public works, bankrupted himself by his lavish expenditures on public improvements, and on the games, in which he introduced three hundred and twenty pairs of gladiators for the amusement of the people. In his book, "On the Offices," Cicero tells us of a thrifty rich man, named Mamercus, who aspired to public office, but avoided taking the ædileship, which stood in the regular sequence of minor offices, in order that he might escape the heavy outlay for public entertainment expected of the ædile. As a consequence, when later he came up for the consulship, the people punished him by defeating him at the polls. To check the growth of these methods of securing votes, Cicero, in his consulship, brought in a corrupt practices act, which forbade citizens to give gladiatorial exhibitions within two years of any election in which they were candidates. We may doubt if this measure was effective. The Roman was as clever as the American politician in accomplishing his purpose without going outside the law. Perhaps an incident in the life of Cicero's young friend, Curio, is a case in point. It was an old Roman custom to celebrate the ninth day after a burial as a solemn family festival, and some time in the second century before our era the practice grew up of giving gladiatorial contests on these occasions. The versatile Curio, following this practice, testified his respect for his father's memory by giving the people such elaborate games that he never escaped from the financial difficulties in which they involved him. However, this tribute of pious affection greatly enhanced his popularity, and perhaps did not expose him to the rigors of Cicero's law.

These gifts from generals, from distinguished citizens, and from candidates for office do not go far to prove a generous or philanthropic spirit on the part of the donors, but they show clearly enough that the practice of giving large sums of money to embellish the city, and to please the public, had grown up under the Republic, and that the people of Rome had come to regard it as the duty of their distinguished fellow citizens to beautify the city and minister to their needs and pleasures by generous private

contributions.

All these gifts were for the city of Rome, and for the people of the city, not for the Empire, nor for Italy. This is characteristic of ancient generosity or philanthropy, that its recipients are commonly the people of a single town, usually the donor's native town. It is one of many indications of the fact that the Roman thought of his city as the state, and even under the Empire he rarely extended the scope of his benefactions beyond the walls of a particular town. The small cities and villages throughout the West reproduced the capital in miniature. Each was a little world in itself. Each of them not only had its forum, its temples, colonnades, baths, theatres, and arenas, but also developed a political and social organization like that of the city of Rome. It had its own local chief magistrates, distinguished by their official robes and insignia of office, and its senators, who enjoyed the privilege of occupying special seats in the theatre, and it was natural that the common people at Ostia, Ariminum, or Lugudunum, like those at Rome, should expect from those whom fortune had favored some return for the distinctions which they enjoyed. In this way the prosperous in each little town came to feel a sense of obligation to their native place, and this feeling of civic pride and responsibility was strengthened by the same spirit of rivalry between different villages that the Italian towns of the Middle Ages seem to have inherited from their ancestors, a spirit of rivalry which made each one eager to surpass the others in its beauty and attractiveness. Perhaps there have never been so many beautiful towns in any other period in history as there were in the Roman Empire, during the second century of our era, and their attractive features--their colonnades, temples, fountains, and works of art--were due in large measure to the generosity of private citizens. We can make this statement with considerable confidence, because these benefactions are recorded for us on innumerable tablets of stone and bronze, scattered throughout the Empire.

These contributions not only helped to meet the cost of building temples, colonnades, and other structures, but they were often intended to cover a part of the running expenses of the city. This is one of the novel features of Roman municipal life. We can understand the motives which would lead a citizen of New York or Boston to build a museum or an arch in his native city. Such a structure would serve as a monument to him; it would give distinction to the city, and it would give him and his fellow citizens æsthetic satisfaction tion But if a rich New Yorker should give a large sum to mend the pavement in Union Square or extend the sewer system on Canal Street, a judicial inquiry into his sanity would not be thought out of place. But the inscriptions show us that rich citizens throughout the Roman Empire frequently made large contributions for just such unromantic purposes. It is unfortunate that a record of the annual income and expenses of some Italian or Gallic town has not come down to us. It would be interesting, for instance, to compare the budget of Mantua or Ancona, in the first century of our era, with that of Princeton or Cambridge in the twentieth. But, although we rarely know the sums which were expended for particular purposes, a mere comparison of the objects for which they were spent is illuminating. The items in the ancient budget which find no place in our own, and vice versa, are significant of certain striking differences between ancient and modern municipal life.

Common to the ancient and the modern city are expenditures for the construction and maintenance of public buildings, sewers, aqueducts, and streets, but with these items the parallelism ends. The ancient objects of expenditure which find no place in the budget of an American town are the repair of the town walls, the maintenance of public worship, the support of the baths, the sale of grain at a low price, and the giving of games and theatrical performances. It is very clear that the ancient legislator made certain provisions for the physical and spiritual welfare of his fellow citizens which find little or no place in our municipal arrangements to-day. If, among the sums spent for the various objects mentioned above, we compare the amounts set apart for religion and for the baths, we may come to the conclusion that the Roman read the old saying, "Cleanliness is next to godliness" in the amended form "Cleanliness is next above godliness." No city in the Empire seems to have been too small or too poor to possess public baths, and how large an item of annual expense their care was is clear from the fact that an article of the Theodosian code provided that cities should spend at least one-third of their incomes on the heating of the baths and the repair of the walls. The great idle population of the city of Rome had to be provided with food at public expense. Otherwise riot and disorder would have followed, but in the towns the situation was not so threatening, and probably furnishing grain to the people did not constitute a regular item of expense. So far as public entertainments were concerned, the remains of theatres and amphitheatres in Pompeii, Fiesole, Aries, Orange, and at many other places to-day furnish us visible evidence of the large sums which ancient towns must have spent on plays and gladiatorial games. In the city of Rome in the fourth century, there were one hundred and seventy-five days on which performances were given in the theatres, arenas, and amphitheatres.

We have been looking at the items which were peculiar to the ancient budget. Those which are missing from it are still more indicative, if possible, of differences between Roman character and modes of life and those of to-day. Provision was rarely made for schools, museums, libraries, hospitals, almshouses, or for the lighting of streets. No salaries were paid to city officials; no expenditure was made for police or for protection against fire, and the slaves whom every town owned probably took care of the

public buildings and kept the streets clean. The failure of the ancient city government to provide for educational and charitable institutions, means, as we shall see later, that in some cases these matters were neglected, that in others they were left to private enterprise. It appears strange that the admirable police and fire system which Augustus introduced into Rome was not adopted throughout the Empire, but that does not seem to have been the case, and life and property must have been exposed to great risks, especially on festival days and in the unlighted streets at night. The rich man could be protected by his bodyguard of clients, and have his way lighted at night by the torches which his slaves carried, but the little shopkeeper must have avoided the dark alleys or attached himself to the retinue of some powerful man. Some of us will recall in this connection the famous wall painting at Pompeii which depicts the riotous contest between the Pompeians and the people of the neighboring town of Nuceria, at the Pompeian gladiatorial games in 50 B.C., when stones were thrown and weapons freely used. What scenes of violence and disorder there must have been on such occasions as these, without systematic police surveillance, can be readily imagined.

The sums of money which an ancient or a modern city spends fall in two categories--the amounts which are paid out for permanent improvements, and the running expenses of the municipality. We have just been looking at the second class of expenditures, and our brief examination of it shows clearly enough that the ancient city took upon its shoulders only a small part of the burden which a modern municipality assumes. It will be interesting now to see how far the municipal outlay for running expenses was supplemented by private generosity, and to find out the extent to which the cities were indebted to the same source for their permanent improvements. A great deal of light is thrown on these two questions by the hundreds of stone and bronze tablets which were set up by donors themselves or by grateful cities to commemorate the gifts made to them. The responsibility which the rich Roman felt to spend his money for the public good was unequivocally stated by the poet Martial in one of his epigrams toward the close of the first century of our era. The speaker in the poem tells his friend Pastor why he is striving to be rich--not that he may have broad estates, rich appointments, fine wines, or troops of slaves, but "that he may give and build for the public good" ("ut donem, Pastor, et ædificem"), and this feeling of stewardship found expression in a steady outpouring of gifts in the interests of the people.

The practice of giving may well have started with the town officials. We have already noticed that in Rome, under the Republic, candidates for office, in seeking votes, and magistrates, in return for the honors paid them, not infrequently spent large sums on the people. In course of time, in the towns throughout the Empire this voluntary practice became a legal obligation resting on local officials. This fact is brought out in the municipal charter of Urso,[95] the modern Osuna, in Spain. Half of this document, engraved on tablets, was discovered in Spain about forty years ago, and makes a very interesting contribution to our knowledge of municipal life. A colony was sent out to Urso, in 44 B.C., by Julius Cæsar, under the care of Mark Antony, and the municipal constitution of the colony was drawn up by one of these two men. In the seventieth article, we read of the duumvirs, who were the chief magistrates: "Whoever shall be duumvirs, with the exception of those who shall have first been elected after the passage of this law, let the aforesaid during their magistracy give a public entertainment or plays in honor of the gods and goddesses Jupiter, Juno, and Minerva, for four days, during the greater part of the day, so far as it may be done, at the discretion of the common councillors, and on these games and this entertainment let each one of them spend from his own money not less than two thousand sesterces." The article which follows in the document provides that the ædiles, or the officials next in rank, shall give gladiatorial games and plays for three days, and one day of races in the circus, and for these entertainments they also must spend not less than two thousand sesterces.

Here we see the modern practice reversed. City officials, instead of receiving a salary for their services, not only serve without pay, but are actually required by law to make a public contribution. It will be noticed that the law specified the minimum sum which a magistrate _must_ spend. The people put no limit on what he _might_ spend, and probably most of the duumvirs of Urso gave more than $80, or, making allowance for the difference in the purchasing value of money, $250, for the entertainment of the people. In fact a great many honorary inscriptions from other towns tell us of officials who made generous additions to the sum required by law. So far as their purpose and results go, these expenditures may be compared with the "campaign contributions" made by candidates for office in this country. There is a strange likeness and unlikeness between the two. The modern politician makes his contribution before the election, the ancient politician after it. In our day the money is expended largely to provide for public meetings where the questions of the day shall be discussed. In Roman times it was spent upon public improvements, and upon plays, dinners, and gladiatorial games. Among us public sentiment is averse to the expenditure of large sums to secure an election. The Romans desired and expected it, and those who were open-handed in this matter took care to have a record of their gifts set down where it could be read by all men.

On general grounds we should expect our system to have a better effect on the intelligence and character of the people, and to secure better officials. The discussion of public questions, even in a partisan way, brings them to the attention of the people, sets the people thinking, and helps to educate voters on political and economic matters. If we may draw an inference from the election posters in Pompeii, such subjects played a small part in a city election under the Empire. It must have been demoralizing, too, to a Pompeian or a citizen of Salona to vote for a candidate, not because he would make the most honest and able duumvir or ædile among the men canvassing for the office, but because he had the longest purse. How our sense of propriety would be shocked if the newly elected mayor of Hartford or Montclair should give a gala performance in the local theatre to his fellow-citizens or pay for a free exhibition by a circus troupe! But perhaps we should overcome our scruples and go, as the people of Pompeii did, and perhaps our consciences would be completely salved if the aforesaid mayor proceeded to lay a new pavement in Main Street, to erect a fountain on the Green, or stucco the city hall. Naturally only rich men could be elected to office in Roman towns, and in this respect the same advantages and disadvantages attach to the Roman system as we find in the practice which the English have followed up to the present time of paying no salary to members of the House of Commons, and in our own practice of letting our ambassadors meet a large part of their legitimate expenses.

The large gifts made to their native towns by rich men elected to public office set an example which private citizens of means followed in an extraordinary way. Sometimes they gave statues, or baths, or fountains, or porticos, and sometimes they provided for games, or plays, or dinners, or lottery tickets. Perhaps nothing can convey to our minds so clear an impression of the motives of the donors, the variety and number of the gifts, and their probable effect on the character of the people as to read two or three specimens of these dedicatory inscriptions. The citizens of Lanuvium, near Rome, set up a monument in honor of a certain Valerius, "because he cleaned out and restored the water courses for a distance of three miles, put the pipes in position again, and restored the two baths for men and the bath for women, all at his own expense."[96] A citizen of Sinuessa leaves this record: "Lucius Papius Pollio, the duumvir, to his father, Lucius Papius. Cakes and mead to all the citizens of Sinuessa and Cædici; gladiatorial games and a dinner for the people of Sinuessa and the Papian clan; a monument at a cost of 12,000 sesterces."[97] Such a catholic provision to suit all tastes should certainly have served to keep his father from being forgotten. A citizen of Beneventum lays claim to distinction because "he first scattered tickets among the people by means of which he distributed gold, silver, bronze, linen garments, and other things."[98] The people of Telesia, a little town in Campania, pay this tribute to their distinguished patron: "To Titus Fabius Severus, patron of the town, for his services at home and abroad, and because he, first of all those who have instituted games, gave at his own expense five wild beasts from Africa, a company of gladiators, and a splendid equipment, the senate and citizens have most gladly granted a statue."[99] The office of patron was a characteristic Roman institution. Cities and villages elected to this position some distinguished Roman senator or knight, and he looked out for the interests of the community in legal matters and otherwise.

This distinction was held in high esteem, and recipients of it often testified their appreciation by generous gifts to the town which they represented, or were chosen patrons because of their benefactions. This fact is illustrated in the following inscription from Spoletium: "Gaius Torasius Severus, the son of Gaius, of the Horatian tribe, quattuorvir with judicial power, augur, in his own name, and in the name of his son Publius Meclonius Proculus Torasianus, the pontiff, erected (this) on his land (?) and at his own expense. He also gave the people 250,000 sesterces to celebrate his son's birthday, from the income of which each year, on the third day before the Kalends of September, the members of the Common Council are to dine in public, and each citizen who is present is to receive eight _asses_. He also gave to the seviri Augustales, and to the priests of the Lares, and to the overseers of the city wards, 120,000 sesterces, in order that from the income of this sum they might have a public dinner on the same day. Him, for his services to the community, the senate has chosen patron of the town."[100] A town commonly showed its appreciation of what had been done for it by setting up a statue in honor of its benefactor, as was done in the case of Fabius Severus, and the public squares of Italian and provincial towns must have been adorned with many works of art of this sort. It amuses one to find at the bottom of some of the commemorative tablets attached to these statues, the statement that the man distinguished in this way, "contented with the honor, has himself defrayed the cost of the monument." To pay for a popular testimonial to one's generosity is indeed generosity in its perfect form. The statues themselves have disappeared along with the towns which erected them, but the tablets remain, and by a strange dispensation of fate the monument which a town has set up to perpetuate the memory of one of its citizens is sometimes the only record we have of the town's own existence.

The motives which actuated the giver were of a mixed character, as these memorials indicate. Sometimes it was desire for the applause of his fellow citizens, or for posthumous fame, which influenced a donor; sometimes civic pride and affection. In many cases it was the compelling force of custom, backed up now and then, as we can see from the inscriptions, by the urgent demands of the populace. Out of this last sentiment there would naturally grow a sense of the obligation imposed by the possession of

wealth, and this feeling is closely allied to pure generosity. In fact, it would probably be wrong not to count this among the original motives which actuated men in making their gifts, because the spirit of devotion to the state and to the community was a marked characteristic of Romans in the republican period.

The effects which this practice of giving had on municipal life and on the character of the people are not without importance and interest. The lavish expenditure expected of a magistrate and the ever-increasing financial obligations laid upon him by the central government made municipal offices such an intolerable burden that the charter of Urso of the first century A.D., which has been mentioned above, has to resort to various ingenious devices to compel men to hold them. The position of a member of a town council was still worse. He was not only expected to contribute generously to the embellishment and support of his native city, but he was also held responsible for the collection of the imperial taxes. As prosperity declined he found this an increasingly difficult thing to do, and seats in the local senate were undesirable. The central government could not allow the men responsible for its revenues to escape their responsibility. Consequently, it interposed and forced them to accept the honor. Some of them enlisted in the army, or even fled into the desert, but whenever they were found they were brought back to take up their positions again. In the fourth century, service in the common council was even made a penalty imposed upon criminals. Finally, it became hereditary, and it is an amusing but pathetic thing to find that this honor, so highly prized in the early period, became in the end a form of serfdom.

We have been looking at the effects of private generosity on official life. Its results for the private citizen are not so clear, but it must have contributed to that decline of independence and of personal responsibility which is so marked a feature of the later Empire. The masses contributed little, if anything, to the running expenses of government and the improvement of the city. The burdens fell largely upon the rich. It was a system of quasi-socialism. Those who had, provided for those who had not--not merely markets and temples, and colonnades, and baths, but oil for the baths, games, plays, and gratuities of money. Since their needs were largely met by others, the people lost more and more the habit of providing for themselves and the ability to do so. When prosperity declined, and the wealthy could no more assist them, the end came.

The objects for which donors gave their money seem to prove the essentially materialistic character of Roman civilization, because we must assume that those who gave knew the tastes of the people. Sometimes men like Pliny the Younger gave money for libraries or schools, but such gifts seem to have been relatively infrequent. Benefactions are commonly intended to satisfy the material needs or gratify the desire of the people for pleasure.

Under the old régime charity was unknown. There were neither almshouses nor hospitals, and scholars have called attention to the fact that even the doles of corn which the state gave were granted to citizens only. Mere residents or strangers were left altogether out of consideration, and they were rarely included within the scope of private benevolence. In the following chapter, in discussing the trades-guilds, we shall see that even they made no provision for the widow or orphan, or for their sick or disabled members. It was not until Christianity came that the poor and the needy were helped because of their poverty and need.

Some Reflections on Corporations and Trades-Guilds

In a recent paper on "Ancient and Modern Imperialism," read before the British Classical Association, Lord Cromer, England's late consul-general in Egypt, notes certain points of resemblance between the English and the Roman methods of dealing with alien peoples. With the Greeks no such points of contact exist, because, as he remarks, "not only was the imperial idea foreign to the Greek mind; the federal conception was equally strange." This similarity between the political character and methods of the Romans and Anglo-Saxons strikes any one who reads the history of the two peoples side by side. They show the same genius for government at home, and a like success in conquering and holding foreign lands, and in assimilating alien peoples. Certain qualities which they have in common contribute to these like results. Both the Roman and the Anglo-Saxon have been men of affairs; both have shown great skill in adapting means to an end, and each has driven straight at the immediate object to be accomplished without paying much heed to logic or political theory. A Roman statesman would have said "Amen!" to the Englishman's pious hope that "his countrymen might never become consistent or logical in politics." Perhaps the willingness of the average Roman to co-operate with his fellows, and his skill in forming an organization suitable for the purpose in hand, go farther than any of the other qualities mentioned above to account for his success in governing other peoples as well as his own nation.

Our recognition of these striking points of resemblance between the Romans and ourselves has come from a comparative study of the political life of the two peoples. But the likeness to each other of the Romans and Anglo-Saxons, especially in the matter of associating themselves together for a common object, is still more apparent in their methods of dealing with private affairs. A characteristic and amusing illustration of the working of this tendency among the Romans is furnished by the early history of

monasticism in the Roman world. When the Oriental Christian had convinced himself of the vanity of the world, he said: "It is the weakness of the flesh and the enticements of the wicked which tempt me to sin. Therefore I will withdraw from the world and mortify the flesh." This is the spirit which drove him into the desert or the mountains, to live in a cave with a lion or a wolf for his sole companion. This is the spirit which took St. Anthony into a solitary place in Egypt. It led St. Simeon Stylites to secure a more perfect sense of aloofness from the world, and a greater security from contact with it by spending the last thirty years of his life on the top of a pillar near Antioch. In the Western world, which was thoroughly imbued with the Roman spirit, the Christian who held the same view as his Eastern brother of the evil results flowing from intercourse with his fellow men, also withdrew from the world, but he withdrew in the company of a group of men who shared his opinions on the efficacy of a life of solitude. A delightful instance of the triumph of the principle of association over logic or theory! We Americans can understand perfectly the compelling force of the principle, even in such a case as this, and we should justify the Roman's action on the score of practical common sense. We have organizations for almost every conceivable political, social, literary, and economic purpose. In fact, it would be hard to mention an object for which it would not be possible to organize a club, a society, a league, a guild, or a union. In a similar way the Romans had organizations of capitalists and laborers, religious associations, political and social clubs, and leagues of veterans.

So far as organizations of capitalists are concerned, their history is closely bound up with that of imperialism. They come to our notice for the first time during the wars with Carthage, when Rome made her earliest acquisitions outside of Italy. In his account of the campaigns in Spain against Hannibal's lieutenants, Livy tells us[101] of the great straits to which the Roman army was reduced for its pay, food, and clothing. The need was urgent, but the treasury was empty, and the people poverty-stricken. In this emergency the prætor called a public meeting, laid before it the situation in Spain, and, appealing to the joint-stock companies to come to the relief of the state, appointed a day when proposals could be made to furnish what was required by the army. On the appointed day three _societates_, or corporations, offered to make the necessary loans to the government; their offers were accepted, and the needs of the army were met. The transaction reminds us of similar emergencies in our civil war, when syndicates of bankers came to the support of the government. The present-day tendency to question the motives of all corporations dealing with the government does not seem to color Livy's interpretation of the incident, for he cites it in proof of the patriotic spirit which ran through all classes in the face of the struggle with Carthage. The appearance of the joint-stock company at the moment when the policy of territorial expansion is coming to the front is significant of the close connection which existed later between imperialism and corporate finance, but the later relations of corporations to the public interests cannot always be interpreted in so charitable a fashion.

Our public-service companies find no counter-part in antiquity, but the Roman societies for the collection of taxes bear a resemblance to these modern organizations of capital in the nature of the franchises, as we may call them, and the special privileges which they had. The practice which the Roman government followed of letting out to the highest bidder the privilege of collecting the taxes in each of the provinces, naturally gave a great impetus to the development of companies organized for this purpose. Every new province added to the Empire opened a fresh field for capitalistic enterprise, in the way not only of farming the taxes, but also of loaning money, constructing public works, and leasing the mines belonging to the state, and Roman politicians must have felt these financial considerations steadily pushing them on to further conquests.

But the interest of the companies did not end when Roman eagles had been planted in a new region. It was necessary to have the provincial government so managed as to help the agents of the companies in making as much money as possible out of the provincials, and Cicero's year as governor of Cilicia was made almost intolerable by the exactions which these agents practised on the Cilicians, and the pressure which they brought to bear upon him and his subordinates. His letters to his intimate friend, Atticus, during this period contain pathetic accounts of the embarrassing situations in which loaning companies and individual capitalists at Rome placed him. On one occasion a certain Scaptius came to him[102], armed with a strong letter of recommendation from the impeccable Brutus, and asked to be appointed prefect of Cyprus. His purpose was, by official pressure, to squeeze out of the people of Salamis, in Cyprus, a debt which they owed, running at forty-eight per cent interest. Upon making some inquiry into the previous history of Scaptius, Cicero learned that under his predecessor in Cilicia, this same Scaptius had secured an appointment as prefect of Cyprus, and backed by his official power, to collect money due his company, had shut up the members of the Salaminian common council in their town hall until five of them died of starvation. In domestic politics the companies played an equally important rôle. The relations which existed between the "interests" and political leaders were as close in ancient times as they are to-day, and corporations were as unpartisan in Rome in their political alliances as they are in the United States. They impartially supported the democratic platforms of Gaius Gracchus and Julius Cæsar in return for valuable concessions, and backed the candidacy of the constitutionalist Pompey for the position of commander-in-chief of the fleets and armies acting against the Eastern pirates, and against Mithridates, in like expectation of substantial returns for their help. What gave the companies their

influence at the polls was the fact that their shares were very widely held by voters. Polybius, the Greek historian, writing of conditions at Rome in the second century B.C., gives us to understand that almost every citizen owned shares in some joint-stock company[103]. Poor crops in Sicily, heavy rains in Sardinia, an uprising in Gaul, or "a strike" in the Spanish mines would touch the pocket of every middle-class Roman.

In these circumstances it is hard to see how the Roman got on without stock quotations in the newspapers. But Cæsar's publication of the _Acta Diurna_, or proceedings of the senate and assembly, would take the place of our newspapers in some respects, and the crowds which gathered at the points where these documents were posted, would remind us of the throngs collected in front of the bulletin in the window of a newspaper office when some exciting event has occurred. Couriers were constantly arriving from the agents of corporations in Gaul, Spain, Africa, and Asia with the latest news of industrial and financial enterprises in all these sections. What a scurrying of feet there must have been through the streets when the first news reached Rome of the insurrection of the proletariat in Asia in 88 B.C., and of the proclamation of Mithridates guaranteeing release from half of their obligations to all debtors who should kill money-lenders! Asiatic stocks must have dropped almost to the zero point. We find no evidence of the existence of an organized stock exchange. Perhaps none was necessary, because the shares of stock do not seem to have been transferable, but other financial business arising out of the organization of these companies, like the loaning of money on stock, could be transacted reasonably well in the row of banking offices which ran along one side of the Forum, and made it an ancient Wall Street or Lombard Street.

"Trusts" founded to control prices troubled the Romans, as they trouble us to-day. There is an amusing reference to one of these trade combinations as early as the third century before our era in the Captives of Plautus.[104] The parasite in the play has been using his best quips and his most effective leads to get an invitation to dinner, but he can't provoke a smile, to say nothing of extracting an invitation. In a high state of indignation he threatens to prosecute the men who avoid being his hosts for entering into an unlawful combination like that of "the oil dealers in the Velabrum." Incidentally it is a rather interesting historical coincidence that the pioneer monopoly in Rome, as in our day, was an oil trust--in the time of Plautus, of course, an olive-oil trust. In the "Trickster," which was presented in 191 B.C., a character refers to the mountains of grain which the dealers had in their warehouses.[105] Two years later the "corner" had become so effective that the government intervened, and the curule ædiles who had charge of the markets imposed a heavy fine on the grain speculators.[106] The case was apparently prosecuted under the Laws of the Twelve Tables of 450 B.C., the Magna Charta of Roman liberty. It would seem, therefore, that combinations in restraint of trade were formed at a very early date in Rome, and perhaps Diocletian's attempt in the third century of our era to lower the cost of living by fixing the prices of all sorts of commodities was aimed in part at the same evil. As for government ownership, the Roman state made one or two essays in this field, notably in the case of mines, but with indifferent success.
